114910 The terbium-activated rare earth oxysulphide binary systems $(\text{Y}_{1-x}\text{La}_x)_2\text{O}_2\text{S}$, $(\text{Y}_{1-x}\text{Gd}_x)_2\text{O}_2\text{S}$ and $(\text{Gd}_{1-x}\text{La}_x)_2\text{O}_2\text{S}$ and their luminescence properties. Huang Zhu-Po, Xu Geng-Wang (Dept. of Chem., Peking Univ., Beijing, China). *J. Less-Common Met. (Switzerland)*, vol.93, no.1, p.236-7 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983). Summary form only given. In a search for new host materials for phosphors, three rare earth oxysulphide binary systems $(\text{Y}_{1-x}\text{La}_x)_2\text{O}_2\text{S}$, $(\text{Y}_{1-x}\text{Gd}_x)_2\text{O}_2\text{S}$ and $(\text{Gd}_{1-x}\text{La}_x)_2\text{O}_2\text{S}$ were investigated. Samples of these systems with various compositions were prepared by sulphidizing the corresponding mixed rare earth oxides at high temperature. The subsolidus phase relations in these pseudobinary systems were determined by lattice parameter measurements. It was found that the diffraction peaks in the middle regions of $(\text{Y}_{1-x}\text{La}_x)_2\text{O}_2\text{S}$ and $(\text{Gd}_{1-x}\text{La}_x)_2\text{O}_2\text{S}$ systems exhibited broadening phenomena as a result of the small crystal size and lattice distortion. The changes in the luminescent brightness, the emission spectrum and the chromaticity coordinates of samples with various host compositions were studied. (no refs.)

114911 Fluorescence spectra, hypersensitivity and lifetimes of the carboxylate and related ligand complexes of the lanthanides in aqueous media. S.P.Sinha (Hahn-Meitner-Inst., Berlin, Germany). *J. Less-Common Met. (Switzerland)*, vol.93, no.1, p.237-8 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983). Summary form only given. During the author's studies of the fluorescence spectra of the lanthanides and their complexes in aqueous solution, the anionic tetracarboxylate complexes $[\text{M}(\text{CO}_3)_4]^{5-}$ ($\text{M} \equiv \text{Sm, Eu, Gd, Tb, Dy, Tm}$) have been systematically investigated. Extreme hypersensitivity was observed for the europium complex, where the hypersensitivity factor for the $^5D_0 \rightarrow ^7F_2$ transition is over 100. For other lanthanide tetracarboxylates the hypersensitivity factor varied from 10 to 50. Comparison of the lifetime of the europium(III) aquo ion (110 μs) with that of the isolated $\text{Eu}(\text{H}_2\text{O})_9^{3+}$ ion in a crystal (bromate, 119 μs ; trifluoromethanesulphonate, 102 μs) and the lifetime of the terbium(III) aquo ion (425 μs) with that of crystalline ethylsulphate (410 μs) led the author to conclude that nine-coordinated aquo ions of europium(III) and terbium(III) were present in solution. The eight-coordinated sulphates of europium(III) and terbium(III) have lifetimes of 187 μs and 713 μs respectively. The changes in the fluorescence intensities and the lifetimes of the above-mentioned lanthanides on complexation with ligands like F^- , Cl^- , Br^- , I^- , NO_3^- , SCN^- , CO_3^{2-} , HCOO^- and CH_3COO^- ions have been studied in detail. (2 refs.)

114912 On the trail of bastnasite: a study of the ternary complex (MFCO_3) of europium(III) using a fluorescence lifetime criterion. P.Sinha, P.Moller (Hahn-Meitner-Inst., Berlin, Germany). *J. Less-Common Met. (Switzerland)*, vol.93, no.1, p.238 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983). Summary form only given. In connection with studies on lanthanide-carbonate systems, the authors found that an $[\text{M}]/[\text{CO}_3^{2-}]$ ratio of 1/80 is capable of keeping the lanthanides in solution as anionic tetracarboxylate complexes. The lifetimes of $[\text{M}(\text{CO}_3)_4]^{5-}$ complexes ($\text{M} \equiv \text{Sm, Eu, Gd, Tb, Dy, Tm}$) have been studied previously. No energy migration was found to take place from europium to terbium whereas the 5D_4 level of terbium transfers a large part of its excitation energy to the 5D_0 level of europium in a 1:1 mixture of the tetracarboxylate complex. Thus excitation with 380 nm (terbium) radiation gave a lifetime value of 610 μs for terbium (547 nm) and 543 μs for europium (618 nm), whereas excitation with 393 nm (europium) radiation produced lifetime values of less than 8 μs and 479 μs for terbium and europium respectively. These values can be compared with those of the parent complexes: europium, 465 μs ; terbium 1100 μs . The exchange time was calculated from the rise curve to be about 25 μs . The authors used this robust $[\text{Eu}(\text{CO}_3)_4]^{5-}$ complex as a model system to study the interaction between this complex and the F^- ions. (no refs.)

114913 Energy transfer processes between Eu^{3+} and Tb^{3+} in KY_3F_{10} . C.Andraud, A.Vedrine (Univ. de Clermont Ferrand II, Aubiere, France), F.Pelle, B.Blanzat. *J. Less-Common Met. (Switzerland)*, vol.93, no.1, p.239 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983). Summary form only given, as follows. The luminescence properties of $\text{KY}_{3(1-x-y)}\text{Eu}_x\text{Tb}_y\text{F}_{10}$ samples ($0 \leq x \leq 15$; $0 \leq y \leq 50$) were investigated at temperatures from 8 to 800K. Two mechanisms of self-quenching between Eu^{3+} ions, which used the 5D_3 , 7F_0 , 5D_2 and 7F_4 levels and the 5D_1 , 7F_0 , 5D_0 and 7F_3 levels, were determined. An energy diffusion process involving 5D_0 and 7F levels of europium was also found. A similar study carried out for terbium luminescence has shown the existence of a self-quenching interaction between 5F_3 , 7D_6 , 5D_4 and 7F_0 levels and an energy diffusion process via the 5D_4 and $^7F_{5,6}$ levels. Two mechanisms for the $\text{Tb}^{3+} \rightarrow \text{Eu}^{3+}$ energy transfer process using (1) the 5D_3 and $^7F_{3,4}$ levels of Tb^{3+} and the 7F_0 and 5D_2 levels of Eu^{3+} and (2) the 5D_4 and $^7F_{4,5}$ levels of Tb^{3+} and the 7F_0 and 5D_0 levels of Eu^{3+} were considered. The luminescence properties of codoped samples showed that at temperatures above 8K only mechanism (2) occurs. Moreover a comparison of the luminescence properties of $\text{KY}_{2.82}\text{Tb}_{0.15}\text{Eu}_{0.03}\text{F}_{10}$, $\text{KY}_{2.73}\text{Tb}_{0.15}\text{Eu}_{0.12}\text{F}_{10}$ and $\text{KY}_{1.44}\text{Tb}_{0.50}\text{Eu}_{0.06}\text{F}_{10}$ indicates a $\text{Eu}^{3+} \rightarrow \text{Tb}^{3+}$ energy transfer phenomenon only at both a high temperature and a high terbium concentration. The proposed mechanism for this process is $\text{Tb}^{3+} (^7F_4) + \text{Eu}^{3+} (^5D_0) \rightarrow \text{Tb}^{3+} (^7F_0) + \text{Tb}^{3+} (^5D_4)$. (no refs.)

114914 Radiative recombination at Ir^{3+} sites in doped AgBr . Visible luminescence. J.P.Sponhower, C.A.Hamer (Res. Labs., Eastman Kodak Co., Rochester, NY, USA). *J. Lumin. (Netherlands)*, vol.28, no.3, p.221-32 (Aug. 1983). Low-temperature photoluminescence spectra of Ir^{3+} -doped AgBr single crystals were obtained. These spectra are highly structured; they show a progression in a low-frequency resonance vibrational mode and the participation of other localised vibrations. A sharp zero-phonon (ZP) line was observed at 1562.9 cm^{-1} . The assignment of this line as the spectral origin of the luminescence band is based upon photoluminescence excitation spectra obtained with a CW dye laser. In crystals doped with ~ 80 molar ppm Ir^{3+} , the linewidth of the ZP line is $\leq 2.0 \text{ cm}^{-1}$. A Zeeman effect on the ZP line was observed. The temperature dependence of the luminescence intensity was obtained. The emission is rapidly quenched with temperature, so that no emission bands are observed above 25K. The results of several experiments suggest that the emission originates at iridium sites in the doped crystal. (23 refs.)

114915 Luminescence of the hydrolysis products of Th(IV). H.G.Brittain (Dept. of Chem., Seton Hall Univ., South Orange, NJ, USA), L.Tsao, D.L.Perry. *J. Lumin. (Netherlands)*, vol.28, no.3, p.257-65 (Aug. 1983). Raising the pH of an aqueous solution of thorium nitrate results in the precipitation of a hydrated thorium oxide. At room temperature this material does not exhibit any emissive properties, but upon cooling to 77K a strong green luminescence can be observed. The emission spectrum is fairly broad, and is characterised by an emission lifetime of 125 μ s. Calcination of the hydrolysis product produces an anhydrous thorium oxide which is not luminescent at any temperature. Through the production of a series of mixed lanthanide/thorium hydrolysis products, it was established that the luminescent species was a clustered thorium compound. Sensitisation of Eu (III) emission by the thorium hydrolysis product was observed. (13 refs.)

114916 Emission spectra in orthorhombic PbCl₂ at low temperature. T.Fujita, K.Soeda, K.Takiyama, M.Nishi (Dept. of Appl. Phys. & Chem., Hiroshima Univ., Higashihiroshima-shi, Japan), T.Hirota. *J. Lumin. (Netherlands)*, vol.28, no.3, p.267-73 (Aug. 1983). The emission spectra and its time decay in PbCl₂ at low temperature are reported. Three emission bands lying at 3.81 (UV), 2.93 (blue) and 2.60 eV are found for the photo-excitation in the intrinsic absorption region at 4.2K. An exponential decay with decay time of 11.4 μ s is observed for the UV emission. For the blue emission two kinds of time decay spectra are observed: a second order process below 10K and an exponential decay above 14K. The mechanisms of these emissions are discussed by taking into account the above results. (10 refs.)

114917 Study of the protoporphyrin luminescence under selective laser excitation. V.I.Rakhovskii (All-Union Centre for Study of Surface and Vacuum Properties, Moscow, USSR), M.N.Sapozhnikov, A.L.Shubin. *J. Lumin. (Netherlands)*, vol.28, no.3, p.301-11 (Aug. 1983). The structural luminescence spectra of protoporphyrin IX solid solutions in ethanol and hydrochloric acid were obtained under selective laser excitation in the region of the inhomogeneously broadened pure electronic and vibronic bands at T=3.8K. The dependence of the excitation selectivity on the excitation frequency was investigated. The vibrational frequencies of protoporphyrin IX were obtained in the ground and excited electronic states when the excitation frequency has been scanned in the region of pure electronic and vibronic bands, respectively. A universal apparatus is described for the investigation of the absorption and luminescence spectra of polyatomic molecules in the temperature range from 3.5 to 300K under the dye laser excitation tunable in the spectral region 265-365 nm, 435-730 nm, detection of spectra in the region 300-900 nm with a polychromator and silicon intensified image detector and processing of the spectral information with an optical spectrum analyser controlled with a microcomputer. (8 refs.)

114918 Site selective excitation of 1-hydronaphthyl radical in irradiated naphthalene crystal. T.Nakayama (Radiation Lab., Univ. of Notre Dame, Notre Dame, IN, USA). *J. Lumin. (Netherlands)*, vol.28, no.3, p.313-17 (Aug. 1983). Fluorescence excitation spectrum of the 1-hydronaphthyl radical is observed by site selective laser excitation. The proposal by Jacobsen et al. (1978) that the origin of the radical is dual is confirmed. (9 refs.)

114919 Time-resolved measurements of photoluminescence in As-S alloy glasses and films evaporated from a-As₂S₃. K.Murayama, G.S.Higashi, M.A.Kastner (Dept. of Phys., MIT, Cambridge, MA, USA). *Philos. Mag. B (GB)*, vol.48, no.3, p.277-88 (Sept. 1983). The excitation-energy dependence of photoluminescence (PL) measurement at short times after 10 ns pulsed excitation and of the spectrally integrated total-light decay (TLD) have been measured for a variety of glasses containing As and S. Measurements are reported for bulk glasses of compositions As₃₅S₆₅, As₄₀S₆₀ and As₄₂S₅₈, as well as for thin films evaporated from bulk a-As₂S₃ which were either measured as prepared, after annealing, or after several hours of optical irradiation. It was found that the short-time (zero-delay) PL spectrum is very sensitive to sample composition and molecular structure. Although only slight variations in the TLD were observed, the zero-delay spectrum changed drastically from sample to sample. Concomitant effects were observed in the quantum efficiency at short times. The results are discussed in terms of some of the current models for the PL mechanism. (17 refs.)

114920 Influence of uniaxial pressure on the impurity photoluminescence band of GaAs:Cu with a maximum near 1.02 eV. T.K.Ashirov, A.A.Gutkin (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Semicond. (USA)*, vol.17, no.3, p.258-60 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.418-21 (March 1983). [received: Sept. 1983] A wide photoluminescence band of n-type GaAs:Cu with a maximum near 1.02 eV, due to radiative transitions of electrons from the conduction band (or from a shallow level near this band) to a deep-level center, was investigated at temperatures 4.2, 77, and 293K at pressures up to ~3 tonne/cm² applied along the [100], [111], and [110] directions. The polarization dependences of the luminescence under pressure indicated that the centers responsible for the band had the T_d symmetry (for example, a substantial impurity with an undistorted symmetry of the environment consisting of the host atoms). The results obtained at 77 and 293K indicated that the deformation potential constants *b* and *d* of the impurity center responsible for the luminescence were -0.92±0.09 and -2.6±0.2 eV, respectively. (11 refs.)

114921 Investigation of the saturation of the intensity of the $\lambda=1.3 \mu$ luminescence emitted from InGaAsP/InP structures at high rates of excitation. V.P.Chalyi, D.Z.Garbuzov, A.V.Chudinov, V.V.Agaev (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Semicond. (USA)*, vol.17, no.3, p.287-9 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.464-8 (March 1983). [received: Sept. 1983] An investigation was made of the dependences of the external quantum efficiency of the photoluminescence on the rate of excitation of InGaAsP/InP double heterostructures at various temperatures. It was found that at T≥225K the 'luminescence saturation' effect was observed not only for the luminescence emerging at right angles to the plane of the structure, but for the luminescence propagating parallel to the heterostructure plane. It was established that at T>225K the luminescence intensity saturation was due to a relative reduction in the rate of radiative transitions in the active region of a heterostructure. At low temperatures (T<225K) this luminescence saturation effect was observed only when the luminescence emerged at right angles to the plane of the structure and it was due to changes in the angular and spatial distribution of photons as a result of the appearance and amplification of the superluminescent component of the radiation. (9 refs.)

114922 Photoluminescence of germanium irradiated with ⁶⁰Co γ rays. V.A.Bykovskii, A.V.Mudryi, V.P.Poskrebyshv, V.D.Tkachev (Belorussian Polytech. Inst., Minsk, Belorussian SSR). *Sov. Phys.-Semicond. (USA)*, vol.17, no.3, p.296-9 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.479-83 (March 1983). [received: Sept. 1983] An investigation was made of the low-temperature (4.2K) photoluminescence of n- and p-type germanium irradiated with ⁶⁰Co γ rays. Isochronous annealing of crystals up to T=400°C revealed a series of vibronic luminescence bands with strong no-phonon lines in the spectral range 0.50-0.75 eV. The atoms of the main dopants (Sb and Ga) did not occur in the luminescence centers. These centers were assumed to be complexes comprising atoms of residual (accidental) impurities and primary radiation defects. (23 refs.)

114923 Nature of the luminescence lines of heavily doped p-type gallium arsenide under uniaxial deformation. N.S.Averkiev, S.A.Obukhov, A.A.Rogachev, N.A.Rud (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.193-4 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.343-5 (Feb. 1983). [received: Sept. 1983] Luminescence spectra were studied in uniaxially deformed crystals of p-type gallium arsenide ($N_A=2\times 10^{18}$ - 10^{19} cm⁻³). Measurements of the linear polarization of the luminescence showed that the presence of two peaks in the luminescence spectrum is due to the recombination of holes from the valence band split under pressure, with $m_x=-1/2$ and with $m_y=\pm 3/2$. The limiting strain values are calculated for which this splitting affects the luminescence line profile. (4 refs.)

114924 Emission from free and bound excitons in gallium selenide layered crystals. Yu.P.Gnatenko, Z.D.Kovalyuk, P.A.Skubenko, Yu.I.Zhirko (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.251-3 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.445-9 (Feb. 1983). [received: Sept. 1983] The emission spectra of single crystals of gallium selenide in the ϵ phase containing impurity cobalt atoms in concentrations of 0.001-0.5% are investigated at various temperatures (4.2-35K) in polarized light. It is found that a wide emission band with an energy of 2.031 eV is caused by structural defects in the GaSe crystal, while other wide bands at 2.039 and 2.008 eV are caused by indirect excitonic transitions with emission of TO phonons. Narrow emission lines correspond to the decay of direct excitons bound to various defects and to phonon replicas of these involving phonons of energy 14.5±0.5 meV. The temperature dependence of the doublet structure of the free-exciton emission line is investigated; it is evidently caused by characteristics of the band structure of the GaSe crystal, in particular by the splitting of the valence band by interlayer interactions. (15 refs.)

114925 Kinetics of exciton radiation in fluorite type crystals. A.V.Agafo-nov, P.A.Rodnyi (M.I. Kalinin Polytech. Inst., Leningrad, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.335-6 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.589-90 (Feb. 1983). [received: Sept. 1983] The authors have studied the characteristic (excitonic) luminescence of specially purified fluorite-type crystals in the temperature range 5 to 160K. The samples were excited by X-ray pulses of 20 nsec duration as well as a 1 μ sec duration, since, for short (nanosecond) excitation, the amplitude of the long-lived component of the luminescence is very small at low temperatures. In all the crystals studied, CaF₂, SrF₂, and BaF₂, measurements were made of the short-lived component of the characteristic luminescence (the so-called singlet excitons) with a lifetime τ_s of 10 nsec, and the long lived (triplet) component with a lifetime in the microsecond range. (6 refs.)

114926 Photoluminescence study of thermally treated silicon crystals. J.Weber, R.Sauer (Phys. Inst., Univ. Stuttgart, Stuttgart, Germany). Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.165-9 CZ silicon samples heated to 450°C or higher temperatures for several hours exhibit many sharp photoluminescence lines well below the band edge. The authors study the production of the lines in terms of carbon and oxygen doping and of the heating temperature and duration. First results as to a level scheme of the P(0.7672 eV) line are reported. (15 refs.)

114927 Deep radiative transitions in InP. H.Tamkin, B.V.Dutt (Bell Labs., Murray Hill, NJ, USA). Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.253-65 Results of a detailed photoluminescence study of deep radiative transitions in InP crystals prepared by bulk and epitaxial techniques with a variety of dopants are reported. In order to understand the origin of the photoluminescence spectra, bulk samples were subjected to isothermal anneals at different partial pressures of phosphorus. Similarly, the LPE wafers were grown with and without phosphorus in the gas stream. The electrical nature of some of the species responsible for the PL emission was inferred by a study of Cd-diffused bulk samples. Based on these experiments the following tentative assignments are proposed. The photoluminescence band at 0.99 eV, common to all samples, is due to emission from a donor-like level related to the P-vacancy-impurity complex. Bands at 1.21 eV and 1.15 eV appear to be due to emission to native acceptor levels associated with the In-vacancy. The 1.08 eV band is attributed to emission to a level involving the complex of the donor (0.99 eV) and acceptor (1.21 eV) species. The relationship between these bands and residual impurities is discussed. A comparison with the work of other investigators tends to support these assignments. (20 refs.)

78.60F Electroluminescence

- 114928 Electroluminescence in ZnS:Mn thin film structures grown with atomic layer epitaxy. R.Tornqvist (Electronic Display Div., Lohja Corp., Espoo, Finland). *Acta Polytech. Scand. Appl. Phys. Ser. (Finland)*, no.Ph140, p.2-34 (1983). Particular emphasis has been given to the excitation and the relaxation processes of the light emitting Mn^{2+} centre in ZnS. Estimations indicate that under operation conditions most of the conduction electrons in the ZnS:Mn layer have a kinetic energy sufficient for impact excitation of the Mn^{2+} centre, and that threshold voltage for the onset of the emission reflects rather free electron generation than the acceleration of electrons up to optical energies. A saturation in the light emission is suggested to arise from an interaction between excited Mn^{2+} centres resulting in nonradiative decay. The experimental results also indicate that the interaction occurs by energy transfer via unexcited Mn^{2+} ions. The aging behaviour of the ZnS:Mn electroluminescence thin film structures is explained in terms of electron trapping at the ZnS:Mn-insulator interfaces. The unique crystalline properties of ZnS:Mn films grown with atomic layer epitaxy are indicated by the presence of fine structure in the emission and the excitation spectra of the Mn^{2+} centre, and by a thin dead layer in the ZnS:Mn film. (32 refs.)
- 114929 Temperature dependent studies of electroluminescence brightness-waves of some rare-earth doped luminors. S.Bhushan, B.R.Kaza (Dept. of Phys., Ravisankar Univ., Raipur, India), A.N.Pandey. *Indian J. Cryog.*, vol.8, no.1, p.32-8 (1983). Brightness-waves (BW) of ZnO:Sm, ZnO:Pr and ZnO:Yb luminors were studied at fixed excitation voltage and frequency from liquid nitrogen temperature (LNT) to room temperature (RT) and above. Due to changes in temperature, for each cycle of the sinusoidal excitation, two primary peaks were observed which always precede the voltage maximum of the exciting field and their positions remained almost fixed with respect to the peak positions of the exciting field. In the case of ZnO:Sm, a secondary peak appears twice in this temperature range. However, for ZnO:Pr, the secondary peak appears only in the alternate primary peaks. The secondary peaks creep forward in the cycle with increase in temperature. No secondary peak was observed for ZnO:Yb but at lower temperatures the height of two consecutive primary peaks are not same and their ratio increases with the rise of temperature and about 255K or above becomes unity. The voltage dependence of electroluminescence (EL) brightness for the systems at RT and LNT satisfied the relation $B=B_0 \exp(-C/V^{1/2})$ which indicates the mechanism of EL excitation to be an acceleration-collision one. The values of the constants B_0 and C at LNT are higher than those at RT and this has been accounted for as due to temperature quenching. The results have been discussed in terms of existing models. (8 refs.)

114930 Low-voltage direct-current electroluminescence in ZnS:RE thin films. F.J.Bryant, A.Krier (Dept. of Phys., Univ. of Hull, Hull, England). *IEEE Proc. 1 (GB)*, vol.130, no.4, p.160-4 (Aug. 1983). Bright direct-current electroluminescence has been obtained in ZnS:Cu:Cl:RE (rare earth) thin films with good maintenance characteristics and efficiency. Different rare-earth elements have been used as dopants, either singly or together, to give devices which exhibit various colour electroluminescence. Brightness/voltage curves were measured as a function of device temperature, and electroluminescence spectra were also recorded. (12 refs.)

114931 Semiconductor electrodes. II. Efficient electroluminescence at ZnS electrode in aqueous electrolytes. F.-R.F.Fan, P.Leempoel, A.J.Bard (Dept. of Chem., Univ. of Texas, Austin, TX, USA). *J. Electrochem. Soc. (USA)*, vol.130, no.9, p.1866-75 (Sept. 1983). Electroluminescence (EL) on ZnS was studied in aqueous solutions containing various redox species. For species able to generate strongly oxidizing intermediates, such as peroxydisulfate or hydrogen peroxide, bright blue luminescence was observed during cathodic polarization at potentials near to or negative of flatband potential (V_{FB}) of ZnS. For solutions containing supporting electrolyte alone at various pH's, no emission was detectable even at potentials 7 V negative of V_{FB} . This suggests that minority carrier (hole) injection is responsible for the initiation of EL. The peak energy of the EL spectrum was much smaller (by 1 eV) than the bandgap of ZnS, suggesting that the radiative recombination is through intermediate luminescent centers. Under steady-state conditions, the EL intensity was proportional to the square of the current, suggesting that EL intensity is dominated by the recombination of electron-hole pairs at luminescent centers. In the early part of a potential pulse (especially the first pulse), the growth behavior of EL intensity was strongly affected by the electron trapping of the empty upper luminescent states. The location of the EL spectra depended on the current density and EL intensity; with increasing EL intensity, a significant blue shift of the emission peak was observed. These results suggest that the overall radiative recombination rate might be limited by electron transfer (through a tunneling mechanism) from the occupied upper luminescent states to the empty lower luminescent states. An EL efficiency of 0.2% can be achieved by operating at a current density of 25 mA/cm². (31 refs.)

114932 A new type of electroluminescent layers with laminar structure. F.Pribyl. *Slaboproudy Obz. (Czechoslovakia)*, vol.44, no.8, p.411-13 (Aug. 1983). In Czech. Discusses the developments of electroluminescent multilayer structures with low-threshold-voltage. The two types of structure described are based on the use of ZnS:Mn/PbTiO₃ (or ZnS:Mn/PLZT) and (Y₂O₃:Eu/ZnS)₃, respectively. Diagrams of these structures together with dependences of luminescence on the excitation voltage at 5 kHz are presented. Practical applicability of multilayer structures are briefly discussed. (3 refs.) E.D.

114933 Effect of chlorine concentration on the spectral characteristics of electroluminescence in ZnS:Cu:Cl phosphor. S.M.Pillai, C.P.G.Vallabhan (Dept. of Phys., Univ. of Cochin, Cochin, India). *Solid State Commun. (USA)*, vol.47, no.11, p.909-11 (Sept. 1983). ZnS:Cu:Cl phosphor prepared under a vacuum firing process is found to give blue electroluminescence with emission peak at 460 nm which remains unaltered with the frequency of the excitation voltage. Addition of excess chlorine in the phosphor gives blue, green and red emission at 460, 520 and 640 nm. The intensity of the blue band decreases and it finally disappears as chlorine concentration is increased. A scheme involving three energy levels attributed to Cu²⁺, Cu⁺ and Cl⁻ centres in ZnS explains the experimental results completely. (8 refs.)

114934 Some characteristics of the electroluminescence emitted by epitaxial Al-Ga-Sb heterostructures. N.S.Zimogorova (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR), I.V.Kryachko, I.I.Matkova, L.D.Pramatarova, V.I.Shostka. *Sov. Phys.-Semicond. (USA)*, vol.17, no.3, p.324-6 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.517-20 (March 1983). [received: Sept. 1983] The interest in the AlGaSb system originates from the small mismatch of the lattice parameters of the components of the system and from potential practical applications of devices made of materials belonging to this system at wavelengths (1.3-1.6 μ) corresponding to low losses in fiber-optic communication lines. The authors report the results of an experimental study of the electrical properties and luminescence of epitaxial p(n)-GaSb-n(p)-Al_xGa_{1-x}Sb structures (0 $\leq x \leq 0.25$ molar fractions). Heterostructures were formed by the method of liquid epitaxy involving successive crystallization of epitaxial films on p-type GaSb (111) substrates [$p=10^{17} \text{ cm}^{-3}$ or $p=(2-5) \cdot 10^{18} \text{ cm}^{-3}$]. (10 refs.)

78.60H Cathodoluminescence, ionoluminescence

- 114935 Method for the analysis of saturation effects of cathodoluminescence in phosphors; applied to Zn₂SiO₄:Mn and Y₃Al₅O₁₂:Tb. D.M.de Leeuw, G.W.'t Hooft (Philips Res. Labs., Eindhoven, Netherlands). *J. Lumin. (Netherlands)*, vol.28, no.3, p.275-300 (Aug. 1983). Saturation of the luminescence of phosphors under stationary cathode-ray excitation is due to activator ground-state depletion and an increased importance of higher order recombination processes at high excitation density. A method based on model considerations is presented to determine the kinetics of the dominating superlinear energy-loss process. The method is illustrated to analyse the saturation of the luminescence of Zn₂SiO₄:Mn and the blue ³D₃-⁵F emission of Y₃Al₅O₁₂:Tb. Quadratic energy-loss processes related to excited activator ions (Mn, Tb) are found. With this result the emitted optical flux under stationary excitation conditions and the rise time and the decay time of the luminescence can be quantitatively interpreted. When activator ground-state depletion occurs excited-state absorption cannot be excluded. (28 refs.)
- 114936 Cathodoluminescence of plasma-grown SiO₂ films. Yu.Ya.Bekeris, M.Kh.Neihtar, V.K.Petrov. *Latv. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR)*, no.4, p.37-40 (1983). In Russian. The cathodoluminescence band dependence on the annealing temperature of plasma-grown SiO₂ films on silicon is studied. The band intensity variations due to annealing temperature are associated with the modification of defect centers in SiO₂ films. (7 refs.)

78.60K Thermoluminescence

114937 Effect of flux content on thermoluminescence yield of BaS phosphors. R.P.Rao, D.R.Rao (Materials Sci. Centre, Indian Inst. of Technol., Kharagpur, India). *Bull. Mater. Sci. (India)*, vol.5, no.1, p.29-32 (March 1983). [received: Sept. 1983]

BaS phosphors doped with impurities like Cu and Bi were prepared by using NaCl as flux. Thermoluminescence of these samples prepared with different quantities of flux has been studied by exciting them at room temperature with X-rays. The amount of flux for a good thermoluminescence yield has been estimated between 25 to 30% by weight depending upon the type of phosphor. (11 refs.)

114938 Thermoluminescence from extended-chain crystals of polyethylene. T.Hashimoto, K.Ogita, S.Umemoto, T.Sakai (Dept. of Textile & Polymeric Materials, Tokyo Inst. of Technol., Ookayama, Meguro-ku, Tokyo, Japan). *J. Polym. Sci. Polym. Phys. Ed. (USA)*, vol.21, no.8, p.1347-56 (Aug. 1983).

Thermoluminescence (TL) has been observed in γ -irradiated extended-chain crystals of polyethylene above room temperature. The TL curve, which exhibits four peaks at 50, 90, 120 and 140°C, is different from that given by folded-chain crystals, in both shape and intensity. In particular, a shape, strong glow peak is observed at 140°C, corresponding to the melting temperature of the extended-chain crystals. These results are discussed in relation to independent measurements by differential scanning calorimetry and electron spin resonance. (17 refs.)

78.65 OPTICAL PROPERTIES OF THIN FILMS

114939 The optical absorption edge of amorphous thin films of borosilicate glass. M.Ilyas, C.A.Hogarth (Dept. of Phys., Brunel Univ., Uxbridge, England). *J. Mater. Sci. Lett. (GB)*, vol.2, no.9, p.535-7 (Sept. 1983).

The authors examined how the absorption edge and optical energy gap changed as the composition was varied in mixed films of SiO and B₂O₃. It was found that adding B₂O₃ to SiO increased the optical energy gap and reduced the spin density and thus the density of unpaired electrons on unsatisfied bonds. The band tailing decreased resulting in an increase in the forbidden energy gap. (12 refs.)

114940 Optical probing of silicon-sapphire interface of heteroepitaxial SOS films. J.Lagowski, L.Jastrzebski, G.W.Cullen (RCA Labs., Princeton, NJ, USA). *J. Electrochem. Soc. (USA)*, vol.130, no.8, p.1744-8 (Aug. 1983).

The reflectivity of silicon-on-sapphire in the visible and near infrared spectral range is found to be dependent on the crystalline quality and on the film processing such as thermal annealing and hydrogenation. These findings are quantitatively explained taking into account an amorphous-like character of the silicon-sapphire interface. It is also shown that reflectivity for $h\nu > 2$ eV can be used as a means for probing the crystalline quality of the silicon-sapphire interface. (20 refs.)

114941 Optical anisotropy and electrostriction in the anodic oxide of tantalum. J.L.Ord, W.P.Wang (Dept. of Phys., Univ. of Waterloo, Waterloo, Ontario, Canada). *J. Electrochem. Soc. (USA)*, vol.130, no.9, p.1809-14 (Sept. 1983).

The anodic oxidation of tantalum in sulfuric acid electrolyte is studied using potential stepping transients to study the optical anisotropy of the oxide film under anodizing conditions and the strain induced in the film by changes in the field. The optical measurements are made with a self-nulling ellipsometer, and galvanostatic transients are used to study the changes in low frequency dielectric constant associated with the field-induced refractive index and film thickness changes. Two different analysis techniques are used to determine values for beta, the degree of anisotropy (the ratio between refractive index changes parallel and transverse to the field). The beta values obtained using the two techniques, 1.95 and 2.04, are not greatly different, but the authors regard the 2.04 value as more accurate because the technique used to obtain it is relatively insensitive to common systematic errors. The film thickness increases and the refractive indexes parallel and transverse to the field decrease when the field is applied. Both thickness and index exhibit dependences on field which curve away from the field axis, but the curves are not the parabolas predicted by the theory of electrostriction. The low frequency dielectric constant also decreases when the field is applied, but the charge-discharge cycles exhibit considerable hysteresis, and the dependence on the field is not as clearly defined as it is at optical frequencies. The results of the study of tantalum oxide are compared with the results of studies of the oxides of niobium, tungsten, and molybdenum carried out under similar experimental conditions. The electrostrictive behavior of these oxides and the absence of electrostriction in the anodic oxides of bismuth and zirconium pose a number of questions which theory cannot answer at present. (14 refs.)

114942 Infrared optical properties of solid monomethyl hydrazine, N₂O₄, and N₂H₄ at cryogenic temperatures. J.A.Roux (Univ. of Mississippi, University, MS, USA), B.E.Wood. *J. Opt. Soc. Am. (USA)*, vol.73, no.9, p.1181-8 (Sept. 1983).

To account for and identify the effects of cryocontamination, the infrared complex refractive-index ($\tilde{n} = n - ik$) values of cryofilms of monomethyl hydrazine (MMH), hydrazine (N₂H₄), and nitrogen tetroxide (N₂O₄) were determined for the 500-3700-cm⁻¹ wave-number range. The authors use techniques similar to those described in an earlier paper by Wood et al. (see ibid., vol.72, p.720, 1982) for thin H₂O, CO₂, and NH₃ condensed-gas films. Thin MMH, N₂O₄, and N₂H₄ films from 0.25 to 9.0 μ m thick were formed on a germanium substrate at 20 and 80K in vacuum, and the infrared transmittances were measured by using a Fourier-transform spectrometer. Values of the optical properties (n, k) were derived from the experimental trans-

mittance data by using a nonlinear least-squares method with a thin-film-transmittance analytical model. These optical constants were compared with results obtained with the subtractive Kramers-Kronig technique. These optical properties are important for predicting the performance of contaminated optical components. (13 refs.)

114943 Linear absorption coefficient of beryllium in the 50-300-Å wavelength range. M.A.Barstow, M.Lewis (Dept. of Phys., Univ. of Leicester, Leicester, England), R.Petre. *J. Opt. Soc. Am. (USA)*, vol.73, no.9, p.1220-2 (Sept. 1983).

Transmittance of thin-film filters fabricated for an extreme-UV astronomy sounding-rocket experiment yield values for the linear absorption coefficient of beryllium in the 50-300-Å wavelength range, in which previous measurements are sparse. The inferred values are consistent with the lowest data previously published and may have important consequences for extreme-UV astronomers. (9 refs.)

114944 In-plane orientation of polyimide. T.P.Russell, H.Gugger, J.D.Swales (IBM Res. Lab., San Jose, CA, USA). *J. Polym. Sci. Polym. Phys. Ed. (USA)*, vol.21, no.9, p.1745-56 (Sept. 1983).

As a nondestructive method of evaluation, integrated optics was used to investigate thin films (<8 μ m) of polyamic acid and polyimide as a function of molecular weight, initial imidization temperature, method of imidization, and annealing treatment. Polyamic acid films were found to exhibit a large optical anisotropy, indicating preferential alignment of the long axis of the molecule in the plane of the film. Imidization increased the birefringence of the film by a factor of 2.5 and reduced the film thickness. The only parameter that was found to effect the anisotropy of the films was the method of imidization. Chemical imidization was found to increase the birefringence by a factor of 3, indicative of a higher degree of molecular orientation parallel to the film surface. This effect was not observed in thicker (>25- μ m) films using X-ray diffraction where the orientation function was found to be independent of the method of imidization. (20 refs.)

114945 Production and release of light sums in thin films of activated alkali halides with different crystal structure. L.G.Zaslavskaya, G.K.Vale. *Lav. PSR Zinat. Akad. Vestis Fiz. Teh. Zinat. Ser. (USSR)*, no.4, p.46-52 (1983). In Russian.

Based on experimental investigations of thermoluminescence and kinetics of photostimulated activator luminescence decay in anion exciton absorption bands after X-ray or light excitation of activated alkali halide thin films (~5 mkm) with different structure (mono- and polycrystalline) it has been concluded that more unstable optical and thermal light sums are produced in polycrystalline films. (5 refs.)

114946 Abnormal optical absorption of quenched Ag films due to surface roughness. T.Lopez-Rios, G.Vuye, Y.Borensztein (Lab. d'Optique des Solides, Univ. Pierre et Marie Curie, Paris, France). *Surf. Sci. (Netherlands)*, vol.131, no.1, p.L367-72 (Aug. 1983).

The optical properties of rough Ag films quenched on substrates cooled to 150K are studied by differential reflectivity during annealing to room temperature. An abnormal optical absorption at about 2.5 eV is assigned to surface roughness. (12 refs.)

114947 Permeability at optical frequencies. A.N.Ageev, V.N.Gridnev, O.G.Rutkin, G.A.Smolsenskii (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.270-1 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.478-81 (Feb. 1983). [received: Sept. 1983]

The validity of using the permeability tensor in the analysis of magneto-optic experiments in the phenomenological equations of electrodynamics is discussed. It is shown that in the optical range there is no need to assume the permeability tensor of every substance to be the unit tensor. The influence of this tensor on the waveguide optics properties of a thin magnetic film is examined. An experiment in waveguide optics is proposed which would allow a separate measurement of the off-diagonal components of the permittivity and permeability tensors. (20 refs.)

114948 Anomalies in the dependence of the transmission coefficient of light through thin silver films. A.P.Balashova, B.I.Indrishenok, A.E.Shabel'nikova (Inst. of Radio Engng. & Electronics, Acad. of Sci., USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.345-6 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.604-7 (Feb. 1983). [received: Sept. 1983]

The authors have observed a room-temperature quantum size effect in thin (less than 100 Å) silver films deposited on indium phosphide single crystals cleaned in an ultrahigh (~10⁻⁹ torr) grease-free vacuum chamber. The light transmission coefficient T_{sub} for the substrate was measured first, and then that for the whole sample as the silver was being deposited. Since indium phosphide begins to transmit light noticeably beginning with wave length $\lambda = 0.9 \mu$, measurements were made in the narrow spectra; range 0.9 < λ < 1.2 μ . They assumed that the transmissivity for the whole sample T_{sample} = T_{sub} T_{Ag}, from which they determined the transmissivity T_{Ag} for the silver film. (4 refs.)

114949 Spectrally selective black tungsten films. L.K.Thomas (Inst. fur Metallforschung-Metallphys. Tech. Univ. Berlin, Berlin, Germany), E.E.Chain.

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.130-3

For efficient photothermal solar energy conversion at operation temperatures in excess of 200°C converter surfaces should not only absorb the incident solar radiation but also suppress reradiation losses in the thermal infrared. Such spectrally selective surfaces must therefore demonstrate low reflectance over the solar range and high reflectance in the infrared. Thin films composed of Cr and Cr₂O₃ and of Mo and MoO₂ are being used or have been tested successfully as selective absorbers. Tungsten as the third member of the 6B transition metals group demonstrates greater spectral selectivity than does Cr or Mo. Therefore the authors prepared thin films composed of tungsten and tungsten oxides, which appear black to the eye and which they thus refer to as 'black tungsten films', in order to extend the knowledge obtained for CVD black molybdenum to black tungsten films. - 114952 Influence of repeated phase transitions on the annihilation of positrons in brass. P.Hautojarvi, V.S.Mikhaleukov, A.Vehanen, Yu.N.Koval' (Inst. of Metal Phys., Acad. of Sci., Kiev, Ukrainian SSR). *Fiz. Met. & Metalloved. (USSR)*, vol.56, no.2, p.286-9 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. A study was made of the changes in the positron lifetime and in the Doppler broadening parameter of an annihilation line as a function of the number of transitions across the martensitic transformation interval in an alloy of copper containing 39.5 mass % of zinc. An analysis of the results based on the positron capture model indicated that 60-70 transition cycles increased the concentration of defects by approximately an order of magnitude and then the accumulation of defects ceased. (5 refs.) A.T.
- 114953 Surface physics with slow positrons. R.M.Nieminen (Dept. of Phys., Univ. of Jyväskylä, Jyväskylä, Finland). *Phys. Scr. (Sweden)*, vol.T4, p.29-33 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982). Recent progress in slow beam studies of positron-surface interactions is reviewed. The key physical phenomena are introduced, and the present knowledge of the parameters involved is reviewed. The potential of the slow positron technique for surface science is discussed. (26 refs.)
- 114954 Experimental investigation of positron self-trapping near the vapour-liquid critical point of helium-4. T.-P.Chen, K.F.Canter (Dept. of Phys., Brandeis Univ., Waltham, MA, USA). *Solid State Commun. (USA)*, vol.47, no.11, p.903-7 (Sept. 1983). Positron self-trapping in helium near the vapor-liquid critical point is investigated using the positron annihilation lifetime technique. A 13% decrease in the slowing-down time for positrons to reach the self-trapped state is observed at the critical temperature 5.190K relative to the slowing-down time at 5.200K. (27 refs.)
- 114955 Two-dimensional angular correlation positron studies of defect and defect related problems in metals. A.Alam, R.N.West (School of Math. & Phys., Univ. of East Anglia, Norwich, England). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.278-80. The results of some preliminary studies of the utility of the recently developed two-dimensional angular correlation technique in positron defect studies are reported and briefly discussed. (9 refs.)
- 114956 The study of thermal equilibrium defects and melting in indium by two-parameter correlation measurement of positron annihilation. Y.Kishimoto, S.Tanigawa (Inst. of Materials Sci., Univ. of Tsukuba, Ibaraki, Japan). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.281-3. Correlation measurements between the positron age at the instant of annihilation and the momentum of the center of mass of the positron-electron pair were carried out in both the solid and liquid states of indium. Direct evidence was obtained that the approximation in the two state trapping model in which the detrapping of positrons from vacancies is neglected is valid in indium. It was found that mean lifetimes decreased upon melting and lifetimes were independent of the momentum in the liquid state. The liquid state of indium is discussed in comparison with that of gallium. (5 refs.)

- 114957 Positron study of a vacancy in graphite. T.Takahashi, M.Shimoto, M.Doyama (Dept. of Materials Sci., Univ. of Tokyo, Tokyo, Japan), T.Iwata. Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.288-90. Positron techniques are applied to the study of the annealing behavior and electronic structure of a vacancy in highly-oriented pyrolytic graphite. The lifetime of positrons trapped in the vacancies is deduced to be 245 ± 5 ps. The vacancies show mobility around 1200°C. The Doppler-broadened lineshape of annihilation radiation from vacancies is obtained and compared with the results of theoretical calculation. (10 refs.)
- 114958 Positron studies of recovery processes in aluminium and aluminium alloys. R.N.West, A.Alam (School of Math. & Phys., Univ. of East Anglia, Norwich, England). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.469-76. A series of Doppler broadening positron studies in neutron-irradiated Al, deformed Al, and quenched Al and low concentration Al alloys is described. Utilization of a simple continuous sample heating technique has enabled the accumulation of a large number of detailed and reproducible recovery curves which provide further evidence concerning the phenomenon of vacancy clustering and the effect of metallic and other impurities on it. (34 refs.)
- 114959 Positron lifetimes in Pb-Ag dilute alloys. Y.Hara, S.Nanao (Inst. of Industrial Sci., Univ. of Tokyo, Tokyo, Japan). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.595-8. The positron lifetimes in Pb, Pb-0.015 at.% Ag and Pb-0.17 at.% Ag were measured in an equilibrium state over the temperature range from 300K to 590K. From the temperature dependence of the lifetime parameters, the vacancy formation enthalpy in pure Pb was evaluated to be 0.58 ± 0.06 eV. No definite difference was observed among the lifetime parameters in pure Pb and in Pb-Ag alloys except at the temperatures above 520K where the values of the mean lifetime in Pb-Ag tend to be slightly larger than those in pure Pb. This suggests that the attractive interactions between a silver atom and a vacancy are not intensive. A tentative analysis indicated that the binding energy is below 0.1 eV. (11 refs.)
- 114960 Threshold temperature of positron capture in Cu-Zn vacancies. I.K.MacKenzie, P.J.Schultz (Dept. of Phys., Univ. of Guelph, Guelph, Ontario, Canada). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.631-4. Doppler broadening of annihilation gamma rays indicates the threshold temperature T_1 for positron capture in thermally generated vacancies. The dependence of T_1 on alloy concentration is measured for the entire Cu-Zn phase diagram with emphasis on α , β and the mixed ($\alpha+\beta$) phases. (6 refs.)
- 114961 Temperature dependence of positron annihilation parameters in irradiated molybdenum. B.Pagh, H.E.Hansen, B.Nielsen, K.Petersen (Lab. of Appl. Phys., Tech. Univ. of Denmark, Lyngby, Denmark). Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.691-4. The temperature dependencies of the positron lifetime parameters have been investigated in molybdenum containing vacancies and in molybdenum containing a mixture of vacancy-loops and voids. The results show no temperature dependence of the positron trapping rate at either mono-vacancies or voids in the temperature range from 77K upwards. By using the void response method it was found that at low temperatures the trapping rate of vacancy-loops decreases strongly with temperature. (5 refs.)
- 114962 A positron annihilation study of neutron irradiated titanium. M.Hasegawa (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Oarai, Ibaraki, Japan), S.Koike, M.Hirabayashi, Y.Higashiguchi, E.Kuramoto, K.Kitajima. Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.695-7. Defects in titanium irradiated with fast neutrons have been studied by measuring lifetime and angular correlation of positron annihilation. Vacancy clusters of microvoids are formed in the specimens irradiated at 80-100°C with the neutron doses of 10^{19} - 10^{20} cm⁻². The formation and dissociation of vacancy clusters or microvoids are sensitive to impurity content in the specimens. (5 refs.)
- 114963 Positron annihilation in molybdenum single crystals irradiated with electrons, neutrons, and α -particles. M.Hasegawa (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Ibaraki, Japan), E.Kuramoto, K.Kitajima, Y.Ohya, K.Abe, S.Morozumi. Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.876-9. In order to reveal the behavior of vacancy clusters created by irradiation of high energy electrons, neutrons and α -particles, positron lifetime measurements have been performed for high-purity molybdenum. Changes in lifetime parameters depending on the irradiating particles and impurity contents are compared. Annealing processes of the irradiated specimens are also studied. (10 refs.)

78.70C X-ray scattering

114964 Temperature dependence of the X-ray diffuse scattering intensity in V_3Si in the temperature range from 8 to 300K. N.N.Sirota, L.P.Polutchankina, N.S.Orlova (Inst. of Phys. of Solids & Semiconductors, Byelorussian Acad. of Sci., Minsk, Byelorussian SSR). *Cryst. Res. & Technol. (Germany)*, vol.18, no.8, p.1029-34 (1983). Measurements of the diffuse X-ray scattering are performed from the (110) plane in V_3Si single crystal at different temperatures from 300 to 8K. Contours of equal diffuse scattering intensity are drawn over the 440 node in the (001) and (111) sections. The temperature dependence and the anisotropy of the thermal diffuse scattering intensity distribution for this compound are analysed. (15 refs.)

114965 Diffraction effects in the presence of Compton and temperature-diffuse X-ray scattering in mosaic crystals. V.A.Bushnev, A.V.Laushkin, R.N.Kuz'min, N.N.Lobanov (M.V. Lomonosov State Univ., Moscow, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.228-33 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.406-15 (Feb. 1983). [received: Sept. 1983] The authors report the results of experimental and theoretical investigations of diffraction effects occurring under inelastic X-ray scattering in mosaic crystals of various degrees of perfection. It is shown that the diffraction of quanta from Compton (CS), Raman, and temperature-diffuse scattering (TDS) in specimens causes interference lines with a fine structure to appear in the angular scattering spectrum. A diffractometric study was made of the profiles of the interference lines from the scattering of Mo K α radiation in LiF single crystals and measurements were made of their widths and their intensities relative to the incoherent background. Within the framework of the theory of secondary extinction the authors give a theoretical explanation of the diffraction effects observed and investigate the dependence of the shape, width, and contrast of the interference lines on the mosaic structure, thickness, reflectivity and scattering geometry of the specimens. The theory is shown to be in satisfactory agreement with the experiment. An anomalous increase in the contrast of the interference lines as the crystal thickness grows is predicted. (21 refs.)

78.70D X-ray absorption and absorption edges

114966 Influence of structural anisotropy on the extended X-ray absorption fine structure at the K edge of polycrystalline cadmium. W.Thulke, P.Rabe (Inst. for Experimentalphys., Univ. Kiel, Kiel, Germany). *J. Phys. C (GB)*, vol.16, no.27, p.L955-60 (30 Sept. 1983). The extended X-ray absorption fine structure at the K edge of polycrystalline cadmium at liquid nitrogen temperature has been measured with X-radiation of a conventional X-ray source. The magnitude of the Fourier transform of the fine structure yields a single maximum which is attributed to the first of two close-lying nearest-neighbour shells alone. The absence of a second-shell contribution due to thermal damping is in good agreement with data obtained from measurements on a cadmium single crystal. (10 refs.)

114967 X-ray spectroscopy contributions to the study of iron oxide mixed valence compounds. Analysis of K absorption fine structure. M.Lenglet, D.Le Calonnec (INSCIR, Faculté des Sci. et Tech., St. Aignan, France), J.Durr, B.Hannoyer, G.Calas, J.Petiau, F.Jeannot. *Mater. Res. Bull. (USA)*, vol.18, no.8, p.935-44 (Aug. 1983). In French. Chemical shifts of $L_{\alpha 1,2}$, $K\beta_{1,3}$, $K\beta_5$ emission bands and X-ray absorption spectra near the K edge have been measured in several iron spinels oxides with the metal in the formal oxidation states +2 and +3. The first high resolution XANES spectra for these materials were performed at the DCI storage ring at LURE, Orsay. Two transitions in the range 15-20 eV above the 1s-3d observed on the derivative XANES spectra are very sensitive to the iron oxidation state. The analysis of the X-ray absorption fine structure in the near edge region and the measurements of the chemical shift of $FeK\beta_5$ are more adapted than Mossbauer effect to disclosing FeII in mixed ferrites. (24 refs.)

114968 L_1 and L_{III} X-ray absorption in dysprosium and location of 4f levels. B.K.Agarwal, V.Balakrishnan (Dept. of Phys., Allahabad Univ., Allahabad, Uttar Pradesh, India). *Phys. Rev. B (USA)*, vol.28, no.5, p.2852-4 (1 Sept. 1983). The L_1 X-ray absorption-edge and near-edge structure in dysprosium are reported along with the first measurement of L_1 extended X-ray-absorption fine structure in metal and compounds. The location of 4f levels is discussed on the basis of the observed near-edge structure in the Dy L_{III} edge. (11 refs.)

114969 Fine structure of ultrasoft X-ray absorption spectra of a number of titanium compounds. A.S.Vinogradov, A.Yu.Dukhnyakov, V.M.Ipatov, A.A.Pavlychev, V.N.Sivkov (A.A. Zhdanov State Univ., Leningrad, USSR). *Sov. Phys.-Solid State (USA)*, vol.25, no.2, p.225-8 (Feb. 1983). Translation of: *Fiz. Tverd. Tela (USSR)*, vol.25, no.2, p.400-5 (Feb. 1983). [received: Sept. 1983] Using an RMS-500 X-ray spectrometer-monochromator, by the method of the quantum yield of the X-ray photoemission effect the authors studied the near-in fine structure in the X-ray absorption spectra of rutile (TiO $_2$) and metallic titanium in the region of the K and $L_{2,3}$ ionization thresholds of oxygen and titanium atoms, respectively. As a result of the joint consideration of the near-in fine structure of the $L_{2,3}$ spectra of titanium in the metal, rutile, and in the earlier investigated coordination compound K $_2$ TiF $_6$ it was found that the main features of these spectra are determined by the spectral distribution of the oscillator strengths for the $2p-3d$, ed transitions in the titanium atomic spectrum, on which are superimposed the neighbourhood effects, manifesting themselves in splitting of the d state, with the magnitude of this splitting increasing with the electronegativity of the surrounding atoms. A marked resemblance is observed between the near-in fine structure of the K spectra of fluorine and oxygen in K $_2$ TiF $_6$ and TiO $_2$. On the basis of this experimental fact as well as the correlation of the energy position of the main details of the near-in fine structure of the spectra of titanium and oxygen in rutile the authors assert that the process of X-ray absorption in the rutile crystal is quasimolecular in character, i.e. the details of the near-in fine structure of all of its spectra are formed mainly by the potential of the first coordination sphere around the titanium atom. 114970 Micro-state analysis of iron compounds using the 9th-order FeK α_1 line. H.Fujimori, H.Iba, H.Tsuchiya (Energy Res. Lab., Hitachi Ltd., Ibaraki, Japan). *Jpn. J. Appl. Phys. Part 1 (Japan)*, vol.22, no.6, p.1025-9 (June 1983). The X-ray spectra of 9th-order FeK α_1 (FeK α_1^9), FeL α and FeL β lines were measured for metallic iron, FeO, Fe $_3$ O $_4$, Fe $_2$ O $_3$, FeF $_2$ and FeF $_3$ with an excitation potential of 20 kV using an electron probe microanalyzer (EPMA). The micro-state analysis of these iron compounds using EPMA was greatly improved by observation of the FeK α_1^9 line, because its intensity relative to the FeL α line varied with the chemical state and its peak position became a marker to measure the wavelength shift of the FeL α line ($\Delta L\alpha$). Factors influencing the absorption effect on the measured spectra were evaluated by calculating the absorption correction factors. The wavelength $\Delta L\alpha$ did not exhibit substantial changes in electron binding energy, though it showed correlation with the valency of iron. (16 refs.)

114971 X-ray emission spectra of titanium in TiN $_{0.8}$ and TiN $_{0.8}$ H $_x$. V.V.Nemoshkalenko, V.P.Krivitskii, M.M.Kindrat, B.P.Mamko (Inst. of Metal Phys., Acad. of Sci., USSR). *Inorg. Mater. (USA)*, vol.18, no.9, p.1371-2 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1596-7 (Sept. 1982). [received: Sept. 1983] The X-ray emission spectra of the components of transition-metal carbides and nitrides demonstrate clearly the energy separation of the electron states involved in directional localized metal-nonmetal bonds M-X and in delocalized metal-type M-M, X bonds. Therefore, these provide good objects for elucidating the interaction of hydrogen atoms with the matrix. The authors present results from X-ray emission spectra in the K $\beta_{2,5}$ and L α bands of titanium in the nitride TiN $_{0.8}$ and the nitrohydride TiN $_{0.8}$ H $_x$; the nitride was hydrogenated to saturation. (3 refs.)

114972 Soft X-ray appearance potential spectroscopy of the lanthanide rare earths. W.E.Harte, P.S.Szczepanek, A.J.Leyendecker (Lab. for Phys. Sci., College Park, MD, USA). *J. Less-Common Met. (Switzerland)*, vol.93, no.1, p.189-200 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983). Soft X-ray appearance potential spectroscopy (SXAPS) exploits the sudden changes in the fluorescent yield associated with the thresholds for the electron excitation of core states. Inflections on the yield curve, easily enhanced by differentiation, provide information on the electronic properties of the target material. For the rare earths, the M $_5$, M $_4$ spectra are multi peaked and unusually intense. The excitations are localized involving atomic f levels relatively unaffected by atomic environment. The spectra are attributed to couplings between the incident electron, the excited electron and the resultant hole which leads to a resonant interaction that splits and intensifies the lines. The present status of SXAPS will be presented concentrating on the interpretations given to specific experiments. (52 refs.)

114973 Appearance potential study of the 4f levels of cerium, praseodymium and their oxides. D.Chopra, H.Naraghi (Dept. of Phys., East Texas State Univ., Commerce, TX, USA). *J. Less-Common Met. (Switzerland)*, vol.93, no.1, p.203-12 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983). The soft X-ray appearance potential spectra of the M $_4,5$ levels of cerium, praseodymium and their oxides were obtained in the 800-1000 eV energy range using the modulation potential technique. Rare earths, which have the same valence in the metal as in the oxide, are predicted to have localized 4f electrons which are not affected by oxidation. Contrary to this assertion, an effect of oxygen on the spectra of the rare earths, cerium and praseodymium has been recorded. The spectra are interpreted in terms of the atomic-like transitions involving exchange interactions between the 4f electrons and 3d vacancies and are not considered to be a self-convolution of the density of unoccupied 4f states in the above metals. The data are consistent with the trends in localization of the screening orbitals across the lanthanide series. (26 refs.)

114974 Molecular effect of Al K α -X-ray yields from aluminum oxide films for H $^+$ and H $_2^+$ ion bombardments. A.Ootuka, F.Fujimoto, K.Komaki (Coll. of General Education, Univ. of Tokyo, Tokyo, Japan), K.Kawatsura, K.Ozawa, M.Terasawa. *Phys. Lett. A (Netherlands)*, vol.97A, no.5, p.191-03 (29 Aug. 1983). Al K α X-ray spectra for equi-velocity H $^+$ and H $_2^+$ ions of ≈ 0.9 MeV/amu incident on thin aluminum oxide films with thickness 100 and 300 Å were observed. The intensity ratio of the KL 1 satellite line to the KL 0 main one for H $_2^+$ incident on the films of thickness 100 and 300 Å was about 10% and 4% larger than that for incident H $^+$, respectively. (9 refs.)

114975 Incomplete relaxation and plasmon formation in the K emission band of copper. J.Bremer (Norwegian Inst. of Technol., Univ. of Trondheim, Trondheim, Norway). *Solid State Commun. (USA)*, vol.47, no.11, p.881-4 (Sept. 1983). A method of calculating the effect of self-absorption in X-ray emission spectra and which is suitable for non-adiabatic excitation processes is presented. The Fermi-level E_F and the 'true' profile of the electron-excited (20-40 keV) CuK $\beta_{2,5}$ band are determined. A deviation from the calculated one-electron spectrum in the energy interval [-12 eV, -7 eV] below E_F is interpreted as a result of plasmon formation and Auger broadening. A pronounced disagreement is found also in the range [-1 eV, +10 eV]. Above E_F , a part of the intensity may be due to incomplete electron relaxation. (21 refs.)

114976 Electrification of polymer particles by impact on a metal plate. N.Masui, Y.Murata (Dept. of Electrical Engng., Sci. Univ. of Tokyo, Chiba, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.6, p.1057-62 (June 1983). Impact charge and impact area of particles of nylon 66 and PMMA (3.18 mm and 2.19 mm in diameter, respectively) by a single impact on a metal plate (Cr plated brass plate) were measured under various impact speeds v (3.7 m/s~20.3 m/s) and impact angles θ (0° ~ 80°). It was found that both the impact charge and the impact area are functions of the vertical component of the impact speed, $v \cos \theta$, while the horizontal component, $v \sin \theta$, was found to have no effect on them. The impact area is calculated using the theory of plastic-elastic deformation, and the measured values are found to agree well with the calculations. The impact charge density is constant within the range of the experimental conditions examined and is determined only by the combination of materials colliding with each other. (17 refs.)

114977 Quantum features of reflection of relativistic particles by a crystal surface. V.G.Khlabutin, Yu.L.Pivovarov, S.A.Vorobiev (Inst. of Nuclear Phys., Tomsk, USSR).

Phys. Lett. A (Netherlands), vol.97A, no.6, p.249-52 (5 Sept. 1983). A new mechanism of reflection of relativistic particles by a crystal surface at grazing angles is considered. The reflection takes place when the 'transverse' energy value (connected with the particle motion perpendicular to the surface) lies in the forbidden band of the energy spectrum in a one-dimensional periodic potential which is the sum of continuous potentials of crystallographic planes being parallel to the surface. 79.20F Electron impact: Auger emission

114978 Calculated Auger sensitivity factors compared to experimental handbook values. S.Mroczkowski (Midwest Res. Microscopy Inc., Milwaukee, WI, USA), D.Lichtman.

Surf. Sci. (Netherlands), vol.131, no.1, p.159-66 (Aug. 1983). A pseudo-first principles technique for Auger quantisation was used to calculate relative Auger yields. These yields were compared to the experimental sensitivity factors found in the Handbook of Auger Electron Spectroscopy. In cases where pure element standards are readily available, theory agreed quite well with experiment 95% of the time. However, when pure element standards are not available, such as the lanthanide series and the light elements from $Z=7$ to 12, large deviations exist. Plots of the calculated yields for 3, 5 and 10 kV primary beams are superimposed upon the Handbook sensitivity factor graphs and the reasons for the similarities and differences are discussed. (10 refs.)

114979 Angle-resolved Auger electron emission from $\text{LaB}_6(001)$ with and without chemisorbed oxygen. S.A.Chambers, L.W.Swanson (Dept. of Appl. Phys. & Electrical Engng., Oregon Graduate Center, Beaverton, OR, USA).

Surf. Sci. (Netherlands), vol.131, no.2-3, p.385-402 (Sept. 1983). The angular intensity distributions of $\text{La}(\text{M}_5\text{N}_{45}\text{N}_{45})$ and $\text{B}(\text{KL}_1\text{L}_1)$ Auger electrons have been measured as a function of polar and azimuthal angles for clean and oxygen-covered $\text{LaB}_6(001)$. The method used employs a dispersive cylindrical mirror energy analyzer and a two-axis rotation and sample manipulator. Significant structure is observed in both polar and azimuthal profiles and, at least in the case of La Auger emission, can be partially accounted for using a simple scattering model. Polar profiles obtained by this method and those obtained using angle-resolved X-ray photoemission show many similarities. The angular intensity profiles are consistent with a model of the surface in which the La layer is outermost on the polar $\text{LaB}_6(001)$ plane and adsorption of oxygen occurs at both La and B sites. (24 refs.)

114980 Calculation of Auger recombination times in p -type InGaAsP solid solutions. D.Z.Garbuzov, Z.N.Sokolova, V.B.Khalfin (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.193-6 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.315-19 (Feb. 1983). [received: Sept. 1983]

The intergap and impurity Auger recombination times are calculated for a series of p -type InGaAsP solid solutions have the same lattice structure as the InP substrate. The nonradiative transition times are compared with the calculated radiative transition times for solid solutions doped to various degrees by acceptor impurities in order to find how the internal quantum yield depends on the composition, temperature, and hole density. It is found that nonradiative Auger recombination in narrow-gap InGaAsP solid solutions may reduce the internal quantum yield at hole densities as low as $p=10^{17} \text{ cm}^{-3}$. A comparison is made with experimental results on the dependence of the radiation efficiency on the hole density for an $\text{In}_{0.73}\text{Ga}_{0.27}\text{As}_{0.60}\text{P}_{0.40}$ solid solution doped with zinc. (10 refs.)

114981 Surface chemistry of (100) indium phosphide. R.A.Winrow. Univ. Nottingham, England thesis, 1983

The technique of Auger Electron Spectroscopy (AES) has been used to investigate the surface chemistry of epitaxially grown (100) InP produced by the

two most important vapour phase techniques: the $\text{In-H}_2\text{-PCl}_3$ (chloride) process and the $\text{In}(\text{C}_2\text{H}_5)_3\text{-PH}_3$ (alkyl) process. The surface of material in the 'as grown' state from both systems is seen to be nonstoichiometric and oxidised to varying degrees. A mechanism is proposed to account for these effects and for the differences observed between the two types of material. In addition the effects of various chemical treatments upon the surface of both bulk and epitaxially grown (100) InP have been investigated. After chemical treatment and characterisation by AES, samples have been evaporated with silver layers under conditions of ultra high vacuum and the sintered in a nitrogen atmosphere. Subsequent removal of contact material by chemical etching has allowed examination of the InP surface by optical and scanning electron microscopy. A correlation has been obtained between the chemical state of the InP surface prior to metallisation and the subsequent interface behaviour on sintering with the silver contact metallisation. This has led to a better understanding of the processes occurring at the metal semiconductor interface at elevated temperatures, and has provided an explanation for the variable levels of effectiveness observed of silver cathode contacts to InP transferred electron oscillators.

114982 Influence of film structure on the electron energy loss spectra of GaAs thin films. H.Boudriot, B.Kubier, K.Deus, R.Grundler, E.Kusior (Sektion Phys., Bergakad. Freiberg, Freiberg, Germany).

Cryst. Res. & Technol. (Germany), vol.18, no.8, p.1035-44 (1983). Energy loss measurements of fast electrons on GaAs yielded values for the plasma oscillation, interband transitions and the dielectric function in the region 5-30 eV. The results are discussed in comparison with literature statements. It is dealt especially with the influence of the degree of crystallinity of examined GaAs-films on the energy loss spectrum and the quantities derived from it. (16 refs.)

114983 Excitation of surface plasmons on He-filled cavities in Al. R.Manzke, G.Crecelius (Inst. fur Festkörperforschung, KFA Jülich GmbH, Jülich, Germany), J.Fink.

Phys. Rev. Lett. (USA), vol.51, no.12, p.1095-8 (19 Sept. 1983). Surface plasmon losses excited on spherical, He-filled cavities in Al are studied with use of transmission electron energy-loss spectroscopy. It is found that the excitation energy of the $l=1$ (dipole) surface plasmon mode decreases with increasing He concentration, in line with predictions of an effective-medium theory taking into account the dipole-dipole interactions between bubbles in dense populations, the density dependence of the He dielectric constant, and a density-dependent atomic polarizability of the He in the bubbles. (27 refs.)

114984 Vibrational spectra of coadsorbed CO and H on Ni(100) and Ni(111). G.E.Mitchell, J.L.Gland (Phys. Chem. Dept., General Motors Res. Labs., Warren, MI, USA), J.M.White.

Surf. Sci. (Netherlands), vol.131, no.1, p.167-78 (Aug. 1983). High resolution electron energy loss spectra are reported for coadsorbed hydrogen and carbon monoxide on Ni(100) and Ni(111). On neither surface was there any evidence for either C-H or O-H bonds. On Ni(111) one CO stretching frequency is observed and it does not change significantly in the presence of coadsorbed hydrogen. This is consistent with segregation of CO and H into islands. On Ni(100) the situation is much different; one frequency is observed in the absence of H(a) while three CO stretching frequencies are observed for the coadsorbed layers. These are attributed to on-top, two-fold bridged and four-fold binding of CO to the Ni(110) surface. These results demonstrate significant structure sensitivity for the organization of these coadsorbed species. (24 refs.)

114985 Angular dependence of the electron energy loss spectra of the reconstructed $\text{Si}(001)$ clean surfaces. H.Iwasaki, S.Nakamura (Inst. of Sci. & Industrial Res., Osaka Univ., Osaka, Japan).

Surf. Sci. (Netherlands), vol.131, no.2-3, p.448-54 (Sept. 1983). It is explicitly shown that the asymmetric dimer model of the $\text{Si}(001)2 \times 1$ reconstructed surface proposed by Chadi (1979) should exhibit logarithmic peaks and specific angular dependences in its electron energy loss spectra between the surface dangling bond bands. By comparison with the present experimental result, the authors suggest that the surface consists of microdomains of the asymmetric dimer $c(4 \times 2)$ surface. (11 refs.)

114986 An EELS study of N_2O adsorption of $\text{Pt}(111)$. N.R.Avery (SCIRO Div. of Materials Sci., Univ. of Melbourne, Parkville, Victoria, Australia).

Surf. Sci. (Netherlands), vol.131, no.2-3, p.501-10 (Sept. 1983). At 78K, N_2O adsorbs on a $\text{Pt}(111)$ surface in an end-on configuration through the terminal N atom and inclined at an angle to the surface estimated at 35° . N_2O is a soft Lewis base with adsorption occurring by donor bond formation and without significant back donation into the unoccupied π^* antibonding orbital. Adsorption is accordingly weak with an initial heat of adsorption of $5.6 \text{ kcal mol}^{-1}$ which increased to $6.05 \text{ kcal mol}^{-1}$ at saturation by attractive lateral interactions. No evidence for decomposition was seen. A multilayer state, adsorbed approximately parallel to the surface, desorbed near 86K with a heat of vaporization estimated at $5.24 \text{ kcal mol}^{-1}$. 114987 A PIXE-RBS method for measuring partial sputtering yields of stainless steel. M.Tomita, N.Ikuchi, S.Miyagi, M.Sakisaka (Dept. of Nuclear Engng., Kyoto Univ., Kyoto, Japan).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.469-75 (1 Aug. 1983).
A collector method has been developed for measuring the partial sputtering yields of stainless steel constituents. The sticking probabilities of Cr-, Fe-, and Ni-atoms to a carbon collector are found to be close to unity. By combining a PIXE with an RBS analysis, each quantity of the constituent atoms deposited on the collector surface is micro-quantitatively measured with a good accuracy. When an SS304 plate is exposed to 25 keV He⁺ ions in a vacuum of 10⁻⁶ Torr range, no evident preferential sputtering is found among three constituent elements at a fluence of 4.9×10¹⁹ He/cm². (19 refs.)

114988 Ion induced electron ejection from solids. H.J.Frischkorn, K.O.Groeneveld, D.Hofmann, P.Koschar, R.Latz, J.Schader (Inst. fur Kernphys., J.W. Goethe-Univ., Frankfurt/Main, Germany).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.1, p.123-8 (1983). (Proceedings of the International Workshop on Cross Sections for Fusion and Other Applications, College Station, TX, USA, 4-6 Nov. 1982).
Electron energy spectra, their angular distribution and their total yield γ give information on electron production mechanisms in energetic (1<E/M<10³ keV/amu) ion-solid interaction. From molecular ion induced total electron yield data the authors report on a novel interference effect of electron density waves in a solid. (29 refs.)

114989 Analytical calculation of energy spectra of keV light particles reflected from solid surfaces. K.Morita (Dept. of Crystalline Materials Sci., Nagoya Univ., Nagoya, Japan).
Jpn. J. Appl. Phys. Part I (Japan), vol.22, no.7, p.112-18 (July 1983).
The energy spectra of keV light particles reflected from solid surface have been calculated within the single collision approximation, taking account of the angular and lateral deviations of the incident beam caused by multiple small-angle collisions. The particle and energy reflection coefficients (R_N and R_E) have also been calculated as a function of the reduced energy (ε₀) in Thomas-Fermi units. It is shown that for various targets, the shape of the energy spectra at given incident and ejection angles depends only on ε₀ and that the values of R_N and R_E are scaled by a universal function of ε₀. Typical values of the calculated reflection coefficients for Au and C together with the energy spectra for Au at normal incidence and for Fe at oblique incidence are shown to agree well with the experimental data on keV H⁺ obtained by the Garching group. (24 refs.)

114990 On the influence of incident energy of protons on chemical erosion of graphite. R.Yamada, K.Sone (JAERI, Ibaraki-ken, Japan).
J. Nucl. Mater. (Netherlands), vol.116, no.2-3, p.200-5 (June 1983).
Calculations of energy dependence of chemical sputtering have been made for 0.1-6 keV protons normally incident on graphite surface. The calculations were based on Erents' model (see *ibid.*, vol.63, p.399, 1976) by taking consideration of surface deposited energy and reflection of protons which are both dependent on the incident energy. The calculated chemical sputtering yields show that they have a maximum value in the vicinity of 1 keV of the incident energy, which is consistent with previous experimental results. (23 refs.)

114991 On the reaction of graphite with atomic hydrogen. Y.Hirooka (Div. of Nuclear Fuel Res., JAERI, Ibaraki, Japan), M.Nagae, T.Sano.
J. Nucl. Mater. (Netherlands), vol.116, no.2-3, p.206-10 (June 1983).
Reaction behaviour of graphite with a molecular/atomic mixture hydrogen beam, produced by a hot W-filament, has been studied in an ultrahigh vacuum system at temperatures between 550 and 800K. Major reaction products have been recognized to be recombined molecular hydrogen and methane. Temperature dependence observed for probability of methane formation suggests apparently negative activation energy for the reaction. It has been implied that molecular hydrogen in the mixture beam may serve as an impurity element to physically adsorb on the graphite surface and hence hinder the reaction due to atomic hydrogen. (23 refs.)

114992 Ion scattering at the surface—elastic and inelastic scattering, and neutralization. Y.Ohtsuki (Dept. of Phys., Waseda Univ., Tokyo, Japan).
J. Vac. Soc. Jpn. (Japan), vol.26, no.2, p.61-8 (1983). In Japanese.
Ion motion caused by potentials on a solid surface has not yet been elucidated, although the motion is a matter of great importance. This paper deals with: (1) local stopping power in inelastic scattering of ion beams; (2) surface plasmon excitations due to motion of valence electrons; (3) wavelet potentials generated when ions go out from a solid surface; (4) ion neutralization by resonance process; and (5) the probability of ion neutralization by Auger process. (17 refs.) K.B.

114993 Ion-induced sputtering. Y.Yamamura (Okayama Univ. of Sci., Okayama, Japan), R.Shimizu, H.Shimizu, N.Itoh.
J. Vac. Soc. Jpn. (Japan), vol.26, no.2, p.69-87 (1983). In Japanese.
Sputtering is the ejection of atoms or groups of atoms from the surface of a solid as the result of heavy-ion impact. The ejected atoms repeat collisions and exhibit collision cascade. This review paper discusses: (1) physics of sputtering, (2) the energy dependency and incident-angle dependency of sputtering, (3) selective sputtering of alloys and compounds, (4) ion enhanced sub-surface segregation, (5) energy and angle distribution of emitted particles, (6) secondary electron emission by ion beam irradiation—kinetic and potential emission, (7) electron enhanced sputtering, (8) chemical sputtering, and (9) measurements of sputtering using a laser resonance excitation method. (59 refs.) K.B.

114994 Low-energy ion scattering. M.Aono (Nat. Inst. for Res. in Inorganic Materials, Ibaraki, Japan).
J. Vac. Soc. Jpn. (Japan), vol.26, no.2, p.136-46 (1983). In Japanese.
The most significant application of low-energy ion scattering analysis (ISS) is the analysis of properties of solid surfaces. This review paper centres around ISS, and is devoted to discussion of: (1) interaction potentials and scattering orbits, (2) neutralization of low-energy ions, (3) impact-collision ion scattering spectroscopy (ICISS), (4) the analysis of surface defect structure using ICISS, (5) the analysis of thermal oscillation amplitude of surface atoms, and

(6) the analysis of two-dimensional space distributions of surface electrons. (19 refs.) K.B.

114995 The effect of an external electric field on the survival of surface-produced negative ions. S.B.Vojvodic (Inst. za Biofiziku Medicinskog Fakulteta, Belgrade, Yugoslavia).
Phys. Lett. A (Netherlands), vol.97A, no.5, p.210-12 (29 Aug. 1983).
Resonant charge exchange between slow atomic particles and a partially coated metal surface, in the presence of a homogeneous electric field, is considered. The survival probabilities are calculated for H⁻ ions, emerging from Cs-coated W and K⁻ coated Ni (110), in the fields of strengths 10⁻⁴, 10⁻³ and 0 au. (13 refs.)

114996 A new observation method of ion-electron emission. M.Soszka, W.Soszka (Inst. of Phys., Jagellonian Univ., Krakow, Poland).
Phys. Lett. A (Netherlands), vol.97A, no.6, p.256-8 (5 Sept. 1983).
The energy spectra of secondary electrons emitted from a molybdenum target in the shape of a wire upon bombardment with 5 keV H³⁺ ions is examined. It is shown that for the grazing angle of ion incidence the structure of the energy spectrum is most sensitive to the target treatment. At such a geometry the ion-electron emission can be used for analysis of the solid surface covered by adsorbed on contaminant particles. (9 refs.)

114997 Reflection of metastable He atoms as ions at surfaces. J.Roussel (Service de Phys. des Atomes et des Surfaces, CENS, Gif-sur-Yvette, France).
Phys. Scr. (Sweden), vol.T4, p.96-9 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).
Scattering in the ionic state of metastable He 2³S and He 2¹S atoms is measured at single crystal surfaces as a function of the work function, lowered by K adsorption. On clean surfaces, the ions cannot be observed. They are again not observed, if the work function is less than the free excited atom ionization energy. A model is proposed, the ion dipole interaction between the He⁺ ion and the adsorbed alkali atom governing the process. Evidence for the conversion of He 2¹S atoms into the He 2³S state is also presented. (19 refs.)

114998 Comments on the physical significance of E* values for excited sputtered atoms. R.F.Garrett, R.J.MacDonald, D.J.O'Conner (Dept. of Phys., Univ. of Newcastle, NSW, Australia).
Surf. Sci. (Netherlands), vol.131, no.1, p.L399-405 (Aug. 1983).
Measurements of parameters associated with the emitted photons from a number of elements have indicated that the kinetic energies of sputtered excited atoms may be of the order of 10²-10³ eV. A recent result of Yu et al. [Phys. Rev. Letters 48 (1982) 427] is in contradiction to those results. The authors argue that the high energy values reported are the result of cascade repopulation of the upper level of the observed transition, distorting the experimental observations. Cascade corrections could reduce the energy values to the order of 10 eV, similar to the most probable energy of secondary ions. (17 refs.)

114999 The velocity dependence of the negatively charged fraction of hydrogen scattered from cesiated tungsten surfaces. J.N.M.van Wunnik, J.J.C.Geerlings, J.Los (FOM-Inst. for Atomic & Molecular Phys., Amsterdam, Netherlands).
Surf. Sci. (Netherlands), vol.131, no.1, p.1-16 (Aug. 1983).
By scattering protons under grazing angles of incidence at a cesiated tungsten (110) surface, the dependence of the scattered H⁻ fraction as a function of the normal and parallel velocity components is measured. The incident energy ranges from 400 to 2000 eV, the angle of incidence is 80° with respect to the surface normal. The experiments are done with a surface which is covered with half a monolayer cesium and a thick layer of cesium, corresponding to work functions of 1.45 and 2.15 eV, respectively. The measurements show a strong dependence on the normal as well as on the parallel velocity component. The normal velocity component dependence can be understood in terms of the probability model. The authors extended this model to incorporate the parallel velocity. The essence of this extension is that the finite velocity of the metal electron is taken into account. (28 refs.)

115000 The scattering of hydrogen from a cesiated tungsten surface. J.N.M.van Wunnik, J.J.C.Geerlings, E.H.A.Granneman, J.Los (FOM-Inst. for Atomic & Molecular Phys., Amsterdam, Netherlands).
Surf. Sci. (Netherlands), vol.131, no.1, p.17-33 (Aug. 1983).
The reflection of protons from a partially cesiated tungsten surface is studied in the energy domain between 100 and 2000 eV and in the angular domain between 75° and 85° with respect to the surface normal. The study is performed by measuring the angular and energy distribution of the scattered negative ions. The reflection can take place along two paths. One path is reflection from the cesium surface layer, the other one is reflection from the tungsten substrate. A dependence of the final charge state on the path is observed. It is inferred that this phenomenon is due to incomplete neutralization of the protons scattered from the cesium layer. The energy loss of the reflected ions cannot be accounted for by using only the binary collision model. Also the electronic stopping of the atoms by the metal electrons is shown to be an important energy loss mechanism. Total conversion measurements of H⁺ to H⁻ combined with the measurements of the negatively charged fraction of the scattered particles yield the particle reflection coefficient as a function of the angle of incidence. These reflection coefficients show that for angles of incidence less than 75° already more than 50% of the particles do not reflect from the surface. Total conversion efficiency measurements with H⁻ ions as primary ions show that the influence of the initial charge state on the total conversion is very small. (13 refs.)

115001 Universal shadow cone expressions for an atom in an ion beam. O.S.Oen (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).
Surf. Sci. (Netherlands), vol.131, no.2-3, p.L407-11 (Sept. 1983).
Some universal expressions for the classical shadow cone formed behind an atom in an ion beam have been calculated using the Moliere scattering potential and impulse approximation. As a function of a single dimensionless parameter, these universal expressions cover a wide range of ion-target combinations and ion energies. The expressions are easy to program on a hand calculator and are expected to be useful in discussing a wide range of shadow and blocking phenomena. (13 refs.)

115002 Semiclassical trajectory study of He scattering off of LiF(001). R.F.Grote, A.E.Depristo (Dept. of Chem., Iowa State Univ., Ames, IA, USA).
Surf. Sci. (Netherlands), vol.131, no.2-3, p.491-500 (Sept. 1983).
A semiclassical trajectory method is used to study atomic diffraction. This technique allows some dynamical degrees of freedom to be treated classically, while others are described quantum mechanically and couples the two descriptions by enforcing energy conservation. To study the accuracy of the semiclassical method, the authors compare the results to other classical, semiclassical and quantum mechanical solutions of He diffracting from the (001) surface of LiF. (23 refs.)

115003 Investigation of gallium arsenide subjected to an intensive plasma treatment. G.I.Bernotas, A.I.Griginis, L.I.Pranayavichyus, G.V.Skorobogatas (Antanas Snehkus Polytech. Inst., Kaunas, Lithuanian SSR).

Sov. Phys.-Semicond. (USA), vol.17, no.3, p.342-3 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.544-5 (March 1983). [received: Sept. 1983]

The authors used electron Auger spectroscopy and electron diffraction (in the reflection configuration) methods to study epitaxial and nonepitaxial samples of n-type gallium arsenide oriented in (100) planes and subjected to treatment in argon, oxygen, and Freon-14 plasmas. The ion current density was varied within the range 0.5-3 mA/cm² and the ion energy within the range 20-1000 eV. The gas pressure in the working chamber was kept within the range 4×10^{-2} – 1×10^{-1} Pa. The ratio of the intensities of the Auger peaks of arsenic and gallium (As/Ga) was 1.0 for epitaxial films and from 0.89 to 0.96 for nonepitaxial films. The ratio As/Ga for the Auger peaks was plotted after 10-min exposure of gallium arsenide to a plasma with an ion current density 1 mA/cm². (3 refs.)

115004 A scattering on an adsorbed layer. IV. Scattering function. N.M.Moskaleva, O.A.Skepko.

Vestn. Leningr. Univ. Ser. Mat. Mekh. & Astron. (USSR), no.3, p.57-63 (July 1983). In Russian.

The problem of scattering on an atom is considered in the framework of hard-sphere theory. The single scattering function is found analytically and the complete scattering indicatrix is estimated by the Monte Carlo method. (3 refs.)

115005 Sputter-induced surface modification in Cu-Ni alloys at elevated temperatures. Y.Ishida (Inst. of Industrial Sci., Univ. of Tokyo, Tokyo, Japan), H.Shimizu, N.Koyama, H.Ichinose.

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.958-61

Structural and compositional modifications were investigated in the sputter-damaged surface layer of Cu-Ni alloys at elevated temperatures. A long range depletion of copper was found in the layer beyond the knock-on mixing range. The apparent activation energy of solute diffusion in the layer was 22.6 kJ/mol at 573–723K, suggesting that interstitial type mechanism is operating in the region over 100 nm from the surface. The effect of grain boundary as the enhanced diffusion path was noted at elevated temperatures. (9 refs.)

115006 Rotational state populations of NO molecules scattered from clean and adsorbate-covered Pt (111) surfaces. J.Segner, H.Robota, W.Vielhaber, G.Ertl (Inst. fur Phys. Chemie, Univ. Munchen, Munchen, Germany), F.Frenkel, J.Hager, W.Krieger, H.Walther.

Surf. Sci. (Netherlands), vol.131, no.2-3, p.273-89 (Sept. 1983).

A supersonic beam of NO molecules was scattered from a Pt(111) surface either clean or covered with NO, C, and O. Rotational state populations and angular distributions of the scattered molecules were determined at two incident energies and at different surface temperatures T_s . The rotational distributions obtained are Boltzmann distributions with rotational temperatures T_{rot} . Interaction with the clean and NO-covered Pt surface shows diffuse angular distributions and the independence of T_{rot} on the initial kinetic energy. Full rotational accommodation was found for scattering from the NO-covered ($T_s < 300$ K), only incomplete accommodation at the clean Pt surface ($T_s > 450$ K). Interaction with the C-covered surface results in broad nearly specular scattering lobes and at higher surface temperatures in a constant value of $T_{rot} < T_s$ which depends on the initial kinetic energy. Scattering at the oxygen-covered surface presents an intermediate case: diffusely and specularly scattered fractions are observed. The experimental results are discussed in terms of underlying microscopic scattering processes. (38 refs.)

Semiconductor detector for the selective detection of atomic hydrogen See Entry 112880

79.40 THERMIONIC EMISSION

115007 Work function of Mo(110) in mixed cesium and cesium monoxide vapors. J.-L.Desplat (Rasor Associates Inc., Sunnyvale, CA, USA).

J. Appl. Phys. (USA), vol.54, no.9, p.5494-7 (Sept. 1983).

Electron emission measurements from a Mo(110) emitter are performed in a diode containing both cesium and cesium monoxide vapors over a temperature range from 500 to 1800K. The vapor pressures can be varied independently within a limited range: typical values are 1×10^{-3} and 2×10^{-4} Torr for cesium and Cs₂O, respectively. At temperatures above 1000K, the electron emission is increased by several orders of magnitude over that obtainable with cesium vapor alone by the addition of Cs₂O. This is believed to result from the dissociation of Cs₂O molecules adsorbed on the emitter surface to form an adsorbed oxygen layer. At temperatures below 700K, the work function decreases with temperature to as low as 1.2 eV around 500K. This is interpreted as resulting from multilayer deposition of Cs₂O. Application to thermionic converters is discussed. (17 refs.)

79.60 PHOTOEMISSION AND PHOTOELECTRON SPECTRA

115008 Detailed absorption, reflectance, and UV photoelectron spectroscopic and theoretical studies of the charge-transfer transitions of CuCl₄²⁻: correlation of the square-planar and the tetrahedral limits. S.R.Desjardins, K.W.Penfield, S.L.Cohen (Dept. of Chem., MIT, Cambridge, MA, USA), R.L.Musselman, E.L.Solomon.

J. Am. Chem. Soc. (USA), vol.105, no.14, p.4590-603 (13 July 1983).

Low-temperature (7K) polarized single-crystal absorption and room-temperature polarized specular reflectance spectra have been obtained of the chloride-to-copper charge-transfer region of the three known square-planar salts of CuCl₄²⁻, bis(methanodimethyl) tetrachlorocuprate(II), bis(N-methylphenethylammonium) tetrachlorocuprate(II), and bis(creatinium) tetrachlorocuprate(II) and of the tetragonal monomer, bis(ethylammonium) tetrachlorocuprate(II). These spectra show two intense, x-y polarized, x-y split transitions in the regions 26000-28000 and 37000-39000 cm⁻¹. These bands are assigned to the allowed ²E_g–²B_{1g}(4e_g(π)–3b_{1g}) and ²E_u–²B_{1g}(3e_g(σ)–3b_{1g}) transitions, respectively. In addition, a weaker band is observed between 22000 and 25000 cm⁻¹ and has been assigned to the ²A_{2g}–²B_{1g}(1a_{2g}(nb)–3b_{1g}) transition. These assignments are compared to the results of SCF-Xα-SW ground- and transition-state calculations; although the calculated transition energies are too low and there is overlap of the calculated d-d and charge-transfer manifolds of states, the differences between the calculated energies of the three charge-transfer transitions agree well with those observed experimentally. (35 refs.)

115009 Angle-resolved photoemission study of some first-row transition-metal intercalates of NbS₂ and TaS₂. J.J.Barry, H.P.Hughes (Cavendish Lab., Univ. of Cambridge, Cambridge, England).

J. Phys. C (GB), vol.16, no.27, p.5393-407 (30 Sept. 1983).

Angle-resolved photoemission studies, using synchrotron radiation and UV discharge lamp sources, of the Mn, Fe, Co and Ni intercalates of NbS₂ and TaS₂ support a rigid band description of intercalation, with charge transferred to the host lattice conduction band leaving double ionised intercalant ions between the layers. The host lattice p-d gap is increased by 0.4 eV relative to that measured in earlier work on unintercalated TaS₂, as a result of the charge transfer. Structure seen in photoemission at photon energies ≥ 35 eV may be understood in terms of the many-electron aspects of photoemission from the localised intercalant 3d levels. (25 refs.)

115010 X-ray and photoelectron spectroscopy of light rare earths.

J.C.Fuggle (Inst. fur Festkörperforschung, KFA Jülich, Jülich, Germany).

J. Less-Common Met. (Switzerland), vol.93, no.1, p.159-69 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

Core level photoelectron spectroscopy, X-ray absorption spectroscopy, bremsstrahlung isochromat spectroscopy and valence band studies are discussed. Particular emphasis is placed on cerium. Correlation effects, multiplet structure, screening effects and the dynamics of the processes involved are illustrated with selected examples. (39 refs.)

115011 The 4f spectral weight in cerium materials—facts and issues.

J.W.Allen (Xerox Palo Alto Res. Center, Palo Alto, CA, USA).

J. Less-Common Met. (Switzerland), vol.93, no.1, p.183-7 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

Experimental work to determine the spectral weight for 4f electron addition and removal in cerium materials is reviewed briefly, and new inverse photoemission results on CeO₂ and collapsed volume cerium compounds are described. It is pointed out that the tendency for the spectral weight of collapsed volume materials to develop a peak at the Fermi level is implicit in a Kondo picture of their loss of magnetism. (34 refs.)

115012 A multispectroscopic investigation of the electronic structure of luminescent, tetrahedrally coordinated vanadium-oxygen compounds: case of YVO₄. I.M.Curelaru (Dept. of Materials Sci. & Engng., Univ. of Utah, Salt Lake City, UT, USA), E.Suonien, E.Minni, K.-G.Strid, T.Ronnhult.

J. Lumin. (Netherlands), vol.28, no.3, p.241-56 (Aug. 1983).

Photoelectron (XPS) and core ionisation loss (CILS) spectra of YVO₄ have been measured and compared to earlier appearance potential (APS) data on the same compound, literature data on X-ray emission of YVO₄, X-ray emission and absorption of Na₃VO₄, and the energy level diagram of molecular orbitals of the VO₄³⁻ cluster. Strong many-body effects, with participation of a 2p core hole on vanadium atoms, are found to lead to a drastic local perturbation of the outer molecular orbitals of the anionic cluster VO₄³⁻ at the site of the excited vanadium atoms. Identification of the spectroscopic features in XPS on one hand and the edge spectroscopies CILS and APS on the other hand enable determination of an empirical energy level diagram of excited configurations, which is different in different spectroscopies used. As a byproduct of the experiment, data on the excitation of oxygen (within the VO₄³⁻ cluster), yttrium (outside the VO₄³⁻ cluster) and carbon impurity are presented and discussed. (24 refs.)

115013 Diffraction of UV excited photoelectrons by an ordered overlayer. C.G.Larsson, J.Paul, L.Walden (Dept. of Phys., Chalmers Univ. of Technol., Goteborg, Sweden).

Phys. Scr. (Sweden), vol.T4, p.44-6 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).

Angle resolved UV photoemission spectra obtained from Cu(111)-(√3×√3)R30° Xe and Cu(111)-(√3×√3)R30° CO samples are compared with spectra obtained from the clean substrate. Interest is focused on the adsorbate induced changes in the Cu3d band range of initial energies. From the similarity between the spectra observed for the ordered Xe and CO overlayers the authors conclude that the changes are primarily due to diffraction of the photoexcited Cu3d electrons by the adsorbate. This is supported also by calculated photoelectron energy distributions. (19 refs.)

115014 Damping effects in angular-resolved ultraviolet photoemission spectroscopy on Cu(111). B.J.Slagsvold, J.K.Grepstad, P.O.Gartland (Inst. of Experimental Phys., Tech. Univ. of Trondheim, Trondheim, Norway).

Phys. Scr. (Sweden), vol.T4, p.65-70 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).

Previously published photoemission spectra taken at several discrete photon energies from the (111)-surface of copper are analyzed with the purpose of extracting information on the broadening effects involved. In the low energy case (6.40 eV) the effect of surface disorder on the spectral shape of a surface state is explained as the result of a reduced coherence length parallel to the surface, while sensitivity to disorder normal to the surface is the prevailing effect for the bulk transition of the same spectrum. The use of angular instead of frequency tuning is proposed as a feasible alternative to extract electronic lifetimes in favourable cases. Numerical values of inverse lifetimes are derived and found to agree well with the trend in recent measurements of energy dependent inverse lifetimes. Finally, accounting for

the authors' instrumental broadening, the residual k_{\parallel} -dependent width of a dispersive peak is compared with values predicted from the band structure of copper and published lifetimes measured in normal emission. Inhomogeneous damping is proposed as a possible explanation of a deviation seen from the calculated widths as the final state crosses a Brillouin zone boundary. (19 refs.)

115015 Rydberg screening in core level photoemission of ammonia adsorbed on nickel surfaces. K.Hermann, P.S.Bagus (IBM Res. Labs., San Jose, CA, USA).

Phys. Scr. (Sweden), vol.T4, p.113-14 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).

The lowest empty orbitals of the ground state of free ammonia, $4a_1$ and $2e$, are quite diffuse Rydberg-type orbitals. Thus, one might expect that involvement of these orbitals in the final hole states would not lead to additional structure in the N1s core hole photoemission spectra of the adsorbed molecule. Model calculations on NiNH_3 clusters show, however, that in the presence of the N1s core hole Rydberg orbitals can lead to a screening mechanism similar to the one proposed by Schonhammer and Gunnarsson (1977) for adsorbed CO and N_2 . In NiNH_3 the different final states are similar in intensity and are separated by 1-1.5 eV. The XPS data for the NH_3/Ni (110) system show a broad asymmetric N1s peak which, from the present study, can be interpreted as a superposition of at least two peaks stemming from unscreened and Rydberg screened final states of the core hole. (8 refs.)

115016 UV photoemission from sulphur saturated (111), $[6(111)\times(100)]$ and (100) platinum surfaces. T.T.A.Nguyen, R.C.Cinti (Groupe de Transitions de Phases, CNRS, Grenoble, France).

Phys. Scr. (Sweden), vol.T4, p.115-17 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).

Angle-resolved UPS, in the photon energy range of 10.2-40.8 eV, is used to study the adsorption of S on (111), $[6(111)\times(100)]$ and (100) Pt surfaces, in the aim of: (a) determining an eventual influence of the surfaces steps on the electronic character of the adsorption, (b) comparing the chalcogen chemisorption on a large d-band transition metal with previous study on a narrower one, Ni. A saturated S adlayer is much more rapidly formed on the vicinal surface than on its partner (111), but no clear evidence of the role of the surface peculiarity can be deduced from the additional electronic structures given by S adsorption. The UPS spectra are complicated by the mixing of the lower part of the metal d-band with adsorbate derived feature and important structureless extra-emissions. The simplest ones are given by the (100) surface. Two supplementary structures are observed at about 6.5 eV and 2 eV below E_F and attributed respectively to the S 3p orbitals and to the metal states localized by the presence of the adsorbate. These results indicate that the chemisorption bonds of S on Pt and Ni are quite similar. (10 refs.)

115017 Surface core-level shifts for Ge(100)-(2X1). T.Miller, E.Rosenwinkel, T.-C.Chiang (Dept. of Phys., Univ. of Illinois, Urbana, IL, USA).

Solid State Commun. (USA), vol.47, no.11, p.935-8 (Sept. 1983).

Using surface-sensitive photoemission techniques, Ge 3d core-level binding energies for surface atoms of Ge(100)-(2X1) are found to be smaller than the bulk values by 0.41 eV. The surface atoms with shifted core-level binding energies correspond to one full (100) atomic layer. A surface core-exciton resonance is observed in the partial-yield measurements. The empty surface state involved in this excitonic transition, without binding-energy correction, is located at the valence-band maximum. (14 refs.)

115018 Systematics of optical energy gaps and XPS core level satellites in CuO and copper dihalides. S.Hufner (Lab. fur Festkorperphys., ETH Zurich, Honggerberg, Switzerland).

Solid State Commun. (USA), vol.47, no.11, p.943-5 (Sept. 1983).

Using a model of Asada and Sugano (see J. Phys. Soc. Japan, vol.41, p.1291, 1976) a good correlation between the satellites measured in XPS core levels and optical determined energy gaps is found. (21 refs.)

115019 Chlorine adsorption on copper. I. Photoemission from clean Cu(001) and Cu(111) substrates. D.Westphal, A.Goldman (Lab. fur Festorperphys., Univ.-GH-Duisburg, Duisburg, Germany).

Surf. Sci. (Netherlands), vol.131, no.1, p.91-112 (Aug. 1983).

As a first step to an understanding of the atomic chemisorption of Cl on Cu(001) and Cu(111) the authors have studied high-resolution angle and photon-polarization dependent photoelectron spectra of the clean substrate surfaces. They demonstrate that a clear identification of bulk direct transitions, surface state emission and contributions from density of states transitions can be given. In particular they investigated the photoemission spectra from Cu(001) in the Γ XWK bulk mirror plane excited by Ne I, He I, and He II radiation, from Cu(001) in the Γ XUL plane excited by He I radiation, and from Cu(111) along Γ LUX and Γ LKL (He I). The experimental bulk direct transitions are in very good agreement with simple calculations based on Burdick's (1963) initial state band structure and a free electron like final state. (49 refs.)

115020 Chlorine adsorption on copper. II. Photoemission from Cu(001)c(2X2)-Cl and Cu(110)($\sqrt{3}\times\sqrt{3}$)R30°-Cl. D.Westphal, A.Goldmann (Lab. fur Festorperphys., Univ.-GH-Duisburg, Duisburg, Germany).

Surf. Sci. (Netherlands), vol.131, no.1, p.113-38 (Aug. 1983).

For pt.I see *ibid.*, vol.131, no.1, p.92 (1983). The authors have studied high-resolution angle-resolved and photon-polarization dependent photoemission from chlorine adsorbed on Cu(001) and Cu(111). Chlorine forms a c(2X2) saturation overlayer on Cu(001) and adsorbs dissociatively as revealed by LEED and XPS. Several two-dimensional energy bands on Cu(001)c(2X2)-Cl could be identified and their dispersion behaviour along the Γ M and Γ X lines of the surface Brillouin zone, their respective mirror symmetry and their orbital character could be determined. An interpretation of these bands is given in terms of the interaction of the ordered overlayers with particular substrate bulk bands. Besides the appearance of adsorbate-induced two-dimensional bands drastic changes are resolved in the substrate d-band emission region. These can be explained almost exclusively by surface umklapp processes involving reciprocal lattice vectors of the ordered adsorbate mesh. Supplementary studies of the Cu(111) ($\sqrt{3}\times\sqrt{3}$)R30°-Cl system support these ideas. (20 refs.)

115021 Adsorbate band structure of bromine on Pd(111) studied by angle resolved ultraviolet photoemission. D.R.Lloyd (Chem. Dept., Univ. of Dublin, Dublin, Ireland), F.P.Netzer.

Surf. Sci. (Netherlands), vol.131, no.1, p.139-47 (Aug. 1983).

The photoemission spectra from Pd(111) and from the Pd(111)-Br($\sqrt{3}\times\sqrt{3}$)R30° system are reported; some new features for the clean surface are detected and assigned. The principal effect of the Br overlayer on the direct transitions is a general intensity reduction. Three adsorbate derived features are detected; one at 4 eV with no dispersion is probably an adsorbate-induced feature of the metal, and the other two which disperse are assigned as Br $4p_{xy}$ (4.5 eV) and Br $4p_z$ (6 eV) at Γ . (21 refs.)

115022 Photoelectron spectra of silicate glasses containing trivalent cations. Y.Kaneko (Res. & Dev. Dept., Taiko Refractory Co. Ltd., Kitakyushu-shi, Japan), H.Nakamura, M.Yamane, K.Mizoguchi, Y.Suginohara.

Yogyo-Kyokai-Shi (Japan), vol.91, no.7, p.321-4 (1983).

The O1s spectra for glasses in the systems $\text{Na}_2\text{O}-\text{SiO}_2-\text{M}_2\text{O}_3$ ($\text{M}=\text{Al, Ga, In}$ and Y) were measured in order to obtain information about the effect of trivalent cation on the structure of soda-silicate glasses. The spectra indicated that Al_2O_3 and Ga_2O_3 act as network formers, that Y_2O_3 acts as a network modifier, and that In_2O_3 acts as an intermediate oxide. (15 refs.)

115023 Core-level XPS studies of Ce and La intermetallic compounds and their implications for the 4f levels of Ce compounds. J.C.Fuggle, F.U.Hillebrecht, Z.Zolnieriek, R.Lasser, C.Freiburg.

Report JUL-1824, Kernforschungsanlage, Julich, Germany (Jan. 1983), 73 pp.

The 3d core hole X-ray photoelectron spectra (XPS) of approximately 30 intermetallic compounds of La and Ce are reported. Transitions to final states with approximately f^0 , f^1 and f^2 character are observed in some Ce compounds (f^0 and f^1 for La compounds). The results are discussed in terms of the current ideas of the influence of f-counts and f-level hybridization on core level lineshapes. (89 refs.)

79.70 FIELD EMISSION AND FIELD IONIZATION

115024 Stable field electron emission from a tungsten tip under the ultrahigh vacuum of 10^{-10} Pa. C.Oshima, R.Souda, M.Aono, Y.Ishizawa (Nat. Inst. for Res. in Inorganic Materials, Ibaraki, Japan).

Appl. Phys. Lett. (USA), vol.43, no.6, p.611-12 (15 Sept. 1983).

A stable field emission from the tungsten tip with axis in the (110) direction has been found under ultrahigh vacuum of 10^{-10} Pa. The noise of 0.3% under the condition is attributed to the surface migration of impurity atoms and/or tungsten atoms. (6 refs.)

115025 Stable carbide field emitter. H.Adachi, K.Fujii, S.Zaima, Y.Shibata (Dept. of Electronic Engng., Tohoku Univ., Sendai, Japan), C.Oshima, S.Otani, Y.Ishizawa.

Appl. Phys. Lett. (USA), vol.43, no.7, p.702-3 (1 Oct. 1983).

New experimental results of very stable field emitted electrons from TiC single crystal needles are presented. The optimum flashing temperature region for the stable field emission was found. The stability, which is defined by the ratio of current fluctuation to total current, was better than 0.5% at a vacuum of 10^{-7} Pa with total electron emission of 1 μA . (8 refs.)

115026 Comment on 'Temperature dependence of the silicon field evaporation voltage' by G.L. Kellogg. L.Ernst (Kalifornische Inst., Kali und Salz AG, Hannover, Germany).

Surf. Sci. (Netherlands), vol.131, no.2-3, p.L419-20 (Sept. 1983).

For original paper see *ibid.*, vol.124, p.L55 (1982). The author states that the linear relationship between the field evaporation voltage of Si and the temperature, found by Kellogg, may be interpreted by a simple model which involves, on the one hand, the reasonable assumption that the field evaporation rate may be determined by hole density in the space charge layer and on the other hand, previous results concerning the density distribution of surface states. (7 refs.)

115027 Reply to comment on 'Temperature dependence of the silicon field evaporation voltage'. G.L.Kellogg (Sandia Nat. Labs., Albuquerque, NM, USA).

Surf. Sci. (Netherlands), vol.131, no.2-3, p.L421-2 (Sept. 1983).

For original paper see *ibid.*, vol.124, p.L55 (1983), for comment see *ibid.*, vol.131, p.L419 (1983). The Comment by Ernst suggests that the linear relationship between the evaporation field and the temperature of a silicon sample can be explained by assuming that the silicon evaporation rate is limited by the density of holes in the space charge layer. Although this model offers a plausible explanation of the temperature versus voltage relationship, the data presented suggest that the temperature dependence of field evaporation is not strongly influenced by the density of holes. (4 refs.)

115028 Reduced evaporation field by the field induced dipoles of physisorbed He Ne and H_2 . O.Nishikawa (Dept. of Materials Sci. & Engng., Tokyo Inst. of Technol., Yokohama, Japan).

Surf. Sci. (Netherlands), vol.131, no.2-3, p.239-44 (Sept. 1983).

Physisorption of He, Ne and H_2 reduces the evaporation field of Cu, Mo, W and Pt. The observed phenomenon is explained as the result of a reduced potential barrier by the induced dipole potential of the physisorbed gases. The evaporation field of Cu in H_2 is only 68% of that in Ne. The potential

diagram for field evaporation shows that the dipole potential of H_2 reduces the potential barrier more than Ne even at this low evaporation field in H_2 . A crude calculation indicates that the dipole potentials of physisorbed He and Ne are also large enough to reduce the evaporation field of Mo, W and Pt significantly. (18 refs.)

81.10D Growth from solutions

115032 Electrolytic growth, electrical conductivity and magnetic susceptibility of stannous iodide. C.C.Desai, J.L.Rai (Dept. of Phys., Sardar Patel Univ., Gujarat, India).

J. Mater. Sci. Lett. (GB), vol.2, no.9, p.463-6 (Sept. 1983). The authors report their results on electrolytic growth in gels of SnI_2 single crystals up to 12-14 mm in size. Control over growth rate and nucleation centre formation was exercised. The variation of DC electrical conductivity of pellet samples was studied from 60 to 300°C. The activation energy for conduction was estimated. The magnetic susceptibility was found to be -3.238×10^{-6} emu. The negative value indicated diamagnetic material behaviour. (17 refs.)

115033 The flux growth of some transition metal phosphates. B.M.Wanklyn, F.R.Wondre (Clarendon Lab., Univ. of Oxford, Oxford, England), W.Davison, R.Salmon.

J. Mater. Sci. Lett. (GB), vol.2, no.9, p.511-15 (Sept. 1983). The authors report the preparation using the flux method of the following phosphates: $Co_3P_2O_7$, $CoPbP_2O_7$, $FeNaP_2O_7$, $FePb(P_2O_7)_2$, $Fe_3Pb_3(PO_4)_4$, $Fe_3K_3(PO_4)_4$ and $Fe_4Na_8(PO_4)_6O$. X-ray powder diffraction data are also given. (4 refs.)

115034 Preparation of $MnCo_2O_4$ by a wet method and its metal ion distribution. N.Yamamoto, S.Higashi, S.Kawano, N.Achiwa (Dept. of Chem., School of Liberal Arts & Sci., Kyoto Univ., Kyoto, Japan).

J. Mater. Sci. Lett. (GB), vol.2, no.9, p.525-6 (Sept. 1983). The authors report a new preparation method for the cubic spinel $MnCo_2O_4$. The method involves synthesis by direct precipitation from an alkaline water solution containing Co^{2+} and Mn^{2+} cations at low temperature. The method produces remarkable differences in metal ion distribution between A and B sites of the spinel lattice. (4 refs.)

115035 Effect of additives and dopants on the growth of KDP crystals. K.V.Ramanaiah, K.B.R.Varma (Dept. of Phys., PSG Coll. of Technol., Coimbatore, India).

Indian J. Pure & Appl. Phys., vol.21, no.7, p.388-90 (July 1983). The effect of addition of borax, nickel phosphate ($NiPO_4$), manganese phosphate [$Mn_3(PO_4)_2$], sodium dihydrogen orthophosphate (NaH_2PO_4) and potassium arsenate on the growth characteristics and growth habits of KDP crystals at room temperature (25°C) has been studied. Single crystals of KDP with various concentrations of these additives have been grown by the Holden's rotary crystallizer (slow evaporation) technique. The crystals obtained

are of excellent optical quality and of fairly large size. The relative importance of the addition of growth-aiding agents like borax to KDP has been brought out. The presence of the additives and dopants in the grown crystals has been detected by the chemical and the X-ray analyses. (10 refs.)

115036 Effects of ultrasonic waves on crystal growth. Y.Murata, K.Wada, M.Matsuoka (Dept. of Chem. Engng., Tokyo Univ. of Agriculture & Technol., Tokyo, Japan).

J. Cryst. Growth (Netherlands), vol.62, no.3, p.458-64 (Aug. 1983). Effects of ultrasonic waves of the growth of APD crystals were investigated by applying them perpendicularly to the (010) face. The observed growth rates were significantly reduced by the ultrasonic waves with lower frequencies, and higher energy densities, contrary to the increase in volume diffusion rates in the bulk solution. This behavior was considered to be due to the decrease in the concentration of the completely dehydrated growth units on the surface of the growing crystals. (8 refs.)

115037 Growth of KH_2PO_4 crystals at constant temperature and supersaturation. G.M.Loiacono, J.J.Zola, G.Kostecy (Philips Lab., Briarcliff Manor NY, USA).

J. Cryst. Growth (Netherlands), vol.62, no.3, p.545-56 (Aug. 1983). A large (144 liter) three-zone crystallizer system was constructed for growing KH_2PO_4 crystals under conditions of constant temperature and supersaturation. Crystal growth rates exceeding 5 mm day⁻¹ were demonstrated for KH_2PO_4 using seeds measuring 5×5 cm in cross section. (44 refs.)

115038 Crystal growth of NbC by flux method. S.Shimada, T.Koyama, A.Tsunashima, K.Kodaira, T.Matsushita (Dept. of Appl. Chem., Hokkaido Univ., Sapporo, Japan).

J. Cryst. Growth (Netherlands), vol.62, no.3, p.557-60 (Aug. 1983). Single crystals of NbC were grown using Ni metal as a flux at a soaking temperature of 1400°C. Increasing the content of NbC in the Ni melt from 14.8 to 34.5 wt.% leads to a decrease in the maximum crystal size from 1.5 to 0.3 mm. With 20 wt.% NbC, increasing the soaking time to 80 h leads to an increase of the size to 2.0 mm. The golden black crystals have a lattice constant of $a_0 = 4.470$ Å and occur in both columnar and cubic forms, with nearly stoichiometric composition. The grown faces were of the {100} family and the dislocation density on these faces was 3×10^5 /cm². The content of Ni impurity in the crystal was less than 600 ppm. (8 refs.)

115039 Conditions variation and procedural improvement for hydrothermal crystal growth of oxides under highly oxidizing conditions. M.McKelvy, L.Eyring (Dept. of Chem., Arizona State Univ., Tempe, AZ, USA).

J. Cryst. Growth (Netherlands), vol.62, no.3, p.635-8 (Aug. 1983). The hydrothermal technique for the growth of small single crystals of the higher oxides of the rare earths has been investigated with a view toward increasing crystal size and perfection. Conditions such as the substrate: mineralizer ratio, pressure cycling, capsule size and charge concentration, depressurization rate and temperature, thermal gradient and initial and final growth pressure were investigated. (5 refs.)

115040 High-temperature solution properties in the flux systems $RPO_4 \cdot Pb_3P_2O_7$ (R=Dy, Y). W.Eigermann, G.Muller-Vogt (Fakultat fur Phys., Univ. Karlsruhe, Karlsruhe, Germany).

J. Cryst. Growth (Netherlands), vol.62, no.3, p.639-41 (Aug. 1983). Density and surface tension of solutions of $DyPO_4$ and YPO_4 in molten $Pb_3P_2O_7$ have been measured in the temperature range from 1170 to 1470K. (19 refs.)

115041 Flow-induced crystallization by surface growth of polyethylene fibers. J.Rietveld, A.J.McHugh (Dept. of Chem. Engng., Univ. of Illinois, Urbana, IL, USA).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.8, p.1513-26 (Aug. 1983). A series of experiments has been carried out investigating several features of the surface growth method for observing longitudinal growth of polyethylene fibers in Couette geometry. Attempts to obtain limiting steady-state take-up rates using a Teflon rotor were hampered by fiber breakage; however, maximum growth rates before breakage were found to be considerably higher than those observed in previous studies. Growth rates were also obtained using a static method, and for the Teflon rotor indicated above a critical concentration a linear growth rate equal to the stirrer velocity with rates essentially independent of temperature. With a silanized glass rotor, the same method gave much lower growth rates at comparable stirrer speeds and temperatures and showed a temperature dependence suggestive of a nucleation-controlled mechanism. The implications of these results for other studies of the mechanisms of growth by the surface method are also discussed. (17 refs.)

81.10F Growth from melts

115042 Spreading resistance of InSb crystals pulled under ultrasonic vibrations. Y.Hayakawa, M.Kumagawa (Res. Inst. of Electronics, Shizuoka Univ., Shizuoka, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.6, p.1069 (June 1983). Most large crystals used as substrates are grown by a pulling method, but it is difficult to make added impurities distribute homogeneously because of the occurrence of facet growth. The ultrasonic waves-introduced pulling (UIP) method was proposed as one method of solving this problem, and the effect of vibrations on pulled crystals and on the melt flow was investigated. In this note, the fluctuation of the resistance in a UIP-grown crystal is described in relation to the growth morphology. An ultrasonic vibrations play an effective role in crystal growth, it is concluded that the control of the interface shape by vibrations is important in obtaining crystals with a homogeneous impurity concentration. (4 refs.)

115043 PBN material results in better GaAs crystals, IC device advances. R.L.Finicle (Union Carbide Corp., Lakewood, OH, USA). *Ind. Res./Dev. (USA)*, vol.25, no.6, p.113-16 (June 1983). The author suggests that pyrolytic boron nitride (PBN) boats and crucibles are opening new doors to the growth of better GaAs crystals and to the development of more-advanced and powerful semiconductor devices. The physical and chemical properties of PBN that make this possible are extreme tolerance to thermal shock, impermeability, low outgassing, high purity, and inertness to wetting and attack by molten metals. Thin-film evaporation, molecular beam epitaxy source crucibles, zone refining, microwave assemblies, and high-frequency insulators are a few of the areas where PBN is replacing more-commonly used materials. (no refs.)

115044 Czochralski crystal growth in an axial magnetic field: effects of Joule heating. W.E.Langlois, Ki-Jun Lee (IMB Res. Lab., San Jose, CA, USA). *J. Cryst. Growth (Netherlands)*, vol.62, no.3, p.481-6 (Aug. 1983). The feasibility of using magnetohydrodynamic effects to improve the quality of silicon crystals obtained by Czochralski growth from the melt has been demonstrated by several experimenters. An earlier publication pointed out that certain approximations widely used in liquid metal MHD make it relatively easy to incorporate magnetomotive effects into numerical models for Czochralski flow. Specifically, the low value of the magnetic Reynolds number gives rise to two useful simplifications: the induced magnetic field is negligible and the electric field is irrotational. These lead to the result that the magnetic part of the calculation is diagnostic rather than prognostic. The earlier paper (see W.E. Langlois et al., Proc. 2nd Intern. Conf. on Boundary and Interior Layers, Dublin, p.299-304, 1982) simulated the effect of a strong axial field applied to the melt, under the assumption that Joule heating is negligible. The validity of that assumption is confirmed: except under extremely high fields, Joule heating represents only a miniscule part of the energy budget in magnetic Czochralski growth. Its effect upon the melt circulation can be ignored. (7 refs.)

115045 Crystal growth of A³B⁵ compounds. F.Moravec (Inst. of Radio Engng. & Electronics, Czechoslovak Acad. of Sci., Prague, Czechoslovakia). *TESLA Electron. (Czechoslovakia)*, vol.15, no.4, p.99-104 (Dec. 1982). [received: Sept. 1983] Presents a description of some properties of A³B⁵ compounds. The results achieved in the preparation of GaP and InP bulk crystals are then given. By a practical example of GaP single crystal growth the principle of the liquid encapsulated Czochralski method (LEC) is shown and the basic conditions for crystal growth are specified. Conditions for the growth of A³B⁵ crystals from high-temperature solutions are analyzed. The principle of crystal growth from high-temperature solutions by diffusion of a dissolved compound in a temperature-concentration gradient (SSD method) is explained. The paper concludes with a description of an improved apparatus for the preparation of InP ingots by the SSD method. (18 refs.)

81.10H Zone melting and zone refining

115046 Preparation of Li₃N single crystal by floating zone technique. K.Nishida, K.Kitahama, S.Kawai (Inst. of Sci. & Industrial Res., Osaka Univ., Osaka, Japan). *J. Cryst. Growth (Netherlands)*, vol.62, no.3, p.475-80 (Aug. 1983). Single crystals of the superionic conductor, Li₃N, have been prepared by a floating zone technique in an infrared imaging furnace. The following peculiar shape transformation of the single crystal is observed. The cross-section of the single crystal at the solid-liquid interface is round. However, it is square at a position about 20 mm below the molten zone. As a result, a single crystal in the shape of a square prism and with dimensions of 9×9×60 mm³ was obtained. Impurity oxygen as well as hydrogen was detected in the crystal, which could possibly enhance the ionic conductivity. The crystal shows the highest ionic conductivity ($\sigma(L_c)=2.0\text{ S m}^{-1}$ at 300K) and the smallest activation energy for Li⁺ ion transport ($E_a=0.15\text{ eV}$) ever known on this material. (14 refs.)

115047 Magnetic field effects on float-zone Si crystal growth. H.Kimura, M.F.Harvey, D.J.O'Connor, G.D.Robertson, G.C.Valley (Hughes Res. Labs., Malibu, CA, USA). *J. Cryst. Growth (Netherlands)*, vol.62, no.3, p.523-31 (Aug. 1983). A transverse magnetic field of 1800 G was applied to the float-zone growth of Ga-doped Si to assess its effects on the distribution of Ga in the crystal. The crystals were grown at a constant average growth rate of 4 mm/min and crystal rotation rates of 12, 6 and 0 rpm. Both application of a magnetic field and rotation of the crystal lead to reduction in the frequency of the fine nonrotational striations. The magnetic field also curtails complex structure ('feathering') in the striations. The application of magnetic field also reduces the amplitude of axial spreading resistance fluctuations at the center of the crystal for rotation rates of 6 and 12 rpm. (5 refs.)

115048 The influence of axial microgravity on the breakage of axisymmetric slender liquid bridges. J.Meseguer (Lab. de Aerodinamica, Univ. Politecnica, Madrid, Spain). *J. Cryst. Growth (Netherlands)*, vol.62, no.3, p.577-86 (Aug. 1983). The dynamics of inviscid, axisymmetric liquid bridges permits a simplified treatment if the bridge is long enough. Under such condition the evolution of the liquid zone is satisfactorily explained through a non-linear one-dimensional model. In the case of breaking, the one-dimensional model fails when the neck radius of the liquid column is close to zero; however, the model allows the calculation of the time variation of the liquid-bridge interface as well as of the fluid velocity field and, because the last part of the evolution is not needed, the overall results such as the breaking time and the volume of each of the two drops resulting after breakage can be calculated.

Numerical results concerning the behavior of cylindrical liquid bridges subjected to a small axial gravitational field are presented. (14 refs.)

115049 The float-zone growth of Ti₃Au and Ti₃Pt. Y.K.Chang (Solid State Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA). *J. Cryst. Growth (Netherlands)*, vol.62, no.3, p.627-32 (Aug. 1983). The preparation of single crystals of the A15 intermetallic compounds Ti₃Au and Ti₃Pt by an electron-beam float-zone method has been investigated. High quality single crystals of Ti₃Au were grown successfully by using a zoning speed of 12 mm/h under a vacuum of at least 10⁻⁸ Torr. For the case of Ti₃Pt, grains varying from a few mm to over 1 cm with large mosaic spreads were obtained. Ti₃Pt crystals were also grown by means of an RF induction-heating float-zone technique. Surface striations were observed on all of the Ti₃Pt crystals grown. These striations are believed to be a result of melt convection caused by surface tension gradient at the free melt-vapor interface. (9 refs.)

115050 Zone-melting recrystallization of semiconductor films. M.W.Geis, H.I.Smith, B.-Y.Tsaur, J.C.C.Fan, D.J.Silversmith, R.W.Mountain, R.L.Chapman (Lincoln Lab., MIT, Lexington, MA, USA). Laser-Solid Interactions and Transient Thermal Processing of Materials, Boston, MA, USA, 1-4 Nov. 1982 (New York, USA: Elsevier 1983), p.477-89 The use of zone melting recrystallization (ZMR) to prepare large-grain (and in some cases single-crystal) semiconductor films is reviewed, with emphasis on recent work on Si on SiO₂. Encapsulants are generally required to minimize contamination and decomposition, induce a crystalline texture, improve surface morphology and prevent agglomeration. In the case of Si, the solid-liquid interface is faceted, which gives rise to subboundaries. These can be entrained by laterally modulating the temperature through the use of an optical absorber on top of the encapsulant. Control of thermal gradients and in-plane crystallographic orientation are important for reliable entrainment. (37 refs.)

115051 Plasma-sprayed silicon as a possible base material for the production of low cost solar cells. M.S.Alaee (Dept. of Phys., Brunel Univ., Uxbridge, England), T.Hashemi, C.A.Hogarth. *J. Mater. Sci. Lett. (GB)*, vol.2, no.9, p.490-4 (Sept. 1983). Studies of silicon plasma-sprayed layers with different surface techniques indicated that it is possible to form layers of silicon having desired thicknesses on substrates of various shapes and materials, to be used for the production of low cost solar cells. Electrical measurements of the layers showed them to have suitable electrical properties for photovoltaic purposes. (9 refs.)

115052 Continuous coating with gravity and jet stripping. E.O.Tuck (Appl. Math. Dept., Univ. of Adelaide, Adelaide, Australia). *Phys. Fluids (USA)*, vol.26, no.9, p.2352-8 (Sept. 1983). A thin layer of viscous fluid is transported by a vertical plane surface moving steadily upward under gravity. Some fluid drains downward, a tendency that can be augmented by blowing an air jet upon the layer from the side. An analysis is provided of the possible steady-flow solutions, leading to a relationship between the ultimate layer thickness and the strength of the jet. In order to test stability, a study is made of corresponding unsteady flows, the conclusion being that the stripped flow is stable to perturbations of long wavelength. (15 refs.)

115053 Possibility of melting of silica particles in a plasma jet. A.G.Gnenenko, E.F.Shul'ts (Altai Sci.-Res. Inst. of Machine Construction Technol., USSR). *Sov. Powder Metall. & Met. Ceram. (USA)*, vol.22, no.1, p.24-7 (Jan. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.1, p.26-9 (Jan. 1983). [received: Aug. 1983] From the results of calculations and experiments, the authors conclude that in practice silica particles, unlike alumina particles, cannot be melted in argon and ammonia plasma jets of the standard arc plasma units. To obtain good-quality silica coatings, it may be necessary to increase the length of the high-temperature zone, e.g. by using a plasma unit with a laminar plasma jet; employ plasma-forming gases of higher heat content (e.g. hydrogen); or introducing the powder in the cathode region (as is done in the Monolit apparatus). (7 refs.)

115054 Control of DC diode sputtering by control electrodes. T.Asamaki, N.Hosokawa (Anelva Corp., Fuchu, Japan), M.Taketani. *Oyo Buturi (Japan)*, vol.52, no.7, p.626-30 (July 1983). In Japanese. A pair of control electrodes between which an AC control voltage can be applied is inserted into the positive column between the target and the substrate holder in order to control the target current of DC diode sputtering systems. By this means the target current can be kept constant within a deviation of $\pm 2\%$ for even such a large pressure change as from 2.7 to 5.3 Pa. This method has been applied to the deposition of Ta films, and electrical properties of the films were investigated. Deposition rates were found to be independent of control voltages. Although specific resistivities and temperature

coefficients of resistance were slightly affected by control voltages, the effect was negligible for the applied voltages between 30 and 130 V. This method is found to be very effective for mass production inline systems combined with a rough pressure control system. (8 refs.)

115055 Structure-hardened amorphous chalcogenide films produced by pulse laser spraying. P.A.Fennich, Yu.Yu.Firtsak, O.V.Luksha, N.M.Erdevdi, V.P.Ivanitskii.

Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1266-8 (Aug. 1983). In Russian. Chalcogenide semiconductor films in the systems Ge-Se and As-Se were sputtered on NaCl substrates. Their thickness was controlled by an interferometric method using a pulsed He-Ne laser. Structural studies showed that film structures sputtered onto heated substrates differ from those sputtered onto cold substrates. (6 refs.) *V.G.P.*

81.15G Vacuum deposition

115056 Some physicochemical problems of vacuum epitaxial growth of ferroelectrics. Yu.Ya.Tomashpol'skii (L.Ya. Karpov Sci.-Res. Physicochem. Inst., Moscow, USSR).

Inorg. Mater. (USA), vol.18, no.10, p.1426-30 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1662-6 (Oct. 1982). [received: Sept. 1983]

The main problems of the vacuum epitaxy of ferroelectrics are: structural heterogeneity and local nonstoichiometry of the atomic-molecular stream; a complex structural and chemical state of the substrate as a consequence of adsorption of gas molecules, lattice desorption, impurity diffusion to the surface, formation of surface phases; crystallographic misfit of the film and substrate lattices, catalytic activity of the substrate, narrow critical temperature interval of epitaxy. Consideration of these problems and optimization of the epitaxy process make it possible to obtain smooth single-crystal condensates of ferroelectrics with a stoichiometric main layer and a minimal surface layer, as is illustrated in films of complex oxides. (10 refs.)

115057 Computer-aided study of hot wall epitaxy system using a Monte Carlo technique. V.Ramachandran, P.R.Vaya (Centre for Systems & Devices, Indian Inst. of Technol., Madras, India).

J. Appl. Phys. (USA), vol.54, no.9, p.5385-93 (Sept. 1983). Theoretical analysis of PbTe molecular flow in hot wall epitaxy system has been made using a Monte Carlo approach for free molecular flow. Variation in transmission probabilities with the dimensions of the wall have been obtained. These results are applied to get epitaxial growth conditions for PbTe on KCl substrates. It has been observed that at condensation energy $E_c = 1.6$ eV, the substrate temperature range obtained using the present analysis agrees well with the experimental observations. (20 refs.)

115058 The heteroepitaxy of Ge on Si(100) by vacuum evaporation. Y.Ohmachi, T.Nishioka, Y.Shinoda (Musashino Electrical Communication Lab., Nippon Telegraph & Telephone Public Corp., Tokyo, Japan).

J. Appl. Phys. (USA), vol.54, no.9, p.5466-9 (Sept. 1983). High quality Ge epitaxial growth has been attained on Si(100) substrates at relatively low temperatures, 350 and 440°C, by a vacuum evaporation technique. Electrical property and structural quality for the Ge layer were evaluated by Hall measurement, X-ray diffraction, and electron beam diffraction. It is found that the growth layers are p-type and that net acceptor concentration and mobility strongly depend on the layer thickness. Of particular significance is the fact that the acceptor concentration decreases most rapidly and hole mobility remarkably increases with the Ge thickness. The acceptor concentration and the mobility at a point larger than 0.7 μ m from the lattice mismatched interface are 1.6×10^{16} cm⁻³ and 1040 cm²/V sec, respectively. Hole mobility varies as a function of $T^{3/2}$ and $T^{-3/2}$ below and above ~ 100 K. (19 refs.)

115059 Silicon molecular beam epitaxy. Y.Ota (Bell Labs., Reading, PA, USA).

Thin Solid Films (Switzerland), vol.106, no.1-2, p.3-136 (12 Aug. 1983). Considering the recent rapid progress in the technique, it is expected that in the near future silicon MBE will be applied to a much wider range of silicon devices including silicon integrated circuits. The author takes a closer look at the basics of the silicon MBE system design, including such fundamental issues as the essential diagnostic methods for characterizing and monitoring an epitaxial film during its growth, the electrical and crystalline properties, and device applications based on both developments in this laboratory and results obtained by numerous other workers in silicon MBE. The review includes a discussion of germanium MBE techniques needed to grow a high quality germanium epitaxial film. It has been found that germanium MBE requires as careful a process as that employed in silicon MBE. (236 refs.)

115060 The growth of epitaxial $NiSi_2$ single crystals on silicon by the use of template layers. R.T.Tung, J.M.Gibson, J.M.Poate (Bell Labs., Murray Hill, NJ, USA).

Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.435-9. A novel crystal growth technique for $NiSi_2$ epitaxy is presented which utilizes thin silicide (<60 Å) template layers to pin the subsequent growth under ultrahigh vacuum conditions. Single crystalline $NiSi_2$ films can be grown with either type A or type B orientations on Si(111). Continuous single crystalline $NiSi_2$ is grown on Si(100) with flat interface and uniform thickness. (13 refs.)

81.15H Chemical vapour deposition

115061 Growth of $Ga_{0.47}In_{0.53}As$ -InP quantum wells by low pressure metal-organic chemical vapor deposition. M.Razeghi, J.P.Hirtz (Lab. Central de Recherches, Thomson-CSF, Orsay, France), U.O.Ziemelis, C.Delalande, B.Etienne, M.Voos.

Appl. Phys. Lett. (USA), vol.43, no.6, p.585-7 (15 Sept. 1983). The authors describe the growth of multiquantum well and single quantum well $Ga_{0.47}In_{0.53}As$ -InP structures by low pressure metalorganic chemical vapor deposition. The multiwell structure consists of 25-, 50-, 100-, and 200-Å quantum wells ($Ga_{0.47}In_{0.53}As$ layers) separated by 500-Å barriers (InP layers). Auger measurements indicate the presence of four distinct wells with abrupt boundaries. Photoluminescence measurements are consistent with the existence of four wells; however, deviations are noted between experimentally determined and theoretically predicted recombination energies. An analogous situation exists for the single (50 and 100 Å) quantum well structures. Possible explanations, including variation of well composition, variation of well thickness, and participation of impurities in the recombination process are suggested. (8 refs.)

115062 $InGa_{1-x}As$ -epitaxy with metalorganic adducts. P.Speier, F.Scholz, K.W.Benz (Phys. Inst., Univ. Stuttgart, Stuttgart, Germany), H.Benz, J.Weidlein.

Electron. Lett. (GB), vol.19, no.18, p.728-9 (1 Sept. 1983). Two metalorganic adducts (trimethylindium-trimethylarsine $(CH_3)_3In-As(CH_3)_3$ and trimethylgallium-trimethylarsine $(CH_3)_3Ga-As(CH_3)_3$) have been used for the epitaxial growth of $InGa_{1-x}As$ on InP and GaAs substrates at normal pressure. Epitaxial layers with net carrier concentrations of $n = 2 \times 10^{16}$ cm⁻³, $\mu_{300K} = 6600$ cm²/V s ($In_{0.53}Ga_{0.47}As/InP$) and $n' = 1 \times 10^{16}$ cm⁻³, $\mu' = 3200$ cm²/V s ($In_{0.2}Ga_{0.8}As/GaAs$) have been grown. (13 refs.)

115063 Plasma enhanced metal-organic chemical vapor deposition of aluminum oxide dielectric film for device applications. K.P.Pande, V.K.R.Nair, D.Gutierrez (Bendix Advanced Technol. Center, Columbia, MD, USA).

J. Appl. Phys. (USA), vol.54, no.9, p.5436-40 (Sept. 1983). Low temperature ($\leq 250^\circ C$) deposition of aluminum oxide gate dielectric film using a new plasma enhanced metal-organic chemical vapor deposition technique is described. With this technique, the substrate was not directly exposed to the plasma which minimizes radiation damage to both the substrate and the film. A DC potential was used to generate the plasma and the deposition of the film was achieved at extremely low plasma power (≤ 2 W) using trimethylaluminum and nitrous oxide reactant sources. The dielectric films were found to have a resistivity of $\sim 10^{14}$ Ω cm, dielectric constant of 7.9 ± 0.2 , and breakdown field $\geq 10^6$ V/cm. A linear dependence of the film growth rate upon TMAI concentration was observed, indicating that the growth process is mass transport limited. Metal-oxide-semiconductor device structures were fabricated both on n-Si and p-InP substrates and the interface properties were evaluated by capacitance-voltage and Auger measurements. Both the devices show sharp interface with a minimum density of states in the range of 8×10^{10} - 10^{11} cm⁻² eV⁻¹ for Si and 4×10^{11} cm⁻² eV⁻¹ for p-InP. (23 refs.)

115064 Enhancement of growth rate due to tin doping in GaAs epilayer grown by low pressure metal-organic chemical vapor deposition. C.Y.Chang, M.K.Lee, Y.K.Su, W.C.Hsu (Dept. of Electrical Engng., Nat. Cheng Kung Univ., Tainan, Taiwan).

J. Appl. Phys. (USA), vol.54, no.9, p.5464-5 (Sept. 1983). Tetraethyltin is used as an n-type dopant in homoepitaxially growing GaAs films from triethylgallium and arsine vapor in a low pressure system. The experimental data show that the growth rate can be enhanced by tin doping. It is found that the deep level transient spectroscopy concentration of the electron trap located at about 0.8 eV below the conduction band is suppressed by Sn doping. Gallium vacancy may be attributed to the trap. A growth model has been proposed, which can be substantiated by the experimental results. (17 refs.)

115065 Tin doping of gallium arsenide by metallic organic chemical vapor deposition (MOCVD). J.D.Parsons, F.G.Krajenbrink (Hughes Res. Labs., Malibu, CA, USA).

J. Electrochem. Soc. (USA), vol.130, no.8, p.1780-1 (Aug. 1983). The authors report the results of a study to determine the feasibility of growing Sn doped GaAs by MOCVD. Tin is a very desirable n-type dopant for MOCVD grown III-V compounds because of its low vapor pressure and low compensation. The most commonly used n-type dopants for MOCVD grown III-V compounds are S, Se and Te. These elements are effective, low compensation dopants; however, they have very high vapor pressures which result in the so called 'memory effect'. As a result, it is not possible to grow epilayers with abrupt high-low doping profiles. The authors have completed a series of experiments in which they determined that: (a) tetramethyltin (TMT) can be used as a Sn source for n-type doping of MOCVD grown GaAs; (b) Sn incorporation can be controlled over a broad range of carrier concentrations; and (c) no surface pile-up of Sn occurs in III-V epilayers grown by atmospheric pressure MOCVD. (2 refs.)

115066 Use of diethylberyllium for metal organic chemical vapor deposition of beryllium-doped gallium arsenide. J.D.Parsons, F.G.Krajenbrink (Hughes Res. Labs., Malibu, CA, USA).

J. Electrochem. Soc. (USA), vol.130, no.8, p.1782-3 (Aug. 1983). A new dopant source [diethylberyllium (DEB)] has been successfully employed to grow Be-doped GaAs epilayers with excellent surface morphology and transport properties. This is the first time that DEB has been used as a Be source for p-type doping of MOCVD-grown GaAs epilayers. Room temperature electrical properties and Hall mobilities of Be doped GaAs epilayers, grown to date, are presented. (2 refs.)

115067 A theoretical study of the low-temperature chemical vapor deposition of SiO_2 films. C.Cobianu, C.Pavelescu (Microelectronica, Bucharest, Rumania).

J. Electrochem. Soc. (USA), vol.130, no.9, p.1888-93 (Sept. 1983). The silicon dioxide deposition on silicon substrates in the SiH_4 - O_2 - N_2 system was investigated in the temperature range from 80° to 400°C on a nozzle-type reactor at atmospheric pressure. An exponential temperature dependence (of Arrhenius type) with a break at 250°C has been observed for the O_2/SiH_4 ratio corresponding to the maximum deposition rate and also for the O_2/SiH_4 ratio corresponding to near-zero deposition rate in the retardation region. Within the bimolecular surface reaction theory (Langmuir-Hinshelwood mechanism), these results are explained, and the break is interpreted as a change in the adsorption mechanism of the reactant gases with temperature. The apparent activation energy of the surface reaction (5.2-6.5 kcal/mol) in the temperature range from 80° to 400°C has been derived from the Arrhenius plot of the maximum deposition rate, in agreement with the above theory. An empirical reaction rate equation has been proposed which, in addition, explains the linear dependence of the maximum deposition rate on silane flow rate at constant O_2/SiH_4 ratio. (16 refs.)

115068 Epitaxial growth of GaAs_{1-x}P_x (0 < x < 0.6) by OM-CVD from ClEt₂GaAsEt₃ complex and diethyl phosphine: HPET₂ as original source of phosphorus. F.Maury, G.Constant (Lab. de Cristallogénie, Reactivité et Protection des Matériaux, Ecole Supérieure de Chimie, Toulouse, France). *J. Cryst. Growth* (Netherlands), vol.62, no.3, p.568-76 (Aug. 1983). In French.

Growth of GaAs_{1-x}P_x epitaxial layers (0 < x < 0.6) on GaAs and Ge substrates has been realized by OM-CVD with ClEt₂GaAsEt₃ and HPET₂ used as element sources for Ga, As and P in the temperature range of 500-650°C. The growth rate strongly depends on the deposition temperature and reaches a maximum at 600°C. The P content of the alloys increases with the HPET₂ molar fraction in the vapor phase but is quite independent of the substrate temperature in the range of 500-600°C. The study of the influence of the parameters shows that the growth mechanism differs from the one which occurs when AsH₃ and PH₃ are used. The good reactivity of HPET₂ is discussed and led the authors to propose this molecule as the phosphorus source in OM-CVD. (18 refs.)

115069 OMVPE growth of GaInP. C.C.Hsu, R.M.Cohen, G.B.Stringfellow (Univ. of Utah, Salt Lake City, UT, USA). *J. Cryst. Growth* (Netherlands), vol.62, no.3, p.648-50 (Aug. 1983).

Excellent photoluminescent quality Ga_{0.5}In_{0.5}P with x ≈ 0.5 has been grown epitaxially on GaAs substrates using OMVPE. The source materials used were trimethylgallium, trimethylindium and phosphine in an H₂ ambient. At the optimum temperature of 625°C and a V/III ratio of 40, high photoluminescence efficiency and narrow half-widths were obtained. (19 refs.)

115070 Epitaxial reactor systems: characteristics, operation, and epitaxy costs. G.W.Cullen, J.F.Corboy, R.Metzl (RCA Labs., Princeton, NJ, USA). *RCA Rev. (USA)*, vol.44, no.2, p.187-216 (June 1983).

Discusses the design and operating characteristics of various homoepitaxial reactor systems for Si deposition now being employed in the semiconductor industry. The parameters available for control of the deposit characteristics, specifically as related to the reactor configurations, are outlined. The current technology of slip control through RF-heated susceptor design is reviewed. The very significant advantages associated with reduced-pressure epitaxial growth are presented. The throughputs and costs involved in each reactor are analyzed. Finally, the authors make some predictions concerning the future trends of development in epitaxial reactor technology. (34 refs.)

115071 An investigation of the factors that influence the deposit/etch balance in a radiant-heated silicon epitaxial reactor. J.F.Corboy, R.Pagliaro (RCA Labs., Princeton, NJ, USA). *RCA Rev. (USA)*, vol.44, no.2, p.231-49 (June 1983).

Discusses the AMC 7900 in the radiant-heated configuration, the thermal gradients normal to the substrate can be minimized. Maintenance of this reactor must be carefully programmed to avoid accumulation of deposits on the reactor bell jar which would attenuate the radiant energy. Despite the drawbacks associated with this approach, this reactor is widely used in the semiconductor industry where deposits with good crystalline perfection are required. Little is to be found in the literature, however, on the impact of the variables of total gas flow, location of the substrate on the susceptor, and susceptor rotation on the local deposition/etch rates and uniformity of the deposit resistivity. To develop an understanding of these factors, the reactor was operated in an experimental mode with no susceptor rotation. The results of this study and the implications with respect to operation of the reactor in the normal rotating-susceptor mode are discussed. (5 refs.)

115072 Double-barrel III-V compound vapor-phase epitaxy systems. G.H.Olsen, T.J.Zamerowski (RCA Labs., Princeton, NJ, USA). *RCA Rev. (USA)*, vol.44, no.2, p.270-86 (June 1983).

A unique system for the growth of III-V compound multilayer structures—without interruption of crystal growth—is described. This system has generated large improvements in the synthesis of long-wavelength optoelectronic devices. A complete 1.3-μm laser structure can be grown in 30 minutes and more than 15 such structures can be grown in a single day. Single layers as thin as 60 Å have been measured. 1.3-μm InGaAsP CW lasers with lasing threshold currents as low as 45 mA and 1.0-1.7-μm InGaAs photodetectors with leakage currents below 10 nA and quantum efficiencies near 80% have been synthesized with the system. (20 refs.)

115073 LPCVD polycrystalline silicon: growth and physical properties of in-situ phosphorus doped and undoped films. G.Harbeke, L.Krausbauer, E.F.Steigmeier, A.E.Widmer (RCA Ltd., Zurich, Switzerland), H.F.Kappert, G.Neugebauer. *RCA Rev. (USA)*, vol.44, no.2, p.287-312 (June 1983).

In this application-oriented study the authors investigate in-situ phosphorus doped LPCVD polysilicon films deposited in the temperature range from 560°C to 640°C and compared the results with those previously obtained on undoped films. X-ray diffraction, TEM, SEM, Raman and elastic light scattering, optical absorption, and reflection, and other techniques were used to obtain information on the grain size, structure, structural perfection, strain, refractive index, surface roughness, and electrical conductivity. They found that to obtain phosphorus doped films of highest quality, deposition in the amorphous form, i.e. at temperatures not exceeding 570°C, is necessary. Of slightly lower quality, but acceptable for less critical applications are films deposited at 580°C ≤ T_d ≤ 620°C. Layers deposited at T_d ≥ 620°C are considered to be of poor quality. (17 refs.)

115074 LPCVD polycrystalline silicon: growth and physical properties of diffusion-doped, ion-implanted, and undoped films. M.T.Duffy, J.T.McGinn, J.M.Shaw, R.T.Smith, R.A.Soltis (RCA Labs., Princeton, NJ, USA), G.Harbeke. *RCA Rev. (USA)*, vol.44, no.2, p.313-25 (June 1983).

The texture and surface smoothness of polycrystalline silicon layers are important in high-density circuits. In this work, amorphous and polycrystalline silicon layers were evaluated with respect to structural, topographical, and electrical properties before and after diffusion doping and ion implantation. Films prepared in the polycrystalline state by LPCVD frequently have a columnar growth structure which is associated with a rough surface. Diffusion-doping with phosphorus promotes grain growth and increases surface roughness. By contrast, films prepared in the amorphous state retain their initial smooth surfaces even after diffusion-doping with phosphorus and subsequent annealing. Amorphous films that are ion-implanted with phosphorus and annealed retain their initial smoothness but reveal inhomogeneity in grain structure from the tops of the films to the bottoms of the films depending upon the depth of the implant. (14 refs.)

115075 A physicomathematical model for the polycrystalline silicon thin film deposition process in a reduced-pressure horizontal reactor. V.G.Kobka, Yu.P.Medvedev, Yu.V.Ushankin. *Sov. Microelectron. (USA)*, vol.12, no.1, p.13-19 (Jan.-Feb. 1983). Translation of: *Mikroelektronika (USSR)*, vol.12, no.1, p.17-23 (Jan.-Feb. 1983). [received: Sept. 1983]

The LPCVD deposition rate dependence on pressure for poly-Si is nonlinear, which can be explained by the effect of adsorption processes. This dependence

is arbitrarily divided into two regions: region 1 is the linear adsorption region and region 2 is the region where adsorption is important. The distribution of the poly-Si thickness over the wafer is determined not only by the total pressure in the reactor, but also by the partial pressure of the reagent, and differs substantially for regions 1 and 2. The depletion of the flow along the reactor leads to a transition of the process from region 2 to region 1 and is accompanied by an increase in the nonuniformity of the poly-Si thickness. The analytical expressions found for deposition rate uniformity G(r) and G(z), for poly-Si give a good description of the experimentally observed regularities. Using the analytical expressions for G(r) and G(z), the authors have optimized the deposition process as a function of the overall gas mixture pressure in the reactor. (12 refs.)

115076 Chemical vapor deposition of group IVB, VB, and VIB elements with nonmetals. A literature review. H.O.McDonald, J.B.Stephenson. *Report IC-8928*, Bur. Mines, Washington, DC, USA (1983), 29 pp.

Reviews the chemical vapor deposition (CVD) literature on the nonmetal binary and ternary compounds of the group IVB, VB and VIB elements, with emphasis directed to the following nonmetals: B, C, N, O, and Si. Each of these binary and selected ternary compounds of the group IVB, VB, and VIB elements are examined as coatings and some of their preparative methods, uses, and properties given. A total of 259 references were found for these compounds of the nine elements. This review was utilized in the Bureau's research to provide abrasion-, erosion-, and corrosion-resistant coatings in order to conserve critical metals and protect various metallic surfaces in metallurgical, mining, and energy conversion systems. (259 refs.)

115077 A systematic approach of the low temperature CVD with organometallic compounds. G.Constant, R.Morancho (Groupe de Recherche, Depots Chimiques A Partir de la Phase Vapeur, ERA, CNRS, Toulouse, France).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.36-43

Some practical rules based on thermal decomposition studies and actual knowledge of the chemical bond, are proposed to guide the choice of an organometallic compound as starting material in an OM CVD process. The mean chemical bond energy between the central atom, which is the element to deposit, and the attached group, gives the approximate reaction temperature; by an electronic modification of the bound carbon or by increasing the stress enthalpy of the substituent the deposition temperature may be lowered. A cooperative elimination of two groups borne by two neighbour atoms is probably a frequent molecular reaction; it takes place at a lower temperature than a radical mechanism and it can be an interesting step when one wants these two elements in the coating. At last amorphous material can be elaborated by OM CVD either by a statistical fragmentation of the different chemical bonds, or by the introduction of organic molecules or atoms group inside an inorganic thin film material. (33 refs.)

115078 Chemical vapor deposition of Si in stagnation point flow. D.B.Graves, K.F.Jensen (Dept. of Chem. Engng. & Materials Sci., Univ. of Minnesota, Minneapolis, MN, USA).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.51-6

A stagnation point flow reactor is presented for the systematic investigation of CVD kinetics over a wide range of conditions. Ideally, stagnation point flow offers a number of attractive features, e.g. the fluid mechanics are relatively simple and well-understood; temperature and chemical species concentration fields vary with axial position, not radius. This configuration may be an effective alternative to the rotating disk because of the absence of natural convective effects; both configurations are ideally one-dimensional. The full power in the method lies in its ability to discriminate between physical transport effects and competing reaction mechanisms thus also allowing identification of kinetic rate constants. The modeling equations are presented and the full set of equations including both gas phase and surface reactions is solved by a Galerkin-finite element technique. Two rival kinetic mechanisms for Si deposition from SiH₄ are used to demonstrate the utility of the method. The effect of pressure and flow on the deposition process is illustrated. (8 refs.)

115079 Low pressure aluminium CVD. R.A.H.Heinecke, M.J.Cooke, R.C.Stern (Standard Telecommunication Labs. Ltd., Harlow, England).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.119-21

Many LPCVD processes are known to be outstanding for their conformal coating properties. The technique has now been applied to the deposition of aluminium-silicon interconnections on silicon integrated circuits. In this presentation the main features of the coatings are highlighted and an outline of the deposition process is given. (no refs.)

115080 CVD-NbC_{1-x}N_y-carbon fiber superconductors. F.Schmaderer, G.Wahl (Brown Boveri, Res. Centre, Heidelberg, Germany), C.H.Dustmann, M.Dietrich.

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.148-55

A new promising superconducting material for high field magnets is B₁-niobium-carbonitride. Chemical vapor deposition is chosen as the method of manufacture when using carbon fibres as substrate material due to the high inherent process throwing power. Carbon fibers are promising as a substrate material in a multifiber conductor for coil fabrication because of their high temperature resistance, high elastic modulus, high tensile strength and chemical compatibility with NbC_{1-x}N_y. This concept using carbon fibers together with NbC_{1-x}N_y offers advantages such as—easy handling for coil fabrication, stress and radiation resistance, low costs and reasonable superconducting properties. NbC_{1-x}N_y deposited at atmospheric pressure using a two step process has given B_{c2} values up to 21 T (4.2K) and film thicknesses in the range of 0.05 to 0.5 μm (6). The authors study the influence of low pressure and capacitively coupled plasma activation on nucleation in order to decrease the grain size and consequently increase the critical current J_c. PAN-based carbon fibers type T 300 and M 40 from TORAY with 1000 to 6000 fibers per bundle, each with a diameter of ~7 μm were used. (14 refs.)

115081 Chemical vapor deposition of Nb₃Sn in a fluidized bed. E.Wilfing, F.Holub, E.Horl (Österreichisches Forschungszentrum Seibersdorf GmbH, Inst. für Werkstofftechnologie, Vienna, Austria).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.156-63

The feasibility of a CVD fluidized bed technique for the fabrication of superconductors has been studied using Nb₃Sn as a representative of A 15 type superconductors. Nb₃Sn has been deposited on particles of quartz, copper, molybdenum and on copper wires suspended in a fluidized bed of molybdenum particles by coreduction of NbCl₅ and SnCl₄ with hydrogen. The most

important process variables were deposition temperature and concentration of metal chlorides. The fluidized bed method favors deposition at low temperatures. Nb_2Sn of exact composition and good quality has been deposited with high growth rate at 700°C , while coatings produced at 1100°C consisted practically of niobium only. Among the benefits of the fluidized bed technique are low deposition temperature, good homogeneity and compactness of coating. The small mean crystallite size must be pointed out which should effect the high J_c of the material. (2 refs.)

115082 Kinetics and transport in the CVD of epitaxial silicon. M.L.Hitchman (Dept. of Chem. & Appl. Chem., Univ. of Salford, Salford, England).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.167-74

One of the problems in trying to obtain kinetic information for heterogeneous processes is that often the reaction is occurring under conditions where transport of reactants to the surface is affecting the rate of growth. This is, in fact, the case for silicon epitaxy under the production conditions of $1150-1250^\circ\text{C}$, since in this temperature range the growth rate is dependent on gas flow rate. Therefore in order to obtain a better understanding of the chemistry of the growth process it is necessary to take account of the transport contribution to growth and to separate it out before trying to interpret kinetic parameters and to arrive at a model for the mechanism of deposition. The design of commercial reactors for silicon epitaxy precludes the possibility of a simple analysis of mass transfer characteristics, although attempts have been previously made to quantitatively describe transport controlled deposition in the commonly used barrel and horizontal reactors. The author discusses the rotating disc system, and wall jet and impinging jet systems, as reactor designs which will allow a more tractable solution to the mass transfer problem to be obtained. (28 refs.)

115083 Laser induced chemical vapor deposition of hydrogenated amorphous silicon. R.Bilenchi, I.Gianinoni, M.Musci (CISE SpA, Milano, Italy), R.Murri.

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.194-6

The authors have previously published results on a new method of hydrogenated amorphous silicon (a-Si:H) deposition, due to resonant absorption of CW CO_2 laser radiation by silane molecules. In order to enhance the deposited area and to improve the transversal uniformity, the authors now report two different approaches using, a high power excitation source, and laser beam scanning. (no refs.)

115084 Deposit of germanium monocrystalline thin films by chemical vapour transport in a diffusional flow system. F.Langlais, J.C.Launay, M.Pouchard, P.Hagenmuller (Lab. de Chimie du Solide CNRS, Talence, France).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.217-23

A new CVD method has recently been proposed, based on a 'three zone' arrangement (source, deposit and sink) with a forced flow between source and sink. It was applied to congruent and dissociative sublimation for HgI_2 and $\text{Pb}_{1-x}\text{Sn}_x\text{Te}$ respectively. An experimental application of the new 'three zone' method to chemical transport and epitaxy of germanium from its tetraiodide is presented. A fundamental study has been carried out, particular emphasis being laid on the influence of total pressure upon the hydrodynamic transport flow and upon the epitaxy rate. (7 refs.)

115085 Analysis of low pressure CVD processes. K.F.Jensen, D.B.Graves (Dept. of Chem. Engng. & Materials Sci., Univ. of Minnesota, Minneapolis, MN, USA).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.224-9

A detailed mathematical model for the hot wall multiple-disk-in-tube LPCVD reactor is presented. The model gives a detailed description of the physico-chemical processes in the annular region formed by the tube wall and the edges of the wafers as well as those occurring in the spaces between the wafers. The deposition of polycrystalline Si from SiH_4 is considered as a specific example. The model predicts experimental observations and provides quantitative comparisons with experimental data from separate reactor studies. In addition the model allows for optimization of film uniformity. (8 refs.)

115086 Low pressure photosensitized chemical vapour deposition. Equipment and application for SiO_2 depositions below 100°C . R.F.Sarkozy (BTU/Bruce Engng. Corp., North Billerica, MA, USA).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.230-4

The ever increasing complexity in Si wafer processing has generated the need for the deposition on dielectric materials at temperatures far below the $400-900^\circ$ range so routinely used in the past. Insulators over and between multilayer sandwich structures sensitive to alloying, and over narrow and shallow diffusions are now commonplace. The widespread use of $10/1$ step and repeat projection printers has prompted the use of multilayer lithographic technologies for the control of depth of focus and standing wave problems. Pattern delineation in thin film materials is frequently achieved by means of multilayer lift-off techniques. All of the requirements for low temperature dielectrics associated with these and similar processes can be satisfied by depositions at or below a critical temperature defined by the author as the soft bake temperature of photoresists in common use. To fill this need, equipment has been fabricated for the chemical vapour deposition of silicon dioxide utilizing the photosensitized combustion of SiH_4 and O_2 at temperatures below 100°C . The process is named low pressure photosensitized chemical vapour deposition LPPCVD. (6 refs.)

115087 Crystal growth mechanisms of semiconductor $\text{A}^{\text{III}}\text{B}^{\text{V}}$ and $\text{A}^{\text{II}}\text{B}^{\text{V}}$ compounds by metalorganic chemical vapor deposition. V.A.Voronin, V.A.Prochorov, L.S.Plahotnaja, S.K.Chuchmarev.

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.235-42

Crystal growth of semiconductors based on metalorganic compounds of non-transition elements is a complex heterogeneous process. Analysis of the probable interaction mechanisms of MO compounds of IIB and IIIA subgroup elements with the hydrides and metals of YA and YIA subgroups is given. The interaction mechanism is represented in the form of a structural topological model (STM), which allows one to account for possible phase and chemical transformations. It has been found that intermediary substance may be formed both in the vapor phase and on the substrate surface. The formed complexes which are superficially active centres, speed up adsorption of

reagents from the vapor phase and later decompose to form a semiconductor compound, methad or ethane. (11 refs.)

115088 LPCVD at quasi high flow. J.Holleman, J.Middelhoek (Dept. of Electrical Engng., Twente Univ. of Technol., Enschede, Netherlands).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.243-56

A new CVD technique is presented. It is especially favourable in the case of the deposition of compound materials. The technique improves the deposition uniformity and reproducibility. The economical use of gaseous reactants is improved by factors of 5-20. The method consists of the manifold repetition of the sequence evacuation, filling and deposition. The filling time of 50 msec is short compared to the deposition period of 1 second. The advantages of the method are demonstrated with the results on the deposition of Si, Si+P, Si+B and SiO_2 . (4 refs.)

115089 GaP and InP films elaborated with the covalent molecules $(\text{Et}_2\text{M}^{\text{III}}-\text{PEt}_2)_3$, $\text{M}^{\text{III}}=\text{Ga, In}$: a possible step in III-V MO-CVD process. F.Maury, M.Combes, G.Constant (Groupe de Recherche, Depots Chimiques a Partir de la Phase Vapeur, Toulouse, France).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.257-64

Growth of polycrystalline GaP layers has been obtained between 650 and 775°C by LP-CVD using the only molecule $(\text{Et}_2\text{Ga}-\text{PEt}_2)_3$ as element source. The compound $(\text{Et}_2\text{In}-\text{PEt}_2)_3$, prepared in situ in the MO-VPE reactor with InEt_3 and HPEt_2 , led to InP epitaxial growth at 550°C . The chemical mechanism discussed in order to explain the results shows that these covalent molecules could be a possible route in the III-V MO-CVD process. (14 refs.)

115090 Epitaxial growth of silicon by CVD in a furnace. H.H.C.de Moor, J.H.L.Hanssen, L.J.Giling, J.Bloem (Dept. of Solid State III, Catholic Univ., Nijmegen, Netherlands).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.278-9

Although epitaxial growth of silicon is a well established technique, there is an increasing demand for growth at lower temperatures in order to obtain sharper pn junctions; for the manufacture of MOS devices and solar cells the costs are of great importance. A solution for both problems is presented. Silicon can be selectively grown on wafers by applying only a very small supersaturation. Under these conditions nucleation difficulties prevent growth on foreign substrates, e.g. quartz or purposely oxidized parts on the silicon slices. To overcome the major problem of depletion a temperature gradient in the direction of the gasflow is applied in such a way that a uniform growth rate can be achieved. (6 refs.)

115091 Chemical vapor infiltration technique. R.Naslain, H.Hannache (Lab. de Chimie du Solide, Univ. de Bordeaux-I, Talence, France), L.Heraud, J.Y.Rossignol, F.Christin, C.Bernard.

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.293-304

CVD has been used for a long time mainly to obtain inorganic coatings on the external surface of different kinds of substrate (e.g. hard coatings for cutting tools or sliding parts, high oxidation resistance coatings on alloys, multi-layer thin films for microelectronics components, etc...). More recently, it has been suggested to use the chemical deposition of a solid from a gas mixture to densify porous materials (chemical vapor infiltration, CVI). One of the most important applications of CVI has been the synthesis of carbon-carbon composites, based on the pyrolysis of methane within the pores of a carbon fiber preform, up to almost complete densification. Later on, this process has been extended to the infiltration of other refractory materials such as carbides (SiC , TiC), nitrides (BN) or oxides and it will undoubtedly concern many other materials in the future. It thus appears that CVI will become a method of material synthesis as general as CVD. The authors try to draw the main features of this new technique from the still limited amount of literature data which has been published in this field up to now. (18 refs.)

115092 The CVD of boron nitride from $\text{BF}_3\text{-NH}_3$ mixtures. Application to the synthesis of 2D-C-C/BN composites. H.Hannache, R.Naslain (Lab. de Chimie du Solide, Univ. de Bordeaux-I, Talence, France), C.Bernard, L.Heraud.

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.305-12

The aim of the authors' contribution is to show, from a thermodynamic and experimental approach, that BN deposition from $\text{BF}_3\text{-NH}_3$ mixtures can be used to prepare composite materials having a 2D³-carbon fiber skeleton and a C/BN hybrid matrix. Such materials could be used in air, when properly processed, up to $900-1000^\circ\text{C}$. BN can be deposited from different gas mixtures (e.g. $\text{BX}_3\text{-NH}_3$ (with $\text{X}=\text{F, Cl, Br}$), $\text{B}_3\text{N}_3\text{H}_6$ or $\text{B}_3\text{N}_3\text{H}_3\text{Cl}_3$). In the authors' work, $\text{BF}_3\text{-NH}_3$ mixtures were chosen since, according to H.O. Pierson (1975), they lead to well crystallized deposits even at the rather low temperatures required in CVI. (10 refs.)

115093 Low pressure CVD of pyrolytic carbon. C.H.J.van den Brekel (Philips Res. Labs., Eindhoven, Netherlands), B.Lersmacher.

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.321-36

The chemical vapour deposition process of pyrolytic carbon from propane in a 'hot-wall' reactor has been studied. A survey of the carbon reaction rate as a function of the input pressure and the deposition temperature is given. The growth rate dependency on the position in the reactor is also reported. The effect of the geometry of the substrate on the growth rate profile is studied by means of the deposition of carbon in capillaries. Growth rate profiles obtained at different experimental conditions are characterized on the basis of the Sherwood number of the process. These measurements allow the characterization of the process as a function of the experimental conditions. (3 refs.)

115094 The effects of reaction parameters on the deposition characteristics in Al_2O_3 CVD. C.Park, J.Kim, J.S.Chun (Dept. of Materials Sci. & Engng., Korea Advanced Inst. of Sci. & Technol., Seoul, Korea).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.401-9

Deposits of aluminium oxides (Al_2O_3) have been formed by a chemical vapor deposition (CVD) technique involving the application of gas mixtures of AlCl_3 , CO_2 and H_2 onto TiN coated cement carbide substrates. The relationships between the deposition rate and various reaction parameters such as the gas flow rate, the deposition temperature, the composition of reactant gases, and the system pressure were studied. The CVD of Al_2O_3 is a thermally activated process and limited by the surface chemical reaction. The apparent activation energy is about 36 Kcal/mol at 50 Torr and decreases with the

increasing system pressure. The dependence of the deposition rate on the reactant gas composition is affected by the variation of the relative contents of the aluminium donor and the oxygen donor. At a low AlCl₃ mole fraction, the deposition rate increases with the AlCl₃ mole fraction; however, at higher AlCl₃ mole fractions, the deposition rate is mainly influenced by the H₂O-forming reaction between CO₂ and H₂. (12 refs.)

115095 Influence of temperature and substrate on Al₂O₃ CVD from AlCl₃/H₂/CO₂ gas mixtures. T.Schmitt, H.Altena, B.Lux (Tech. Univ. Wien, Vienna, Austria).
Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.421-7
CVD deposition of Al₂O₃ was carried out in a hot-wall reactor with a temperature gradient. Al₂O₃, W, Mo, Fe, Ni, Ni/Cr and Cr were used as substrates. For all experiments high levels of the impurity silicon were present. The experiments showed the influence of the substrate, in the presence of Si, on the crystal morphology resulting at high temperatures (950°-1050°C) where α-Al₂O₃ is formed. At low temperatures unusual crystal morphologies were observed. It became clear from these experiments that the oversaturation existing in the gas mixture has a strong influence on the morphologies of the deposits. The fresh incoming gas mixture gives different morphologies than the gas mixture near the outlet, where high levels of the reaction products CO and HCl are present. The experiments permitted the observation of α-Al₂O₃ growth features similar to those common for Al₂O₃ layers on cemented carbides produced under poorly controlled conditions. (7 refs.)

115096 Deposition and characterization of MO-CVD ZrO₂. L.Ben Dor (Dept. of Inorganic Analytical Chem., Hewbrew Univ., Jerusalem, Israel), A.Elshtein, J.Shappir.
Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.444-50
ZrO₂ layers obtained by MO-CVD have physical and electronic properties making them suitable for various applications such as discrete capacitors as well as miniature capacitors in VLSI. (5 refs.)

115097 CVD of TiN at the tempering temperature of alloy-steels. W.Hanni, H.E.Hintermann (Lab. Suisse de Recherches Horlogeres, Neuchatel, Switzerland).
Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.468-73
The deposition of titanium nitride on nitriding and heat-treatment steels, corrosion-resistant ledeburitic and high speed steels (HSS), and, in certain cases, maraging steels has been carried out by the reaction of titanium tetrachloride with ammonia diluted in nitrogen carrier gas. The specimens were coated in a hot-wall reactor where the graphite heating element acts as the reaction chamber or in a hot wall reactor with an ordinary external furnace. To avoid a reaction between the substrate materials and titanium tetrachloride (halide inclusions), special attention is needed when starting the deposition. The titanium nitride layers obtained were hard golden-yellow in colour and bright on polished surfaces. Density and adhesion vary with the deposition temperature and the chloride concentration. Such titanium nitride coatings can be used as functional coatings for friction and wear applications. (6 refs.)

115098 Formation of thin refractory coatings, their properties and fields of application. O.V.Roman, P.A.Vityaz, G.N.Dubrovskaya, L.M.Kirilyuk (Byelorussian Powder Metall. Assoc., Minsk, Byelorussian SSR).
Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.474-8
The production of TiN coatings by CVD and physical vapour deposition is compared. It is shown that TiN CVD on cutting tools used for processing steels can improve cutting rates by up to 1.4 times and increase the tool life by 1.5 to 2.5 times. (2 refs.)

115099 On the theoretical conditions of deposition of refractory solid solutions: titanium carbonitride. F.Teyssandier (DRET-ETCA, Arcueil, France), M.Ducarroir, C.Bernard.
Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.509
Summary form only given. The composition of titanium carbonitride deposits generated by an input gas mixture of TiCl₄-CH₄-N₂-H₂ may be thermodynamically predicted if the excess free energy of the ternary solid solutions is known as a function of the temperature and the composition of the solid phase. For titanium carbide the theoretical composition of the solid solution versus the input methane partial pressure is compared with the experimental one of the deposits obtained in a cold wall process. In the case of the titanium nitride system, the deposit domains with isostoechiometric curves are presented at 1400K. Some comparison of theoretical and experimental results is also mentioned. After presentation of the ternary solid solution (TiC_xN_{1-x}) free energy equation, the predicted composition of the vapour deposited materials is discussed. (no refs.)

115100 Industrialisation of titaniumcarbonitride deposition process at moderated temperatures. P.Bonetti, H.Wahl (Bernex Div., Berna AG Olten, Olten, Switzerland).
Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.510-16
Deals with the scaling-up of a CVD-titaniumcarbonitride coating process using organic nitriles as raw materials. Coating thickness distribution over the reactor volume is discussed in function of nitrile composition, gas mixtures, temperature and residence time. Surface finish is influenced by the nitrile to titanium-tetrachloride ratio and the deposition temperature. In this process adhesion of the coatings is improved at higher temperatures and in the case of steels at temperatures where austenite is stable. (6 refs.)

115101 Effects of the experimental conditions of chemical vapor deposition on TiC/TiN double layer coating. M.S.Kim, J.S.Chun (Dept. of Materials Sci., Korea Advanced Inst. of Sci. & Technol., Seoul, Korea).
Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.517-30
Deposits of titanium nitride (TiN) were formed on TiC-coated WC-6Co substrates by chemical vapor deposition (CVD) using a TiCl₄, H₂, and N₂ gas mixture. The effects of the deposition temperature, total flow rate of the reactant gases, and the TiCl₄ partial pressure on the deposition rate, preferred orientation, and surface morphology of the TiN deposit were investigated. The controlling mechanism of the TiN deposition reaction and its relationship with the deposition temperature and total flow rate of reactant gases were also investigated. The deposition rate and (220) preferred orientation are increased with an increase in deposition temperature and TiCl₄ partial pressure, and

with a total flow rate of less than 700 cc/min. The particle size of the TiN deposit is reduced with an increase in TiCl₄ partial pressure, and is increased with an increase in deposition temperature and with a total flow rate of less than 700 cc/min. When the total flow rate is larger than 700 cc/min, the deposition rate, (220) preferred orientation, and the particle size of the TiN deposit no longer vary. (15 refs.)

115102 The growth of TiC on iron-carbon substrates by CVD. P.P.J.Ramaekers, F.J.J.van Loo (Lab. of Phys. Chem., Eindhoven Univ. of Technol., Eindhoven, Netherlands).
Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.546-52
Describes CVD experiments on various iron-carbon substrates with and without carbon supply in the gas phase. From these experiments and from a theoretical consideration the authors try to elucidate the influence of carbon content in the substrate on the kinetics of the growth process. A comparison with diffusion couple experiments is made. All experiments are carried out at a temperature of 1273K. (9 refs.)

81.15J Ion plating and other vapour deposition

115103 Radical species in argon-silane discharges. R.Robertson, D.Hils, H.Chatham, A.Gallagher (Joint Inst. for Lab. Astrophys., Univ. of Colorado, Boulder, CO, USA).
Appl. Phys. Lett. (USA), vol.43, no.6, p.544-6 (15 Sept. 1983).
SiH_n radical densities at the surface of discharges in Ar-SiH₄ mixtures have been measured by low-energy, electron-collisional ionization and mass spectrometer detection of SiH_n⁺. The principal radical seen at the substrate surface of a DC proximity discharge is SiH₃. (11 refs.)

115104 Quantitative ion beam process for the deposition of compound thin films. J.M.E.Harper, J.J.Cuomo, H.T.G.Hentzell (IBM Thomas J. Watson Res. Center, Yorktown Heights, NY, USA).
Appl. Phys. Lett. (USA), vol.43, no.6, p.547-9 (15 Sept. 1983).
The authors describe a quantitative ion beam technique for the deposition of compound thin films. The metal atom flux is supplied by inert ion beam sputtering, and the reactive flux is supplied by a low-energy ion beam directed at the growing film, allowing the fundamental deposition parameters of arrival rates, ion energy, and direction to be measured and controlled. Analysis gives the sputtering yields and incorporation probabilities as a function of film composition, arrival rate ratios, and ion energy. Results are presented for Al films deposited under a range of N₂⁺ ion bombardment (100-500 eV) up to arrival rate ratios exceeding the value needed to form AlN. Nitrogen ions are almost fully incorporated into Al films, and excess N is rejected above the composition N/Al=1. The microstructure is shown to depend on the N/Al arrival rate ratio and the nitrogen ion energy used during deposition. (5 refs.)

115105 Homoeptitaxial growth of ZnTe by horizontal open-tube method. M.Nishio, Y.Nakamura, H.Ogawa (Dept. of Electrical Engng., Saga Univ., Saga, Japan).

Jpn. J. Appl. Phys. Part 1 (Japan), vol.22, no.7, p.1101-5 (July 1983).
The vapor-phase epitaxy of ZnTe was carried out in H_2 , Ar and I_2 gas ambients by the horizontal open-tube method. The depletion rate of the ZnTe source and the growth rate on (110), (111)A and (111)B ZnTe substrates are described here as functions of the carrier gas flow rates, and the molar ratios of I_2 to H_2 and of Ar to H_2 . The values of the depletion rate and the growth rate decreased in the following order: ZnTe- H_2 - I_2 > ZnTe- H_2 > ZnTe-Ar and ZnTe- H_2 - I_2 > ZnTe- H_2 > ZnTe-Ar system, e.g. the depletion rates were 3.0, 3.0 and 2.4 mg/min, and the growth rates were 0.30, 0.24 and 0.18 μ m/min respectively, when the source temperature was kept at 293°C, the substrate temperature at 862°C and the carrier flow rate at 100 ml/min. The surface pattern of the epitaxial layer was strongly influenced by the growth temperature and the surface orientation. (17 refs.)

115106 Low-temperature epitaxial growth of (100) silicon. M.Milosavljevic, C.Jeyens, I.H.Wilson (Univ. of Surrey, Guildford, England).
Electron. Lett. (GB), vol.19, no.17, p.669-71 (18 Aug. 1983).
Epitaxial silicon films have been grown onto as-received and implanted (100) silicon wafers by electron-beam evaporation. A high-temperature treatment to remove native oxide was not employed. Optimum temperatures for epitaxial growth were between 600°C and 700°C. Deposition rates were from 30 to 80 nm/min and the operating pressure was $<5 \times 10^{-7}$ mbar. The Rutherford backscattering spectra of the optimum films have values of χ_{\min} indistinguishable from that of a bulk wafer (3.9%). (7 refs.)

115107 Control of the uniformity of thin films formed by an RF plasma [Josephson technology application]. R.F.Broom, V.Graf, W.Heuberger (IBM Corp., Armonk, NY, USA).
IBM Tech. Disclosure Bull. (USA), vol.26, no.2, p.866-9 (July 1983).
The problem of film uniformity during the formation of nonplanar structures can be significantly reduced by applying a nonuniform magnetic field (providing a field gradient) or by using a modified cathode geometry. This has particular application to edge junction technology employed for Josephson devices. (no refs.)

115108 Deposition rate and structural properties of microcrystalline glow discharge Si:H:Cl films. G.Bruno, P.Capezzuto, F.Cramarossa (Dipt. di Chimica, Univ. di Bari, Bari, Italy).
Thin Solid Films (Switzerland), vol.106, no.3, p.145-52 (19 Aug. 1983).
The deposition rate and the structural properties of Si:H:Cl films produced in $SiCl_4$ - H_2 glow discharges were studied as functions of the substrate temperature, the gas feed composition and the operating pressure. The experiment results were interpreted on the basis of a discharge equilibrium involving both deposition and etching of the film. A close relationship between the deposition rate and the crystallite size is shown. (27 refs.)

81.15L Deposition from liquid phases (melts and solutions)

115109 Liquid phase epitaxial growth on {111}_A planes of InP. R.A.Logan, C.H.Henry, F.R.Merritt, S.Mahajan (Bell Labs., Murray Hill, NJ, USA).

J. Appl. Phys. (USA), vol.54, no.9, p.5462-3 (Sept. 1983).
Two-step, liquid phase epitaxy is a high yield process without critical steps in the AlGaAs system when used to form buried devices such as buried heterostructure lasers, but similar procedures give a low yield in the InGaAsP system with many short circuited devices. The {111}_A stop-etch plane enables one to etch narrow mesas (≈ 1.5 - μ m wide) to ensure single mode laser operation but regrowth of InP on this plane has a highly nonradiative interface, a characteristic that appears unique to this plane. Studies of the growth morphology correlate the nonradiative behavior with an inability of the initial islands of nucleation so spread laterally to form a continuous layer which gives rise to melt entrapment. (6 refs.)

115110 Electroepitaxial growth of HgCdTe from Te-rich solution. L.Jedral, H.Ruda, P.Becla, J.Lagowski, H.C.Gatos (MIT, Cambridge, MA, USA).

J. Electrochem. Soc. (USA), vol.130, no.7, p.1614-16 (July 1983).
Liquid phase electroepitaxial (LPEE) layers of HgCdTe have been grown from Te-rich solution at 501°C. Growth experiments were performed in a two-zone furnace. A graphite boat with BN slider was placed in the high temperature zone. The lower temperature zone contained a pure Hg reservoir. The mercury pressure over the growth system was controlled by selecting the temperature of this zone and the flow rate of H_2 . A Te-rich solution with the composition $Hg_{0.188}Te_{0.012}Te_{0.800}$ was used. The experimentally determined liquidus temperature for this solution was 501°C, with a mercury reservoir temperature of 294°C at a H_2 flow rate of about 50 cm³/min. (11 refs.)

115111 A highly stable nonaqueous suspension for the electrophoretic deposition of powdered substances. J.Mizuguchi (Res. Center, Sony Corp., Yokohama, Japan), K.Sumi, T.Muchi.

J. Electrochem. Soc. (USA), vol.130, no.9, p.1819-25 (Sept. 1983).
A highly stable nonaqueous suspension for the electrophoretic coating of alumina powders on double helical filaments has been developed. This suspension enables uniform coating in less than a second at a voltage of 300-600 V with an average current density of about 1 mA/cm². The suspension is composed of dispersing powders, acetone, nitrocellulose, and a small amount of the strong base and strong acid. A variety of powders can be anodically deposited uniformly using the same composition. Successful results are obtained for Al₂O₃, (Ba,Sr,Ca)CO₃, MgO, ZnO, TiO₂, SiO₂, SiO, In₂O₃, LaB₆, WC, and CdS powders; for phosphors such as ZnS:Cu,Al, ZnS:Ag, ZnS:Ag,Ag,Al, Y₂O₃:S:Eu, Y₂O₃:Eu, Y₂O₃:Tb, and CaS:Ce; and for metallic powders such as W, Mo, Ni, Al, Zn, and Ru. (17 refs.)

115112 Liquid phase epitaxial growth conditions of lattice-matched Al_{0.48}In_{0.52}As and Al_{0.48}Ga_{0.52}In_{1-x-y}As layers without surface defects. K.Nakajima, T.Tanahashi, S.Komiyama, K.Akita (Semiconductor Materials Lab., Atsugi Labs., Fujitsu Labs. Ltd., Ono, Atsugi, Japan).

J. Electrochem. Soc. (USA), vol.130, no.9, p.1927-33 (Sept. 1983).
The liquid phase epitaxial (LPE) growth conditions for lattice-matched Al_{0.48}In_{0.52}As and Al_{0.48}Ga_{0.52}In_{1-x-y}As layers with various compositions and energy gaps were determined by using the X-ray diffraction and photoluminescence measurements. The epitaxial layers were grown on InP (111)A and (100) substrates. By using these LPE growth conditions, the lattice-matched epitaxial layers can be grown in the energy gap range from 0.8 to 1.44 eV. The Hall measurements unintentionally doped Al_{0.48}In_{0.52}As layers which were grown without using special baking methods were performed at room temperature. The carrier concentration was 4.7×10^{15} and 5.9×10^{15} cm⁻³, and the Hall mobility was 4549 and 4466 cm²/Vsec. The compositional grading in Al_{0.48}Ga_{0.52}In_{1-x-y}As layers was studied by the CuK α rocking curves. It was found that the epitaxial layers with mirror surface were more easily obtained on (111) A InP than on (100) InP. The composition dependence of the growth rate of Al_{0.48}Ga_{0.52}In_{1-x-y}As was studied. The possibility of obtaining heterostructures such as Al_{0.48}Ga_{0.52}In_{1-x-y}As/Al_{0.48}In_{0.52}As and In_{0.52}Ga_{0.48}As/Al_{0.48}In_{0.52}As was also studied. (19 refs.)

115113 In situ electrochemical monitoring and control of oxygen in liquid phase epitaxial growth of GaAs. S.C.Chang, G.Y.Meng, D.A.Stevenson (Dept. of Materials Sci. & Engng., Stanford Univ., Stanford, CA, USA).
J. Cryst. Growth (Netherlands), vol.62, no.3, p.465-74 (Aug. 1983).

An electrochemical method, employing an yttria stabilized zirconia electrolyte, was used to measure and control the oxygen activity in liquid gallium in a vertical liquid phase epitaxial (LPE) growth system for GaAs. A zirconia tube serves both as the container for the Ga(l) solvent and as the electrolyte in an oxygen concentration cell. The rate and extent of deoxygenation of the liquid gallium solvent are reported for three methods of deoxygenation: high temperature annealing in flowing purified hydrogen or argon; use of chemical deoxidizers added to the melt; and electrochemical coulometric titration. In addition, GaAs LPE layers were grown at different measured oxygen activities and the resulting carrier type and concentration related to the oxygen concentration in the gallium solvent. (21 refs.)

115114 Improved meltback procedures for liquid-phase-epitaxial growth of planar and buried heterostructures. B.H.Chin, A.K.Chin, M.A.Digiuseppe, J.A.Lourengo, I.Camilbel (Bell Labs., Murray Hill, NJ, USA).
Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.277-81

In the liquid phase epitaxy on indium phosphide, the substrate, just prior to the growth of the first epitaxial layer, is commonly etched back with an indium melt to remove any thermally-degraded surface and to ensure uniform and consistent wetting. This procedure, however, often produces defects which degrade both planar and buried heterostructure devices. For planar edge-emitters and lasers, the resulting rippled surface morphology degrades device performance by scattering light. For buried heterostructures, the meltback in the regrowth step leads to indium-rich inclusions. The effects of meltback on material quality are presented, and a new multiple meltback procedure which maintains flat surface morphology and eliminates inclusions is described. (6 refs.)

115115 Enhanced InP substrate protection for LPE growth of InGaAsP DH lasers. P.Besomi, R.B.Wilson, W.R.Wagner, R.J.Nelson (Bell Labs., Murray Hill, NJ, USA).
Defects in Semiconductors II, Symposium Proceedings, Boston, MA, USA, Nov. 1982 (New York, USA: North-Holland 1983), p.289-93

Thermal degradation of InP single crystal substrates prior to LPE growth has been virtually eliminated by using an improved protection technique. The phosphorus partial pressure provided by a Sn-In-P solution localized inside an external chamber surrounding the InP substrate prior to growth prevents thermal damage to the surface. Nomarski contrast photomicrographs, photoluminescence and X-ray diffractometric measurements indicate that InP substrates protected by this method suffer negligible deterioration, in contrast to the results of the more commonly used cover wafer method. 81.20 OTHER METHODS OF PREPARATION OF MATERIALS

115116 Graphite produced by extrusion of pitch mesophase. J.C.Jenkins, G.M.Jenkins (Dept. of Metall. & Materials Technol., Univ. Coll. of Swansea, Swansea, Wales).

Carbon (GB), vol.21, no.5, p.473-83 (1983).
It is shown that an ideal pitch mesophase can be extruded to form a rod in which the flow anisotropy induced by shear and stretch is preserved. This rod can be coked and graphitized to form a new graphite with prescribed dimensions and structure imposed during extrusion. Optical microscopy, X-ray diffraction and dilatometric analysis served to determine the structural anisotropy of the new coke and the changes taking place during heat treatment. The graphitized product exhibits a highly anisotropic structure and low volume coefficient of thermal expansion similar to premium grade needle coke produced by the delayed coking process. (20 refs.)

115117 Preparation of multialkali antimonide photocathode. R.L.Verma, R.C.Bapna (Laser Section, Bhabha Atomic Res. Centre, Bombay, India).

Indian J. Pure & Appl. Phys., vol.21, no.7, p.422-4 (July 1983).
A method for preparing multialkali photocathode starting with an antimony layer possessing island structure is described. The photocathode thus formed is found to be more sensitive in the near infrared region than that prepared by the conventional method. A reproducible photocathode with average yield of 160 μ A/lm and having long wavelength threshold at 870 nm is obtained. (11 refs.)

115118 Formation of titanium and zirconium carbides with interaction of the oxides with carbon in a low-temperature plasma. G.K.Moisev, S.K.Popov, L.A.Ovchinnikova, N.A.Vatolin (Inst. of Metall., Acad. of Sci., USSR).

Inorg. Mater. (USA), vol.18, no.9, p.1301-4 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1521-4 (Sept. 1982). [received: Sept. 1983]

Calculations modeling the formation of TiC and ZrC with the interaction of TiO₂ and ZrO₂ with carbon at 1000-4000K in the starting Ar medium and total pressure $9.81 \cdot 10^{-2}$ MPa were performed. It was established that TiC can form at 1500-3400K and ZrC can form at 1900-3800K without appreciable losses of metal in the gas phase. The phase compositions and energy expended in completing the process were determined. Experiments were performed in an (Ar+H₂) plasma on the formation of maximum and minimum carbon-defect TiC_x and ZrC_y from their oxides and carbon at ~3000K within 180 sec. In obtaining maximum defect carbides, oxides were found in the products; in obtaining minimum defect carbides, the phases TiC_{0.975} and TiC_{0.983} are formed with 97-99% transformation. The unit cell parameters were determined. (12 refs.)

115119 Acid orthophosphates and triphosphates of the rare earths. P.P.Mel'nikov, T.A.Butuzova, G.Ya.Pushkina, L.N.Komissarova (M.V. Lomonosov Moscow State Univ., Moscow, USSR).

Inorg. Mater. (USA), vol.18, no.9, p.1333-6 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1557-60 (Sept. 1982). [received: Sept. 1983]

A cryochemical method has been developed for preparing the acid ortho- and triphosphates of the rare earths. Structural analogies have been established for the compounds discussed with the double phosphates of composition M₃Ln(PO₄)₂. The X-ray diffraction characteristics of the compounds have been determined. (14 refs.)

115120 Synthesis of acid polyphosphates of rare-earth metals and the structure of ErH(PO₃)₄. K.K.Palkina, N.N.Chudinova, C.M.Balagina, S.I.Maksimova, N.T.Chibiskova (N.S. Kurnakov Inst. of General & Inorganic Chem., Acad. of Sci., Moscow, USSR).

Inorg. Mater. (USA), vol.18, no.9, p.1337-41 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1561-6 (Sept. 1982). [received: Sept. 1983]

Acid polyphosphates of rare-earth metals of the composition LnH(PO₃)₄ (Ln=Sm,Eu,Gd,Tb,Dy,Ho,Er) have been obtained. It has been established that they crystallize in two forms: triclinic (Sm,Eu) and monoclinic (Tb-Er). The change in structure occurs with gadolinium. The structure of the monoclinic form ErH(PO₃)₄ has been studied. It has been shown that the polyphosphate chains in ErH(PO₃)₄ are crystallographically not equivalent. (4 refs.)

115121 Stationary configuration of fibers formed under nonisothermal conditions. A.L.Yarin.

J. Appl. Mech. & Tech. Phys. (USA), vol.23, no.6, p.865-70 (Nov.-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR)*, vol.23, no.6, p.139-44 (Nov.-Dec. 1982). [received: Sept. 1983]

Analytic solutions of the stationary problem in fiber molding are obtained under the assumption of large activation energy of the viscous flow. The melt is considered to be shaped to be a Newtonian fluid with viscosity dependent on the temperature according to the Arrhenius law. Such high values of the viscosity correspond to sufficiently low temperatures that flow practically ceases and the material solidifies. The two most widespread technological processes are examined: (1) drawing a fiber from a cylindrical glass blank heated to high temperature, and (2) drawing through a spinneret hole from a tank containing the melt. (9 refs.)

115122 Syntheses and thermal properties of new liquid crystalline materials involving tropolone. T.Uemura, S.Takenaka, S.Kusabayashi (Dept. of Appl. Chem., Osaka Univ., Osaka, Japan), S.Seto.

Mol. Cryst. & Liq. Cryst. (GB), vol.95, no.3-4, p.287-97 (1983). To examine the effect of a tropolone ring system on mesomorphic behaviour, the following 2- and 3-ring compounds have been prepared: R.Ph.X.Ph.OY and R.Ph.CO.O.Ph.X.Ph.OY, where Ph=phenyl; R=C_nH_{2n+1}, C_nH_{2n+1}O; Y=OH, OCH₃; and X=—CH=N—, —N=N—. The 2-ring compounds are non-mesogenic whereas the 3-ring compounds exhibit nematic phases of high stability when R=alkyl or alkoxy, X=—CH=N— or —N=N—, and Y=OH or OCH₃, and an additional smectic phase when R=alkoxy. The nematic phase tends to align homeotropically when placed between two glass plates. (19 refs.)

115123 Skin technology—fundamentals and applications. H.Sprenger (MAN-Neue Technol., Munich, Germany).

Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.353-8

The Skin Technology provides a valuable means for quality improvement of intricately shaped parts under micro-gravity. The technique is especially suitable for refining multiphase alloys or composites like eutectics, dispersion or whisker reinforced alloys, immiscibles etc. by a melting/solidification process. First experiments have shown that shape stability of skin coated specimens depends mainly on effective compensation of forces introduced by the volume increment during melting and freezing. By use of an expansion container this problem is solved and will be tested in further μ -g experiments. The technology will also find application in cases in which increased heat transfer compared to conventional crucibles is required. Furthermore an advanced version, called Liquid Skin Technology, will allow dynamic supercooling of large volume specimens, and is an alternative to containerless melting. (3 refs.)

Polycrystalline infrared optical fibersSee Entry 113132

81.20E Powder techniques, compaction and sintering

115124 Hydrodynamic pressing of β -alumina components. G.T.Pozdnyakova, O.P.Golubeva, V.M.Levchenko.

Inorg. Mater. (USA), vol.18, no.9, p.1370-1 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1594-5 (Sept. 1982). [received: Sept. 1983]

Hydrodynamic pressing is used to produce β -alumina parts with elevated density, and this is used along with other methods of pulse pressing in powder metallurgy and is beginning to be used in ceramic production. The method provides high pressures with comparatively low energy consumption and without the use of complicated sealing units. Hydrodynamic pressing is also more productive than the hydrostatic method. The present study was performed with a GDM 20/10-135/190-700 apparatus for hydrodynamic pressing of powders by means of explosive charges. (2 refs.)

115125 The synthesis of densified CMD from Mn-NH₄-carbamate and its discharge properties in ZnCl₂ batteries. I.Tanabe (Technol. Univ. of Nagaoka, Nigata, Japan), N.Miyamoto, H.Kido, Z.Kato, T.Uno.

J. Electrochem. Soc. (USA), vol.129, no.10, p.2372-8 (Oct. 1982). The densification of crude MnO₂ (CMD) from the oxidation of MnCO₃ and its discharge properties were investigated in order to improve the properties of CMD as follows: The chlorate reaction was observed to be quite effective for the densification of CMD. Mn²⁺ adsorbed on the inner surface of the particles of crude MnO₂ reacts with NaClO₃ to form MnO₂, which accumulates on the inner surface. By increasing both the ratio of MnO₂ formed by this reaction to total MnO₂, and decreasing the content of the residual MnCO₃ in the crude MnO₂, the degree of densification of the product was increased. For crude MnO₂ with a lower content of residual MnCO₃, its apparent density, specific surface area, and ion exchange capacity were almost the same as that of EMD when the ratio was about 22%. When the ratio was below 30%, the product appeared to be the amorphous type. Above 34%, the peak of ρ -type MnO₂ was observed. With increasing ratio of MnO₂ formed by the chlorate reaction to total MnO₂, the discharge efficiencies for both wet cells and D-size dry batteries were negligibly decreased up to 22-23%; they were considerably decreased for ratios above 23%. Therefore, the product obtained when the ratio was 22-23% can be regarded as optimum. Its packing capability was the same as that of EMD. For this type of CMD and EMD, the electrolytic solution comprising 32% ZnCl₂ and 1% NH₄Cl can be regarded as optimum. The heavy load discharge properties of this type of CMD were quite similar to those of EMD. Further, the intermittent discharge properties were considerably better than those of EMD. For densified CMD, crushing of the product was desirable to improve the heavyload discharge properties. (13 refs.)

115126 Effect of grain size distribution on sintered density. M.F.Yan (Bell Labs., Murray Hill, NJ, USA), R.M.Cannon, Jr., H.K.Bowen, U.Chowdhry.

Material. Sci. & Eng. (Switzerland), vol.60, no.3, p.275-81 (Sept. 1983). Conditions of pore separation from grain boundaries during sintering are analyzed. It is shown analytically that a minimum intrinsic and solute drag force is required to prevent pore separation. In microstructures with a non-uniform size distribution the minimum dopant concentration is typically 14 times higher than that required in microstructures with a narrow grain size distribution. If the drag force is below the required minimum, pore separation will occur after the compact is sintered to a critical density. In compacts with a narrow grain size distribution, the critical density is about 99.3% of the theoretical density. However, in compacts with a non-uniform size distribution the critical density decreases to about 90.6% of the theoretical density. This analysis shows that it is imperative to maintain a narrow grain size distribution in order to obtain a high sintered density. Sintering data for BaTiO₃, β -Al₂O₃ and ZrO₂ agree with this analysis. (13 refs.)

115127 Cold sintering under high pressure—mechanisms and application. E.Y.Gutmanas (Dept. of Materials Engng., Technion-Israel Inst. Technol., Haifa, Israel).

Powder Metall. Int. (Germany), vol.15, no.3, p.129-32 (Aug. 1983). Plastic flow of powder particles in gradients of high pressure leads to high density, physical contact and chemical bonding of freshly formed surfaces at room temperature, or to cold sintering. Cold sintering of various materials with metallic, ionic and ionic-covalent bonds was observed. Thermal treatments of cold sintered samples at relatively low temperatures compared with those used in sintering show that higher mechanical properties and improved ductility may be obtained on cold sintered samples. Mechanisms of cold sintering are discussed. Possible application of cold sintering for processing of structural parts is considered. (21 refs.)

115128 Densification and change in shape of porous materials during hot pressing under conditions of nonuniform triaxial compression. V.M.Gorokhov, M.S.Koval'chenko, O.V.Roman (Inst. of Materials Sci., Acad. of Sci., Ukrainian SSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.22, no.1, p.7-11 (Jan. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.1, p.8-13 (Jan. 1983). [received: Aug. 1983]

A study is presented, using an approximating model of a linear viscous liquid, of the densification kinetics of a porous body. It is shown that the variation of the density of such a body averaged over its whole volume can be determined directly from the external forces acting on it. An equation is derived describing the densification of a powder material during pressing under conditions of complex loading associated with any pattern of force distribution on its surface. It can be employed for determining the density of a part in free upsetting, pressing in a rigid die, isostatic pressing in a gas, and the like. The plastic change in shape of a porous body under conditions of complex loading is described within the framework of the theory of volume viscous flow by an equation determining the mean value of the deformation tensor at any stage of densification. An equation is proposed for the axial and radial strains in pressing under conditions of nonuniform triaxial compression; it shows that, depending on the lateral-to-axial pressure ratio, the radial deformation of a porous body may take the form of a compressive or tensile strain. (5 refs.)

115129 Initial sintering temperature of ultrafine powders. V.N.Troitskii, A.Z.Rakhmatullina, V.I.Berestenko, S.V.Gurov (Inst. of New Chem. Problems, Acad. of Sci., USSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.22, no.1, p.12-14 (Jan. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.1, p.13-15 (Jan. 1983). [received: Aug. 1983] Determines the initial sintering temperatures of some ultrafine metal, nitride, silicide, and oxide powders under conditions of free filling during vacuum heating and establishes the dependence of these characteristics of the powders on particle size. (3 refs.)

115130 Excess energy stored in the fine powder system. Y.Inomata (Nat. Inst. for Res. in Inorganic Materials, Ibaraki, Japan).

Yogyo-Kyokai-Shi (Japan), vol.91, no.7, p.318-21 (1983). Excess energy stored in a fine crystalline powder system in comparison with large crystal having same structure and composition with the powder was evaluated theoretically. For the system in which the size of particles are larger than ca. 0.1 μ m, the excess energy can be evaluated by the sum of surface energy of powder particles in the system with good approximation. It is not adequate to use Thomson-Freundlich equation for the calculation of the excess energy. The internal pressure of crystalline particle does not increase with decreasing particle size. The pressure, chemical potential and vacancy concentration in the powder particle does not show any gradient caused by the local variation of curvature of the surface and/or interface of the particle. (8 refs.)

- 115131** An analysis of the driving forces in liquid-phase sintering. P.M.Ossi, F.Rossitto (CESNEF, Politecnico di Milano, Milano, Italy), R.Roberti, G.Silva. Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.343-5.
A study of the first stage of the liquid-phase sintering process is presented, to assess the relevance of the capillary forces in the rearrangement and densification of metallic powders and wires. The force-balance equation is studied to evaluate the various contributions for the different model configurations. The meniscus shapes are evaluated by integrating the Young-Laplace equation. The 'Liquid-phase sintering' experiment to be performed within the ESA Microgravity Programme and included in the TEXUS 8 payload is presented. The aim of the experiment is to obtain a better evidence and quantitative evaluation of the driving forces. (6 refs.)

81.20G Specific metals and alloys (compacts, pseudoalloys)

- 115132** Ferromagnetic multifilamentary Fe and Ni wires with high coercive fields produced by powder metallurgy processing. Y.D.Yao (Inst. of Phys., Acad. Sinica, Taipei, Taiwan), S.Foner. *Appl. Phys. Lett. (USA)*, vol.43, no.7, p.697-9 (1 Oct. 1983).
Powder metallurgy processed multifilamentary Cu-Fe, Cu-Ni, and Nb-Ni ferromagnetic composite wires were fabricated with a relatively high coercive field H_c at room temperature. Compacts of Cu-36 wt.% Fe, Cu-36 wt.% Ni, and Nb-36 wt.% Ni powders were reduced in cross section to produce ferromagnetic multifilamentary materials. Nominal areal reduction ratios of 10^8 for Cu-36 wt.% Fe and 10^4 for Nb-36 wt.% Ni and Cu-36 wt.% Ni resulted in values of $H_c \sim 195$ Oe, 94 Oe, and 77 Oe, respectively. A final 300°C anneal of the Cu-36 wt.% Fe composite gave $H_c \sim 460$ Oe. The average ferromagnetic fiber diameters are estimated to be 100-1000 Å for the Fe fibers and are about 1 μ m for the Ni fibers. (6 refs.)
- 115133** Ferromagnetic multifilamentary composites produced by cold powder metallurgy processing. Y.D.Yao (Inst. of Phys., Acad. Sinica, Taipei, Taiwan), S.Foner. *Annu. Rep. Inst. Phys. Acad. Sin. (Taiwan)*, vol.12, p.18-28 (Dec. 1982). [received: Sept. 1983]
Powder-metallurgy-processed multifilamentary Cu-Fe, Cu-Ni and Nb-Ni ferromagnetic composite wires were fabricated with a relatively high coercive field, H_c , at room temperature. Compacts of Cu-36 wt.% Fe, Cu-36 wt.% Ni and Nb-36 wt.% Ni powders were reduced in cross section to produce ferromagnetic multifilamentary materials. Areal reduction ratios of 10^8 for Cu-36 wt.% Fe and 10^4 for Nb-36 wt.% Ni and Cu-36 wt.% Ni resulted in values of $H_c \sim 195$ Oe, 94 Oe and 77 Oe respectively. A final 300°C anneal of the Cu-36 wt.% Fe composite gave $H_c \sim 460$ Oe. The average ferromagnetic fiber

diameters are estimated to be 100 Å to 1000 Å for the Fe fibers and are about 1 μ m for the Ni fibers. (7 refs.)

- 115134** Liquid phase sintering of tungsten [and optimum mechanical properties]. C.H.Lin, J.H.Jean (Dept. of Materials Sci. & Engng., Nat. Tsing Hua Univ., Hsinchu, Taiwan). *J. Mater. Sci. Lett. (GB)*, vol.2, no.9, p.480-4 (Sept. 1983).
The alloy is prepared by liquid phase sintering. In order to find the optimum mechanical properties the effect of varying the cooling rate and composition of the alloy on the mechanical properties and the fracture of the alloys was examined. (2 refs.)
- 115135** Preparation of rapidly solidified ribbons with second phase particles. P.G.Zielinski, D.G.Ast (Materials Sci. & Engng., Cornell Univ., Ithaca, NY, USA). *J. Mater. Sci. Lett. (GB)*, vol.2, no.9, p.495-8 (Sept. 1983).
The authors describe a new method to prepare metallic glasses containing a distribution of second phase particles. In this process, the particles are added after the liquid alloy is extruded but before it freezes into a ribbon. The method minimizes the contact time between the second phase particle and the liquid and offers the potential of adding a wide variety of particles, since it restricts the opportunities for reaction at the particle matrix interface. (7 refs.)
- 115136** Hot isostatic pressing of oxide dispersion strengthened superalloy parts. R.F.Singer, G.H.Gessinger (Forschungszentrum BBC AG, Baden, Switzerland). *Powder Metall. Int. (Germany)*, vol.15, no.3, p.119-21 (Aug. 1983).
MA6000E powders were consolidated by hot isostatic pressing. MA6000E is a γ' precipitation and oxide dispersion strengthened superalloy. For high temperature applications a coarse grained structure is required. The consolidated material has to be prestrained under certain conditions before it can be successfully grain coarsened by recrystallization. (10 refs.)
- 115137** Modern trends in creating sintered antifriction materials. I.M.Fedorchenko (Inst. of Materials Sci., Acad. of Sci., Kiev, Ukrainian SSR). *Powder Metall. Int. (Germany)*, vol.15, no.3, p.126-8, 132 (Aug. 1983).
Presents ideas on friction mechanism as a dynamical process. The main trends in creating composite sintered antifriction materials are shown. The influence of the phase components of material on the internal stress distribution in the process of work has been considered. Conditions ensuring the optimum internal stress distribution in the material and its optimum wear resistance during functioning are shown. (14 refs.)
- 115138** The effect of sintering in hydrogen-nitrogen atmospheres and subsequent aging on the magnetic properties of iron. K.H.Moyer, M.J.McDermott (Hoeganaes Corp., Riverton, NJ, USA). *Powder Metall. Int. (Germany)*, vol.15, no.3, p.134-8 (Aug. 1983).
The effect of nitrogen on the magnetic properties of iron cores sintered at 1120°C in nitrogen and hydrogen atmospheres is examined. The change in magnetic properties resulting from aging at various times and temperatures is also discussed. Case histories are included which demonstrate how sintering in contaminated production atmospheres causes deterioration of the magnetic properties. An example is also presented which shows that the magnetic properties of contaminated magnetic parts can be restored if the parts are resintered under properly controlled sintering conditions which reduce the carbon, nitrogen, and oxygen contaminants. (2 refs.)
- 115139** Heat evolution during the shock pressing of iron powder. V.F.Reshetnikov, L.I.Svistun, G.G.Serdyuk, Yu.M.Shulyakov (Krasnodar' Polytech. Inst., Acad. of Sci., Ukrainian SSR). *Sov. Powder Metall. & Met. Ceram. (USA)*, vol.22, no.1, p.4-6 (Jan. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.1, p.5-7 (Jan. 1983). [received: Aug. 1983]
The temperature of compacts was studied as a function of loading rate and their density. An experiment was carried out by pressing a powder with thermocouples embedded in it and recording the temperature indicated. In the contact zone between the powder and the working surface of the die intense heat evolution took place during shock pressing as a result of sliding and friction. The rise in temperature in this zone may affect the frictional properties of the sliding pair and the welding process, which manifests itself in the formation of metal excrescences on the die walls. In the peripheral layer of the die the heating may give rise to structural changes lowering the hardness of the working surface, which will lead to increased wear of the die. (2 refs.)
- 115140** Structure and mechanical and corrosion properties of P/M Kh23Ni18 stainless steel. I.D.Radomysel'skii, S.G.Napara-Volgina, L.N.Orlova, L.M.Apininskaya, A.K.Grabchak, N.M.Vergeles (Inst. of Materials Sci., Acad. of Sci., Ukrainian SSR). *Sov. Powder Metall. & Met. Ceram. (USA)*, vol.22, no.1, p.39-44 (Jan. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.1, p.43-9 (Jan. 1983). [received: Aug. 1983]
It was found that HVP (hot vacuum pressing) and HFPB (hot forging porous blanks) of a prealloyed powder enable high-density Kh23Ni18 stainless steel to be obtained exhibiting good mechanical and corrosion properties. Such steel, when produced by any of the processes investigated, is superior in strength to cast steel; its elongation and corrosion resistance are comparable to or better than those of cast steel only when additional operations of presintering of blanks and diffusional annealing after hot plastic working are employed. For the production of P/M Kh23Ni18 steel and other sintered stainless steels of the austenitic class on an industrial scale the hot-forging method is recommended, since it requires a simpler installation and enables parts of complex configuration to be produced. (5 refs.)
- 115141** Densification kinetics of chromium carbide and its alloys in hot pressing. V.N.Klimenko, V.G.Kayuk, V.A.Maslyuk (Inst. of Materials Sci., Acad. of Sci., Ukrainian SSR). *Sov. Powder Metall. & Met. Ceram. (USA)*, vol.22, no.1, p.60-3 (Jan. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.1, p.68-72 (Jan. 1983). [received: Aug. 1983]
A study was made of the densification kinetics in the hot pressing of chromium carbide and its alloys under pressures of 10.8-21.6 MPa at temperatures of 1350-1500°C for Cr₃C₂ and 900-1200°C for KKhN-15 and KKhNF-15 alloys in the isothermal holding time range from 300 to 1500 sec. It was found that increasing the duration of isothermal holding at all the temperatures and pressures investigated increased the relative densities of the materials from 0.65-0.7 at the lowest pressures and temperatures to 0.98-0.99 at the maximum values of these parameters. It is shown that the densification of chromium carbide and its alloys with nickel and nickel-phosphorus binders in hot pressing is described by a generalized equation of volume viscous flow of a porous solid. (8 refs.)

115142 Production of artificial channel insulating matrices and ultrathin metal filaments. V.N.Bogomolov, V.A.Gordeev, Yu.A.Kumzerov, M.I.Marty-nov, A.V.Fokin (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.599-600 (Nov. 1982). Translation of: *Pis'ma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1393-5 (Nov. 1982). [received: Sept. 1983]

The authors synthesized porous matrices from mica ($K_2O \cdot 3Al_2O_3 \cdot 6SiO_2 \cdot 2H_2O$) and fianite (ZrO_2). The densities of these matrices were 2.7 and 6.0 g/cm³, respectively. Ultrathin metal filaments are synthesized by forcing the liquid metal into etched channels. The diameter distribution of the channels is studied by mercury porosimetry. The procedure proposed for synthesizing ultrathin metal filaments by means of synthetic porous insulating matrices extends the list of so-called composite superconductors and makes it possible to study the influence of a photon contact on the value of T_c in metals. (4 refs.)

115143 Preparation of superconducting lead-alloy long filaments by glass-coated melt spinning. T.Goto (Dept of Polymer Technol., Nagoya Inst. of Technol., Nagoya, Japan).

Trans. Jpn. Inst. Met. (Japan), vol.24, no.8, p.595-600 (Aug. 1983). The glass-coated melt spinning of Pb alloy was investigated to produce a superconducting long filament with T_c more than 4.2K. Continuous smooth filaments less than 60 μ m in diameter of Pb, and Pb-Bi, Pb-In and Pb-Sn system alloys, and of $Pb_{84.4}Au_{15.6}$ and In_2Bi alloys were obtained from a molten state at 1450K with various spinning speeds ranging from 0.95 m/s to 7.95 m/s. The Pb system alloy filament obtained was a ductile material with the tensile strength of 40 MPa and elongation of 2.0%. The T_c of the Pb alloy filament did not depend on the sample current density (J_c) less than 3×10^7 A/m², whereas the T_c of the Pb filament depended on the J_c more than 2×10^6 A/m². The maximum T_c at 8.0K was observed for the $Pb_{60.2}Bi_{39.8}$ filament. The enhancement of superconductivity was observed for the $Pb_{70}Sn_{30}$ and $Pb_{65}Sn_{35}$ filaments. (12 refs.)

115144 Siloxanes, silanes, and silazanes in the preparation of ceramics and glasses. R.R.Wills, R.A.Markle, S.P.Mukherjee (Columbus Labs., Battelle, OH, USA).

Am. Ceram. Soc. Bull. (USA), vol.62, no.8, p.904-11, 915 (Aug. 1983). The use of selected organosilicon compounds for the preparation of silicon based ceramic materials is discussed in terms of processing microstructure-property relationships. The mechanisms operative in the formation of gel derived silicate glasses and glass ceramics are reasonably well understood, but this is not true for silicon carbide/nitride based ceramics. The properties of organosilicon precursors and the mechanism of pyrolysis affect the microstructural features of the ceramic. Reaction mechanisms are proposed and the microstructural features and properties of organosilazane derived ceramics discussed. (81 refs.)

115145 Development of zinc oxide varistors. H.S.Kalsi, B.K.Das (Nat. Phys. Lab., New Delhi, India).

Bull. Mater. Sci. (India), vol.5, no.1, p.33-8 (March 1983). [received: Sept. 1983] Grain growth kinetics of ZnO ceramics containing 6% additives of Bi₂O₃, CoO and MnO in equal molar ratios has been studied in the temperature range 1000 to 1350°C. It has been observed that the grain growth data fits the $D^2 = kt$ law and the activation energy computed from the rate constants is 65 kcal/mol. (9 refs.)

115146 Sinterability of alkoxide-derived magnesia. T.Hattori, H.Tatsuo-moto, J.Mohri (Dept. of Industrial & Synthetic Chem., Chiba Univ., Chiba, Japan).

J. Mater. Sci. Lett. (GB), vol.2, no.9, p.503-4 (Sept. 1983). The authors' study showed that the sinterability of magnesia obtained by direct calcination of alkoxide was considerably good. Carbon is believed to have played an important role in the sintering. (9 refs.)

115147 Development of cryochemical processes in oxide piezoceramic technology. Yu.D.Tret'yakov, V.A.Fokin (M.V. Lomonosov Moscow State Univ., Moscow, USSR).

Inorg. Mater. (USA), vol.18, no.10, p.1411-15 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1645-9 (Oct. 1982). [received: Sept. 1983] The question of employing cryochemical processes in oxide piezoceramic technology is discussed. The processes taking place in solutions of ceramic ingredients treated at low temperatures have been investigated with model substances. The effectiveness of the cryochemical technology as compared with traditional methods of production is illustrated with industrially important ceramic materials based on lead titanate zirconate. (11 refs.)

115148 Physicochemical aspects of production of ferroelectric ceramics. V.V.Klimov, O.S.Didkovskaya, V.V.Prisedskii.

Inorg. Mater. (USA), vol.18, no.10, p.1415-20 (Oct. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.10, p.1650-5 (Oct. 1982). [received: Sept. 1983]

The authors have considered the physicochemical factors which make it possible to vary the properties of ferroelectric and piezoelectric ceramics for spe-

cific purposes: enhancement of the piezo activity in the morphotropic region, composition, structure, structure of the p-T-x phase diagrams, nonstoichiometry, and defects of the crystal structure. (19 refs.)

115149 Properties of hot-pressed zirconium pyrovanadate ceramics. R.C.Buchanan, G.W.Wolter (Dept. of Ceramic Engng., Univ. of Illinois, Urbana, IL, USA).

J. Electrochem. Soc. (USA), vol.130, no.9, p.1905-10 (Sept. 1983). Zirconium pyrovanadate powders prepared from solution precipitation and by solid-state reaction were hot pressed below 800°C. Unit cell parameter and thermal expansion were found to have a negative slope above 150°C, attributed to flexing of the bond angles in the ZrV_2O_7 structure. Thermal expansion coefficient determined was $72 \times 10^{-7}/^\circ C$. Electrical conductivities measured were in the range 10^{-5} - $10^{-6}(\Omega \cdot cm)^{-1}$ at 25°C with activation energy of 0.2 eV. Conduction was determined to be n-type and was attributed to the presence of V^{4+} ions in the hot-pressed ZrV_2O_7 . Infrared transmission was significant in the range 2.5-10 μ m with a maximum (85%) at 7.5 μ m. (15 refs.)

115150 Kinetics and mechanism of cluster growth in mixtures of calcia and magnesia. I.B.Bashir (Dept. of Ceramics, Univ. of Leeds, Leeds, England).

Mater. Sci. & Eng. (Switzerland), vol.60, no.3, p.255-60 (Sept. 1983). The growth of CaO and MgO clusters in dense hot-pressed mixtures of calcia and magnesia was studied. The kinetics observed obeyed a fifth-power law which was expressed in the form $CS^5 - CS_0^5 = Kt$ (where CS is the average cluster size at a time t, CS_0 is the average cluster size at zero time and K is a constant); the mechanism proposed for cluster growth was coalescence by atom diffusion along dislocations. Microstructural evidence showing the presence of dislocations was provided, and a dislocation pipe diffusion coefficient of 6.22×10^{-12} m² s⁻¹ was estimated. Also a dislocation density of 5.2×10^6 cm⁻² agrees well with the value of 10^7 cm⁻² observed for as-fired polycrystalline MgO. (13 refs.)

115151 Equipment for the sintering and melting of ceramic materials. C.Wieja, J.Wieckowski.

Pol. Tech. Rev. (Poland), no.2-3, p.22-3 (1983). The equipment is based on an induction furnace and comprises a graphite crucible lined with a tungsten or molybdenum film. The graphite crucible acting as a heater-susceptor is heated with high frequency currents induced by an exciter coupled with a h.f. generator. The crucible lining makes impossible the reaction between the graphite and the oxides reducing to a minimum the consumption of expensive high-melting metals. (no refs.)

115152 Fine ceramics. H.Okuda.

Solid State Phys. (Japan), vol.18, no.6, p.359-60 (June 1983). In Japanese.

Fine ceramics have been attracting interest recently in many applications for machine parts. The present status of fine ceramics and its trend are described. (no refs.)

115153 Production of metal-carbon system materials with groups IV-V refractory metals. Yu.P.Solodov (All-Union Sci.-Res. Inst. of Electromech., USSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.22, no.1, p.15-17 (Jan. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.1, p.16-18 (Jan. 1983). [received: Aug. 1983] The method described is based on the reduction of appropriate metallic oxides with carbon. A characteristic feature of this method is that the oxide is used in the liquid state and carbon in the form of a carbon-graphite material, a metal-carbon system material forming inside the carbon-graphite material during its infiltration with the liquid oxide. (3 refs.)

115154 Formation of ZnAl₂O₄ in ZnO-Al₂O₃ system accompanied by uneven mixing and composition change. Y.Hukuhara, E.Suzuki, M.Hashiba, E.Miura, Y.Nurishi, T.Hibino (Dept. of Industrial Chem., Gifu Univ., Gifu-shi, Japan).

Yogyo-Kyokai-Shi (Japan), vol.91, no.6, p.281-9 (1983). In Japanese. The mixture of coarse alumina and fine zinc oxide, with different mole fractions of ZnO, X_z , was heated at 1000~1200°C for different times. The rate of ZnAl₂O₄ formation was determined, and also the microstructure was observed. The rate of ZnAl₂O₄ formation increased with the decrease of the composition X_z in the range of $X_z < 0.5$, but its dependence on the composition was not observed in the range of $X_z > 0.5$. The microstructure showed the presence of the agglomerates of sintered ZnO, which resulted in incomplete reaction in the range of $X_z < 0.5$, and consequently, the alumina particles were not able to react with ZnO because of incomplete mixing. The ZnAl₂O₄ layer grew around alumina particles at a rate of formation in parabolic relation with time. The diffusion constant controlling the process was determined from the product layer thickness as 3.59×10^{-15} to 3.16×10^{-13} cm²/s at 1000~1200°C. The temperature dependence of the diffusion constant gave an activation energy of 85.4 kcal/mol. The application of Jander's model to the powder mixture with difference compositions was discussed, and the introduction of three factors to correct the deviation of the practical condition from the Jander's ideal assumption was considered. (25 refs.)

115155 Sintering and electrical resistivity of ZnO-Nb₂O₅ ceramic. K.Hamano, A.Sayano, Z.Nakagawa (Res. Lab. of Engng. Materials, Tokyo Inst. of Technol., Yokohama-shi, Japan).

Yogyo-Kyokai-Shi (Japan), vol.91, no.7, p.309-17 (1983). The sintering behavior and relation between microstructure and electrical resistivity of the sintered bodies were investigated in the system ZnO-Nb₂O₅. ZnO reacted with Nb₂O₅ to form ZnO.Nb₂O₅ and then to form 3ZnO.Nb₂O₅ with increasing temperature, and 3ZnO.Nb₂O₅ melted at the eutectic point of 1297°C in the system 3ZnO.Nb₂O₅-ZnO. Addition of Nb₂O₅ delayed the initial sintering of ZnO (specimens), and the compacts expanded with the melt formation. The wetting of intergranular layer on the ZnO grains of the quenched one was better than that of the one cooled in the furnace with slight variation before and after annealing at 1000°C. Microhardness tests showed that the strength of ZnO-ZnO grain boundary of the quenched body was lower than that of the one cooled in the furnace. Therefore, the difference in the resistivity between the quenched body and the one cooled in the furnace depended on the strength of ZnO-ZnO grain boundaries as well as the wetting of the intergranular layer with a high resistance. (11 refs.)

115156 Preparation of porous Mg-Al spinel ceramics. S.Kanzaki, H.Tabata (Government Industrial Res. Inst., Nagoya, Japan), N.Otsuka, Z.Nakagawa, K.Hamano.

Yogyo-Kyokai-Shi (Japan), vol.91, no.7, p.344-5 (1983). Porous spinel ceramics was prepared from spray pyrolyzed spinel powder. Effects of forming pressure and firing temperature on the bulk density and pore size distribution of the samples were examined. The fired density of the specimens was less than 50% of theoretical density even when fired at 1400°C. The maximum frequency of the pore radius decreased and the pore size distribution became narrower with increasing of forming pressure. The maximum frequency of the pore radius increased with the increasing firing temperature, but the pore size distribution became narrower. A highly porous

spinel ceramics with less than 50% of theoretical density and the maximum frequency of the pore radius ranging from 700 Å to 2000 Å was obtained. (2 refs.)

- 115157 The stability of blends of incompatible thermoplastics. B.Maxwell, G.L.Jasso (Dept. of Chem. Engng., Princeton Univ., Princeton, NJ, USA). *Polym. Eng. & Sci. (USA)*, vol.23, no.11, p.614-17 (mid-Aug. 1983). Conventional thermodynamic reasoning would predict that it would be very difficult to melt blend incompatible polymers and that if such blends were made they would be highly unstable and would phase separate upon heating. A method has been developed to melt blend incompatible polymers (such as poly(methylmethacrylate) and polyethylene) to form two continuous interpenetrating phases and that upon prolonged heating the stability of the structure is increased rather than decreased. - 115158 Vibration-resistant composites intended for damping devices. D.M.Karpinos, I.I.Tuchinskii, A.V.Stupko, L.R.Vishnyakov, Yu.B.Askochenskii (Inst. of Problems of Material Sci., Acad. of Sci., Kiev, Ukrainian SSR). *Strength Mater. (USA)*, vol.14, no.9, p.1281-4 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.103-5 (Sept. 1982). The authors describe the testing of new wear- and vibration-resistant frictional materials intended for damping devices, and dampers with frictional elements fashioned from new materials. Two groups of composite materials based on a modified phenolformaldehyde oligomer filled with metallic powders with additives of thermoplastic polymers (PEND polyethylene, 32L fluoroplastic, and 42L fluoroplastic) were used as new materials for the frictional elements. (5 refs.)
- 115159 Melt compounding of PVC with ethylene copolymer resins. G.H.Hofmann (Polymer Products Dept., E.I. Du Pont de Nemours & Co., Wilmington, DE, USA). Polymer Alloys III Blends, Blocks, Grafts and Interpenetrating Networks. Proceedings of a Symposium, New York, USA, 23-28 Aug. 1981 (New York, USA: Plenum 1983), p.149-66. Routine procedures used for liquid plasticized PVC are often inadequate to produce homogeneous low gel alloys of PVC/ECR. Melt compounding morphology and rheology were used in analyzing this problem. A Brabender Plasti-Corder technique, used to evaluate the melt compounding of PVC/ECR, showed that standard particle (grain) sized PVC suspension resin produces heterogeneous blends, at shear stresses of 75 kPa or less. The more shear-sensitive large particle PVC suspension resins, however, produce homogeneous blends under these conditions. (15 refs.)
- 115160 The role of the matrix in fibrous composite structures. J.C.Halpin (ASD Engng., Aeronautical Systems Div., Wright-Patterson AFB, OH, USA). Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.3-17. An overview is provided to advanced composite structural technology and the role played by the matrix material system in this technology. It is concluded that advanced composite technology is a technology whose time has come. Subsonic aircraft application is within the current technological capability. (13 refs.)

Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.231-43. Discusses the major factors affecting the development of new matrix resins for advanced composites, which include: moisture resistance, toughness, improved processability, and elevated temperature performance. These factors dictate the directions of matrix materials development activities, with the two principal directions being: adapting existing chemistry to new matrix requirements, and developing new chemistry matrices. (7 refs.)

115162 Effects of matrix characteristics in the processing of short fiber composites. L.A.Goettler (Rubber Chem. Div. Monsanto Co., Akron, OH, USA).

Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.289-318. The role of the matrix on the processing of short fiber composites has been examined with regard to thermoset, thermoplastic, and rubber polymers. The matrix serves as more than a carrier vehicle for the fibers; it imparts its own characteristics upon the reinforced melt: viscosity level, elasticity, stiffness, melt strength, wetting or adhesion characteristics. The wide variations in some of these parameters between the different classes of polymeric matrices dictate applicable processing methods. All are amenable to closed cavity molding, but only the more coherent melts allow free surface forming, as in extrusion and calendaring. (20 refs.)

115164 Vapor pressure of dysprosium in the Dy-Pt system. A.I.Zaitsev, Yu.A.Priselkov, An.N.Nesmeyanov (M.V. Lomonosov Moscow State Univ., Moscow, USSR).

High Temp. (USA), vol.20, no.6, p.852-5 (Nov.-Dec. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.6, p.1081-4 (Nov.-Dec. 1982). [received: Sept. 1983]

Results are presented for the vapor pressure of dysprosium over its alloys with platinum in the concentration interval of 0.62 at.% Pt. The measurements were carried out by an integral variant of the Knudsen effusion method under conditions of ultrahigh oilless vacuum. The temperature dependence of the vapor pressures and the partial thermodynamic functions of dysprosium are calculated from the experimental data. An intermetallic compound is formed in the concentration interval of 48.6-38.0 at.% dysprosium and that the compound Dy₃Pt is absent. (16 refs.)

115165 Investigation of phase equilibria related to fusion reactor materials. I. The ternary system Zr-Al-N. J.C.Schuster (Inst. fur Physikalische Chem., Univ. Wien, Vienna, Austria), J.Bauer, J.Debaigne.

J. Nucl. Mater. (Netherlands), vol.116, no.2-3, p.131-5 (June 1983). Phase equilibria in the ternary system Zr-Al-N are investigated. AlN coexists at 1273K with ZrAl₃, ZrAl₂, Zr₂Al₃, Zr₃AlN and ZrN; at 1573K with ZrAl₃, ZrAl₂ and ZrN. Thus AlN is thermodynamically unstable against zirconium or binary aluminium-zirconium alloys rich in zirconium. Zr₂Al₃ with Mn₂Si₃-type structure is a binary low temperature phase but stabilized by nitrogen solution to higher temperatures. α -zirconium has an extended solubility for aluminum up to the melting region when stabilized by about 2 at.% nitrogen. No other ternary solubilities are observed. The getter characteristics of the Zr-Al-alloy ST 101 for impurity control and hydrogen recycling in fusion reactors are discussed in terms of the phase equilibria within the ternary system. (14 refs.)

115166 Revision of the eutectoid isotherms of the uranium-chromium system. L.R.Chapman (Metals & Ceramics Dept., Union Carbide Corp., Oak Ridge, TN, USA).

J. Nucl. Mater. (Netherlands), vol.116, no.2-3, p.328-31 (June 1983).

Examines previous work on the determination of the eutectoid isotherms. Due to discrepancies in previous work the authors have determined these values to a higher degree of certainty. (7 refs.)

115167 Phase equilibria in nickel rich Ni-Al-Mo and Ni-Al-W alloys. P.Nash, S.Fielding, D.R.F.West (Dept. of Metall. & Materials Sci., Imperial Coll. of Sci. & Technol., London, England).

Met. Sci. (GB), vol.17, no.4, p.192-4 (April 1983). [received: Sept. 1983]

Phase equilibria have been investigated in the Ni rich regions of the Ni-Al-Mo system at 1473K and of the Ni-Al-W system at 1523 and 1273K using electron microprobe analysis, X-ray diffraction, and optical metallography. The phase relationships at 1473 and 1523K are similar in the two systems showing three-phase equilibria of $\gamma + \gamma' + \alpha$ (Mo or W) and $\gamma' + \beta + \alpha$ (Mo or W); no ternary compounds were found in the regions studied. The maximum solubilities of Mo and W in γ' were found to be ~ 6 at.-%. Differences between the present and previous work are reviewed. (20 refs.)

115168 Robust numerical procedure for calculating equilibrium compositions in binary alloy systems. G.R.Luecke, D.M.Bailey, J.F.Smith (Iowa State Univ., Ames, IA, USA).

Met. Sci. (GB), vol.17, no.4, p.195-7 (April 1983). [received: Sept. 1983]

An algorithm for finding common tangents to Gibbs energy functions is presented. The approach differs significantly from those which have been used previously and has the advantage of being very robust in the sense that one can start with a quite rough approximation to the desired solution and still obtain iterative convergence to any required precision to the solution. (16 refs.)

115169 Short-range atomic order in the Fe-Ni system. V.I.Goman'kov, N.I.Nogin, E.V.Kozis.

Russ. Metall. (GB), no.3, p.152-6 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.174-9 (1982).

From the diffusion intensities of neutron scatter on quenched alloys, the temperature and concentration dependences were obtained for the short-range order parameters for five coordination spheres throughout the γ phase. In this way, structural states above the Kurnakov temperature have been established which supplement the phase diagram. The ordering energies have been obtained for three spheres which characterise the atomic interaction potential. (17 refs.)

115170 Influence of alloying with germanium and copper on the conditions of formation of the superconducting compound Nb₃Si. V.M.Pan, V.I.Latyshcheva, O.G.Kulik, A.G.Popov.

Russ. Metall. (GB), no.3, p.167-71 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.191-6 (1982).

Isothermal cross-sections of the Nb-Nb₃Si₃-Nb₃Ge₃ system at 1780, 1800 and 1820°C, were constructed. The compound Nb₃Si with a structure of the Ti₃P type is present in this ternary system at 1800-1820°C in a limited range of compositions. At 1820°C the solubility of silicon in the β -Nb₃Ge increases up to 4 at.% in comparison with lower temperatures. An isothermal cross-section of the Nb-Si-Cu system at 1500°C was constructed and in the niobium-rich range, existence of a new ternary compound with a crystal structure of Nb₃CoSi type was established. In the Nb-Si-Cu system, the compound Nb₃Si is not formed up to a temperature of 1780°C. (15 refs.)

115171 On the thermodynamic properties of Co-Cu melts. V.P.Mintsis, L.Sh.Tsemekhman, B.P.Burylev, V.D.Linev, A.I.Tertichnyy, V.I.Volkov.

Russ. Metall. (GB), no.3, p.171-4 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.196-8 (1982).

1. The equilibrium liquid-vapour was experimentally investigated and activity coefficients at 1793K in the Co-Cu melts were determined. 2. Positive asymmetrical deviations were described by two-member equations of substitution solutions and the concentration dependence of the thermodynamic components of the melts in the Co-Cu system was obtained. (7 refs.)

115172 Examination of alloys of the Pd-Ni-Th system in the palladium-rich region. G.I.Terekhov, S.I.Sinyakova.

Russ. Metall. (GB), no.3, p.189-91 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.211-14 (1982).

The corner of the phase diagram of the Pd-Ni-Th system with the sum of the thorium and nickel contents of up to 12 at.% was constructed by X-ray diffraction, microstructural and thermal analyses. The combined alloying of palladium with thorium and nickel reduces the solubility of thorium in palladium because of an unfavourable change in the volume factor. The large area is occupied by the region of the ($\alpha_1 + \alpha_2$)-solid solutions based on palladium and nickel. Additional alloying of the Pd-Th alloys with nickel increases the size of reduction in their melting point. (4 refs.)

115173 The Zn-Bi-Hg phase diagram. M.V.Nosek, N.M.Atamanova, B.T.Asanova.

Russ. Metall. (GB), no.3, p.192-4 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.215-19 (1982).

The Zn-Bi-Hg phase diagram was constructed and examined using differential thermographic, X-ray phase and microstructural analyses. Three four-phase equilibria were found in the system; two are peritectic: (Zn) + L \rightleftharpoons γ + Bi ($\sim 30^\circ\text{C}$), γ + L \rightleftharpoons β + Bi ($\sim 13^\circ\text{C}$), and one is eutectic: L \rightleftharpoons Bi + β + (Hg) ($\sim 44 \pm 2^\circ\text{C}$). No ternary intermetallic compounds form in the system. (5 refs.)

115174 Thermodynamic study of oxidation of molybdenum sulfides. Jun Soo Kim, Jae Hyun Oh.

J. Korean Inst. Met., vol.21, no.6, p.558-65 (June 1983). In Korean.

Oxidation reactions of molybdenum sulfides have been studied by thermodynamic analysis of the phase diagrams of the molybdenum-sulfur-oxygen system. The results obtained are listed. (18 refs.)

115175 A thermodynamic analysis of the Cu-O system with an associated solution model. R.Schmid (Tech. Univ. Clausthal, Clausthal-Zellerfeld, Germany).

Metall. Trans. B (USA), vol.14B, no.3, p.473-501 (Sept. 1983).

An extension of the associated solution model is developed and applied to the Cu-O liquid phase. Associated species 'Cu₂O' in the liquid solution are assumed, which interact with the surrounding free Cu and O atoms. All thermodynamic properties and the phase diagram calculated from this model

are in good agreement with the experimental information. The success of this mathematical description is, of course, no proof for the physical existence of associated species. A consistent set of thermodynamic data of the various solid, liquid, and gaseous phases is given by this comprehensive evaluation. In addition, linear approximations for the Gibbs energies of reaction of formation and the interaction coefficients are offered. A metastable liquidus of the compound CuO at elevated pressure is predicted, the congruent melting point being 1228°C at $P_{0(2)} = 24.4$ atm (2.47 MPa). (6 refs.)

115176 Predominance area diagrams of the system Co-S-O between 583 and 1148K. N.Jacinto (Univ. of Oruro, Oruro, Bolivia), H.Y.Sohn, M.Nagamori.

Metall. Trans. B (USA), vol.14B, no.3, p.506-9 (Sept. 1983).

Presents new predominance area diagrams of the Co-S-O system in the temperature range 583 to 1148K, including the stability zones of all known cobalt sulfides. (12 refs.)

115177 Influence of pressure on the equilibrium of the melt with graphite, diamond and carbide Mn₇C₃ in the Mn-C system. T.P.Ershova, D.S.Kamenetskaya.

Russ. Metall. (GB), no.3, p.157-61 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.180-4 (1982).

Presents a thermodynamic calculation of graphite, diamond and carbide liquidus in the Mn-C system at pressures up to 100 kbar. The calculated T-P-N_C state diagram on the Mn-C system is illustrated by three isobaric cross-sections ($P = 0.60$ and 100 kbar) as well as by the projections of lines of monovariant equilibria on to the T-P and N_C-P planes. (16 refs.)

115178 Calculation of complex equilibria in ceramic systems. Y.K.Rao, H.G.Lee (Dept. of Mining Metall. & Ceramic Engng., Univ. of Washington, Seattle, WA, USA).

Trans. & J. Br. Ceram. Soc. (GB), vol.82, no.4, p.123-8 (July-Aug. 1983).

Computer-assisted methods for the determination of equilibrium compositions in complex systems are presented. The use of Matrix algebraic techniques to determine the number of linearly independent reactions inherent in a system is demonstrated. An iterative type of method, adapted to a high-speed digital computer, was used to obtain the equilibrium composition. The application of the iterative method is illustrated by suitable examples which include Si-O and Ga-In-As-H-Cl systems. Ordinary calculational methods are used in the analysis of equilibria in the systems Si-C-O and Si-C-N-O. (5 refs.)

115179 A quantitative investigation of phase compositions in magnesia-R₂O₃-silicate systems. IV. A study of commercial magnesia-chrome mixtures. J.D.Dewendra, C.M.Wilson, N.H.Brett (Dept. of Ceramics, Glasses & Polymers, Univ. of Sheffield, Sheffield, England).

Trans. & J. Br. Ceram. Soc. (GB), vol.82, no.4, p.132-6 (July-Aug. 1983).

For pt.III see *ibid.*, vol.82, p.87 (1983). A series of mixtures containing different proportions of a commercial sea-water magnesia and two chrome ores was studied by quenching pressed specimens from temperatures in the range 1400-1700°C and analyzing them by reflected light microscopy and electron probe microanalysis. The volume percentages of the periclase, spinel and liquid phases present in the microstructures were determined by a point-counting method. The results are compared with those previously obtained on synthetic mixtures of similar compositions and phase diagrams relevant to the magnesia-chrome system are reviewed. (7 refs.)

115180 The time-temperature-transformation (TTT) state diagram and cure. J.K.Gillham (Dept. of Chem. Engng., Princeton Univ., Princeton, NJ, USA).

Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.127-45.

A generalized time-temperature-transformation (TTT) state diagram for the thermosetting process is presented in which the four physical states encountered (i.e. liquid, rubber, ungelled glass and gelled glass) are related to the time and temperature of cure. Gelation and vitrification, as a consequence of quenching morphological development and chemical conversion, respectively, are discussed with respect to the control of material properties. A generalized stress response model for rubber-modified thermoset materials is presented which relates morphology to low and high strain rate behavior. (23 refs.)

115181 Strontium as a modifier for aluminium-silicon-copper alloys. A.Latkowski.

Arch. Hutn. (Poland), vol.28, no.2, p.187-91 (1983). In English.

An evaluation of the Al-16% Si-10% Sr master alloy in the Al-Si-Cu alloy was made. Addition was convenient and recovery was satisfactory, thus eliminating two of the major problems with sodium modification, namely fume generation and gas porosity and uncertain recovery. In spite of continuous loss of strontium during holding the degree of modification actually improved with holding time. (6 refs.)

115182 Unidirectional growth of dilute Bi-Sb alloys. H.Jamgotchian, B.Billia, L.Capella (Lab. de Phys. Cristalline, Univ. Aix Marseille, Marseille, France).

J. Cryst. Growth (Netherlands), vol.62, no.3, p.539-44 (Aug. 1983).

Observations on the planar and cellular morphologies of the solidification front during upward Bridgman growth of dilute Bi-Sb alloys are reported. Matter transport in the melt is analysed. The importance of averaging of the thermal gradients and of the capillarity term in the Mullins-Sekerka criterion is emphasized. (20 refs.)

115183 Directionally solidified structure and mechanical properties in monovariant Al-Fe-Ni eutectic alloy. Doo Han Kim, Kee Dae Lee, Hyun-Kee Cho.

J. Korean Inst. Met., vol.21, no.6, p.576-83 (June 1983). In Korean.

The variations of microstructure, interphase spacing and mechanical properties in Al-Fe and Al-Fe-Ni eutectic alloys have been investigated over a range of solidification rate from 1.2 to 38 mm/min under the thermal gradient of approximately 80°C/cm. The results obtained are summarized. (17 refs.)

115184 An analysis of local flow effects in flow-induced orientation and crystallization. I.S.Dairanieh, A.J.McHugh (Dept. of Chem. Engng., Univ. of Illinois, Urbana, IL, USA).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.8, p.1473-92 (Aug. 1983).

An analysis is presented of the effects of external flow kinematics on the so-called local flow in seeded, flow-induced crystallization and orientation. The flow field around a growing crystal or nucleation seed is modelled by the Stokes flow equations past a prolate ellipsoid of high aspect ratio. Exact solutions for various flow kinematics, worked out elsewhere by the singularity method, are applied to the analysis of local gradients. The results show that along the symmetry axis of the spheroid, the extensional gradients which

result for various free-stream velocity fields are primarily the result of the constant-velocity free-stream component. However, free-stream, extensional flow can significantly enhance the region of such high gradients. Along the symmetry plane of the spheroid, primarily shearing gradients result, with small extensional gradients occurring when the free-stream flow has extensional components. Results of chain extension and birefringence calculations are also presented and discussed. The calculations for Newtonian flow past a prolate ellipsoid can be used to demonstrate the influence of various external flow kinematics on the local gradients and stresses in seeded growth of crystalline fibers. (31 refs.)

115185 The formation of coarse intermetallics in rapidly solidified Al-Co alloys. R.K.Garrett,Jr., T.H.Sanders,Jr. (School of Materials Engng., Purdue Univ., West Lafayette, IN, USA).

Mater. Sci. & Eng. (Switzerland), vol.60, no.3, p.269-74 (Sept. 1983). Rapidly solidified hypereutectic Al-Co alloys cast by melting spinning may contain coarse intermetallic Al_3Co , fine Al_3Co_2 or primary aluminum dendrites with cobalt segregated interdendritically. A metallographic investigation of as-cast ribbons indicated that the volume fraction and size of the intermetallics are determined by the cooling rate and the solute content; decreasing the cooling rate and increasing the solute content tended to increase the fraction of Al_3Co_2 precipitates. The intermetallic Al_3Co_2 does not appear to result from a breakdown of primary aluminum solidification as has been previously proposed but rather from the direct nucleation of Al_3Co_2 from the melt followed by subsequent growth. (8 refs.)

115186 Analysis of the effect of the comparative number of primary crystals on the kinetics of peritectic transformation. I.M.Galushko. *Russ. Metall. (GB)*, no.3, p.145-8 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.168-71 (1982).

The examination of the peritectic solidification of the melts of the Cu-Cd and Cu-Sn peritectic systems showed that the yield of the peritectic reaction (ϵ) decreases with an increase in the comparative amount of the primary crystals (η). This dependence is described by the equation $\epsilon = \kappa(1-\eta)^2$. Coefficient κ depends on the extent of the three-phase contact in peritectic transformation. The difference in the values of ϵ in solidification of the melts with different comparative amounts of the primary crystals is associated with the variation of the mean rate of peritectic transformation in the melts of various compositions. This rate was evaluated on the basis of the ratio of ϵ to the time determined by the width of the plateau corresponding to the peritectic reaction on the solidification thermogram. (11 refs.)

115187 Formation of defects during the solidification of alloys in a two-dimensional region with a short-life internal heat sink. V.A.Zhuravlev, S.P.Bakumenko, G.A.II'in, L.A.Sokolov, N.V.Fedorova. *Russ. Metall. (GB)*, no.3, p.149-51 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.172-3 (1982).

Introducing short-lived internal heat sinks into a two-dimensional solidification region is an effective way to influence the kinetics of melt solidification and the nature of defect (pore) distribution in the growing phase. The presence of short-lived internal heat sinks in the solidification region leads to a rapid development of the two-phase zone and a more uniform distribution of pores in the solid phase (ingot). 81.30H Constant-composition solid-solid phase transformations: polymorphic, massive, and order-disorder

(see also 64.70K Solid-solid transitions)

115188 Kinetics of a polymorphic transition in an Ag-Zn alloy under the action of γ rays. M.P.Krulikovskaya, L.I.Chirko (Inst. of Phys., Acad. of Sci., Kiev, Ukrainian SSR).

Fiz. Met. & Metalloved. (USSR), vol.56, no.2, p.345-50 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)* A study was made of the influence of γ irradiation at rates up to 4×10^3 R/sec on the kinetics of a $\beta' \rightarrow \zeta$ polymorphic transition in an Ag-Zn alloy. The change in the converted volume of the ζ phase with time as a result of γ irradiation was determined at various temperatures by the electrical resistance method. The results indicated that γ irradiation accelerated the $\beta' \rightarrow \zeta$ process. This was due to an increase in the probability of nucleation of the ζ -phase. Estimates were obtained of the changes (as a result of irradiation) in the probability and energy of formation of nuclei of the ζ -phase and of the energy parameters of the transition. The mechanisms were analysed allowing for the radiation-induced enhancement of the migration of atoms. (11 refs.) A.T.

115189 The cooling behavior of deep penetration welds undergoing austenite-ferrite transformation. M.J.Bibby (Dept. of Mech. & Aeronautical Engng., Carleton Univ., Ottawa, Canada), K.Eastman, J.A.Goldak. *Metall. Trans. B (USA)*, vol.14B, no.3, p.483-6 (Sept. 1983).

Austenite and ferrite-pearlite cooling rate and cooling-time relationships are proposed for deep penetration (electron beam) carbon-manganese and low alloy steel welds. These relationships are based on an analysis of experimental results by the heat transfer methods first suggested by Dorsch (1968), Signes (1972) and recently extended by Gravielle (1973) for the shallow penetration (arc) techniques. The cooling behavior of carbon-manganese and low alloy deep penetration welds is compared to the cooling behavior of equivalent austenitic stainless steel welds where there are no transformation effects. The results are rationalized in terms of the thermal properties of ferrite and austenite. (9 refs.)

115190 Electron microscopic investigation of the growth of martensite platelets. V.M.Schastlivtsev, I.L.Yakovleva, L.N.Romashev (Inst. of Metal Phys., Ural Sci. Centre, Acad. of Sci., Sverdlovsk, USSR).

Fiz. Met. & Metalloved. (USSR), vol.56, no.2, p.271-9 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)* An electron microscopic study was made of the structure of martensite in 52Kh2N23 steel during intermediate stages of formation of lenticular martensite from thin martensite platelets formed under the action of magnetic field pulses. A characteristic dislocation fringe was observed at the beginning of the isothermal treatment around some of the thin martensite plates and its was due to the onset of side growth of these plates. Longer isothermal treatment resulted in the formation of a step-like martensite-austenite interface, which became smooth only on completion of the platelet growth. (9 refs.) A.T.

115191 Mechanism of formation of martensite single crystals as a result of plastic deformation of the alloys based on γ -Mn. E.Z.Vintaikin, S.Yu.Makushev, D.F.Litvin (Inst. of Metall. & Phys. of Metals, Moscow, USSR).

Fiz. Met. & Metalloved. (USSR), vol.56, no.2, p.298-302 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)* X-ray diffraction data were used to plot the pole figures of the tetragonal axes of the original and deformed (by compression along (100)) single crystals of the Mn-18% Cu alloy with a polydomain structure formed as a result of the face-centred cubic-tetragonal transition. It was found that the deformation produced a tetragonal single crystal with axes directed along the cubic axis of the original lattice. A mechanism was proposed according to which the formation of a single crystal was determined by the conditions of accommodation of the deformed twin structure. (7 refs.) A.T.

115192 Structural and phase transition of γ' martensite in binary Cu-Al alloy during deformation. V.V.Martynov, G.P.Martynova, L.G.Khandros (Inst. of Metal Phys., Acad. of Sci., Kiev, Ukrainian SSR).

Fiz. Met. & Metalloved. (USSR), vol.56, no.2, p.303-7 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)* An X-ray diffraction study was made of the structural and phase transitions in single crystals of Cu-13.5 mass % Al with the martensitic point at 180°C. These transitions occurred in the process of deformation at room temperature. The phase transitions occurred under load because the basal plane was oriented suitably for the preferred martensite variant. For different orientations of the stretching axis the deformation was either limited by the process of a reorientation of γ' martensite crystals and led to the formation of a perfect γ' single crystal or gave rise to the $\gamma' \rightarrow \alpha_1'$ phase transition. An α_1' single crystal formed as a result of this phase transition was retained after unloading. (7 refs.) A.T.

115193 Influence of the quenching temperature on the onset of the $\alpha \rightarrow \gamma$ transition and mechanical properties of maraging steel. S.B.Nizhnik, S.P.Doroshenko, G.I.Usikova (Inst. of Mech., Acad. of Sci., Dnepropetrovsk, Ukrainian SSR).

Fiz. Met. & Metalloved. (USSR), vol.56, no.2, p.327-33 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)* X-ray diffraction and direct electron microscopy were used to study the influence of the temperature of quenching of maraging N18K9M5T steel on the onset of the $\alpha \rightarrow \gamma$ transition and the associated changes in the martensite and austenite substructures, and also the influence on the dependences of the morphology and crystal lattice parameter of the converted austenite on its amount. The temperature of the onset of the $\alpha \rightarrow \gamma$ transition decreased and the relaxation of the initial microdistortions of the martensite and austenite lattices became accelerated when the quenching temperature was lowered in the intercritical interval. When the temperature intervals of the $\alpha \rightarrow \gamma$ transition and of the ordering ageing coincided, the converted austenite did not enhance the plasticity of the investigated steel. (9 refs.) A.T.

115194 Shape memory effect in martensitic transformations in TiNi-TiCu alloys. V.N.Tokarev, A.S.Savinov, V.N.Khachin (V.D. Kuznetsov Siberian Physicotech. Inst., Tomsk, USSR).

Fiz. Met. & Metalloved. (USSR), vol.56, no.2, p.340-4 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)* A significant but nonunique change in the parameters of a martensitic transformation and in the shape memory effects were observed when titanium nickelide was alloyed with copper. The replacement of nickel with copper gradually induced two martensitic transitions, B2 \rightarrow B19 and B19 \rightarrow B19', which ensured the optimal conditions for the shape memory effect. These conditions were realized in alloys with 10-12 at.% Cu and 1-3 at.% Fe. (8 refs.) A.T.

115195 Reversion of BCC α' martensite in Fe-Cr-Ni austenitic stainless steels. K.B.Guy, E.P.Butler, D.R.F.West (Engelhard Industries Ltd., Cheshington, England).

Met. Sci. (GB), vol.17, no.4, p.167-76 (April 1983). [received: Sept. 1983] The reverse transformation $\alpha' \rightarrow \gamma$ within two austenitic stainless steels of nominal composition Fe-18Cr-8Ni and Fe-18Cr-12Ni has been studied. A magnetic balance apparatus was used to determine the phase contents after rapid, salt bath heating. Information concerning the structures produced and the mechanisms of the transformation was obtained using transmission electron microscopy examination, including in situ hot stage experiments and

X-ray microanalysis. The results obtained show that the $\alpha'\rightarrow\gamma$ transformation proceeds by both diffusional and shear processes depending upon the heating time and temperature, initially producing austenite having a twinned substructure which recovers into fine subgrains. Diffusion occurs at temperatures between the A_s and A_f to produce the equilibrium austenite and ferrite duplex structure. Further observations on the recrystallisation behaviour, the effect of transformation cycling, and the phenomenon of a magnetic phase 'peak' at $\sim 400^\circ\text{C}$ are also reported, and possible mechanisms operating during these processes are discussed. 81.30M Precipitation

(inc. segregation; see also 64.75 Solubility, segregation and mixing)

115196 Composition of Zr(Cr, Fe)₂-type precipitates in Zircaloy-2 and Zircaloy-4. R.A.Versaci, M.Ipohorski (Dept. de Materiales, Gerencia de Desarrollo, Comision Nacional de Energia Atomica, Buenos Aires, Argentina). *J. Nucl. Mater. (Netherlands)*, vol.116, no.2-3, p.321-3 (June 1983). The results of transmission electron microscopy, electron diffraction and X-ray energy dispersive microanalysis (EDAX) of second-phase particles in Zircaloy-2 and Zircaloy-4 are reported. The chemical composition of the Zr(Cr, Fe)₂-type precipitates were determined, and further information on the stability of their hexagonal structure was obtained. (11 refs.)

115197 The influence of molybdenum on the solubility of phosphorus in α -Fe. S.Suzuki, K.Abiko, H.Kimura (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan). *Mater. Sci. & Eng. (Switzerland)*, vol.60, no.3, p.L17-21 (Sept. 1983). The authors have re-examined the effect of molybdenum on the solubility of phosphorus in α -Fe and found that the reduction in the phosphorus solubility due to molybdenum is not as large as was found by Kaneko et al. (see J. Jpn. Inst. Met., vol.29, p.166, 1965). The new solubility data are reported. (9 refs.)

115198 Aging behaviour of 18Mn-18Cr high nitrogen austenitic steel for end rings. R.Presser, J.M.Silcock. *Met. Sci. (GB)*, vol.17, no.5, p.241-7 (May 1983). The end windings of electrical generators are held in place by end rings which are heated to over 300°C during the fitting process. A new non-magnetic 18Mn-18Cr-0.6N steel has recently been developed for this application and the possibility of sensitization during service has been investigated. Precipitation of grain boundary nitrides is slow and from observations between 400 and 800°C the extrapolated time at 300°C for 10% of the boundaries of the as-received material to contain precipitates is 10⁵ h. Cellular precipitation occurs at high temperatures but is only detected at 600°C after 32 h. A re-solution treatment for 1 h at 1080°C reduces the subsequent rate of precipitation, whereas prior cold work accelerates precipitation. The precipitates are Cr rich but contain Mn and Fe. Below 700°C only the M₂₃X₆ structure forms, but above 700°C (CrMnFe)₂N is also observed. Both structures coexist for up to 68 h at 800°C. At temperatures above 550°C the rate of precipitation appears to be governed by Cr bulk diffusion. (9 refs.)

115199 Chemical composition of σ phase precipitated in chromium-nickel austenitic steels. J.Barcik, B.Brzycka. *Met. Sci. (GB)*, vol.17, no.5, p.256-60 (May 1983). Using an X-ray microanalyser the chemical composition was determined for σ phase precipitating in type 310 austenitic steels with varying carbon and silicon contents and for type AISI 316 steel stabilized with titanium. It was found that the range of α -phase stability, estimated by average group number, depends on the presence of additional alloying elements. (38 refs.)

115200 Crystalline defects in M₇C₃ carbides. J.P.Mornioli, E.Bauer-Grosse, M.Gantois (Lab. de Genie Metall., Ecole des Mines, Parc de Saurupt, Nancy, France). *Philos. Mag. A (GB)*, vol.48, no.3, p.311-27 (Sept. 1983). M₇C₃ carbides prepared in various conditions have been observed by electron microscopy and diffraction. Examinations of the first-order Laue zone with crystals having the c axis parallel to the electron beam demonstrate that the unit cell describing the structure of these carbides is the orthorhombic cell proposed by Fruchart and Rouault. This cell can be considered as an ordered cell of an average hexagonal cell and can have three orientations at 120° from each other. It contains metal atom tetrahedra whose local environment in prismatic interstices containing carbon atoms is typical and is never destroyed, whatever the conditions of preparation may be. Thus, in primary carbides present in cast irons and steel, the state of crystallization is such that a long-range order of the environment is established: orthorhombic domains are separated by {1100} twins and antiphase boundaries. In Fe₇C₃ carbides, crystallized from amorphous iron-carbon alloys, the local environments are only short-range ordered, and domains and {1120} defects have the same size. Intermediate cases, as seen in ion-plating carbides, are also described. (13 refs.)

115201 The segregation of osmium to grain boundary dislocations in tungsten. H.C.Eaton (Materials Sci. Program, Louisiana State Univ., Baton Rouge, LA, USA), H.Norden. *Scr. Metall. (USA)*, vol.17, no.8, p.1043-6 (Aug. 1983). The field ion microscope and the atom probe are used in an analysis of grain boundary chemistry in tungsten doped with nickel and osmium. The nickel atoms are randomly distributed in the grain boundary plane whereas the osmium is strongly segregated to the core region of a grain boundary dislocation. The differences in behavior of the solute atoms is explained by comparing atomic volumes. (7 refs.)

115202 Precipitation processes in a β -phase Cu-15 at.% Sn shape memory alloy. N.Kuwano, C.M.Wayman (Dept. of Metal. & Mining Engng., Univ. of Illinois, Urbana, IL, USA). *Trans. Jpn. Inst. Met. (Japan)*, vol.24, no.8, p.561-73 (Aug. 1983). β -phase CuSn alloys, like many other β -phase alloys of the noble metals, exhibit various 'extra' reflections in diffraction patterns. The phases which give rise to extra reflections in a quenched Cu-15 at.% Sn shape memory alloy were examined by means of electron microscopy using a dark field imaging technique. The as-quenched alloy was found to consist of a DO₃ matrix containing scattered small particles (designated as the 's'-phase) and another phase which may be identified as a surface phase or a so-called

'surface martensite'. The structure of the s-phase resembles that of an omega phase. In the same alloy annealed at 373K after quenching, coarse precipitates (designated as the 'L-phase') formed. The L-phase forms as four variants in the β -phase each of which takes the shape of a hexagonal platelet, the basal plane of which is parallel to {111} _{β} . After considering the structure of the L-phase it is concluded that the unit cell has the lattice parameters $a=b\approx\sqrt{6}a_\beta$, $c\approx\sqrt{3}a_\beta/2$, and $\gamma=120^\circ$, where a_β is the lattice dimension of the fundamental β -phase parent unit cell. (22 refs.)

115203 Microphase segregation in segmented amine-cured polyurethanes. C.R.Desper, N.S.Schneider (Army Materials & Mech. Res. Center, Organic Materials Lab., Watertown, MA, USA). Polymer Alloys III Blends, Blocks, Grafts and Interpenetrating Networks. Proceedings of a Symposium, New York, USA, 23-28 Aug. 1981 (New York, USA: Plenum 1983), p.233-51. The use of amine curing agents results in a very strong propensity for microphase separation in segmented polyurethanes. The resulting polymers, also denoted as polyurethaneureas, contain urea linkages which promote hard segment aggregation by specific interaction, namely the formation of a three-dimensional hydrogen bonding pattern. The SAXS evidence supports a model of extensive microphase segregation with narrow interphase boundaries, in which the hard segment phases are reasonably pure and the soft segment phases contain varying amounts of dissolved hard segment. The mechanical strength properties are strongly influenced by the state of dispersion of the two phases, and in particular on the relative values of the hard segment phase inhomogeneity length. In a poor material, the hard segments are isolated as microphases with limited lateral dimensions. In better materials the lateral dimensions increase, leading to higher l_H values, with little change in the longitudinal period indicated by the Bragg spacing. (3 refs.)

115205 Relationship between processing parameters and mechanical properties of standard test pieces of selected partly crystalline thermoplastics. G.Fienhold, B.Rademacher. *Plaste & Kautsch. (Germany)*, vol.30, no.7, p.390-3 (July 1983). In German. Three high-density polyethylenes and three polypropylenes were examined with regard to the effect of their manufacturing on the characteristic mechanical properties of the material. One of the polypropylenes had been extruded. All the other test pieces were injection mouldings. The injection moulding temperature had the greatest influence on the mechanical characteristics of these plastics. The tool temperature was of comparatively little effect. There is a need for tightening up of the temperature control in the production of test pieces. (16 refs.) *R.S.*

115206 Torsional strength of pressureless-sintered silicon nitride. K.Matsusue, Y.Fujisawa, K.Takahara (Nat. Aerospace Lab., Chofu-shi, Japan). *Yogyo-Kyokai-Shi (Japan)*, vol.91, no.7, p.346-8 (1983). Torsional strength tests of pressureless-sintered silicon nitride were carried out at temperature range from room temperature to 1400°C in air. The torsional strength rapidly decreased at temperatures above 800°C, being 15 percent of room temperature value of 35.6 kg/mm² at 1400°C. Observations of the fracture mode and of the crack propagation on the fracture surfaces were made and discussed. (2 refs.)

115207 Development of design analysis methods for new materials. F.J.Lockett. Report NPL-DMA(A)-66, Nat. Phys. Lab., Teddington, England (May 1983), 21 pp.

Polymers and composites have some mechanical characteristics which are significantly different from those of familiar metallic materials. Consequently, design analysts may have less confidence in these newer materials and in their own ability to design with them. Thus, material selection may be confined to familiar materials, or components may be overdesigned, or failures may occur in service due to faulty design. Essentially, the design analyst requires relevant and credible design data, together with valid calculation methods for predicting and optimising component performance. These methods may involve design formulae or design charts, and the growing use of computer-aided design provides an opportunity for polymers and composites to be handled on an equal basis with other materials. The author examines these factors in the motor vehicle context, identifies present and future needs, surveys the current state of the art, and indicates some relevant recent and ongoing research work. 115208 Investigation of the influence of thermomechanical treatment on the hardening of AlMgSiCu alloys. S.Stojadinovic (Tech. Inst., Bor, Yugoslavia).

Fiz. Met. & Metalloved. (USSR), vol.56, no.2, p.358-60 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

A study was made of the influence of the deformation regime on the hardening of previously aged AlMgSiCu alloys (1.5% Mg₂Si). The hardening was found to depend on the degree of deformation, deformation regime, and copper content. Alloys subjected to a less intense deformation regime, as well as those with high copper concentrations, exhibited stronger hardening. (14 refs.) A.T.

115209 Substructure hardening of polycrystalline niobium. V.M.Netesov, L.A.Chirkina, V.S.Okovits.

Fiz. Met. & Metalloved. (USSR), vol.56, no.2, p.401-3 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

High-purity niobium was annealed for 16 h in vacuum at 1150°C. It was then subjected to various rolling and annealing treatments. The dislocation structure was studied by determining the amplitude dependence of the internal friction and the mechanical properties were measured by stretching a sample. The results indicated that a considerable increase in the yield stress could be induced in the as-prepared and previously deformed (by 5%) niobium. The increase was 40 and 100%, respectively, and it was produced by annealing in an elastically stressed state at temperatures below the dislocation recovery stage. Formation of additional boundaries from dislocations was the main hardening mechanism. (6 refs.) A.T.

115210 Effect of cold rolling on the magnetic properties of nonoriented silicon steel. B.H.Hahn, I.S.Park, J.S.Woo.

J. Korean Inst. Met., vol.21, no.6, p.541-7 (June 1983). In Korean.

The effect of cold rolling on the magnetic properties of a nonoriented electrical steel sheet containing 3% silicon was examined by the observation of microstructure and texture analysis. The grain size of each was a maximum when the reduction rate of the second cold rolling was 5% and it gradually reduced as the rate increased. It was thought that grain growth of the second cold rolled specimen occurred by random, abnormal grain growth. In view of the texture of the final product, specimens processed by single cold rolling method had (222) texture, which is unfavorable to magnetic properties, but the ones processed by double cold rolling method had nearly random texture. A specimen subjected to the second cold reduction of 5% thus had the minimum iron-cold loss. (10 refs.)

115211 The use of microscopic and hardness measurement methods in recrystallization studies. C.M.Kamma (Dept. of Mech. Engng., Univ. of Lagos, Lagos, Nigeria), E.Hornbogen.

Mater. Res. Bull. (USA), vol.18, no.8, p.1027-36 (Aug. 1983).

The use of microscopic and hardness measurement methods as effective experimental techniques for recrystallization studies has been investigated. Consideration was given to the production of different starting-point microstructures of varying Fe₃C-particle dispersion, known to be associated with the complications of recrystallization mechanism of second-phase materials. Each of the investigation methods considered was used to study the various aspects of recrystallization phenomenon (recovery, in-situ-recrystallization, particle-controlled subgrain growth, partial recrystallization, grain growth) and the merits and limitations of application are discussed. (11 refs.)

115212 Recrystallization mechanisms in commercial Al-2Mg alloy.

M.A.Zaidi, T.Sheppard.

Met. Sci. (GB), vol.17, no.5, p.219-28 (May 1983).

The mechanism of nucleation of recrystallization is described for material having either a hot worked substructure or a cold work structure. Experiments have been conducted using low and high voltage transmission electron microscopy including in situ observations in the high voltage microscope. Salt bath experiments have been conducted to confirm the results. It is shown that recrystallization of hot worked structures involves subgrain coalescence followed by boundary migration. In the alloy investigated the dissolution of the β phase was important in creating a dislocation free region. The recrystallization of cold worked structures involves the creation of subgrains about the same size as in the parent hot rolled material, dislocation activity to form a medium angle boundary, and the migration of this boundary to form a high angle boundary and the recrystallization nucleus. (13 refs.)

115213 Effect of strain rate on the resistance of metals to plastic deformation. V.A.Persiyantsev, V.V.Fimin.

Russ. Metall. (GB), no.3, p.123-9 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.143-50 (1982).

In deriving the rate of strain-softening under plastic extension with the aim of a more accurate determination of the relaxation rate A the time function $A = \text{pk}^{\text{p}} \text{t}^{-1}$ was used. For the same alloy, according to the test conditions, this function is governed by the value of t, which defines the degree of 'proximity' of the relaxation process in metals to a visco-elastic process, described by the Maxwell equation: $\sigma = \sigma_0 \exp(-K_p t)$. Investigations into relaxation, creep and extension of 1Kh18N9L steel, described in the present paper, confirm that the generalised, or effective, relative relaxation rate A, is, to a large extent, determined by the type of testing. (12 refs.)

115214 Derivation of the through-hardenableity of steels in a fluidised bed. N.N.Varygin, T.V.Merenkova, L.N.Muchkin, O.N.Poddubnaya.

Russ. Metall. (GB), no.3, p.136-8 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.159-61 (1982).

The hardenableity of steels in a fluidised bed depends on the structure of the bed, its temperature and the conditions of fluidisation. Through-hardenableity for 'thin' bodies in a fluidised bed can be predicted by calculation to a sufficient degree of accuracy by using the regular process method. (9 refs.)

115215 Recovery behavior of hydrogen charged 7075-T6 aluminum. M.Mueller, I.M.Bernstein, A.W.Thompson (Dept. of Metall. & Materials Sci., Carnegie-Mellon Univ., Pittsburgh, PA, USA).

Ser. Metall. (USA), vol.17, no.8, p.1039-42 (Aug. 1983).

An investigation was carried out on the recovery behavior of 7075-T6 Al alloy. The ductility decrease observed for specimens tested in laboratory air at slow strain rates is likely due to hydrogen embrittlement by moist air since it does not occur if tests are conducted in vacuum or dried air. Recovery of ductility below a certain strain rate is not influenced by testing in a low pressure hydrogen environment. It is suggested that recovery is due to internal rearrangement of hydrogen at Cr-rich inclusions and at rather large particles, like η and T-phase precipitates in 7075-T6 and 7075-T73 alloys, both of which act as innocuous traps. This behavior should only be evident when testing under conditions of fixed and moderate hydrogen content. The difference in recovery behavior between the tempers UT, T6, T73 observed earlier is attributed to the presence and the size of η and T-particles which reduce by different amounts the hydrogen available to embrittle the material. (21 refs.)

115216 Influence of the degree of preliminary strain on the strain aging of pearlitic casing steel. V.A.Yukanov, S.I.Arkhangel'skii, A.A.Astaf'ev, S.I.Markov (Central Sci.-Res. Inst. for Machine Building Technol., Moscow, USSR).

Strength Mater. (USA), vol.14, no.11, p.1540-4 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.97-100 (Nov. 1982). [received: Sept. 1983]

The influence of the degree of preliminary strain on artificial strain aging of 15Kh2NMFA pearlitic casing steel was investigated by the internal friction method in combination with mechanical tests. It is concluded that the amount of hardening of 15Kh2NMFA steel in strain aging in the area of small degrees of preliminary strain (up to 6%) is controlled by dislocation-impurity interaction, while in the area of higher degrees ϵ the primary contribution to strengthening is made by the interaction of dislocations. 115217 Electron microscopic studies on the effect of Sn addition on the ageing characteristics of Al-0.7% Mg₂Si alloy. Gouthama, Kishore (Dept. of Metall., Indian Inst. of Sci., Bangalore, India). *Bull. Mater. Sci. (India)*, vol.5, no.1, p.61-70 (March 1983). [received: Sept. 1983]

The effect of trace addition of Sn on the ageing characteristics of Al-0.7% Mg₂Si has been studied by hardness measurements and transmission electron microscopy. The changes observed in the microstructural features have been explained on the basis of the strong interaction existing between Sn atoms and quenched-in vacancies. At aging temperatures below 200°C Sn addition brings about a retardation in the kinetics of GP zone growth whereas at higher ageing temperatures, it aided the precipitate nucleation and growth. The hardness data agree well with the deductions based on observations made on the thin foils. (10 refs.)

115218 Relationship between grain boundary segregation and heat-treatment parameters in an aluminium alloy. F.Pavlyak (Phys. Inst. of Tech. Univ., Budapest, Hungary), T.Churbakova. *J. Mater. Sci. Lett. (GB)*, vol.2, no.9, p.485-9 (Sept. 1983).

The authors investigated oxygen, iron and other dopants segregation on grain boundaries in cast Al-Mg-Si alloy. It was found that the quantity of the inhomogeneities in the grain boundaries decreased with increase of heat duration. Iron and manganese segregation was practically eliminated using a 3 h heat treatment. (11 refs.)

115219 Towards the analysis of magnetothermoelastic effects in metallic specimens during magnetic treatment. V.I.Dresvyannikov, A.A.Ponikarov, S.N.Postnikov.

Elektron. Obrab. Mater. (USSR), no.3, p.36-9 (1983). In Russian. English translation in: *Electrochem. Ind. Process. & Biol. (GB)*

Using as a basis the macroscopic interaction of thermoelectric and electro-magnetic fields, an analysis is made of the effects accompanying the magnetic treatment of metals in a range of weak (with strength up to 10^6 A/m) pulsed magnetic fields. The results of numerical calculations show that mechanical stresses produced by the action of electrodynamic forces do not exceed the yield point of the material. However, the instantaneous interaction of stresses in zones with an abrupt instantaneous plane shift of cross-sections facilitates magnetotriaxial substructural strengthening. (11 refs.) *A.J.B.*

115220 Electron microscopic investigation of structural changes caused by annealing of tungsten wires. G.Radnoci, Yu.A.Skakov (Inst. of Tech. Phys., Hungarian Acad. of Sci., Budapest, Hungary).

Fiz. Met. & Metalloved. (USSR), vol.56, no.2, p.315-21 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

Transmission and scanning electron microscopy were used to study thinned sections (foils) and cuts of tungsten wires after deformation and annealing. At the lowest annealing temperatures ($T \geq 1100^\circ\text{C}$) the boundary structure became ordered and dislocations were set in motion producing walls. Below 1700°C there were further changes in the dislocation walls and the diameters of some of the wires increased, but the nature of the fibrous structure was retained. Annealing at 1800 – 2200°C destroyed the fibrous structure producing almost equilibrium grains of 1 – $3 \mu\text{m}$. At higher temperatures a nonuniform grain growth predominated and it produced a structure typical of a nonsagging wire. (19 refs.) *A.T.*

115221 Influence of ageing at room temperature on the changes in volume as a result of tempering of quenched carbon steels. V.A.Korablev, A.P.Shkolenko, A.I.Kabes (Lenin Komsomol Industrial Inst., Tyumen, USSR).

Fiz. Met. & Metalloved. (USSR), vol.56, no.2, p.409-10 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*

The influence of ageing at room temperature on the volume effects during tempering of 35, U8, and U12 quenched steels was investigated. The carbon content of these steels was 0.36, 0.78, and 1.18%, respectively. The steels were subjected to austenization at 850°C and quenching in 20% solution of NaOH. This was followed by cooling in liquid nitrogen and then ageing at room temperature. The volume effects were studied in the range of tempering at temperatures up to 450°C . The results were interpreted in terms of a redistribution of carbon during tempering and formation of aggregates. (4 refs.) *A.T.*

115222 The effects of cooling rate after controlled rolling on the mechanical properties of HSLA line pipe steels. Tai-Ung Kim, Jae-Eun Kim, Young-Gil Kim.

J. Korean Inst. Met., vol.21, no.2, p.98-104 (Feb. 1983). In Korean. [received: Sept. 1983]

The effects of cooling rates after controlled rolling (CR) on the mechanical properties were investigated for the Mo-Ni-Nb-V type HSLA line pipe steels. The accelerated cooling was carried out after CR in the temperature range from 800°C to 600°C followed by air cooling. Cooling methods employed were air cooling ($1.3^\circ\text{C}/\text{sec}$), compressed air cooling ($4.1^\circ\text{C}/\text{S}$), oil quenching ($9.5^\circ\text{C}/\text{S}$) and water spray cooling ($13.6^\circ\text{C}/\text{S}$). It was found from this work that controlled rolled 0.3%Mo-0.3%Ni type steel exhibited 40% yield strength increments by water spray cooling, while impact energy was not changed greatly. For the conventionally rolled boron containing steel, impact energy at -20°C was increased from about 3 to 17 Kgf.m under water spray cooled condition. (11 refs.)

115223 The effect of hydrogen on reversible and irreversible softening of spheroidized steel. S.X.Xie (Beijing Inst. of Aeronautics & Astronautics, Beijing, China), J.P.Hirth.

Mater. Sci. & Eng. (Switzerland), vol.60, no.3, p.207-12 (Sept. 1983).

Spheroidized AISI 1090 steel was charged with hydrogen at various charging current densities. The effect of hydrogen on the steel was detected by micro-hardness measurements. The charging produced reversible softening below a critical charging current density and irreversible softening above it. The results are discussed in connection with other indications of a critical charging current density and possible mechanisms for softening. (25 refs.)

115224 Microstructural stability of γ' strengthened Co-Cr-Ti alloys. N.-G.Ingesten, R.Warren, M.Dahlen (Dept. of Engng. Metals, Chalmers Univ. of Technol., Goteborg, Sweden).

Met. Sci. (GB), vol.17, no.4, p.159-66 (April 1983). [received: Sept. 1983]

A study has been made of the microstructural stability of various Co-Cr-Ti alloys. The alloy Co-16Cr-5Ti, when solution treated and cooled, forms a microstructure consisting of a homogeneous precipitation of Co_3Ti (γ') particles in an FCC (γ) matrix. This structure remains relatively stable during heat treatment between 600 and 800°C . The addition of 3% Mo to the

alloy causes transformation of the structure in this temperature range both by an FCC—HCP transformation and by discontinuous reprecipitation. The kinetics of these transformations are reported. The addition of 11%Ni to the Mo containing alloy suppresses the FCC—HCP transformation but not the discontinuous transformation. The FCC—HCP transformation, though martensitic in appearance, exhibits thermally activated kinetics. Possible explanations for this are discussed and possible reasons for the enhancement of the discontinuous transformation by Mo are also examined. (19 refs.)

115225 Tempering of cast nickel-aluminium bronze. F.Hasan, G.W.Lorimer, N.Ridley (Dept. of Metall., Univ. of Manchester, Manchester, England).

Met. Sci. (GB), vol.17, no.6, p.289-95 (June 1983).

Microstructural changes associated with the tempering at 675°C of cast nickel-aluminium bronze, of nominal composition (wt.%) Cu-10Al-5Ni-5Fe, have been investigated using optical, electron optical, and microprobe analysis techniques. The tempering treatment resulted in the elimination of the nonequilibrium martensitic phase (retained β), precipitation with the α grains and a coarsening of the as-cast structure. On heating to 675°C the martensite phase, which contained a high density of NiAl precipitates, reconstituted to form the high temperature BCC β phase and, after extended times at 675°C , this phase progressively decomposed into NiAl and α . The precipitates which formed in α grains were based on NiAl and had the B2 structure. These precipitates nucleated as laths either in the α matrix or on the pre-existing particles of Fe_3Al ; the two morphologies exhibited the Kurdjumov-Sachs and the Nishiyama-Wasserman orientation relationships, respectively, with α . (9 refs.)

115226 Phase composition of aluminium alloys Al-Mn-Li. L.V.Tarasenko, N.I.Turkina, G.N.Matveyeva.

Russ. Metall. (GB), no.3, p.185-9 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.207-11 (1982).

The phase composition and structure of alloys Al-(1.3-1.5)% Mn-(2.5-2.9)% Li after casting and homogenisation, as well as after hardening and ageing of various semis, hot extruded strip, hot and cold rolled sheets was studied. Al-Mn-Li alloys are susceptible to the formation of a non-equilibrium manganese intermetallic (Al,Mn) similar to the alloys of the Al-Mn and Al-Cr-Mn systems. After hardening and ageing the Al-Mn-Li alloys with 2.9% Li contain Al_3Li and AlLi phases in addition of MnAl_6 . Due to a thermal treatment in air a mixture of oxides Li_2O and LiAlO_2 is formed on the cold rolled sheets which decreases the tensile strength in comparison with hot rolled sheets. After hardening and ageing of the hot extruded strip it has higher strength due to the effect of working than sheets in which this phenomenon was not observed. (6 refs.)

115227 The mechanical properties and structure of Ti-Al-Zr-Mo alloys.

L.A.Ryabtsev, O.B.Tarasova.

Russ. Metall. (GB), no.3, p.195-8 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.220-3 (1982).

The mechanical properties, at room and elevated temperatures, of Ti-Al-Zr-Mo alloys with a high aluminium (7 wt.%) and zirconium (1 wt.%) contents were studied as functions of the molybdenum content (from 0 to 5%) and of the heat treatment process (annealing and quenching). Introduction of molybdenum into the Ti-7Al-12Zr alloys, up to a content of 3%, increases the ultimate strength at room temperature from 950 to 1200 and the yield limit from 900 to 1150 Mpa (after annealing at 800°C for 1 h and air cooling). Further additions of molybdenum does not bring about an increase in the strength properties of annealed alloys. Over the same range, the ductility properties decrease continuously. The strongest tendency towards an increased strength as a result of quenching is exhibited by an alloy with 5% Mo, the ultimate strength of which reaches 1450 MPa. (4 refs.)

115228 Structure of molybdenum high speed steels after atomization and annealing. A.N.Popandopulo, G.E.Titenskaya (Tulachermest Sci. Production Assoc., USSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.22, no.1, p.69-73 (Jan. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.1, p.77-82 (Jan. 1983). [received: Aug. 1983]

A study was made of the structures and phase compositions of powdered M6F1, M6K8F1, M10F1, and M10F3 molybdenum high-speed steels after atomization and annealing (cooling in a hydrogen stream). Powders were produced by atomization with nitrogen. Annealing was performed for 2 h at 850°C ; the rate of cooling was varied in the range 30 – $50^\circ\text{C}/\text{h}$. Unfractionated powder particles ranging in size from 10 to $600 \mu\text{m}$ were used for investigation. The predominant particle size lay in the range 200 – $250 \mu\text{m}$. The microstructures and phase compositions of the powders were studied in the as-atomized condition and after annealing. X-ray photography of the powders was performed using Fe K_α radiation, with a URS-501M diffractometer. (12 refs.)

115229 Possibility of predicting hardening cracks. V.S.Morganyuk, N.I.Kobasko, V.K.Kharchenko (Inst. of Strength Problems, Acad. of Sci., Kiev, Ukrainian SSR).

Strength Mater. (USA), vol.14, no.9, p.1233-8 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.63-8 (Sept. 1982).

The authors develop a procedure of strength calculation for engineering components during hardening taking account of phenomena accompanying steel structural transformations. (6 refs.)

115230 Quenching investigations on BCC transition metals. M.Tietze (Max-Planck-Inst. fur Metall., Stuttgart, Germany), S.Takaki, I.A.Schwirtlich, H.Schultz.

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.265-7

New observations based on the superfluid helium quenching technique and resistivity measurements are reported for Ta and Ta+C and Ta+C. The results are compared with similar experiments on other BCC metals. (19 refs.)

115231 Quenching secondary defects in austenitic steels containing phosphorus. M.Kikuchi, T.Arai, Y.Yamamoto, H.Takashima, R.Tanaka (Dept. of Metall. Engng., Tokyo Inst. of Technol., Tokyo, Japan).

Point Defects and Defect Interactions in Metals. Proceedings of the Yamada Conference V, Kyoto, Japan, 16-20 Nov. 1981 (Amsterdam, Netherlands: North-Holland 1982), p.733-5

A certain amount of metallic alloying element, such as aluminum, titanium, vanadium, manganese or chromium, need to be added for the formation of quenching secondary defects in a 32 wt pct Ni–0.3 wt pct P austenitic steel. This observation reveals that the metallic alloying element as well as phosphorus plays a significant role in the dislocation loop formation. Direct and interrupted quenching, and two-step and three-step aging including up- and down-quenching were performed in the temperature range between 400 and 900°C , using a 28 wt pct Ni–25 wt pct Cr–2 wt pct Mo–0.3 wt pct P austenitic steel. The latter experiment strongly suggests that the mobility of

the vacancy in this austenitic steel is greatly reduced by forming vacancy-phosphorus-chromium atom complexes. (9 refs.)

115232 Thermal stresses and viscoelastic relaxation in metallic glasses prepared by liquid quenching. A.R.Yavari, P.Desre (Lab. de Thermodynamique & Phys.-Chimie Metall. ENSEEG, Domaine Univ., Saint Martin d'Heres, France).

J. Mater. Sci. Lett. (GB), vol.2, no.9, p.516-18 (Sept. 1983).

The authors' analysis of experimental data has shown that viscoelastic relaxation (transient creep) similar to that produced by a tensile stress is produced by thermal stresses inherent in the quenching process. (8 refs.)

115233 Elastic constants of fiber-reinforced boron-aluminum: observation and theory. S.K.Datta (Dept. of Mech. Engng., Univ. of Colorado, Boulder, CO, USA), H.M.Ledbetter.

Int. J. Solids & Struct. (GB), vol.19, no.10, p.885-94 (1983).

Elastic constants, both the C_{ij} 's and S_{ij} 's, were measured and calculated for a laminated, uniaxially fiber-reinforced boron-aluminum composite. Three theoretical models were considered: square-array, hexagonal-array, and random-distribution. By combining several existing theoretical studies on randomly distributed fibers, the authors derived relationships for predicting the full set of elastic constants for this model. The random-distribution model agrees best with observation, especially for off-diagonal elastic constants. Considering all nine elastic constants, observation and theory differ on the average by 6%. These discrepancies arise from three sources: experimental error propagation, limited applicability of a transverse-isotropic model to a laminated composite, and elastic anisotropy of boron fibers. (16 refs.)

115234 Dependence of the elastomechanical properties of granular corundum-zirconium refractory materials on their microstructure. I.G.Orlova, A.I.Gudilina (Ukrainian Sci.-Res. Inst. of Refractory Materials, Ukrainian SSR).

Inorg. Mater. (USA), vol.18, no.9, p.1356-8 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1583-5 (Sept. 1982). [received: Sept. 1983]

The effect of the microstructure of granular corundum-zirconium refractory materials on the elastomechanical properties was studied. The dependence of the tensile strength on the degree of heterogeneity, characterizing the heterogeneity of the material with a maximum with values of $\sim(20-40\%)$ and a decrease in the effective energy of decomposition with an increase in the degree of heterogeneity, was determined. It was found that the tensile strength on bending should be maximally increased while the value of the modulus of normal elasticity should remain unchanged for increasing the overall resistance to decomposition for granular multiphase and microfissured materials. (5 refs.)

115235 Local acoustoelasticity in poly(methyl methacrylate) by Brillouin scattering. B.C.Yap, S.Hichijyo, T.Takemura (Dept. of Appl. Sci., Kyushu Univ., Fukuoka, Japan), K.Matsushige.

J. Appl. Phys. (USA), vol.54, no.9, p.5456-8 (Sept. 1983).

The Brillouin scattering technique was used to study the local mechanical deformation of poly(methyl methacrylate) (PMMA). The extent of local stress concentration could be determined by measuring longitudinal hypersonic velocities in the close vicinity of a circular hole and a sharp single-edge-notch (SEN) in panel PMMA specimens under uniaxial tensile stress. Craze formation in PMMA is also briefly discussed in association with such a local deformation. Present studies demonstrate that the Brillouin scattering technique is a new and effective probe for such an investigation in transparent materials. (6 refs.)

115236 On the measurement of Young's modulus of tubes by propagation of longitudinal waves. F.Povolo (Dto. de Materiales, CNEA, Buenos Aires, Argentina), R.F.Bolmaro.

J. Nucl. Mater. (Netherlands), vol.116, no.2-3, p.166-71 (June 1983).

The equation that describes the propagation of elastic waves has been solved numerically for longitudinal vibrations of tubes and the results are used to calculate Young's modulus for Zircaloy-4 fuel sheathings. The values are compared with the results obtained by using the approximate equations proposed in the literature. The differences observed are less than 0.5% for the fundamental frequency. For the harmonics, however, the numerical solution leads to resonant frequencies that are within 1% of the experimental values and the approximate equations give errors higher than 10%. (15 refs.)

115237 Poisson's ratio in zirconium single crystals. F.Povolo (Comision Nacional de Energia Atomica, Buenos Aires, Argentina), R.E.Bolmaro.

J. Nucl. Mater. (Netherlands), vol.118, no.1, p.78-82 (Aug. 1983).

Poisson's ratio for α -Zr monocrystals has been shown to be strongly dependent on texture and temperature. These data have been compared with results reported for dilute zirconium alloys and several inconsistencies have been pointed out. (9 refs.)

115238 Ab initio calculation of polyethylene deformation including electron correlation effects. S.Suhai (Lehrstuhl fur Theoretische Chem., Friedrich-Alexander-Univ. Erlangen-Nurnberg, Erlangen, Germany).

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.8, p.1341-6 (Aug. 1983).

The longitudinal acoustic elastic modulus of polyethylene has been calculated with the aid of the ab initio crystal orbital method applying corrections also for electronic correlation effects. The basis set and correlation dependence of the elastic modulus have been investigated. The best theoretical value of 305 GPa of this modulus is in reasonable agreement with the published experimental values. At an elongation of ca. 0.1 the deviation from Hooke's law is found to be substantial. (32 refs.)

115239 Elastic modulus of syntactic foams. L.E.Nielsen.

J. Polym. Sci. Polym. Phys. Ed. (USA), vol.21, no.8, p.1567-8 (Aug. 1983).

A simple method of estimating the shear and Young's moduli of syntactic foams is presented. It is based on the estimation of the apparent modulus of hollow spheres in terms of their inner and outer radii. (5 refs.)

115240 Elastic properties (the stiffness constants, the shear modulus and the dislocation line energy and tension) of Ni-Al solid solutions and of the Nimonic alloy Pe16. H.Pottebohm, G.Neite, E.Nembach (Inst. fur Metallforschung, Univ. Munster, Munster, Germany).

Mater. Sci. & Eng. (Switzerland), vol.60, no.3, p.189-94 (Sept. 1983).

The stiffness constants C_{ik} of the following nickel-base alloys were measured: Ni-Al solid solutions with aluminium contents up to 8 at.%, Nimonic alloy

PE16 and an experimental alloy with the same composition as the matrix of fully precipitated PE16. The temperature range covered is 80-360K. From the stiffnesses C_{ik} a shear modulus and the dislocation line energy and tension are derived. Extrapolation formulae, which describe the temperature and concentration dependences of the elastic parameters are given for the range 0-550K. (19 refs.)

115241 Internal friction study on structural relaxation of a glassy metal $\text{Fe}_{32}\text{Ni}_{36}\text{Cr}_{14}\text{P}_{12}\text{B}_6$. N.Morito (Dept. of Materials Sci. & Engng., Univ. of Pennsylvania, Philadelphia, PA, USA). *Mater. Sci. & Eng. (Switzerland)*, vol.60, no.3, p.261-8 (Sept. 1983). The internal friction of Metglas 2826A ($\text{Fe}_{32}\text{Ni}_{36}\text{Cr}_{14}\text{P}_{12}\text{B}_6$) glassy metal was investigated using a torsion pendulum type of apparatus. The magnitude of the internal friction is reduced by structural relaxation during annealing. It was found that the internal friction reaches, after prolonged annealing, an equilibrium value which depends on temperature. The decay kinetics can be expressed by first-order kinetics with a log-normal distribution of time constants. The activation energy spectrum of the change in the internal friction associated with the structural relaxation of Metglas 2826A alloy was obtained by subtracting the internal friction curve for the fully relaxed material from that for the as-received material. The resulting spectrum has a wide distribution of activation energies from 1.1 to 2.2 eV, with a maximum at about 2.0 eV or higher. (32 refs.)

115242 Strain modulation measurements of stiffening effects in carbon fibers. C.P.Beetz, Jr., G.W.Budd (Phys. Dept., General Motors Res. Labs., Warren, MI, USA). *Rev. Sci. Instrum. (USA)*, vol.54, no.9, p.1222-6 (Sept. 1983). An experimental technique for directly measuring strain-induced stiffening effects in individual carbon fibers has been developed. The technique involves the superposition of a small amplitude oscillating strain ($\Delta\epsilon \sim 10^{-4}$) on a slow linearly increasing strain ($\sim 1.1 \times 10^{-3} \text{ s}^{-1}$). Synchronous detection of the resultant AC component of the measured stress yields a signal proportional to the slope of the stress versus strain curve provided the modulation amplitude is small compared to the ultimate strain at failure (~ 0.005). The experimental arrangement has been designed for use in conjunction with an Instron tensile test apparatus. A novel design for a fiber gripping apparatus which permits direct measurement of the strain is also described. The technique has been applied to carbon fibers produced from two different precursor materials: polyacrylonitrile and mesophase pitch. Fibers from both precursors exhibited strain-induced stiffening. The modulus of the pitch-based fibers increased in proportion to the square root of the strain, whereas that of the PAN-based fibers showed an almost linear increase. (14 refs.)

115243 Fatigue and recovery processes in a multilayer iron-copper composite material. S.L.Revo, V.S.Kopan', V.P.Maiboroda (T.G. Shevchenko Kiev State Univ., Kiev, Ukrainian SSR). *Sov. Powder Metall. & Met. Ceram. (USA)*, vol.22, no.1, p.64-8 (Jan. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.1, p.72-7 (Jan. 1983). [received: Aug. 1983] A study was made of the amplitude-dependent internal friction (ADIF) of a sandwich-type MCM consisting of st. 45 (0.45% C) steel and MI copper layers. The composite was produced by thermomechanical working of a steel-copper pseudoalloy with overall reductions of blanks of 70-90%. It was found that in a composite produced from a pseudoalloy by thermomechanical processing the density of microcracks did not grow with decreasing mean layer thickness. The anisotropy of the ADIF indicated that the directions of climb of edge dislocations and of slip of screw dislocations in the MCM were not equivalent. This circumstance must be taken into account when designing parts which are to be made of such materials, because the mechanical properties of sandwich-type composites are linked directly with the density and distribution of dislocations. (5 refs.)

115244 Effect of static tensile stresses on the dissipative properties of copper-aluminum-zinc alloys. V.V.Matveev, B.S.Chaikovskii, D.E.Shpak, G.Ya.Yaroslavskii, S.Yu.Kondrat'ev (Inst. of Strength of Materials, Acad. of Sci., Kiev, Ukrainian SSR). *Strength Mater. (USA)*, vol.14, no.9, p.1271-5 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.95-8 (Sept. 1982). The authors investigated the effect of static tension on the damping capacity of alloys subjected to flexural vibrations. True vibration decrements were obtained and it was found that the static tensile stresses had a substantial effect on the dissipative properties of the alloys. The degree of this effect was found to depend to a large extent on the chemical composition of the alloy. (11 refs.)

115245 Anisotropy of elastic properties of titanium base α -alloys. R.A.Adamesku, L.P.Andreeva, P.V.Gel'd, E.A.Mityushov, N.D.Reimer (Ural Polytech. Inst., Sverdlovsk, USSR). *Strength Mater. (USA)*, vol.14, no.9, p.1284-7 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.105-8 (Sept. 1982). A method of calculating the anisotropy of the elastic properties in metals and alloys with a close-packed hexagonal structure in which limitations imposed on the type and character of dispersion of the crystallographic structure are absent has been developed and used. The anisotropy of Young's modulus in titanium α -alloys (within a wide range of deformations) is determined primarily by the crystallographic texture. The role of the interaction between the grains is small. To calculate the anisotropy of Young's modulus in titanium α -alloys, information on the texture obtained by plotting 'to the reflection' from the basal planes is sufficient. (8 refs.)

115246 Analysis of process stresses in two-layer SiC-Si disks. A.S.Tsybenko, A.L.Maistrenko, V.N.Kulakovskii, G.G.Gnesin, Yu.P.Dyban', V.L.Yupko (Kiev Polytech. Inst., Acad. of Sci., Kiev, Ukrainian SSR). *Strength Mater. (USA)*, vol.14, no.11, p.1515-18 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.76-9 (Nov. 1982). [received: Sept. 1983] The level of residual process stresses and the reasons for crack formation in SiC-Si two-layer discs are investigated. A mathematical model was constructed for the deformation of a disc with cooling from 700°C to room temperature. The finite element method was used in the calculation. (14 refs.)

115247 Influence of the level of stresses on the static Young's modulus of a number of constructional materials. A.F.Voitenko, Yu.D.Skrinipik, H.G.Solov'eva, G.N.Nadezhdin (Inst. of Strength Problems, Acad. of Sci., Kiev, Ukrainian SSR). *Strength Mater. (USA)*, vol.14, no.11, p.1524-6 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.83-6 (Nov. 1982). [received: Sept. 1983] The results are presented of investigating a number of constructional materials of various classes: the austenitic steel 12Kh18N10T; austenitic steels 03Kh20N16AG6 and 03Kh13AG19; 07Kh16N6 martensitic steel; VT6S titanium alloy; AMtS and AMg6 low strength weldable aluminium alloys. It is concluded that an increase in stresses in a sample to the level at which microplastic deformation occurs leads to a significant reduction in the moduli

of elasticity of the investigated materials. The form and condition of the sample surface plays a definite role in the development of microplastic deformations. (1 ref.)

115248 Polymer-performance on the dimensional stability and the mechanical properties of wood-polymer composites prepared by an electron beam accelerator. T.Handa, I.Seo, T.Ishii, Y.Hashizume (Dept. of Appl. Chem., Sci. Univ. of Tokyo, Tokyo, Japan). Polymer Alloys III Blends, Blocks, Grafts and Interpenetrating Networks. Proceedings of a Symposium, New York, USA, 23-28 Aug. 1981 (New York, USA: Plenum 1983), p.167-90 The state of the art of polymers in wood and their performance were studied for the wood-polymer composites produced by electron beam irradiation. The balance between the enhanced dynamic modulus and the dimensional stability of the products were discussed in relation to the prevention of the formation of fatigue cracks during a long exposure to repeated cycles of humid and dry weather. The particular action of the tight cross-linking bonds in enhancing the mechanical properties as well as the dimensional stability of the products was recognized with regard to the unsaturated polyester WPC. In this regard, an impregnation method in two steps was proposed for producing a polyester WPC fancy veneer with distinguished mechanical properties and dimensional stability. (21 refs.)

115249 Viscoelastic properties of particulate reinforced matrices. C.Migliaresi (Istituto di Principi di Ingegneria Chimica, Univ. di Napoli, Napoli, Italy). Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.357-68 The viscoelastic behavior of both polystyrene and epoxy resin/glass bead composites has been studied by means of stress relaxation experiments over a wide range of temperatures in the linear viscoelastic region. The glass transition temperature of the thermosetting resin is increased because of the presence of the second phase while no effect has been observed for the thermoplastic matrix. According to the time-temperature superposition principle all the stress relaxation data have been shifted to obtain single master curves at a reference filler content by taking into account the reinforcing effect of the filler and the glass transition temperature of the matrix. (17 refs.)

115250 Reinforced polyester structural foam. G.Carignani, M.Mazzola (Tech. Center, SNIAL Resine Poliestere SpA, Roma, Italy). Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.453-68 It is concluded that a composite material consisting of three phase components (resin, gas and continuous or long chopped fibers) has the maximum flexural strength and stiffness with minimum weight. It is possible to calculate at the first approximation the elastic modulus of this kind of composite with the quasi-isotropic laminate theory. With polyester foam reinforced with continuous glass fibers it is possible to obtain at the same time high specific flexural stiffness and strength, as well as v.s. the temperature, high thermal insulation and sound deadening, low thermal expansion, good surface appearance, easy and non toxic foaming and molding technology and low cost. 81.40L Deformation, plasticity and creep

(see also 62.20F Deformation and plasticity, 62.20H Creep)

115251 An inelastic finite element model of 4D carbon-carbon composites. L.Delnestre, B.Perez (Soc. Europeenne de Propulsion, Bordeaux, France). *ALAA J. (USA)*, vol.21, no.8, p.1143-9 (Aug. 1983). Sepcarb 4D is a carbon-carbon composite material wherein the reinforcing fibers are bundled in four directions. It is widely and successfully used in integral solid rocket nozzles. An accurate prediction of the material behaviour is difficult, due to the anisotropy and above all to the nonlinear inelasticity of the composite. An elastoplastic finite element model, including homogenized monaxial stiffnesses, is presented. A consistent set of constitutive constants is obtained from test data. The adequacy of the model is demonstrated through comparisons between predicted and measured test results of Sepcarb 4D uniaxial specimens and rings. Results showing the significant influence of the orientation of the 4D reinforcements relative to the applied load are discussed. The model can be extended to an increased number of directional composites and offers new possibilities in the stress analysis of such materials. (8 refs.)

115252 Process of α -relaxation in dense network epoxide polymers obtained under deformation conditions. Yu.K.Glotova, T.I.Ponomareva, V.G.Sheinberg, V.I.Irzhak, B.A.Rozenberg. *Vysokomol. Soedin. Ser. B (USSR)*, vol.25, no.6, p.407-9 (1983). In Russian. A conclusion arrived at from previous work, according to which the deformation of the matrix under the action of the filler is the decisive factor in determining the changes occurring in the structure and properties of dense

network epoxide polymers is studied in more detail, with deformation of the polymer matrix during synthesis by two methods, i.e. direct deformation by bending a polymer plate formed on a metal base, and relaxation of an inclusion previously deformed to a given extent during synthesis of the epoxide polymer matrix. It is suggested that the main factor involved in the relaxation process is chemical flow of the polymer, as was concluded previously in studying the effect of deformation on the structure of a formed cross-linked polymer (see V.I. Irzhak et al., Dok. Akad. Nauk, SSSR, vol.239, no.4, p.876, 1978). (4 refs.) N.S.

115253 Influence of stress cycling on creep behaviour of an Al-Mg alloys under strain ageing conditions. A.G.V.Vladimirova, G.A.Malygin, V.A.Stepanov (A.F. Ioffe Phys.-Tech. Inst., Acad. of Sci., Leningrad, USSR). *Res. Mech. (GB)*, vol.9, no.2, p.65-71 (1983). Low-frequency cyclic loading of Al-0.55 at.%Mg alloy at room temperature with a constant stress amplitude leads to creep rate acceleration due to breakaway of dislocations blocked by impurity atmospheres. (8 refs.)

115254 Steady state and transient creep of Al at 400K—an analysis in terms of recovery controlled by thermally activated glide. W.Blum, H.Schmidt (Inst. für Werkstoffwissenschaften, Friedrich-Alexander-Univ. Erlangen-Nürnberg, Erlangen, Germany). *Res. Mech. (GB)*, vol.9, no.2, p.105-24 (1983). Creep of pure Al has been investigated at 400K. The steady state creep rate $\dot{\epsilon}_s$ (determined by an extrapolation procedure in order to compensate for the effect of necking) varies exponentially with stress σ . In the transient creep range following a stress reduction, the creep rate $\dot{\epsilon}$ goes through a maximum followed by a minimum. This transient is only weakly influenced by static recovery (annealing at test temperature and negligible stress) preceding the transient. The results are interpreted in terms of a model of creep (knitting model) in which recovery is controlled by thermally activated glide of dislocations through subgrain boundaries. The model gives a quantitative description of $\dot{\epsilon}_s(\sigma)$ and correctly predicts the range in which $\dot{\epsilon}$ varies after stress reduction. (18 refs.)

115255 On the mixture rule for strength of fibre reinforced cements. V.Laws (Building Res. Establ., Watford, England). *J. Mater. Sci. Lett. (GB)*, vol.2, no.9, p.527-31 (Sept. 1983). The author suggests how a relationship between bending strength and fibre volume fraction having the appearance of a mixture law can arise although the tensile strength/volume fibre fraction relationship depends on the fibre contribution alone. (11 refs.)

115256 The effect of fast neutron irradiation on the compressive stress-strain relationships of graphite. M.Birch (Springfields Nuclear Power Dev. Labs., UKAEA, Preston, England), D.J.Bacon. *Carbon (GB)*, vol.21, no.5, p.491-6 (1983). A study of the effects of fast neutron irradiation on the mechanical properties of polycrystalline graphite is reported. Irradiation to a maximum dose of 1.14×10^{19} n/cm² at $\sim 50^\circ\text{C}$ increased the Young's modulus by 140%. The linearity of the compressive stress-strain curve increased and the hysteresis losses decreased. The fracture stress doubled, whilst the fracture strain decreased by $\sim 24\%$. Measurements of the total energy absorbed in compression indicated an average increase in the energy required for failure after irradiation. A constant elastic strain to failure criterion was found to be applicable for these irradiation conditions. Upon subsequent thermal annealing the Young's modulus decreased and had almost reached its unirradiated value by 400°C . The fracture stress also decreased towards its unirradiated value and the hysteresis losses increased. (3 refs.)

115257 Influence of substructure on the mechanical properties of austenitic alloys deformed by warm rolling. V.I.Izotov, Yu.G.Virakhovskii, S.Ya.Marusenko (Inst. of Metall. & Phys. of Metals, Moscow, USSR). *Fiz. Met. & Metalloved. (USSR)*, vol.56, no.2, p.372-8 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. An investigation was made of the relationship between the substructure and mechanical properties of some austenitic iron alloys differing in respect of the amount of carbon and of carbide-forming elements, as well as in respect of the stacking fault energies. These alloys were subjected to warm rolling. The maximum value of the yield stress after this treatment was achieved for an alloy with a low stacking fault energy because of a high density of thin twins which were formed in this case. (9 refs.) A.T.

115258 Finite plastic strain in annealed mild steel during proportional and non-proportional loading. J.F.Bell (Dept. of Mech., Johns Hopkins Univ., Baltimore, MD, USA). *Int. J. Solids & Struct. (GB)*, vol.19, no.10, p.857-72 (1983). Proportional and non-proportional loading experiments show that the finite strain plastic response of annealed mild steel between the termination of the initial yield and the termination of the ultimate stress closely follows the predictions of an incremental theory of finite plastic strain for which stress and strain components are referred to the original, undeformed reference configuration. Experimental studies of the initial yield domain in terms of dead weight loading of mild steel have shown that the initiation and termination of this region also may be described in terms of the same parabolic generalization. Finally, for annealed mild steel in dead weight loading, the generalized stress at failure is shown to occur on a common von Mises loading surface. (11 refs.)

115259 Elongation minimum and strain rate sensitivity minimum of zircaloy-4. S.I.Hong, W.S.Ryu, C.S.Rim (Div. of Nuclear Fuel Design, Korea Advanced Energy Res. Inst., Chaong-Nam, Korea). *J. Nucl. Mater. (Netherlands)*, vol.116, no.2-3, p.314-16 (June 1983). Annealed Zircaloy sheets were used in experiments to identify the elongation minimum and strain rate sensitivity minimum. The results imply that the elongation minimum is not associated with brittle fracture and that it can be explained in terms of the strain rate sensitivity. (13 refs.)

115260 Plastic deformation of spherical steel shells under internal blast loading. L.N.Aleksandrov, A.G.Ivanov, V.N.Mineev, V.I.Tsyupkin, A.T.Shitov. *J. Appl. Mech. & Tech. Phys. (USA)*, vol.23, no.6, p.831-5 (Nov.-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR)*, vol.23, no.6, p.103-8 (Nov.-Dec. 1982). [received: Sept. 1983] The authors present computational and experimental results of research directed toward finding the laws of behaviour of spherical shells of various thicknesses in the region of plastic deformation (up to rupture) under a single internal blast loading. The results show that a simple physical model gives a satisfactory analytic description of the parameters of plastic deformation spherical shells of mild steel under internal symmetric loading by the explosion of a charge of TH 5050. (16 refs.)

115261 Study of molecular deformation mechanisms in the glassy state. I. Temperature effect on stress-birefringence and strain-birefringence responses of poly(methyl methacrylate). S.D.Hong, S.Y.Chung, R.F.Fedors, J.Moacanin (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA). *J. Polym. Sci. Polym. Phys. Ed. (USA)*, vol.21, no.9, p.1647-60 (Sept. 1983). In order to gain better understanding of the molecular deformation processes occurring in poly(methyl methacrylate), a series of studies was carried out in uniaxial tension on the simultaneous stress and birefringence response in both constant-strain-rate and stress relaxation-experiments. The former covered the temperature range -120 to 75°C and the latter 0 to 90°C . Three deformation mechanisms, i.e. (i) change in intermolecular distance, (ii) distortion of the conformation of the COOCH_3 group from its thermal equilibrium state, and (iii) orientation of main-chain segments, are invoked to interpret the experimental results. It is concluded that, in the temperature range from -120 to 75°C and possibly at higher temperatures as well, the polymer chains deform in the small-strain region by an orientation of those chain segments having lower potential-energy barriers to conformational changes and straining those chain segments having higher potential-energy barriers. Subsequent chain orientation of the already strained segments occur in the higher strain regions. (21 refs.)

115262 Rheo-optical studies on the deformation mechanism of semicrystalline polymers. XIV. Alpha and beta mechanical dispersions of spherulitic high-density polyethylene and the dynamic orientation distribution function of crystallites. K.Fujita, H.Niwa, S.Nomura, H.Kawai (Dept. of Polymer Chem., Faculty of Engng., Kyoto Univ., Kyoto, Japan). *J. Polym. Sci. Polym. Phys. Ed. (USA)*, vol.21, no.9, p.1713-43 (Sept. 1983). The dynamic tensile deformation mechanism of spherulitic high-density polyethylene was investigated by dynamic X-ray diffraction at various temperatures and frequencies in order to assign the α and β mechanical dispersions explicitly. The uniaxial orientation distribution function $g(\xi, 0)$ of the j th crystal plane and its dynamic response $\Delta g(\xi, 0)$ in phase with dynamic strain were observed for the (110), (200), (210) and (020) crystal planes. Then the orientation distribution function $w(\xi, 0, \eta)$ of crystallites (crystal grains) and its dynamic response $\Delta w(\xi, 0, \eta)$, also in phase with the dynamic strain, were determined by a mathematical transformation procedure proposed by Roe and Krigbaum on the basis of the Legendre addition theorem. The temperature and frequency dependences of $\Delta w(\xi, 0, \eta)$, were analyzed in terms of the model parameters for dynamic spherulite deformation, combining affine orientation of crystal lamellae with several types of preferential reorientation of the crystal grains within the orienting lamellae. (44 refs.)

115263 Coble and Harper-Dorn creep in iron at homologous temperatures T/T_m of 0.40-0.54. J.Fiala, J.Novotny, J.Cadek (Inst. of Phys. Metall., Czechoslovak Acad. of Sci., Brno, Czechoslovakia). *Mater. Sci. & Eng. (Switzerland)*, vol.60, no.3, p.195-206 (Sept. 1983). The creep of high purity iron at low stresses (0.1-3.5 MPa) was investigated over a homologous temperature range T/T_m of 0.40-0.54 (where T is the temperature under consideration and T_m is the temperature of the melting point) using the helicoid specimen technique; the mean intercept grain size ranged from 82 to 478 μm . The results obtained enabled the most probable dominant deformation mechanism to be identified as Coble creep (1963) for intercept grain sizes smaller than about 123 μm and Harper-Dorn creep (1957) for intercept grain sizes greater than 123 μm . Coble creep in α -Fe was found to be characterized by Bingham behaviour. The threshold stress increases exponentially with decreasing temperature but does not depend on the mean intercept grain size. Under the experimental conditions considered, Harper-Dorn creep is most probably dislocation core diffusion controlled. It was found that for Harper-Dorn creep in α -Fe there is a threshold stress which increases exponentially with decreasing temperature and does not depend on the mean intercept grain size. (29 refs.)

115264 Properties of two high strength, high temperature, high conductivity copper-base alloys. A.K.Lee, N.J.Grant (Dept. of Materials Sci. & Engng., MIT, Cambridge, MA, USA). *Mater. Sci. & Eng. (Switzerland)*, vol.60, no.3, p.213-23 (Sept. 1983). The properties of two high strength, high temperature, high conductivity ingot-based copper alloys were examined in detail. These are the Cu-0.66 wt.% Mg-0.63 wt.% Cr-0.13 wt.% Zr (M2C) and the Cu-4.94 wt.% Ni-2.40 wt.% Ti materials produced as wrought ingot-based alloys. Tensile tests at 293K and stress rupture tests at 673K were performed. An oxide-dispersed Cu-Zr-Cr alloy produced from fine atomized powders has the same stress rupture properties at 673K as the fully heat-treated wrought M2C alloy, and both are stronger than the wrought Cu-Ni-Ti alloy. The effects of short-time (1 h) annealing to 1223K were examined with the interesting observation that the Cu-Ni-Ti alloy, after loss of hardness due to overaging in the temperature interval 673-1073K, rehardens on heating above 1073K and then cooling, by a resolution and aging process. Combining water quenching from the temperature range 1138-1223K with reaging at 848-873K permitted recovery of the original fully heat-treated room temperature strength and hardness properties to full strength and hardness. (28 refs.)

115265 Work-hardening rates during the high temperature creep of aluminium determined from the instantaneous strain on sudden stress changes. H.Oikawa, M.Nakata, S.Karashima (Dept. of Materials Sci., Tohoku Univ., Sendai, Japan). *Mater. Sci. & Eng. (Switzerland)*, vol.60, no.3, p.247-53 (Sept. 1983). The work-hardening rates during the creep of polycrystalline aluminium were determined from instantaneous plastic strains in stress change tests in the temperature range 455-650K under stresses for which the steady state creep rates lie within the range 5×10^{-7} to $2 \times 10^{-5} \text{ s}^{-1}$. The true work-hardening rates h were estimated by extrapolating the apparent values which were determined from the instantaneous plastic strains occurring during about 0.2 s after the stress increases ranging from 0.1 to 1 MPa. The values of h are of the order of Young's modulus and depend markedly on temperature and stress. The need not only to improve the existing theories of recovery creep but also to extend the present fine structure observations is suggested. (21 refs.)

115266 Role of eutectoid transformation and grain size on the creep behaviour of mild steel. M.R.Nagy, M.M.El-Sayed, A.A.Mohamed (Phys. Dept., Ain Shams Univ., Cairo, Egypt). *Mater. Sci. & Eng. (Switzerland)*, vol.60, no.3, p.113-16 (Sept. 1983). Creep curves were obtained under a constant applied stress σ of 68.7 MN m^{-2} (7 kgf mm^{-2}) for mild steel samples with various grain sizes tested at temperatures between 660 and 750°C (the eutectoid temperature, 723°C , falls into this temperature range). The creep rate showed a maximum at 710°C (i.e. near the eutectoid point) and the peak creep rate increased with increasing grain diameter. This peak was attributed to coarsening and/or dissolution of iron carbide in the vicinity of the eutectoid point. The activation energy for steady state creep in the vicinity of the peak was $268 \pm 4 \text{ kJ mol}^{-1}$. This activation energy was attributed to the decomposition of pearlite. (16 refs.)

115267 Large strain plastic deformation of commercially pure nickel. W.H.Zimmer, S.S.Hecker, D.L.Rohr (Univ. of California/Los Alamos Nat. Lab., Los Alamos, NM, USA), L.E.Murr.

Met. Sci. (GB), vol.17, no.4, p.198-206 (April 1983). [received: Sept. 1983]
Commercially pure nickel was deformed to very large strains by cold rolling. Tensile tests on prestrained sheet were used to establish strain hardening behaviour and residual ductility. The hardening of nickel was found to be peculiar: initial rapid hardening was followed by an apparent plateau, which, in turn, was followed by another stage of rapid hardening at strains larger than 4. The residual elongation dropped precipitously with initial prestrain, levelled off, and then increased again during the final stage of hardening. Nickel rolled to a strain of 6.1 exhibited a remarkable tensile strength of 1400 MN m⁻² with 4% total elongation. Extensive in-plane and limited edge-on transmission electron microscopy was used to examine the evolution of substructure. Dislocation cells formed at strains <0.10 and continued to refine in size with increasing strain. Definite evidence of dynamic recovery was found. The formation of elongated, well defined subgrains appears to coincide with a saturation of hardening in the plateau region. The hardening transition may be caused by the reemergence of original grain boundaries as important structural features at very large strains. (14 refs.)

115268 Luder's strain and ductility of ordered Fe-Co-2V and Fe-Co-V-Ni. C.D.Pitt, R.D.Rawlings (Dept. of Metall. & Materials Sci., Imperial Coll. of Sci. & Technol., London, England).

Met. Sci. (GB), vol.17, no.6, p.261-6 (June 1983).
The effect of thermomechanical treatment on tensile properties has been measured in ordered Fe-Co-2V and Fe-Co-V-Ni alloys containing up to 7.4 wt.% Ni. The aim was to determine the microstructural features affecting the Luder's strain and ductility of these alloys. The dominant microstructural feature was found to be the grain or subgrain size, which was determined by the volume fraction of γ phase present. The extent of the Luder's strain decreased with increasing grain size but the ternary and quaternary alloys showed different grain size dependences. The ductility of all the alloys was proportional to $d^{-1/2}$, where d is the grain, subgrain, or deformation cell size. (19 refs.)

115269 Effects of V and Nb additions on high temperature deformation properties of low alloy martensites. Y.Ohmori, T.Kunitake (Central Res. Labs., Sumitomo Metal Industries Ltd., Amagasaki, Japan).

Met. Sci. (GB), vol.17, no.6, p.267-75 (June 1983).
The effects of microalloying elements such as V and Nb on the high temperature deformation properties of low alloy martensites have been investigated by means of slow strain rate tensile tests at various temperatures. It was confirmed that the precipitations of fine carbonitrides, such as V(C,N) and NbC, are quite effective in reducing the high temperature ductilities. In particular, it has been concluded that the most detrimental effects on ductility arise from the dynamic trapping of the mobile dislocations generated at prior austenite grain boundaries by the simultaneous precipitation of V(C,N) or NbC. The cyclic repetition of such a process would result in strain concentration in the vicinity of prior austenite grain boundaries, and microvoids would form at the cementite/matrix interfaces on these boundaries, leading to intergranular ductile fracture. (37 refs.)

115270 Role of molybdenum in sintered steels [tensile properties]. M.Hamiuddin (Chem. Section, Z.H. Coll. of Engng. & Technol., Aligarh, India).

Powder Metall. Int. (Germany), vol.15, no.3, p.147-50 (Aug. 1983).
The role of molybdenum in PM grade steels is reviewed. Additional experiments are carried out with Fe-O, 45P-(0.4 to 0.8)C-(1 to 4) Mo powder premixes which were compacted at 691 MPa pressure into MPF tensile test bars and sintered at 1120°C and 1200°C for 30 min in dry hydrogen. Ultimate tensile and yield strengths, elongation and linear dimensional change after sintering were determined. Strength properties improved with increasing Mo or C contents and increasing sintering temperature. Ductility increased with increasing sintering temperature but decreased with increasing Mo or C content. The results are supported by microstructural and scanning electron fractography studies and explained on the basis of phase stabilization and diffusion data. (24 refs.)

115271 Work hardening and the stability of deformation in AlZnMg alloys. I.Kovacs, J.Lendvai, T.Ungar, Z.Rajkovits (Inst. for General Phys., Eotvos Univ., Budapest, Hungary).

Philos. Mag. A (GB), vol.48, no.3, p.329-39 (Sept. 1983).
The stress-strain curves of the Al-Zn-Mg alloys investigated consisted of a linear and a parabolic part. The slope of the linear part, unlike that of the parabolic part, was found to be fairly independent of heat treatment, testing temperature and strain rate. The fracture stress of the samples is always smaller than what might be expected on the basis of the classical stability criterion, and this is caused by microcrack formation at grain boundaries. (17 refs.)

115272 The plastic compression of copper cones. M.M.Chaudhri (Cavendish Lab., Univ. of Cambridge, Cambridge, England).

Philos. Mag. A (GB), vol.48, no.3, p.L15-20 (Sept. 1983).
Annealed and unannealed (i.e. work-hardened) cones of included angles in the range 30°-170° of high-conductivity copper have been quasi-statically compressed against a hard transparent surface and their deformation stress measured under load. It was found that for the unannealed cones the deformation stress increased linearly with the cone angle whereas for the annealed cones the deformation stress peaked at a cone angle in the range 60°-90°. The deformation pattern of the cones has also been investigated and found to be quite different in the two types of cone. The deformation stress versus cone angle behaviour has been explained on the mode of deformation of the two types of cone. (10 refs.)

115273 Deformation properties of refractory glass-fiber goods based on mullite-silicate fiber. E.Z.Korol', V.M.Panferov, V.V.Martynenko, E.P.Saenko, A.N.Gaodu, N.V.Pitak (Inst. of Mech., M.V. Lomonosov Moscow State Univ., Moscow, USSR).

Refractories (USA), vol.23, no.11-12, p.594-9 (Nov.-Dec. 1982). Translation of: *Ogneupory (USSR)*, vol.23, no.11, p.41-5 (Nov. 1982).
Studies have been carried out on the deformation characteristics under uniaxial extension and compression of specimens of thermal-insulation refractory glass-fiber tiles type MKRP-340 based on mullite silica fiber in organic binder in the 20-1200°C interval. It was established that the tiles are transversely isotropic, i.e. their mechanical properties remain unchanged with a random rotation relative to the axis perpendicular to the plane of the tile with reflection relative to the plane containing this axis; the anisotropy disappears on heating to 1000-1200°C. It is concluded that the tested tiles can be used as compensation and heat-insulation materials in thermally stressed designs in which compressive stresses are ≤ 0.2 MPa at temperatures up to 1200°C and extension-bend deformation is < 0.005 . The tiles retain their strength when stacked in linings with a curvature > 1.0 m. (4 refs.)

115274 Rheological properties of ShKh15 steel under multistage loading. Polukhin P.I., A.M.Galkin, V.P.Polukhin, S.P.Efimenko, I.M.Gridnev, V.L.Pilyushenko.

Russ. Metall. (GB), no.3, p.119-22 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.139-42 (1982).
An examination was carried out on the resistance to deformation and the plasticity of ShKh15 (NLZ) steel under hot single-stage and multi-stage loading in torsion and compression. Torsion tests were carried out in a torsional plasticity meter. Depending on the temperature and rate of strain conditions of deformation, the amounts of deformation in each of the passes and the durations of the time intervals between loadings, the multi-stage deformation curves may lie below, at the same level or above the curve for continuous loading. (7 refs.)

115275 Influence of silicon on the structure and properties of alloyed compound Ni₃Al. V.P.Buntushkin, K.I.Portnoy, O.D.Melimevker, M.Kh.Levin-skaya, I.V.Romanovich, G.F.Loskutova.

Russ. Metall. (GB), no.3, p.162-5 (1982). Translation of: *Izv. Akad. Nauk. SSSR Met.*, no.3, p.185-9 (1982).
The results of an investigation of the dependence of the structure and properties of alloyed phase Ni₃Al on the amount of introduced silicon, in a concentration within the limits of 0.58-1.4 wt.%, are reported. In the compound Ni₃Al, alloyed with chromium, tungsten, titanium, carbon and close in composition to the γ -phase of heat-resistant nickel alloys, silicon replaces aluminium in the crystal lattice and determines the appearance in the structure of the β -phase on NiAl; thus the transition $\gamma \rightarrow \beta$ shifts towards smaller concentrations of aluminium. Additions of silicon to the compound Ni₃Al in amounts 0.58-1.4%, at 20°C, result in reduced ductility, an increase in its hardness and yield point, and at 1150°C softens the alloyed intermetallic. Silicon has a beneficial influence on the heat resistance of alloyed intermetallic Ni₃Al at 1220°C. (7 refs.)

115276 Effects of stabilization on the elastic to visco-plastic transition in metallic glasses. L.T.Shi, A.S.Argon, H.Y.Kuo (MIT, Cambridge, MA, USA).

Ser. Metall. (USA), vol.17, no.8, p.1014-20 (Aug. 1983).
Experimental data on inelastic deformation in Cu₅₆Zr₄₄ and Pd₈₀Si₂₀ by Argon and Kuo (1980) showed considerable deviations from the proposed theoretical curve of Argon and Shi (1983). Additional creep recovery experiments on Cu₄₀Zr₆₀ ribbons are reported to gain further understanding of the causes of this discrepancy. (11 refs.)

115277 Influence of impurity atoms on the mechanical properties of group Va metals and alloys based on them. V.V.Shirokov, O.I.Eliseeva (G.V. Karpenko Physicomech. Inst., Acad. of Sci., Lvov, Ukrainian SSR).

Sov. Mater. Sci. (USA), vol.18, no.6, p.471-4 (Nov.-Dec. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.6, p.16-20 (Nov.-Dec. 1982).
The influence of interstitial and substitutional atoms on the strength characteristics of group Va metals and alloys based on them was investigated. Unalloyed vanadium, niobium, and tantalum, and alloys based on them were used for the experiments. The investigations made showed that under certain conditions (rate of tension and temperature) in group Va metals and alloys based on them, dynamic interaction of the interstitial and substitutional impurity atoms with dislocation occurred, which lead to significant hardening and a reduction in plasticity of the materials. In the area below 650°C interstitial atoms were responsible for the effects of dynamic strain hardening and above 650°C substitutional atoms. (12 refs.)

115278 Creep of hardened steel in tempering. V.A.Likhachev, A.P.Demenkov (A.A. Zhdanov Leningrad State Univ., Leningrad, USSR).

Sov. Mater. Sci. (USA), vol.18, no.6, p.475-8 (Nov.-Dec. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.6, p.21-5 (Nov.-Dec. 1982).
The tests were made in different stressed states of the material, including by torsion of thin-walled tubes and under conditions of loading ends of equal cross section with a concentrated tensile force. The error in measuring the strain ϵ was $\sim 3 \times 10^{-3}\%$ and in temperature $t \pm 1^\circ\text{C}$. The rate of heating in tempering was 0.2°C/sec. The stresses and strains were referred to the most heavily loaded outer fiber of the samples, using the theory of elasticity for the calculation. The apparatus was equipped with a device compensating for thermal expansion. The objects of the investigation were various carbon (20, 30, 40, 45, 55, U8, U10, and U12) and alloy (40 Kh, 40 N, and 40 KhN) steels previously subjected to standard (production) hardening cycles. (4 refs.)

115279 Variational functional for a rigid-plastic porous material. A.M.Laptev (Kramatorsk Industrial Inst., USSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.22, no.1, p.1-3 (Jan. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.1, p.1-4 (Jan. 1983). [received: Aug. 1983]
To derive a variational functional with allowance for rate discontinuities, an equation of the virtual powers of a true stressed and kinematically possible strained state is considered. (8 refs.)

115280 Effect of small amounts of tungsten carbide on the strength, creep, and brittle-to-ductile transition temperature of zirconium carbide. B.D.Gurevich, L.B.Nezhevenko, P.V.Zubarev, V.P.Bulychev, N.N.Bragin, V.N.Kruglov, M.A.Fedotov.

Sov. Powder Metall. & Met. Ceram. (USA), vol.22, no.1, p.35-8 (Jan. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.1, p.39-42 (Jan. 1983). [received: Aug. 1983]
The starting material was a zirconium carbide powder produced by the carbothermic reduction of ZrO₂ at 1800°C. It was subjected to homogenizing annealing for 1 h at 2100°C under a residual pressure of 1.33×10^{-2} Pa. It is concluded that the use of hard-metal mills for the pretreatment of carbide powders with the aim of increasing to a maximum their sintering activity is permissible when the resultant tungsten content does not exceed 0.5 wt.%. The presence of this amount of tungsten had no effect on the microstructure, lattice constant, substructural characteristics, short-time strength, and creep resistance of zirconium carbide specimens sintered at 2600°C. However, when considering the potentialities and conditions of operation of parts of zirconium carbide containing ~ 0.3 mole % W, it is necessary to bear in mind that the brittle-to-ductile transition temperature of the material was raised some 100°C as a result of the presence of the addition. (10 refs.)

115281 Experimental investigation of laws governing the hardening of initially anisotropic materials. V.V.Kosarchuk, B.I.Koval'chuk, A.A.Lebedev (Inst. of Strength Problems, Acad. of Sci., Kiev, Ukrainian SSR).

Strength Mater. (USA), vol.14, no.9, p.1157-64 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.3-9 (Sept. 1982).
Using aluminium alloys D16T, AMtS and AMg₃, the authors experimentally investigated the rules of governing the hardening of initially anisotropic metallic materials in order to establish relationships between the parameters that define the shape and size of subsequent yield surfaces, and the level of plastic deformation, and the orientation of the preloading path in stress space. (20 refs.)

115282 Experimental study of the effect of scale and shape of a body on deformation and failure mechanisms of structurally inhomogeneous materials. V.P.Lamashevskii, P.T.Alfimov, A.A.Lebedev (Inst. of Strength Problems, Acad. of Sci., Kiev, Ukrainian SSR).

Strength Mater. (USA), vol.14, no.9, p.1238-43 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.68-72 (Sept. 1982).

On the basis of data for grey cast iron, the deformation process for quasibrittle materials was found to depend essentially on geometric dimensions of the deformed body, and the greater the deformed volume then the more intense was disintegration, which ultimately affected the value of ultimate strength. The dependence of ultimate strength was satisfactorily described by the statistical theory of strength, and cross-sectional shape did not affect deformation and failure mechanisms for quasibrittle bodies. (12 refs.)

115283 Temperature-time dependence of the cyclic-creep activation energy of heat-resistant alloys. V.P.Golub (Inst. of Mech., Acad. of Sci., Kiev, Ukrainian SSR).

Strength Mater. (USA), vol.14, no.11, p.1466-73 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.38-45 (Nov. 1982). [received: Sept. 1983]

Determines the activation energy of cyclic creep U_z of heat-resistant nickel alloys in high-cycle loading and evaluates the effect of cycle temperature and stresses on U_z . A cycle of experimental studies were made for cyclic creep within a broad range of temperatures and stresses. The following nickel-based heat-resistant alloys were studied: deformable EI867, and foundry VZhL12U, after the standard heat treatment. The results obtained showed that cyclic creep is based on the mechanism of dislocation limb. (18 refs.)

115284 Study of the high-temperature creep of multilaminar iron/copper and nickel/copper condensates. B.A.Movchan, E.V.Dabizha, R.F.Bansha, R.Nimmagadda (E.O. Paton Inst. of Electric Welding, Kiev, Ukrainian SSR).

Strength Mater. (USA), vol.14, no.11, p.1474-6 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.45-7 (Nov. 1982). [received: Sept. 1983]

Condensates were used to prepare flat specimens with a working length of 10 mm and working width of 3 mm. The specimens were annealed in a vacuum at 600°C for 1 h before testing. Creep tests were conducted in a vacuum at 600°C in the stress range 20-130 MPa. The microstructure of the original condensates and after the creep tests was studied with a scanning attachment for the JSEM-200 electron microscope. A typical fine two-phase structure was formed in multilaminar condensates with microlayers less than 2-3 μ m thick during high-temperature creep. The dispersed particles of iron or nickel were located in internal volumes of subgrains comprising the copper matrix, characterized by the presence of dislocations with a higher thermal mobility than in pure iron and nickel. (3 refs.)

115285 Influence of alloying on the strength of vanadium. G.G.Maksimovich, E.M.Lyutiy, V.V.Shirokov, I.P.Druzhinina, G.N.Per'kova (Physico-mech. Inst., Acad. of Sci., Kiev, Ukrainian SSR).

Strength Mater. (USA), vol.14, no.11, p.1531-5 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.89-93 (Nov. 1982). [received: Sept. 1983]

Presents the results of an investigation of the effect of various contents (5-20 wt.%) of titanium, tungsten, chromium, niobium, and tantalum on the strength characteristics of vanadium samples in a wide temperature range (293-1673K). For comparison an alloy of vanadium with 20 wt.% titanium was also tested. It was found that all of the alloying additions tested significantly strengthened the vanadium. (12 refs.)

115286 Experimental examination of the strength of a glass-fiber plastic with longitudinal-transverse reinforcement in the plane stress state. V.I.Kulik, E.V.Meshkov, R.B.Rikards, Z.T.Uptis (Leningrad Inst. of Mech. Engng., Leningrad, USSR).

Strength Mater. (USA), vol.14, no.11, p.1544-50 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.100-6 (Nov. 1982). [received: Sept. 1983]

The strength of glass-fiber tubular specimens with longitudinal-transverse reinforcement in the plane stress state was examined by means of experiments. The results of the main independent experiments, required for determining the strength properties of the material with the aid of fracture criteria were obtained. Additional experiments were also carried out to verify the reliability of construction of the strength surface. (8 refs.)

115287 Strength of porous net materials in the uniaxial strain state. A.F.Tret'yakov, G.P.Polushkin, A.D.Panov (N.E. Bauman Higher Tech. School, Moscow, USSR).

Strength Mater. (USA), vol.14, no.11, p.1551-6 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.106-9 (Nov. 1982). [received: Sept. 1983]

A method is proposed of constructing the tensile diagram of the PNM, and the strength and strain anisotropy of a porous sheet with a given type of laying the net layers is examined for the case of the uniaxial strain state. (3 refs.)

115288 Model plastic-rubber composites from emulsion polymers. M.Morton (Inst. of Polymer Sci., Univ. of Akron, Akron, OH, USA), N.K.Agarwal, M.Cizmecioglu.

Polymer Alloys III Blends, Blocks, Grafts and Interpenetrating Networks. Proceedings of a Symposium, New York, USA, 23-28 Aug. 1981 (New York, USA: Plenum 1983), p.1-18

The preparation is described of well-defined dispersions of hard, glassy plastics in SBR vulcanizates and rubber particles in a polystyrene matrix. Both types of composite materials were prepared by blending latex polymers of known particle size, which, upon coagulation, became composites containing the desired particles of plastic 'fillers' for the rubber and rubber particles in the plastic. The effects of filler particle size, rigidity and the filler-rubber adhesion on tensile strength are discussed. (8 refs.)

115289 On the correlation of mechanical properties of high impact polystyrene with its morphology, molecular-weight characteristics and extrusion conditions. V.D.Yenaleyev, V.I.Melnichenko, O.P.Boukunenko, A.N.Shelest, N.M.Tchalaya, Y.I.Yegorova, N.G.Podosyonova (Donetsk State Univ., Donetsk, USSR).

Polymer Alloys III Blends, Blocks, Grafts and Interpenetrating Networks. Proceedings of a Symposium, New York, USA, 23-28 Aug. 1981 (New York, USA: Plenum 1983), p.19-25

An attempt is made to establish, by means of statistical methods, the quantitative correlation between HIPS elongation at break and impact strength and the molecular weight and its distribution of the polystyrene matrix, copolymer and gel quantity, and morphological characteristics. (9 refs.)

115290 Correlation of morphology, mechanical properties and processing conditions of modified high impact polystyrene. V.V.Abramov, V.D.Yenaleyev, M.S.Akutin, N.M.Tchalaya, V.I.Melnichenko, A.N.Shelest (Donetsk State Univ., Donetsk, USSR).

Polymer Alloys III Blends, Blocks, Grafts and Interpenetrating Networks. Proceedings of a Symposium, New York, USA, 23-28 Aug. 1981 (New York, USA: Plenum 1983), p.27-30

Deals with the effect of elastomer addition, introduced into the extrusion process on HIPS morphology and some strength properties. To introduce the elastomer, a single screw extruder was used. The morphology of modified HIPS was studied by electron microscopy, impact strength (according to Charpy, without a notch), elongation at break, and tensile strength. The blending conditions of copolymers A and B with HIPS and their effect on mechanical properties are presented. It is seen that the introduced copolymer greatly affects the impact strength and elongation at break (depending on extrusion conditions). (3 refs.)

115291 RIM systems from interpenetrating polymer networks. R.Pernice, K.C.Frisch, R.Navare (Polymer Inst., Univ. of Detroit, Detroit, MI, USA).

Polymer Alloys III Blends, Blocks, Grafts and Interpenetrating Networks. Proceedings of a Symposium, New York, USA, 23-28 Aug. 1981 (New York, USA: Plenum 1983), p.219-31

Simultaneous interpenetrating polymer networks (SIN-IPNs) based on polyurethane and polyepoxides were synthesized according to the processing conditions of RIM technology. Catalytic systems were selected in order to minimize or avoid formation of any covalent bonds between the epoxy and the polyurethane chains. In this way topological polymer alloys (IPNs) were obtained which exhibited improved physical properties. Both low modulus and high modulus urethane elastomers were used in combination with epoxy resins derived from glycidyl ethers of bisphenol A. In addition, combinations of the latter with novolac epoxy resins were employed together with high modulus urethane elastomers. Maxima in ultimate tensile strength occurred at the ratio of 20/80 of epoxy resin/polyurethane systems. These maxima were interpreted as evidence of a permanent entanglement, between the two different types of polymer networks. A thermoanalytical study using a Rheovibron and DSC was carried out to give further support for the formation of IPNs. (14 refs.)

115292 A stress transfer model for the deformation and failure of polymeric matrices under swelling conditions. D.Cohn, G.Marom (Casali Inst. of Appl. Chem., Hebrew Univ. of Jerusalem, Jerusalem, Israel).

Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.245-59

It was found that polymers in which the diffusion mechanism was characterized by a sharp advancing boundary between the swollen shell and the core, showed a highly anisotropic swelling response. The anisotropy of the swelling strains was caused by the mechanical constraints exerted mutually by the two regions of the specimen. The swelling stresses developing during the process eventually led to fracture of the polymer specimen. An analytical model which explained the modes of failure of the polymer under the swelling stresses was developed. The proposed approach was based on the general analogy existing between the studied swollen specimens and composite materials. A model for the prediction of the anisotropic hygroelastic response of the swollen systems was also proposed. (12 refs.)

115293 Effect of fiber aspect ratio on ultimate properties of short-fiber composites. J.L.Kardos, E.Masoumy, L.Kacir (Dept. of Chem. Engng., Washington Univ., St. Louis, MO, USA).

Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.407-23

Even though a ductile epoxy matrix was used, highly oriented short fiber systems were still found to produce nearly linear, brittle-like tensile stress-strain behaviour when tested in the major fiber direction (0°). As the fiber bundle aspect ratio increased, the tensile modulus approached that for a continuous fiber system of the same volume loading, whereas the tensile strength achieved only 59% of the continuous fiber value for the largest aspect ratio studied (557). When the aligned fiber system was tested off-axis, the effect of aspect ratio on modulus became very small at angles exceeding about 15°. (11 refs.)

115294 Dimensional stability of reinforced matrices. A.Apicella, P.Masi, L.Nicodemo, L.Nicolas, S.Piccarolo (Istituto Principi di Ingegneria Chimica, Univ. di Napoli, Napoli, Italy).

Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.469-79

The effect of draw ratio and glass filler on the recoil kinetics of composite sheets is analyzed. Both amorphous and semicrystalline matrices were used. The recoil of filled polystyrene was largely affected by the presence of filler. In particular the fibers strongly enhanced the dimensional stability of the polystyrene at very low concentration. In contrast the recoil of polypropylene was not influenced by the presence of fillers, at least for the polypropylene studied. (18 refs.)

115295 In situ analysis of the interface. J.L.Koenig, Chwan-hwa Chiang (Dept. of Macromolecular Sci., Case Western Reserve Univ., Cleveland, OH, USA).

Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.503-16

It is concluded that the great improvement in properties imparted to the fiberglass reinforced composite by traces of appropriate reactive silanes at the interface suggests that an understanding of the molecular structure of the interface might be the key to understanding the mechanical behaviour of composites. The effect of water at the interface of composites is quite complex, depending upon the nature of the polymer system and that of the fibers. Thermosetting resins like epoxy absorb water with swelling and reduction in modulus. Molecular water diffuses readily through the resin phase and attacks the interface of composites. Liquid water can leach soluble materials from the interface and the matrix phase. Silane coupling agents may partially prevent water from attacking the fiber-resin interface. So the strength retention of the silane-treated fibre composite is better than that of non-silane treated fibre composites. (55 refs.)

115296 Internal stresses in fibre reinforced plastics. K.H.G.Ashbee, J.P.Sargent, E.Walter (H.H. Wills Phys. Lab., Univ. of Bristol, Bristol, England).

Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.517-28

Three experiments are reported. The first two investigate two stages in the development of self-stress during fabrication of a composite and the third investigates the generation of interfacial pockets of osmotic pressure asso-

ciated with the uptake of water. The techniques developed for these experiments include a combination of optical interferometry and thin plate elasticity theory to study cure stresses, the application of oblique incidence polarising optical microscopy to uniquely determine the magnitudes of radial and tangential stresses present in the resin after cooling from the cure temperature, and an analysis of the equilibrium of pressure-filled cavities in order to investigate the phenomenon of loss of load transfer attributable to osmosis during weathering. (6 refs.)

115297 Stress and strength analysis in and around composite inclusions in polymer matrices. A.Pavan (Politecnico di Milano, Milano, Italy). Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.529-43.

An elementary model is considered for composite inclusions in polymer matrices, and a micromechanical analysis is carried out subject to some simplifying assumptions and based on numerical values applicable to rubbery inclusions containing glassy polymer sub-inclusions. Results of this analysis provide some insight into the effects that the composite particle structure has on stress distribution and craze-yielding. (39 refs.)

115298 The mechanical properties and failure modes in reinforced polypropylene. Lu Sinien (Inst. of Mech., Chinese Acad. of Sci., China). *Acta Mech. Sin. (China)*, no.3, p.286-92 (1983). In Chinese.

Describes the tension, relaxation behaviour and failure modes in short fibre reinforced PP. The test material is 20% (by weight) glass fibre reinforced chemically coupling polypropylene. The effects of tension speed and temperature on tension strength are shown. The σ_T -log V curves are superimposed by shifting along log V axis to give a master curve of tension strength and shift factors of strength. In the same way, the shift factors of relaxation and the master curve of relaxation are obtained. The log a_T - T curve shows that up to 120°C log a_T follows an approximately linear relation with temperature, which is a simplifying form of W-L-F equation. As a result, it is concluded that from room temperature up to 120°C the principle of time-temperature equivalence is acceptable. The scanning electronic microscope photographs show five typical kinds of failure mode on the tension fracture surface. They are brittle, semi-brittle, ductile (cup-like and layers) and flow mode. The failure mode is greatly affected by test temperature, strain rate and state of stress. (15 refs.)

115299 Discrete spectrum for the strength of Capron fibres. G.M.Bartenev, L.P.Kosareva, A.G.Barteneva.

Vysokomol. Soedin. Ser. B (USSR), vol.25, no.6, p.441-5 (1983). In Russian. Information published since 1960 is discussed in some detail and this leads to the conclusion that the structural discreteness of polymer fibres (Capron) leads to a discrete distribution in the fibre along the lines of microcracks and submicrocracks, which in its turn leads to the existence of a discrete fibre strength spectrum. The discrete dimensions of the microcrack lines obtained by X-ray methods are in agreement with calculations on discrete strength levels. (12 refs.) N.S.

115300 Effect of texture and grain size on the fracture behaviour of hot rolled Mg, Mg-12.5%Li and Mg-5%Ti alloys. G.Sambasiva Rao, Y.V.R.K.Prasad (Dept. of Metall., Indian Inst. of Sci., Bangalore, India). *Res. Mech. (GB)*, vol.9, no.1, p.41-61 (1983).

The dependence of tensile fracture characteristics of hot rolled magnesium, Mg-12.2%Li and Mg-5% Ti alloys, in the temperature range 77-420K, on grain size and texture has been studied. Hot rolled magnesium is found to have a strong basal texture and to undergo intercrystalline fracture at 77K, transcrystalline cleavage at 300 K and ductile failure at 420 K. The brittle fracture stress is grain size dependent and follows a Hall-Petch type relation. The alloys also exhibited a similar relation although the mode of failure has been found to consist of mixed features. The mechanism of crack initiation and mode of failure in hot rolled magnesium have been related to the difficulty of occurrence of basal slip and the ease of occurrence of prismatic slip which are consequences of the texture. The changes observed in the alloys have been attributed to the opposing effects of texture weakening and solid solution strengthening. (21 refs.)

115301 The surface microhardness of nickel alloys cut with a low speed diamond saw. C.E.Price (School of Mech. & Aerospace Engng., Oklahoma State Univ., Stillwater, OK, USA). *Res. Mech. (GB)*, vol.9, no.2, p.125-8 (1983).

Microhardness measurements utilising Vickers DPH impressions were made on a number of Ni alloys after cutting with a low speed diamond saw. They all showed the same type of hardness profile with the hardness level peaking a few microns beneath the surface. (9 refs.)

115302 Fracture, strength and fatigue of filled thermoset composites. S.K.Brown (Dept. of Industrial Sci., Melbourne Univ., Parkville, Australia). *Br. Polym. J. (GB)*, vol.14, no.1, p.1-13 (March 1982).

Flexural strength, impact energy and fatigue resistance are reported for a wide range of filled unsaturated polyester resin composites. Behaviour of these properties is compared with fracture energies reported earlier. Little correlation with the latter is found and reasons for this are discussed. (18 refs.)

115303 Microstructure and thickness effects on fracture in a glass thermoplastic PET injection moulding compound. K.Friedrich (Inst. for Materials Sci., Ruhr-Univ. Bochum, Bochum, Germany). *Plast. & Rubber Process. & Appl. (GB)*, vol.3, no.3, p.255-65 (1983).

Describes the microstructure of injection moulded, short glass fibre reinforced, thermoplastic polyethylene terephthalate plaques as a function of fibre loading and plaque thickness. The influences of the microstructural variations on the fracture mechanical properties of this composite system are measured. The fracture toughness is higher for cracks perpendicular to the main fibre orientation and increases with weight fraction of fibres. Fatigue cracks indicate the same tendency, i.e. their growth rate is low for cracks transverse to the fibres in samples with high fibre loading. Additional effects on fracture mechanical behaviour due to differences in matrix toughness, strength of fibre/matrix bond quality and plaque thickness are also discussed. (14 refs.)

115304 Environmental influences of fatigue damage in glass fibre reinforced polyester. P. Prentice, C.R. Wachnicki, J.C. Radon (Dept. of Mech. Engng., Imperial Coll. of Sci. & Technol., London, England).

Plast. & Rubber Process. & Appl. (GB), vol.3, no.3, p.273-9 (1983). In order to evaluate the influence of the load biaxiality factor, B , and environment on the fatigue behaviour of chopped strand mat glass reinforced polyester, low frequency tensile fatigue tests were performed under constant load conditions on centre notched biaxial test specimens in both air and dilute acid solution. A compliance calibration method was used to give a value of an effective crack length which was used in a fracture mechanics approach to analyse crack propagation data. The Paris law, relating the crack growth rate to the stress intensity factor range, has been found to hold, the value of the exponent decreasing slightly with increasing biaxiality. The value of the exponent for fatigue tests performed in an acid environment was found to be lower, by a factor of at least two, than for the corresponding tests in air. The appearance of the fracture surfaces of specimens from the two test series were found to be different; those tested in air displayed significant fibre pull-out over the whole surface whereas the surface of the slow crack growth region of specimens fatigued in an acid environment showed little sign of fibre pull-out. (12 refs.)

115305 Design for toughness in polymers. IV. The effect of geometry on stable crack propagation in thermoplastics for pressure pipe duties. M.W. Birch, M.D. Taylor, G.P. Marshall (Dept. of Polymer Technol., Manchester Polytech., Manchester, England).

Plast. & Rubber Process. & Appl. (GB), vol.3, no.3, p.281-91 (1983). For p.III see *ibid.*, vol.2, no.4, p.369-79 (1982). The use of fracture mechanics criteria in the design of pipes necessitated a direct measurement of the resistance of material to crack propagation using pre-notched samples. However, the requirement that the stress be restricted to 0.8 of the yield stress for a valid fracture toughness determination results in such large sample sizes in the tougher polymers that the potential usefulness of such tests are severely limited. Previously reported work by the authors on the determination of values of toughness independent of crack length and test configuration has therefore been extended to cover the effect of sample size. It has been shown from bending tests that the conventional minimum width requirement is rather conservative and that a valid initiation fracture toughness may be calculated from results obtained on small samples by the use of a post-yield theory. The influence of sample thickness is shown to be particularly significant in polyethylene due to the presence of large shear lips with their high resistance to crack growth. By using sufficiently thick samples the influence of the shear lips are minimised and it has been possible to produce unstable failure in some grades of PE at room temperature in air. (14 refs.)

115306 Cavitation in high purity aluminium during fatigue at elevated temperatures. P. Yavari, T.G. Langdon (Dept. of Materials Sci. & Mech. Engng., Univ. of Southern California, Los Angeles, CA, USA).

J. Mater. Sci. Lett. (GB), vol.2, no.9, p.522-4 (Sept. 1983). High purity Al was found to exhibit grain boundary cavitation when tested in fatigue at elevated temperatures (573K) although no cavities are formed in this material during high temperature creep. It appeared that the cavities were formed primarily after the grain boundaries had stabilised into the orthogonal grain configuration. (20 refs.)

115307 The impact endurance of polycrystalline graphite. M. Birch, J.E. Brocklehurst (Springfields Nuclear Power Dev. Labs., UKAEA, Preston, England).

Carbon (GB), vol.21, no.5, p.497-10 (1983). Repeated impact tests have been carried out on a wide range of polycrystalline graphites. Two modes of test were employed using centrally impacted rods and discs with the rods supported horizontally at their ends and the discs supported around the circumference. The resulting impact endurance curves for all the different graphites under repeated impacts of constant energy were found to have a substantially common shape in both the disc and the rod tests. The absolute levels of the endurance curves differ considerably and correlate well with other mechanical properties of graphites, in particular the strain energy density at failure in bend. Measurement of impact forces on the single impact failure of graphite rods supports this correlation by showing that the dynamic stresses generated at failure in a single impact are the same as the corresponding static 3-point bend strengths in the same test mode. Measurement of impact forces at energies less than those required to cause failure in a single impact show that the fraction of energy absorbed as specimen strain energy is dependent on specimen size and shape but is not very sensitive to impact energy. A fracture mechanics model based on incremental crack growth and previously used to interpret stress-cycling fatigue data for graphite is proposed to describe also the endurance of polycrystalline graphite under repeated impacts. The model describes available experimental data obtained under both impact and fatigue conditions. On this model, the difference between the two cyclic stressing modes is the rate of crack growth per stress cycle, this being greater under repeated impacts than under fatigue cycles of the same stress amplitude. (6 refs.)

115308 Embrittlement of construction steel with bainite structure during tempering. A.Yu. Kaletin, V.M. Schastlivtsev, N.T. Kareva, M.A. Smirnov (Inst. of Metal Phys., Ural Sci. Centre, Acad. of Sci., Sverdlovsk, USSR).

Fiz. Met. & Metalloved. (USSR), vol.56, no.2, p.366-71 (Aug. 1983). In Russian. English translation in: *Phys. Met. & Metallogr. (GB)*. The reasons for reduction in the impact toughness of tempered 38KhS steel with the bainite structure were investigated. Magnetometric and electron-microscopic methods were used to show that isothermal quenching produced a carbide-free bainite consisting of ferrite and carbon-rich residual austenite. Embrittlement was due to conversion of this residual austenite retained in considerable amounts. The products of conversion were either regions with a pearlite structure formed during tempering or regions with a lath-like martensite structure formed during cooling of the steel after tempering. The influence of high-temperature plastic deformation on the processes of embrittlement of quenched steel during tempering were considered. (7 refs.) A.T.

115309 Fatigue strength of a rotor steel subjected to torsional loading simulating that occurring due to circuit breaker reclosing in an electric power plant. K. Tanaka, S. Matsuoka, F. Kouzu (Nat. Res. Inst. for Metals, Tokyo, Japan).

Fatigue Eng. Mater. & Struct. (GB), vol.6, no.2, p.103-20 (1983). The fatigue strength of notched specimens of a rotor steel was examined under variable torsional loading which simulates turbine-generator oscillations resulting from the high speed reclosing of transmission-line circuit breakers. The local stress-strain response at a notch root was analysed using Neuber's rule and the resulting complex strain sequences applied to smooth specimens. Using the rain flow analysis and the linear summation rule, fatigue lives of the smooth specimens were successfully predicted from constant amplitude fatigue life data in association with the cyclic stress-strain curve obtained by the incremental step method. Experimental crack initiation lives for notched specimens subjected to variable torsional loading were in excellent agreement with the theoretical curves derived from results on smooth specimens. Accord-

ing to the view that fatigue damage is equated to crack length, the propagation life of a mode II crack along the notch root was predicted to be actually coincident with the life to crack initiation at the notch root defined in this study, i.e. the life at the stage of finding a continuous circumferential crack. (22 refs.)

115310 Mixed-mode fracture mechanisms near the fatigue threshold of AISI 316 stainless steel. Gao Hua (Inst. of Mech., Acad. Sinica, Beijing, China), E.R. de los Rios, K.J. Miller.

Fatigue Eng. Mater. & Struct. (GB), vol.6, no.2, p.137-47 (1983). Near threshold, mixed mode (I and II), fatigue crack growth occurs mainly by two mechanisms, coplanar (or shear) mode and branch (or tensile) mode. For a constant ratio of $\Delta K_I/\Delta K_{II}$ the shear mode growth shows a self-arrest character and it would only start again when ΔK_I and ΔK_{II} are increased. Both shear crack growth and the early stages of tensile crack growth are of a crystallographic nature; the fatigue crack proceeds along slip planes or grain boundaries. The appearance of the fracture surfaces suggests that the mechanism of crack extension is by developing slip band microcracks which join up to form a macrocrack. This process is thought to be assisted by the nature of the plastic deformation within the reversed plastic zone where high back stresses are set up by dislocation pile-ups against grain boundaries. The interaction of the crack tip stress field with that of the dislocation pile-ups leads to the formation of slip band microcracks and subsequent crack extension. The change from shear mode to tensile mode growth probably occurs when the maximum tensile stress and the microcrack density in the maximum tensile plane direction attain critical values. (20 refs.)

115311 Fatigue crack propagation in a cast magnesium alloy. Chen Chuan-Yao, Gao Da-Xing (Dept. of Mech., Huazhong Univ. of Sci. & Technol., Wuhan, China).

Fatigue Eng. Mater. & Struct. (GB), vol.6, no.2, p.167-76 (1983). Fatigue crack propagation behaviour in a cast Mg-Al-Zn alloy was examined. The fatigue crack growth rate of the alloy under constant amplitude loading and the threshold resulting from a number of tests are given. Delayed retardation after the application of a single tension overload is explored in detail and described by using the model proposed by Matsuoka and Tanaka. From these observations, it may be seen that the Matsuoka model can be applied to the cast magnesium alloy as well as steels and aluminium alloys. Changes in the extent of retardation and the overload affected zone size with respect to the ratio of peak-to-baseline stress intensity factor range are discussed. Two phenomena, delayed arrest and acceleration in the later stages of retardation are reported. (7 refs.)

115312 Frequency dependence of the high temperature fatigue properties of He-implanted stainless steel. I.S. Batra, H. Ullmaier, K. Sonnenberg (Inst. für Festkörperforschung, Kernforschungsanlage Jülich, Jülich, Germany).

J. Nucl. Mater. (Netherlands), vol.116, no.2-3, p.136-40 (June 1983). The authors have measured the frequency dependence of the number of cycles to failure, N_f , of type 316 stainless steel specimens fatigued at 600°C with a total strain range of 1.2%. Whereas for the helium-free reference material N_f is high and decreases only slightly with decreasing frequency, there is a sharp drop in N_f below a critical frequency, ν_c , for specimens containing 800 ppm He. This behaviour and the value of $\nu_c \approx 3$ Hz is compatible with a theoretical model by Trinkaus (see Scripta Met., vol.15, p.825, 1981) which predicts a change from transgranular to intergranular failure below a critical frequency. This conclusion is substantiated by SEM observations of fracture surfaces and grain boundary bubble structures. (14 refs.)

115313 On the modeling of the high-temperature embrittlement of metals containing helium. H. Trinkaus (Inst. für Festkörperforschung, Kernforschungsanlage Jülich, Jülich, Germany).

J. Nucl. Mater. (Netherlands), vol.118, no.1, p.39-49 (Aug. 1983). Models for premature intergranular fracture of metals in creep tests during He injection and after room temperature He implantation are critically assessed. The creep rupture lifetime and its dependences upon stress, temperature, He generation rate, He concentration and microstructure of the metal are determined by the intrinsic properties of the lifetime-controlling mechanism as well as by the He flux to and the resulting bubble density on the grain boundaries. The He flux on the other hand is controlled by the He generation rate and the bubble density developing within the grains. On the basis of these considerations the differences in the stress and temperature dependences of the lifetimes observed in creep tests during He implantation and after room temperature He implantation are attributed to differences in the bubble nucleation and growth kinetics of the two cases. For creep tests during He injection the approximate agreement between predicted and observed trends in the time to rupture indicate gas driven stable bubble growth up to the stability limit as the life time controlling mechanism. A set of special creep tests to check this indication is suggested. (30 refs.)

115314 Fatigue and overload fracture of carburized steels. T.B. Cameron, D.E. Diesburg (Molybdenum Co., Ann Arbor, MI, USA), K. Kim.

J. Met. (USA), vol.35, no.7, p.37-41 (July 1983). Predictions resulting from a theoretical fracture mechanics model are reviewed and confirmed by experimental fatigue and fracture results from a variety of carburized steels. This comparison emphasizes the unique contribution of molybdenum to the fatigue strength of the carburized part through its role in maintaining case hardenability and a desirable residual stress profile. This analysis also indicates that the use of molybdenum in carburizing steels results in a superior fracture toughness profile and, hence, improved protection against overload-induced failures. (12 refs.)

115315 Rupture and viscosity of lead during spall. V.K. Golubev, S.A. Novikov, Yu.S. Sobolev, N.A. Yukina.

J. Appl. Mech. & Tech. Phys. (USA), vol.23, no.6, p.836-41 (Nov.-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR)*, vol.23, no.6, p.148-14 (Nov.-Dec. 1982). [received: Sept. 1983]. Experiments are performed in order to determine the loading levels corresponding to generations of spall microdamage in the material, as are a detailed metallographic analysis of the specimens in order to determine the nature of the rupture, as well as computational estimates of the viscosity of lead under spall rupture conditions. (16 refs.)

115316 Effect of cold working and annealing on stress corrosion cracking of AISI 304 stainless steel. Y.M. Yeon (Dept. of Metall. Engng., Coll. of Engng. Korea Univ., Seoul, Korea), S.I. Kwon.

J. Korean Inst. Met., vol.21, no.2, p.105-11 (Feb. 1983). In Korean. [received: Sept. 1983]. A study was made of the effects of cold working and annealing on the stress corrosion cracking of AISI 304 stainless steel in boiling 42% MgCl₂ solution. When the 60% or 76% of yield stress was applied, the resistance to SCC showed maximum at 30% of cold work. However, when the same load was applied to the annealed specimens after cold working, the resistance to SCC decreased abruptly at 675°C annealing. The fracture mode changed from mixed to intergranular to transgranular as the amount of cold work increased. (12 refs.)

- 115317 Study on the strengthening mechanism by diffusion of temper carbon into ferritic matrix.** S.W.Im, W.Y.Lee, P.W.Shin, J.H.Hong. *J. Korean Inst. Met.*, vol.21, no.6, p.584-91 (June 1983). In Korean. To investigate the effects of hard eye structure on the mechanical properties of BMC (black heart malleable cast iron), a harder second phase was formed around the temper carbon by carbon diffusion. The index, n , in the rate equation for the austenitization (Johnson-Mehl equation) was 1.4. It was found that, although the hardness increased considerably, the impact strength of BMC, having a pearlitic structure surrounding the temper carbon, was inferior to that of BMC not having hard eye structure, but the decrease in the impact strength was not as large as when the tempered martensitic structure was formed. BMC also showed a change from ductile to a brittle mode of fracture with increasing the volume fraction of hard eye structure. (33 refs.)
- 115318 The relationship between the physical structure and the microscopic deformation and failure processes of poly(*p*-phenylene terephthalamide) fibers.** R.J.Morgan, C.O.Prueneda, W.J.Steele (Lawrence Livermore Nat. Lab., Livermore, CA, USA). *J. Polym. Sci. Polym. Phys. Ed. (USA)*, vol.21, no.9, p.1757-83 (Sept. 1983). Relations between the physical structure and the deformation and failure processes of poly(*p*-phenylene terephthalamide) (PPTA) fibers are reported. The effects of the physical processes involved in fiber fabrication, including the crystallization of PPTA-H₂SO₄ dopes under stress, are considered in relation to their effect on the structure of the fiber. The deformation and failure processes together with the structure of the fiber are discussed in the light of fracture-topography studies of fiber-epoxy composite strands, single filaments, HCL-etched and unetched yarns, and transmission optical microscopy studies of stressed and unstressed yarns. In view of these observations, the physical structure of PPTA fibers is discussed in terms of pleated H-bond sheets, the macromolecular chain-end concentration and distribution, and the presence of impurities. The structural parameters that affect the failure processes of these fibers and how such parameters can be modified by service environment conditions are also addressed. (62 refs.)
- 115319 The incipient characteristic tearing energy for an elastomer cross-linked under strain.** R.S.Rivlin (Lehigh Univ., Bethlehem, PA, USA), A.G.Thomas. *J. Polym. Sci. Polym. Phys. Ed. (USA)*, vol.21, no.9, p.1807-14 (Sept. 1983). In a previous paper (see Eng. Fract. Mech., vol.18, p.389, 1983) a two-network model for an elastomer in which crosslinks have been introduced in the strained state, similar to that proposed by Green and Tobolsky (1948) was used to calculate the dependence of the incipient characteristic tearing energy on the number of chain segments in each of the two networks, the number of links in these chain segments, and the deformation at which the crosslinking takes place. The tearing energies were calculated for tearing on planes perpendicular to the principal directions of this deformation. The calculations are extended to cover tearing on a plane with arbitrary orientation. (7 refs.)
- 115320 Mixed-mode crack opening in fatigue.** D.L.Davidson, J.Lankford (Southwest Res. Inst., San Antonio, TX, USA). *Mater. Sci. & Eng. (Switzerland)*, vol.60, no.3, p.225-9 (Sept. 1983). The crack-opening displacements at distances in the range 1-30 μm behind the crack tip were measured in mode I (parallel to the loading axis) and in mode II for the ingot aluminum alloy 7075 in the T651 condition and the similar powder metallurgy aluminum alloy MA-87 using the stereo-imaging technique. A substantial mode II opening was found for both alloys, but for MA-87 the mode II opening exceeded the mode I opening at the crack tip. The crack openings were found to be greater in a very dry environment than in moist air. (10 refs.)
- 115321 Fractographic aspects of cyclic cleavage.** J.I.Dickson, I.Uribe-Perez (Dept. de Genie Metall., Ecole Polytech., Montreal, Quebec, Canada), E.Geckinli. *Mater. Sci. & Eng. (Switzerland)*, vol.60, no.3, p.231-40 (Sept. 1983). A number of aspects of cleavage crack propagation occurring during fatigue were identified from a fractographic study of low cycle fatigue samples of a quenched reinitrogenized mild steel, tested at 20 and 100°C. The most striking aspect was the frequent presence of cyclic cleavage striations, whose visibility increased with an increase in the plasticity accompanying cleavage. Cyclic cleavage results in a locally accelerated crack growth rate and often in a local crack front that proceeds ahead of the macroscopic front. Increasing hindrance to the continuation of cyclic cleavage often results and is responsible for transitions from brittle to semibrittle to ductile striations. This observed continuity between the three types of striation strongly indicates that the first two types of striation correspond to temporary crack arrest sites. (16 refs.)
- 115322 Studies for the interpretation of fatigue behaviour of prime quality chrome nickel stainless steels—presented on wires which for example may be used for orthodontic purposes.** J.Pirs, V.Ciprus. *Mater. Test. (Germany)*, vol.25, no.8, p.271-4 (Aug. 1983). In German. The fracture surfaces of the wires were examined. The wires are produced from Cr-Ni stainless steels and are used in orthodontic practice for holding the active free plate. The wires were broken in fatigue (partly under oxidation influence) and the fracture surfaces examined by a scanning electron microscope. Profiles of the chemical element composition on the surface and beneath the fracture surface were made for a better interpretation of the fracture mode. (2 refs.)
- 115323 A note on the correlation between sulfide inclusion level and fracture toughness of a 12 weight % chromium steel.** V.P.Raghuopathy, R.Vasudevan. *Mater. Test. (Germany)*, vol.25, no.8, p.275 (Aug. 1983). In English. The plane strain fracture toughness K_{IC} of a 12 weight % chromium steel increases with a reduction in sulfur content. The K_{IC} value however tends to saturate at a value around 91.7 MPa $\sqrt{\text{m}}$ corresponding to a sulfur content of about 55 ppm. A further reduction in sulfur level does not appear to improve the K_{IC} value. (10 refs.)
- 115324 Interfacial segregation and embrittlement in liquid phase sintered tungsten alloys.** B.C.Muddle, D.V.Edmonds. *Met. Sci. (GB)*, vol.17, no.5, p.209-18 (May 1983). Auger electron spectroscopy has been used to examine the fracture surfaces of specimens of W-Ni-Cu and W-Ni-Fe particulate composites in both the as-sintered condition and following post-sintering heat treatments. Changes in the levels of impurity contamination on the fracture surfaces and changes in fracture mode detected by scanning electron microscopy have been correlated with changes in toughness determined by comparative impact tests. Changes in microstructure accompanying heat treatments have also been monitored using both quantitative metallography and transmission electron microscopy. Brittle failure of as-sintered, furnace cooled specimens occurs principally by interfacial decohesion and appears to be associated with the presence of an excess concentration of phosphorus, and possibly sulphur, at the interphase boundaries. High temperature solution treatment followed by quenching produces a reduction in the level of segregation, an improvement in the inter-

phase boundary strength, and a resultant improvement in impact resistance. (28 refs.)

- 115325 Relationships between microstructure and mechanical properties of microduplex $\alpha + (\gamma + \epsilon)$ 6 and 9%Mn steels for cryogenic applications.** D.Duchateau, M.Guttman. *Met. Sci. (GB)*, vol.17, no.5, p.229-40 (May 1983). Room temperature tensile properties and low temperature toughness of quenched and doubly tempered 6 and 9%Mn steels were studied for a variety of tempering treatments, and the influence of the various phases present (α tempered martensite, α' and ϵ martensites, and austenite) on the mechanical properties has been established. The intergranular brittleness of the 9%Mn steels is plain temper embrittlement due to P and Mn cosegregation to the former austenite grain boundaries, which can be suppressed by small Mo additions. ϵ martensite is not intrinsically embrittling and the mechanical properties are controlled by the total volume fraction of $(\gamma + \epsilon)$ islands dispersed in the tempered α lath martensitic matrix: the impact transition temperature is lowered and the strain hardening capacity $\sigma_R - \sigma_Y$ increases as $(\gamma + \epsilon)$ increases. These relationships are explained in terms of the morphology of the dispersed phases and of the strain induced phase transformations. (29 refs.)
- 115326 Effect of molybdenum on temper brittleness and internal friction behaviour of medium carbon alloy steels.** T.C.Lei, C.H.Tang, M.Su. *Met. Sci. (GB)*, vol.17, no.5, p.249-55 (May 1983). U-notched impact toughness and internal friction curves were measured for steels 0.4C-2Mn, 0.4C-2Mn-Mo, and 0.4C-Cr, 0.4C-Cr-Ni, 0.4C-Cr-Ni-Mo after different heat treatments. It was found that in these steels temper brittleness always corresponds with the decrease in Koster peak height. The mechanism of the phenomenon has been suggested as being the result of an aging process of α solid solution with precipitation of Fe₃C(N) particles causing 'dead pinning' of dislocations. The effect of molybdenum in diminishing the susceptibility to temper embrittlement may be considered as being due to its high affinity to C,N atoms by which the precipitation processes of the α phase are obstructed. (6 refs.)
- 115327 Prediction of stress relaxation and stress relief cracking in SEN testpieces.** C.A.Hippesley (Dept. of Metall. & Materials Sci., Univ. of Cambridge, Cambridge, England). *Met. Sci. (GB)*, vol.17, no.6, p.277-87 (June 1983). A computer model has been described for the prediction of stress relaxation and stress relief cracking (in coarse grained, heat affected zone microstructure) during the heating period of a simulated post-weld heat treatment in four-point bend single edge notched (SEN) testpieces. Stress relaxation by plastic deformation was calculated from isothermal creep strain rate data. The two main mechanisms of stress relief cracking were considered, i.e. higher temperature, intergranular microvoid coalescence and lower temperature, low ductility, intergranular fracture. Existing theoretical models for 'creep cavitation' were used to estimate crack growth by the intergranular microvoid coalescence mechanism. An experimental relationship between crack propagation rate, stress intensity, and temperature was derived for the estimation of crack growth by the low ductility intergranular fracture mechanism. A comparison was made between the model predictions and experimental results from a recently developed, reheat cracking assessment test which employs SEN specimens. The model was found to predict the major features of stress relaxation and stress relief cracking with reasonable accuracy for three 2.25 Cr-1 Mo steel alloys considered. Practical application of the model to the quantitative assessment of reheat cracking in actual weldments was discussed. (42 refs.)
- 115328 Influence of slow strain rate tensile deformation on creep-fatigue endurance of 20Cr-25Ni-Nb stainless steel at 593°C.** V.B.Livesey, J.Wareing (Springfields Nuclear Power Dev. Labs., UKAEA, Preston, England). *Met. Sci. (GB)*, vol.17, no.6, p.297-303 (June 1983). Tests have been conducted on a 20Cr-25Ni-Nb stabilized stainless steel at 593°C during which a creep component was introduced into the tensile half of a fully plastic fatigue cycle. This was achieved either by the introduction of hold period at the maximum tensile strain of a rapid fatigue cycle or by the reversal of slow strain rate tensile deformation by rapid compressive straining. These cycles result in a significant reduction in fatigue endurance from that obtained during rapid fatigue cycling tests. The present results indicate that the most damaging cycle is one in which slow strain rate tensile deformation is reversed by rapid compressive straining. Here an order of magnitude reduction in life from that in cycles with equal rates of tensile and compressive straining was observed over a wide range of applied strain levels. Detailed metallographic examination of failed specimens has indicated that these life reductions occur because failure takes place by the interaction between a surface nucleated fatigue crack and internal grain boundary creep cavitation. A theoretical model based on this damage mechanism is presented which describes the experimental data obtained from the different cycle shapes. (14 refs.)
- 115329 Mechanical parameters used for the propagation of creep cracks.** D.Francois (Univ. de Technol. de Compiègne, Compiègne, France), K.Dang Van, F.Mudry. *Mem. & Etud. Sci. Rev. Metall. (France)*, vol.80, no.7-8, p.367-76 (July-Aug. 1983). In French. Parameters connected with fracture mechanics are discussed. Special features of stresses and deformations in the neighbourhood of a crack are considered in addition to experimental determination of the cracking rate under creep evaluation of the damaging effect of a defect. (19 refs.)
- 115330 Effect of structure modifying additives on wear resistance and fatigue strength of polyamide 6.** N.Tscholakowa, P.Sobew, A.Nekesow, G.Iwanow, M.Gatewa. *Plaste & Kautsch. (Germany)*, vol.30, no.7, p.406-7 (July 1983). In German. 0.1 wt.% of an hydraulic oil of a kinematic viscosity of 25 to 32 $\times 10^{-6} \text{m}^2/\text{s}$ increased the fatigue strength of polyamide 6. In creep tests the tensile strength was increased from 56.5 to 58.5 MPa. 0.1% was the optimum plasticising concentration. The oil appeared to penetrate into the amorphous parts of the highest polymerised regions of polyamide 6. Increasing the rate of application of tensile stress reduced the Bayley integral criterion which also depended on the oil content of the polymer. With increasing oil content the wear resistance decreased up to a concentration of 0.1%. (5 refs.) R.S.
- 115331 Failure of rubber-modified plastic liners.** Y.W.Mai (Dept. of Mech. Engng., Univ. of Sydney, Sydney, NSW, Australia). *Polym. Eng. & Sci. (USA)*, vol.23, no.10, p.560-6 (July 1983). In order to analyze the failure phenomenon of plastic liners in freezers and refrigerators the mechanical properties of the freon blown polyurethane (PU) foam insulator material and the acrylonitrile-butadiene-styrene (ABS) plastic liner are determined. The properties considered essential for this problem are the elastic modulus, the tensile strength and the fracture toughness over the temperature range -40 to 20°C. By laminating a layer of the polyurethane foam to the ABS liner and depending on the test temperature brittle to semi-brittle fractures are promoted and the maximum load fracture toughness

of the liner material is reduced. The reduction is more severe for notched bend than for single-edge notched tension specimens. Based on these mechanical properties plausible reasons for linear fractures are discussed. (14 refs.)

115332 Mechanical properties of injection molded blends of poly(ethylene-terephthalate) and poly(amide-6,6). M.R.Kamal, M.A.Sahto (Dept. of Chem. Engng., McGill Univ., Montreal, Quebec, Canada), L.A.Utrachi.

Polym. Eng. & Sci. (USA), vol.23, no.11, p.637-41 (mid-Aug. 1983). Data have been obtained regarding the tensile and impact behavior of pure poly(ethylene terephthalate) (PET) and polyamide 6,6 (PA) and blends of PA in PET in concentrations of 5, 10, 25, 30 and 35 percent by weight of PA. The measurements were carried out at -40, 23 and 70°C. Dispersion and sample preparation were carried out in a reciprocating screw injection molding machine. All blends exhibited brittle behavior and low strength, when compared to pure components. Although some enhancement of mechanical properties might be realized by orientation, it is suggested that the observed behavior might be attributed to the low quality of dispersion achievable in the injection molding process. This conclusion is supported by microscopic evidence. (9 refs.)

115333 Effect of bluing on fatigue strength of cold drawn steel wire. T.Hata, H.Usuda, S.Aoki.

Rep. Gov. Ind. Res. Inst. Nagoya (Japan), vol.32, no.5-6, p.117-23 (May-June 1983). In Japanese.

In order to improve the fatigue strength, the bluing of the cold drawn steel wire was undertaken at various temperatures from 250 to 500°C. Instead of the notch, an indentation was given by using a Vickers hardness tester, and then it was subjected to rotating bending fatigue test. The results obtained were as follows: (1) Original specimens had the range of applied load that the fatigue notch factor was nearly 1.0. And the sample wire also had the same range. (2) When the temperature of the bluing was nearly 350°C, the fatigue strength was increased. (2 refs.)

115334 A phenomenological model of embrittlement of metals under conditions of the adsorption action of liquid metal media. I.G.Dmukhovskaya, V.V.Popovich (G.V. Karpenko Physicomech. Inst., Acad. of Sci., Lvov, Ukrainian SSR).

Sov. Mater. Sci. (USA), vol.18, no.6, p.461-7 (Nov.-Dec. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.6, p.5-13 (Nov.-Dec. 1982). It is considered how under the influence of a medium on deformation of the surface layer there are created the conditions for the origin and propagation of a brittle crack and how the fracture process itself occurs. (37 refs.)

115335 Embrittlement of chrome-nickel-molybdenum steel after the high-temperature action of hydrogen. V.B.Shepilov, V.I.Kholodnyi, A.M.Belikov, N.K.Meshkov, A.V.Mikhailov (Voronezh Polytech. Inst., USSR).

Sov. Mater. Sci. (USA), vol.18, no.6, p.482-5 (Nov.-Dec. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.6, p.28-33 (Nov.-Dec. 1982). The influence of high-temperature gaseous hydrogen impregnation on the strength and plastic characteristics of cast steel containing 0.05% C, 13% Cr, 8% Ni, and 3% Mo was studied. Round samples with a diameter of 5 mm and a working portion length of 25 mm were used. Before testing they were heat-treated by hardening from 1403K with cooling of the container in air for 3 h, cold treatment at 203K for 4 h, and tempering at 773K for 3 h (all twice). Metallographic and X-ray investigations showed that after such a treatment a martensitic structure was formed in the steel. The gaseous hydrogen impregnation was carried out at 793K and pressures of 40 kPa and 70 MPa. Tensile tests were made on an R-20 tensile machine with different strain rates. (13 refs.)

115336 Crack propagation in titanium alloys in a hydrogen atmosphere under constant load. A.V.Fishgoit, B.A.Kolachev (K.E. Tsiolkovskii Moscow Aviation Technol. Inst., Moscow, USSR).

Sov. Mater. Sci. (USA), vol.18, no.6, p.486-91 (Nov.-Dec. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.6, p.33-9 (Nov.-Dec. 1982). A physically based model of crack advance in titanium alloys in a hydrogen medium under constant load is developed on the basis of the theory of hydrogen embrittlement caused by internal hydrogen taking into consideration the distribution of stresses at the tip of a crack. (18 refs.)

115337 Influence of internal microstresses in martensite on near-threshold fatigue crack growth. O.N.Romaniv, A.N.Tkach, V.N.Simin'kovich (G.V. Karpenko Physicomech. Inst., Acad. of Sci., Lvov, Ukrainian SSR).

Sov. Mater. Sci. (USA), vol.18, no.6, p.500-5 (Nov.-Dec. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.6, p.49-56 (Nov.-Dec. 1982). The investigations were made on 20Kh13 steel, and have shown that the static and cyclic crack resistance of martensite is primarily determined by the level of internal microstresses, decreasing with an increase in them. This is related to the occurrence of cleavage failure in the habitual boundaries of the martensite packets, which are points of localization of the internal microstresses, and to intensification of intergranular crack growth. A reduction in internal microstresses makes it possible to weaken the occurrence at a fatigue crack tip of the hydrogen brittleness of the hardened steel and to create conditions for closing of the crack as a result of formation of oxides, which slows the kinetics of its near-threshold growth in martensite in tests in water or moist air. (19 refs.)

115338 Low-cycle deformation and failure of die steels at service temperatures. V.I.Dobrovolskii, B.P.Kucheryavii, V.V.Pryakhin (Izhevsk Mech. Inst., USSR).

Sov. Mater. Sci. (USA), vol.18, no.6, p.529-31 (Nov.-Dec. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.6, p.79-81 (Nov.-Dec. 1982). Investigates the rules of low-cycle deformation and failure of the promising steels 40Kh5MFS and 50KhNMFS and the widely used 50KhNM steel at 600°C, which is characteristic of the surface layers of a die impression in service. Flat samples with a working portion 50 mm long, 10 mm wide, and 5 mm high were subjected to low-cycle tests. The tests were made under conditions of pure bending on a specially developed machine with a symmetric deformation cycle and a frequency of 0.417 Hz. The results presented indicate that 40Kh5MFS steel possesses higher resistance to low-cycle deformation and failure at service temperatures than the widely used 50KhNM steel. In this respect 50KhNMFS steel occupies an intermediate position. (5 refs.)

115339 Influence of melting method on the crack resistance of 42KhMFA steel. A.N.Lipchina, V.I.Povar (Perm Polytech. Inst., USSR).

Sov. Mater. Sci. (USA), vol.18, no.6, p.537-40 (Nov.-Dec. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.6, p.86-8 (Nov.-Dec. 1982). The properties of five production heats of 42KhMFA steel were investigated on transverse samples cut from disks from 160-mm square hot-rolled bars and from a 230×125 mm ESR ingot. For a comparison of the properties, the individual characteristics were studied on longitudinal samples. The sample blanks cut from the disks were annealed to 900°C, oil hardened from 870°C, and tempered at 680°C for 2 h. From the data obtained it follows that purging of molten metal with argon together with refining with synthetic slags makes it possible to substantially increase the quality of steel, which is

economically justified, since in crack resistance the steel approaches the very expensive electrosilag remelted. (10 refs.)

115340 Fatigue failure in the grain boundaries in lead and lead alloys. M.A.Bol'shanina, P.A.Kondrat'ev, T.F.Elsukova, M.B.Makogon (V.D. Kuznetsov Physicotech. Inst., Tomsk, USSR).

Strength Mater. (USA), vol.14, no.9, p.1195-201 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.33-9 (Sept. 1982). An investigation was made of grain boundary failure of lead and lead alloys under cyclic loading, their fatigue characteristics and structural changes in cyclic loading were determined, and the statistics of the number and distribution of cracks by dimensions and their influence on the mechanical strength in different stages of fatigue were studied. (15 refs.)

115341 Delayed fracture of structural alloy E1607A in plane stress. P.A.Pavlov, V.Kh.Bronz (Leningrad Polytech. Inst., Leningrad, USSR).

Strength Mater. (USA), vol.14, no.9, p.1202-5 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.39-41 (Sept. 1982). The authors studied the fracture laws of nickel-base heat-resistant alloy E1607A in plane stress and under transient loading. The experimental part of the investigation was carried out on a UEM-10TM unit with an attachment which made it possible to test thin-walled tubular specimens under simultaneous tension and torsion. The tensile force and torque could be changed in any ratio, with the transition from one ratio to another being possible after an intervening complete unloading of the specimens. All of the tests were conducted at 700°C. (5 refs.)

115342 Critical size for structural fragments of thermal-shock-resistant refractories. K.K.Strel'ov, G.A.Prantskyvichyus (S.M. Kirov Ural Polytech. Inst., Sverdlovsk, USSR).

Strength Mater. (USA), vol.14, no.9, p.1225-7 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.57-9 (Sept. 1982). Several simple theoretical methods are suggested for use in determining the critical size of fragment. The critical sizes obtained by these methods are close to the actual sizes. (11 refs.)

115343 Subcritical crack growth in brittle materials in microcracking conditions. S.M.Barinov, Yu.L.Krasulin (A.A. Baikov Inst. of Metall., Moscow, USSR).

Strength Mater. (USA), vol.14, no.9, p.1256-61 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.84-8 (Sept. 1982). The authors describe the results of investigations into the effects associated with the instantaneous reaction of the system, i.e., with the processes of brittle fracture of the material in the region at the crack tip. Attention is given only to stable subcritical crack propagation leading to the critical state, i.e. spontaneous fracture. This case is of special interest in connection with the problem of increasing the thermal stability of refractory materials. (19 refs.)

115344 Fractographic features of failure of tungsten cermet in the temperature range 20-2000°C. V.A.Stepanenko, A.V.Babak, E.I.Uskov (Inst. of Problems of Strength, Acad. of Sci., Kiev, Ukrainian SSR).

Strength Mater. (USA), vol.14, no.9, p.1262-5 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.88-90 (Sept. 1982). An attempt was made to analyse qualitatively the crack resistance of tungsten on the basis of the results of electron diffraction examination. It was found that tungsten cermet with the cellular deformation structure was distinguished by the presence of initial defects in the form of sharp micropores and narrow short microcracks. An increase of test temperature resulted in the growth of the initial microcracks. New micropores appeared at 2000°C as a result of the polygonisation stage. (4 refs.)

115345 Calculation of fatigue and life of crack-bearing structural elements under cyclic load. V.T.Troshchenko, P.V.Yasnii, V.V.Pokrovskii (Inst. of Strength Problems, Acad. of Sci., Kiev, Ukrainian SSR).

Strength Mater. (USA), vol.14, no.11, p.1434-9 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.12-16 (Nov. 1982). [received: Sept. 1983] A method is developed for predicting the life of a crack-bearing specimen under cyclic load with the stage of unsteady crack propagation and the effect of cyclicality on fracture toughness taken into account; the method is based on experimental data concerning the material and on an analysis of crack propagation conditions. The comparison is calculated and experimental data on unsteady crack propagation in a specimen subjected to cantilever bending was carried out on 15Kh2NMFA steel at 183K, and confirmed the correctness of the life calculation method described. (10 refs.)

115346 Fracture toughness of aluminum alloys of the system Al-Mg-Si for cyclic and static loads. V.G.Kudryashov, Yu.K.Shtovba (All-Union Inst. of Light Alloys, USSR).

Strength Mater. (USA), vol.14, no.11, p.1439-43 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.16-19 (Nov. 1982). [received: Sept. 1983] For the investigation of the fracture toughness of the AVpch, AD33, and AD35 alloys, strip with a 65×200 mm section was pressed. Strip from the AVpch and AD33 alloys was hardened (520°C, 1 h) and aged by a standard process, 165°C, 8 h, and 170°C, 10 h, respectively. The AD35 alloy was aged at 170°C for 10 h after cooling in the press. Regarding the comparison of fracture toughness values obtained in static and cyclic loading, the following was noted. If the cycle symmetry factor R was small (about 0.1) during cyclic fracture of the specimen, then the difference between the K_{IC} and K_{IC}^C values. (6 refs.)

115347 Effect of loading-cycle asymmetry on the crack resistance of structural alloys. P.V.Yasnii, V.V.Pokrovskii, V.T.Kaplunenko, M.V.Avanesov, B.T.Timofeev, G.P.Karlov (Inst. of Strength Problems, Acad. of Sci., Kiev, Ukrainian SSR).

Strength Mater. (USA), vol.14, no.11, p.1456-61 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.29-34 (Nov. 1982). [received: Sept. 1983] The fatigue crack growth rate (FCR) and fatigue fracture-toughness characteristics of steels 15Kh2NMFA and 15Kh3MA were studied in cantilever bending of flat specimens 25×70×350 mm at frequencies of 0.4 and 25 Hz. The crack resistance of steel 15Kh2NMFA under static and cyclic ($R=0.1-9$ Hz) loading was studied in the off-center tension of flat specimens 150 mm thick. The fatigue fracture toughness K_{IC}^C of steels 15Kh3MA, 15Kh2MFA, and 15Kh2NMFA increased with an increase in positive values of the cycle asymmetry coefficients. For steel 15Kh2NMFA in the range 183-213K and for steel 15Kh3MA at 153K, fracture toughness was roughly the same under symmetrical and nonzero loading conditions. For steel 15Kh2NMFA at 183 and 213K, the critical SIF corresponding to final fracture was not sensitive to a change in the cycle asymmetry coefficient when $R=-1-0.4$. (14 refs.)

115348 Evaluating the limiting states of a steel under combined low-cycle loading and diffusion of sorbed hydrogen. V.V.Litvin, G.N.Tret'yachenko (Inst. of Strength Problems, Acad. of Sci., Kiev, Ukrainian SSR).

Strength Mater. (USA), vol.14, no.11, p.1462-6 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.35-8 (Nov. 1982). [received: Sept. 1983]

Tubular specimens of steel 20 with an outer diameter of 24 mm, wall thickness of 2 mm, and working length of 45 mm were tested. Electrolytic hydrogenation was done inside the internal cavity of the specimen. The specimen was subjected to elastic-plastic symmetrical tension-compression, with the strain controlled, at a frequency $f=0.033$ Hz and a temperature $T=293$ K on units made originally for low-cycle tests. The distribution of the sorbed hydrogen was determined by means of an electrolytic cell. The experiments showed that the life of steel 20 under low-cycle fatigue was sharply reduced by hydrogen. Hydrogen sorption not only increased stresses in the material under one-time static loading, but also raised the stresses for the entire duration of the fatigue loading. (10 refs.)

115349 Intergranular brittle fracture resistance of 18Kh2N4VA steel after hardening. G.A.Filippov, O.N.Chevskaya (Central Sci. Res. Inst. for Ferrous Metall., Moscow USSR).

Strength Mater. (USA), vol.14, no.11, p.1536-40 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.93-7 (Nov. 1982). [received: Sept. 1983]

The tendency toward the formation of segregation of antimony atoms in the grain boundaries in austenite was investigated with 18Kh2N4VA steel melted from pure charge materials and containing 0.0005 and 0.007% antimony. The investigation was made in the freshly hardened condition (delay of 15 min) after various hardening cycles. The results of the delayed fracture tests indicated that with a drop in the level of applied stress there was an increase in the time until failure. An increase in antimony content decreased the strength of the steel, the threshold stress, the load below which delayed fracture did not occur, and the time until fracture with the same stress. (19 refs.)

115350 Fracture mechanics of syntactic foam composites. P.G.Krzhechkovskii (Nikolaevsk Shipbuilding Inst., USSR).

Strength Mater. (USA), vol.14, no.11, p.1556-64 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.110-15 (Nov. 1982). [received: Sept. 1983]

The author proposes a variant of fracture mechanics of the syntactic foam composite based on the combined examination of the strength of the structural constituents of the composite in an arbitrary complicated stress state using the theory of scattered fracture. (22 refs.)

115351 Intergranular fracture of a high purity iron due to oxygen. H.Matsui, H.Kimura (Res. Inst. for Iron, Steel & Other Metals, Tohoku Univ., Sendai, Japan).

Trans. Jpn. Inst. Met. (Japan), vol.24, no.8, p.539-47 (Aug. 1983).

The authors have prepared a high purity iron which in a form of smooth wire does not show intergranular fracture (IGF) at 4.2K by tensile test. Polycrystalline specimens of this iron was doped with oxygen; a thin oxide film was formed on the surface and a concentration (<several mass ppm) of oxygen was dissolved in equilibrium with the oxide. Thereafter, the oxide film was removed and tensile test was performed between 4.2 and 20K. It was found that as the oxygen concentration is increased by increasing the doping temperature (873, 973 and 1073K), the elongation to fracture at 4.2K is decreased. Specimens, which are doped with oxygen at 973 and 1073K and fracture along grain boundaries without any appreciable elongation, are completely ductile at 20K. If well-decarburized and not doped with oxygen, a commercial high purity iron (the Johnson-Matthey iron) is more susceptible to IGF than our high purity iron. The results show that oxygen segregated at grain boundaries weakens the grain boundary cohesion of iron to some extent, but the effect is not so large as considered before. Some previous researches have shown that smooth specimens fracture along grain boundaries by tension at 77K. These results should be interpreted as due to oxide particles or to interactions between oxygen and other impurities, and not due solely to the oxygen segregated at grain boundaries. (25 refs.)

115352 Shape effect of particles on high-temperature hardness of dispersion-hardened Ni-SiO₂ alloys. S.Goto (Graduate School of Engng. Sci., Kyushu Univ., Kasuga, Fukuoka, Japan), K.Mori, H.Yoshinaga.

Trans. Jpn. Inst. Met. (Japan), vol.24, no.8, p.548-60 (Aug. 1983).

In order to investigate the shape effect of the particles on the high-temperature strength of dispersion-hardened alloys, two kinds of nickel alloys with SiO₂ particles of complex and spherical shapes were made by internal oxidation and a heat-treatment after the internal oxidation, respectively. Their strengths were compared by means of hardness test at high temperatures. The Vickers microhardness of the alloy with particles of complex shape was found to be always higher than that of the alloy with particles of spherical shape at all test temperatures from room temperature to 1273K, though the difference in hardness depended on test conditions; for a short loading time only a slight difference was observed, whereas the difference at high temperatures increased gradually with the increase in loading time and approached a final constant value. The dispersion hardening estimated from the final value was in good agreement with the Orowan stress calculated from the dispersion, that is, the final difference between the two alloys can be well explained by the difference in the particle density on a slip plane, and any shape effect on the decrease in high-temperature strength due to the local climb of dislocations around particles was not detected. Creep behaviour of the alloys was estimated from the loading time dependence of the hardness. Both of the stress exponent and the apparent activation energy for the creep were larger in the alloy with complex particles than in the alloy with spherical particles. (25 refs.)

115353 Microstructure and mechanical strength of aluminum titanate ceramics prepared from synthesized powders. Y.Ohya, K.Hamano, Z.Nakagawa (Res. Lab. of Engng. Materials, Tokyo Inst. of Technol., Yokohama-shi, Japan).

Yogyo-Kyokai-Shi (Japan), vol.91, no.6, p.289-97 (1983). In Japanese.

Relations between the microstructure, bending strength and thermal expansion behavior of an aluminum titanate ceramic were investigated. The ceramics were prepared from three kinds of synthesized powders having several grain sizes and various amounts of free corundum. Under crossed nicols field of a polarization microscope, the fired bodies showed domain free structures. The grain size of the titanate of specimens fired at 1500°C for 4 h varied from 2.3 to 7.2 μ m depending on the starting powders. Many cracks were observed on the grain boundaries of bodies which had a grain size larger than 3 μ m, whereas only a few cracks were observed in a body with grain size of 2.3 μ m. In the specimens fired at 1300°C for 2~8 h, their grain sizes were less than 1 μ m, and few cracks were observed on their grain boundaries. The bending strength of the fired bodies increased markedly as their grain sizes decreased below 2.5 μ m. (13 refs.)

115354 Tensile strength of pressureless-sintered silicon nitride at elevated temperature. K.Matsusue, Y.Fujisawa, K.Takahara (Nat. Aerospace Lab., Chofu-shi, Japan).

Yogyo-Kyokai-Shi (Japan), vol.91, no.7, p.325-8 (1983).

Uniaxial tensile strength tests of pressureless-sintered silicon nitride were carried out in air from room temperature up to 1600°C. Three kinds of silicon nitride tested contained Y₂O₃.Al₂O₃, Al₂O₃.MgO or MgO.CeO₂ additives respectively which were used for promoting sintering. The test results showed that the composition of additive influences the strength characteristics of silicon nitride. The tensile strength rapidly decreased above 800°C for materials containing MgO and above some 1000°C for materials with Y₂O₃. At 1300°C, the strength decreased to about 10 percent of the room temperature strength for each case. Observations of the fracture origin and of the crack propagation on the fracture surfaces were made and discussed. (8 refs.)

115355 The K_{IC} values of silicon nitride and zirconia obtained by micro-crack indentation method and single-edge notched beam method. H.Seko (Aisin Seiki Co. Ltd., Kariya-shi, Japan), M.Okada, A.Sawaoka.

Yogyo-Kyokai-Shi (Japan), vol.91, no.7, p.339-43 (1983).

K_{IC} values obtained by the micro-indentation method and the single edge notched beam method were compared for silicon nitride and zirconia ceramics. Results of our measurements demonstrate that K_{IC} values obtained by both methods for silicon nitride and zirconia ceramics corresponded with each other when χ is 0.10. K_{IC} value of partially stabilized zirconia obtained by the single-edge notched beam method decreased upon polishing the surface of the specimen whose opposite surface had a notch. (9 refs.)

115356 Fractographic study of cracks produced by thermal shocks in 20MnMoNi55 and comparable weld material in water environment. K.Torronen, M.Kemppainen, R.Rintamaa.

Report 176, Tech. Res. Centre Finland, Metall. Lab., Espoo (April 1983), 26 pp.

Cracking in the feed water piping system has been found in both PWR and BWR-type nuclear power stations. To avoid this cracking problem and to assure the piping integrity experimental work has been initiated where the crack formation and growth mechanisms are studied under simulated conditions as close as possible to operating conditions. The results of a fractographic study of several cracks produced by thermal loading in 20MnMoNi55 steel and comparable weld material in an aqueous environment are presented. The basic crack growth mechanism is shown to be by mechanical fatigue, but after some crack growth indications of environmentally assisted cyclic crack growth are seen. (6 refs.)

115357 High strength sheet steel of medium thickness. T.F.Gulvin, L.Conway, W.P.Tait.

Report EUR 8007 EN, Comm. European Communities, Luxembourg (1982), 82 pp. Contract 6210.KH/8/801.

Weldability and fracture toughness assessments of welded joints for thirty high strength steels from four European countries are reported. Steel plates in the thickness range 25-76 mm at yield stress levels of (nominally) 420 and 490 N/mm² have been evaluated. In the selected steels, the specified strength levels were achieved by different mechanisms using normalising, controlled rolling, and quenching and tempering routes. From the weldability assessment, a rank order of relative weldability based on the risks of hydrogen cracking in the heat affected zones and solidification cracking in the weld metal was established for the selected steels.

115358 Resistenza a fatica di acciai ad alto limite di snervamento laminati a caldo (Fatigue resistance of high strength hot rolled steels). M.Castagna, G.Pezzuto.

Report EUR 8063 IT, Comm. European Communities, Luxembourg (1982), vi+115 pp. In Italian. Contract 7210.KD/403.

Presents the results concerning the fatigue behaviour of two high strength microalloyed hot rolled steels (8 mm thickness) with strength levels of 500 and 600 MPa respectively. The investigation was carried out with particular reference to use of such steels in the construction of industrial vehicles frames. In view of specific problems, the fatigue behaviour of steels was investigated on notched and welded plates, with constant and variable amplitude tests. Results of variable amplitude fatigue tests simulating a typical service load history have indicated a considerable improvement of fatigue life when a conventional structural steel is replaced by a higher strength microalloyed steel. A computer program was also applied to predict fatigue life of a notched component, subjected to a complex loading history. (16 refs.)

115359 Fracture toughness of poly(methyl methacrylate) blends. R.P.Kusy, W.F.Simmons (Dental Res. Center, Univ. of North Carolina, Chapel Hill, NC, USA).

Polymer Alloys III Blends, Blocks, Grafts and Interpenetrating Networks. Proceedings of a Symposium, New York, USA, 23-28 Aug. 1981 (New York, USA: Plenum 1983), p.71-89.

A series of acrylic blends was prepared from three feedstocks having number average molecular weights (M_n) of 4×10^3 (L), 3×10^4 (M), and 1×10^5 (H). After single-edge-notched tension bars were machined from molded sheets, the fracture surface energy (γ) was determined using the Brown and Srawley equation (1965). When the mean γ was plotted against the blend composition, results showed a different dependence for each binary combination: H/M suggested a linear relationship, while H/L and M/L appeared concave downward and upward, respectively. Further reduction of this data to a molecular weight basis permitted analysis via three general approaches: that a property, $P \propto M_n^{-1}$, that $P \propto \log M_w$, and that $P \propto \log \bar{x}_n$ (where $\bar{x}_n = M_n/M_0$). The first two relationships gave straight line segments for each binary combination and provided interesting parallels with several previous investigators—Sookne, Flory, Nielsen, and Berry. In the second case, moreover, the intersection of the H/L and M/L data lines suggested a common origin, which corresponded to $\gamma = 525$ erg/cm² at $M_w = 26000$ (the entanglement molecular weight, M_e ?). (49 refs.)

115360 Rubber modified matrices. R.Y.Ting (Naval Res. Lab., Orlando, FL, USA).

Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.171-88.

An experimental study was carried out on epoxy polymers modified by carboxy-terminated butadiene acrylonitriles. It is concluded that rubber-modified polymers exhibit improved fracture toughness over that of the unmodified resin. Whether the liquid and the solid rubber are used alone or in combination, the fracture energy may be increased by orders of magnitude. When these materials are used as matrix resins in composites, the 'toughening' effect is transferred into the composites to enhance their interlaminar fracture energy, flexural fatigue and other off-axis mechanical properties. The rubber-modified resins also offer the additional advantages of high peel strength and controlled flow. Unfortunately, the reduced resin modulus of the rubber-modified matrices will adversely affect composite properties to reduce the interlaminar shear strength, to cause a fast drop-off of strength and

modulus at elevated temperatures, and to lead to a poor wet strength retention. (16 refs.)

115361 Characterization of high performance composite matrices. R.J.Morgan (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA).

Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.207-13
Reviews the fundamental areas of the structure-property relations of composite matrices that are necessary for making meaningful durability predictions. These areas include the chemical and physical structure of epoxies and their modes of deformation and failure. (33 refs.)

115362 Fatigue crack propagation in short-glass-fiber-reinforced nylon 66: effect of frequency. R.W.Lang, J.A.Manson, R.W.Hertzberg (Materials Res. Center, Lehigh Univ., Bethlehem, PA, USA).

Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.377-96
The fatigue crack propagation response of nylon 66 and composites containing 16 and 31 vol.% short glass fibers was determined at frequencies of 1, 10, 50, and 100 Hz. The sensitivity to frequency was found to depend on glass content and, in the case of the pure matrix, on the value of the stress intensity factor range. (35 refs.)

115363 Creep and fracture initiation in fibre reinforced plastics. J.-F.Jansson, H.Sundstrom (Dept. of Polymer Technol. Royal Inst. of Technol., Stockholm, Sweden).

Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.397-406
Presents a brief review and analysis of the present state of knowledge and some initial studies concerning the relations between the creep behaviour and creep fracture phenomena in thermoset-based fibre composites with special regard to the fracture initiation. (21 refs.)

115364 Compression fatigue behaviour of notched composite laminates. R.M.Walsh, R.B.Pipes (Center for Composite Materials, Univ. of Delaware, Newark, DE, USA).

Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.587-606
The influence of compression fatigue on graphite/epoxy laminates containing circular holes of 0.25 inch diameter was investigated. The nature and extent of induced compression fatigue damage was examined and the effects of this damage on the laminate residual failure mechanisms determined. Two modes of compressive failure were found to occur: the diagonal shear and the net compression modes. The mode and direction of failure were dependent upon the nature of the specimen delamination. It was also found that the laminate stacking sequence influenced the intraply crack development in the laminates as well as the failure mode. (11 refs.)

115365 Delamination in graphite-epoxy. D.J.Wilkins (General Dynamics, Fort Worth, TX, USA).

Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.629-31
Delamination growth is the fundamental issue in the evaluation of laminated composite structures for durability and damage tolerance. When primary composite structures are evaluated originally with respect to durability (fatigue) and damage tolerance (safety), they are judged against the design service usage, and tests are performed to demonstrate their structural integrity. However, after the parts enter service, they are exposed to a variety of operational usages so that techniques are needed to estimate the behaviour of defects as a function of time under changing service conditions. 115366 Electron-microscopical investigations of the structure of the surface layers of titanium carbide after friction at 20-1400°C. A.N.Pilyankevich, V.F.Britun, Yu.G.Tkachenko, V.K.Yulyugin (Inst. of Materials Sci., Acad. of Sci., Ukrainian SSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.22, no.1, p.56-60 (Jan. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.1, p.63-7 (Jan. 1983). [received: Aug. 1983]

An account is given of electron microscopical investigations of the structural changes taking place in the contact zones of TiC specimens during rubbing in a vacuum in the temperature range 20-1400°C. Titanium carbide specimens of composition close to stoichiometric were prepared by pressing a commercially pure TiC powder in metal dies and sintering the resultant compacts in a vacuum. Friction and wear testing was performed in a high-temperature vacuum apparatus. Pairs of identical TiC specimens were rubbed against each other at a mean speed of 0.01 m/sec under a load of 1 MPa in a vacuum corresponding to 5.10^{-3} Pa. The test temperatures were 20, 400, 800, 1200, and 1400°C. The investigation showed that during heating in a vacuum from 20 to 1200°C the coefficient of friction μ and wear rate w of a TiC-TiC pair decreased, but with a further rise in temperature they began to show a tendency to increase. The microhardness of the rubbing surfaces after tests, measured on contact spots, decreased from 28000 at 400°C to 20000 MPa at 1400°C. (6 refs.)

115367 Dry wear studies on glass-fibre-reinforced epoxy composites. R.Ramesh, Kishore (Dept. of Metall., Indian Inst. of Sci., Bangalore, India), R.M.V.G.K.Rao.

Wear (Switzerland), vol.89, no.2, p.131-6 (15 Aug. 1983).
Continuous glass-fibre-reinforced epoxy composites were fabricated and their wear behaviour was studied. A rapid drop in the wear loss occurred with an increase in the sliding speed for the pure epoxy resin while the reinforced sample exhibited a mild decrease, a flat region and then a rise. Optical microscopy examination indicates that the higher wear loss for the composite at higher speeds could be due to loss of glass fibres. The variation in the coefficient of friction, μ , with load and sliding speed was studied. Both the epoxy resin and the composite show a marked dependence of μ on load, which

includes a peak. The pure epoxy resin showed no significant dependence of the coefficient of friction on sliding speed whereas the composite shows a peak value, thereby emphasizing the important role of the reinforcing fibres. (2 refs.)

115368 The effects of erodent composition and shape on the erosion of steel. A.V.Levy, P.Chik (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

Wear (Switzerland), vol.89, no.2, p.151-62 (15 Aug. 1983).

The effects of erodent composition, hardness-strength characteristics and shape on the erosion of AISI 1020 carbon steel were determined. Tests were performed at a velocity of 80 m s^{-1} at two angles of impingement ($\alpha=30^\circ$ and 90°). Angularly shaped particles of five compositions were used with Vickers' hardness H_v from 115 to 3000 kgf mm^{-2} . It was determined that the erosion rate increased with increasing particle hardness to a constant rate for particles with $H_v > 700 \text{ kgf mm}^{-2}$. The hardness was a measure of the friability of the particle composition. When the particles were strong enough not to break up on impacting the AISI 1020 steel surface, the erosion rate became constant. It was also determined by using angular and spherical steel erodents that angular particles can result in four times more erosion than spherical particles. (9 refs.)

115369 Comparison of the wear resistance of various grades of cemented carbides that may find application in wood machining. A.-M.Bayoumi, J.A.Bailey, J.S.Stewart (Dept. of Mech. & Aerospace Engng., North Carolina State Univ., Raleigh, NC, USA).

Wear (Switzerland), vol.89, no.2, p.185-200 (15 Aug. 1983).

A laboratory test is described in which specimens of rectangular cemented carbide tool inserts of a standard size are allowed to slide against a rapidly rotating fiberboard disc in either the presence or the absence of a mist spray of a dilute organic acid (tannic acid or acetic acid) to simulate the cutting of green wood and cured wood respectively. It is shown that the worn surfaces of cemented carbide tools used in (field) service are remarkably similar to the worn surfaces of specimens used in the laboratory (simulation) tests. Extensive results are presented that show quantitatively the progressive wear of a wide range of cemented carbides as a function of time for sliding under wet and dry conditions. It is shown that wear depends on the type and amount of binder present in the cemented carbide and on the nature of the environment. Materials with Co-Cr and Ni-Cr binders containing significant amounts of chromium showed the greatest resistance to wear. (19 refs.)

115370 Friction and wear properties of nitrided and N^+ -implanted 17-4 PH stainless steel. G.M.Ecer (Sii Smith Tool Tech. Center, Irvine, CA, USA), S.Wood, D.Boes, J.Schreurs.

Wear (Switzerland), vol.89, no.2, p.201-14 (15 Aug. 1983).

N^+ implantation of thermally nitrided 17-4 PH stainless steel substantially improved friction and wear properties in lubricated sliding wear tests. Some improvement was also obtained by nitriding or by N^+ implantation alone. Auger and surface topography analyses of specimens before wear testing indicated that the improved wear performance may be due in part to the implantation of carbon, and perhaps oxygen, when N^+ was being implanted under a relatively high target chamber pressure and in part by the topographical alteration of the surface in thermal nitriding. (11 refs.)

115371 The effect of surface hardness of carbon steels on scuffing resistance in rolling-sliding contact. Y.Yamamoto (Dept. of Mech. Engng., Kushu Univ., Fukuoka, Japan).

Wear (Switzerland), vol.89, no.2, p.225-34 (15 Aug. 1983).

The effect of surface hardness on scuffing was investigated using a two-disc machine. The changes in the surface conditions, especially surface roughness, surface hardness and the formation of an oxide film, in the running-in process have a marked influence on the scuffing resistance. Therefore a hard disc does not always have a high resistance to scuffing. In this investigation, quenched discs of the highest surface hardness, in which the improvement in surface roughness and the formation of an oxide film are expected to be small, offered the poorest resistance to scuffing. By contrast, annealed discs of lowest hardness, in which a diminished surface roughness and an increased surface hardness caused by the work hardening that necessarily accompanies the formation of an oxide film are expected, exhibited a considerably higher resistance to scuffing. (13 refs.)

115372 Mechanical and electromechanical behaviour of fibre brushes. L.Boyer, G.Fournet (Lab. de Genie Electrique de Paris, Univ. de Paris VI et XI, Gif-sur-Yvette, France).

Wear (Switzerland), vol.89, no.3, p.245-63 (1 Sept. 1983).

Investigations of the mechanics of metal fibres capable of carrying very high currents are presented. The role played by the Laplace force is emphasized. This force appears whenever a fibre carrying a current is subjected to a magnetic field whose direction is different from that of the fibre. The role played by the coefficient of friction is also taken into account. An exact non-linear differential equation is used to describe the problem, i.e. no assumptions are made about the magnitudes of the deflections. When the normal force exerted on the track by the fibre is an increasing function of the Laplace force, it is found that the maximum stress within the fibre has a non-linear dependence on the Laplace force. When the same normal force is a decreasing function of the Laplace force, it is shown that the normal force vanishes for a critical value of the Laplace force. A perturbation method is used to explain the behaviour of the fibre. (20 refs.)

115373 Some aspects of improving abrasive resistance. V.N.Kashcheev (Siberian Phys.-Tech. Inst., Tomsk, USSR).

Wear (Switzerland), vol.89, no.3, p.265-72 (1 Sept. 1983).

A survey of literature on the structural and phase strengthening of alloys and steel is presented. Methods of strengthening such as mechanical riveting and expanding the length of intergrain boundaries do not increase abrasive wear resistance to hard particle attack. Alloying to increase the interatomic bond forces does not increase abrasive wear resistance. Thus there is a close connection between the modulus of normal elasticity of different metals and the wear resistance. The sharp decrease in dislocation mobility at the brittle transition temperature increases abrasive wear resistance. For a high carbon steel the resistance increases by a factor of 2.5. Increased resistance to attack by abrasive particles (by a factor of 2) can be achieved by preliminary friction treatment of the steel surface (especially by dry frictional contact against low carbon steel) because of the complex phase and structural transformations in the material of the surface that is subjected to frictional contact. (12 refs.)

115374 Effects of hardness on the solid particle erosion mechanisms in AISI 1060 steel. Le Khac Hein, P.G.Shewmon (Dept. of Metall. Engng., Ohio State Univ., Columbus, OH, USA).

Wear (Switzerland), vol.89, no.3, p.291-302 (1 Sept. 1983).

The mechanisms of mass loss were studied using impacts of single particles (WC spheres $3/16 \text{ in.}$ in diameter) for a 0.6% C steel (AISI 1060 steel) heat treated to give hardnesses of 12, 45 or 60 HRC. Both oblique and near-normal angles of impact were used. A new foil laminate was developed to measure rebound velocity and angle. Velocities of $100\text{--}200 \text{ m s}^{-1}$ were stu-

died. A measurable mass loss was found only at 200 m s^{-1} . At a hardness of 12 HRC the mode of metal loss involved the loss of shear lips. At 60 HRC the dominant loss mode involves the intersection of adiabatic shear bands (ASBs) and shows a maximum mass loss at near-normal impact. The material with a hardness of 45 HRC shows both modes of mass loss and a maximum mass loss rate at oblique (30°) impact. ASBs on the surface and welding of target material to the impacting ball indicate a high temperature at the surface. However, the material welded to the particle is not a significant fraction of the material lost. (23 refs.)

115375 The use of transmission electron microscopy to study the effects of abrasive wear on the matrix structure of a high chromium cast iron. J.T.H.Pearce (Dept. of Metall., West Bromwich Coll. of Commerce & Technol., Wednesbury, England).

Wear (Switzerland), vol.89, no.3, p.333-44 (1 Sept. 1983).

The wear behaviour of an austenitic high chromium cast iron was investigated under conditions of high stress abrasion using a specimen-on-track test apparatus. The austenite matrix at the wear surfaces of test specimens work hardened during abrasion giving hardness values up to 950 HV but the depth of hardening was seen to be much smaller than that obtained under service conditions. The nature of the work hardening was studied by thin foil transmission electron microscopy. This work has provided evidence of strain-induced martensite formation which is believed to be responsible for the observed increases in hardness. (23 refs.)

115376 Thermal stress limitations to laser fire polishing of glasses.

Y.M.Xiao, M.Bass (Univ. of Southern California, Los Angeles, CA, USA).

Appl. Opt. (USA), vol.22, no.18, p.2933-6 (15 Sept. 1983).

The process of laser fire polishing of optical glasses is shown to work very well for materials with small coefficients of thermal expansion. The surfaces of other glasses crack during laser fire polishing or during cool down from an elevated preheat temperature. An analytical model is described and is used to show that, in materials which cannot be laser fire-polished, the thermal-gradient stress resulting from differential expansion exceeds the yield stress. Successful laser fire polishing of fused quartz and Pyrex glasses is reported. (12 refs.)

115377 The long term durability of stressed GRP in acidic environments. F.R.Jones, J.W.Rock, A.R.Wheatley (Dept. of Metall. & Materials Technol., Univ. of Surrey, Guildford, England).

J. Mater. Sci. Lett. (GB), vol.2, no.9, p.519-21 (Sept. 1983).

The authors studied the mode II fracture of an 80°C post-cured, 0° unidirectional polyester laminate after approximately one year half immersed in aqueous H_2SO_4 at constant load. It is found that the long term life in a corrosive environment appears to be controlled by the rate of stress corrosion of the glass-resin interface. (11 refs.)

115378 Considerations on SG insulator failures in operating conditions. L.Egizano, B.Macchiaroli (Univ. di Napoli, Napoli, Italy), P.Giordano Orsini.

Energ. Elettr. (Italy), vol.60, no.3, p.117-21 (March 1983). In English.

Insulators coated with semiconducting glazes, proposed for more compact high voltage transmission lines and for the use in heavily contaminated areas, have shown a poor durability in service. An analysis of the main reasons of the present failures is carried out. The microstructural defects of the insulator glazes and the morphology of their corrosion are examined. Suggestions to improve the manufacturing techniques are proposed. (25 refs.)

115379 Metallization of Lavsan in a glow discharge. I.N.Brovikova, L.V.Bulanova, G.D.Krotova, V.I.Svetlov.

Elektron. Obrab. Mater. (USSR), no.3, p.52-4 (1983). In Russian. English translation in: *Electrochem. Ind. Process. & Biol. (GB)*.

Investigations of the process of metallization of Lavsan by the method of cathodic sputtering were conducted. Data were obtained on the rate of deposition of a nickel coating on the surface of Lavsan in a plasma of helium and residual gases under different conditions of combustion of the glow discharge ($P=10-100$ Pa, $i=2-8$ Ma). It is shown that by the use of cathodic sputtering, coatings of satisfactory quality can be deposited on the surfaces of textile materials at technologically-acceptable rates. (5 refs.) *A.J.B.*

115380 Electroplating of an ultrasonically-activated surface for automatic filling of indentations. H.Coufal, W.Imaino, A.C.Tam (IBM Corp., Armonk, NY, USA).

IBM Tech. Disclosure Bull. (USA), vol.26, no.2, p.837-9 (July 1983).

The present work is concerned with an effect whereby if the whole cathode is ultrasonically activated by appropriate ultrasonic frequencies, automatic focusing of ultrasonic energy occurs in the electrolyte at locations close to indentations; i.e. the cathode surface itself can automatically redistribute the input ultrasonic energy to cause hole-filling without the necessity of directing an energy beam by an external device onto a hole to enhance plating (as in previous experiments). (1 ref.)

115381 Orientation of (100) InGaAsP/InP wafers by HCl chemical etching. L.W.Stulz (Crawford Hill Lab., Bell Labs., Holmdel, NJ, USA), L.A.Coldren.

J. Electrochem. Soc. (USA), vol.130, no.7, p.1628-30 (July 1983).

Presents a very simple method for orienting (100) InP wafers. It does not require X-rays, photomasking or the loss of a significant amount of material. The technique is superior to other orientation techniques, which generally require masking the surface. The edge-to-surface juncture provides a natural nucleation site, and most desirably, it is best to have a mediocre cleave that provides edge striations for a distinctive result. Such results are obtained consistently. Little or no wafer area need be sacrificed, and virtually no additional processing time is spent in this orienting procedure. (10 refs.)

115382 Centrifugal etching: a promising new tool to achieve deep etching results. H.K.Kuiken, R.P.Tijburg (Philips Res. Labs., Eindhoven, Netherlands).

J. Electrochem. Soc. (USA), vol.130, no.8, p.1722-9 (Aug. 1983).

The authors present some theoretical considerations to show that by etching in an enhanced acceleration field, such as can be obtained in a centrifuge, it is possible to circumvent many of the typical objectionable features of some of the traditional etching techniques. The theory is corroborated by a small series of experiments. These clearly indicate that centrifugal etching may yield very low undercutting, large etch rates, and, if proper care is taken, an extremely smooth surface finish. (14 refs.)

115383 Properties of thermal oxides grown on phosphorus in situ doped polysilicon. M.Sternheim, E.Kinsbron, J.Alspector, P.A.Heimann (Bell Labs., Murray Hill, NJ, USA).

J. Electrochem. Soc. (USA), vol.130, no.8, p.1735-40 (Aug. 1983).

The oxidation characteristics and the electrical conductivity and breakdown of thin oxides grown on phosphorus in situ doped polysilicon are reported. Breakdown fields of 8 MV/cm and leakage currents as low as 5×10^{-8} A/cm² at 3.5 MV/cm were measured for 400- to 1200 Å oxides grown thermally at 1000°C in dry O₂ on phosphorus in situ doped films deposited at 600°C. The oxides grown on the 600°C polysilicon films are superior to the oxides grown on the 640°C polysilicon films. The high breakdown fields and low leakage currents are related to the film structure and surface morphology as revealed by SEM and TEM micrographs. (26 refs.)

115384 Cation and anion transport numbers in anodic GaAs oxides. C.W.Fischer, J.D.Canaday (Dept. of Phys., Univ. of Guelph, Guelph, Ontario, Canada).

J. Electrochem. Soc. (USA), vol.130, no.8, p.1740-4 (Aug. 1983).

An Xe¹³⁴ marker atom layer of concentration 2×10^{15} cm⁻² has been implemented into GaAs to a depth of 20 nm. The GaAs containing the Xe¹³⁴ was anodized to various thicknesses, and Rutherford backscattering was used to measure the change in the Xe¹³⁴ marker atom depth relative to the change in oxide thickness. These measurements are used to calculate the cation and anion transport numbers which are 0.18 and 0.82, respectively. A secondary result from backscattering measurements is the oxide bulk stoichiometry and oxide density. The results show a bulk oxide composition of (Ga+As)₂O=2:3, and an oxide density of 4.64 g/cm³. (26 refs.)

115385 Corrosion behavior of SiC/Al metal matrix composites. P.P.Trzaskoma, E.McCafferty (Naval Res. Lab., Washington, DC, USA), C.R.Crowe.

J. Electrochem. Soc. (USA), vol.130, no.9, p.1804-9 (Sept. 1983).

The effect of the SiC phase on the corrosion behavior of SiC/Al metal matrix composites has been studied on 0.1 and 0.6N NaCl, both in the presence and absence of dissolved oxygen. Anodic polarization behavior has been determined, and pitting potentials have been measured for three composite systems: SiC/Al 2024, SiC/Al 6061, and SiC/Al 5456. General corrosion behavior and the effects of anodizing on the corrosion resistance of the composites have been studied by AC impedance techniques. The results show that pitting susceptibility is about the same for the composites and their corresponding alloys, except for Al 2024. In this system, the composite is less resistant to pit initiation than the corresponding wrought aluminum alloy. General corrosion is more significantly affected by the presence of oxygen than by the SiC phase. In the absence of oxygen, corrosion resistance is improved for both the alloys and composites. In addition, the corrosion resistance of the composites can be improved by anodizing. (11 refs.)

115386 The effects of arsenic doping in reactive ion etching of silicon in chlorinated plasmas. G.C.Schwartz, P.M.Schaible (IBM General Technol. Div., East Fishkill Facility, NJ, USA).

J. Electrochem. Soc. (USA), vol.130, no.9, p.1898-1905 (Sept. 1983).

The results of a study of the influence of arsenic doping of silicon and Cl₂ and CCl₄ reactant concentrations on etch rate and etch profile are described. From approximately 10^{16} to 10^{20} As/cm³, the etch is anisotropic and the etch rate does not increase in either Cl₂ or CCl₄ plasmas. At concentrations above 10^{20} As/cm³, mask undercutting occurs and the etch rate rapidly increases (approximately 300% for 1.5×10^{21} As/cm³), although the functional form of the relationship between etch rate and As concentration depends on the reactant, reactant supply, and silicon load. Temperature effects are also described. (10 refs.)

115387 On the formation of planar-etched facets in GaInAsP/InP double heterostructures. L.A.Coldren, K.Furuya, B.I.Miller (Bell Labs., Holmdel, NJ, USA).

J. Electrochem. Soc. (USA), vol.130, no.9, p.1918-26 (Sept. 1983).

Techniques to predict and control the etch wall profile as a mask edge are developed. An understanding of the etch rate vs. substrate orientation angle is

used to predict and experimentally realize desired etched wall profiles on (001) GaInAsP/InP double heterostructure (DH) wafers. The identification and utilization of crystallographic stop etch planes is key to ensuring planar and reproducible etched facets. Fabrication procedures employing wet and dry etching techniques are outlined for either isolated step-etched vertical wall profiles or narrow grooves. (33 refs.)

115388 On the preferential etching of GaAs by H₂SO₄-H₂O₂-H₂O. D.N.MacFadyen (Dept. of Electronic & Electrical Engng., Glasgow Univ., Glasgow, Scotland).

J. Electrochem. Soc. (USA), vol.130, no.9, p.1934-41 (Sept. 1983).

The preferential etching of gallium arsenide in H₂SO₄-H₂O₂-H₂O has been studied. A mechanism for the etching process is discussed drawing on observation by optical and scanning electron microscopy, published results on UHV surface analysis, and surface state models. The etch rates of the revealed planes are related to surface step densities, and the exposure of 'equilibrium' step density surfaces is related to the surface migration lengths of probable reactant species. (18 refs.)

115389 Substrate biasing for plasma etching. T.D.Mantei (Dept. of Electrical & Computer Engng., Univ. of Cincinnati, Cincinnati, OH, USA).

J. Electrochem. Soc. (USA), vol.130, no.9, p.1958-9 (Sept. 1983).

Most plasma etching processes require negative substrate biasing to ensure directional ion bombardment. In many cases, however, it may be desirable to apply an additional separately controllable substrate bias or to establish a substrate bias in a quiescent plasma in which self-bias is negligible. The negative DC substrate bias resulting from the application of an external alternating voltage to a substrate can be accurately predicted by a simple calculation. The results is confirmed by bias measurements in a quiescent plasma. (8 refs.)

115390 Phenomenological model for silicon oxidation in dry oxygen in the presence of HCl. A.I.Ellis, K.M.Gardiner, T.E.Cyr (Solid State Electronics Div., Honeywell Inc., Plymouth, MN, USA).

J. Electrochem. Soc. (USA), vol.130, no.9, p.1970-4 (Sept. 1983).

Thermal oxidation of silicon to form a thin SiO₂ layer is one of the most important processes in VLSI and VHSIC technology. In spite of the pioneering studies of Deal and Grove (1965), the growth of the first several hundred angstroms of oxide has not yet been quantitatively explained. The authors propose a conceptually simple modification of the Deal-Grove model based on the assumption that the oxygen atoms impacting the oxide surface have a definite probability of penetrating to a certain depth. Expressions useful for data analysis and simulation (SUPREM II and III) are given. (13 refs.)

115391 On the study of oxidation kinetics of molybdenite pellets. Jun Soo Kim, Hyun Gun Kim, Jae Hyun Oh.

J. Korean Inst. Met., vol.21, no.6, p.566-75 (June 1983). In Korean.

Oxidation roasting of molybdenite pellets was carried out to study the effect of temperature and oxygen concentration on the oxidation rate. The effect of heat transfer between pellet and surroundings on the reaction rate was also studied by measuring the temperature of the pellet during reaction. The results obtained in these experiments are listed. (27 refs.)

115392 Volume changes and the technical properties of composites in the spinel-manganese oxide system. Yu.D.Kuznetsov, S.A.Suvorov (All-Union Inst. of Refractories, USSR).

Refractories (USA), vol.23, no.11-12, p.584-90 (Nov.-Dec. 1982). Translation of: *Ogneupory (USSR)*, vol.23, no.11, p.33-8 (Nov. 1982).

The volume changes during the oxidation-reduction process of the manganese oxide in the Mg(Al,Cr)₂O₄-Mn₂O₃-Mn₃O₄ system have been studied. It was found that the factors destroying the refractory caused by the oxidation-reduction processes of the manganese oxides appear in composites containing high-chromite spinels. Therefore this study makes it possible to recommend as refractories to be in contact with manganese-type material those in which the spinel part consists of high-alumina spinels. (6 refs.)

115393 Corrosion resistance of materials of the AlN-Si₃N₄ system. A.F.Alekseev, T.S.Bartnitskaya, A.B.Goncharuk, V.A.Lavrenko, E.S.Lugovskaya, A.D.Panasuyuk, P.P.Pikuza, I.I.Timofeeva (Kiev Polytech. Inst., Acad. of Sci., Kiev, Ukrainian SSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.22, no.1, p.48-50 (Jan. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.1, p.53-6 (Jan. 1983). [received: Aug. 1983]

An investigation was carried out into the high-temperature oxidation kinetics of materials of the Si₃N₄-AlN system in oxygen and in air at 800-1400°C. The resultant oxidation products were determined by X-ray phase and petrographic analyses. It was established that the components exert a mutual influence on their oxidation parameters, and that the materials investigated surpass the individual nitrides in oxidation resistance right up to 1400°C. (5 refs.)

115394 A study of the thermo-oxidative process and stability of graphite and glass/PMF polyimide composites. D.A.Scola (United Technol. Res. Center, East Hartford, CT, USA).

Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.159-69

Composite materials consisting of HTS, HMS T-300, Celion 600 graphite fibers and S-glass fibers in two polyimide matrices, PMR-11 and PMR-15, were subjected to isothermal aging at 316°C in flowing air at two flow rates (100 cc/min and 900 cc/min) for time periods up to 600 hours. The weight losses, shear and flexural properties were determined at room temperature and 316°C. One system, Celion 6000/PMR-15, was selected for study at 335°C in flowing air at 100 cc/min over a 1015 hour period. The oxidation process of this isothermally exposed composite system was followed by optical microscopy and mechanical property measurements. (1 ref.)

115395 Environmental aging of epoxy composites. A.Apicella, L.Nicolais, C.Carfagna (Istituto di Principi di Ingegneria Chimica, Univ. degli Studi di Napoli, Napoli, Italy).

Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.215-29

Specimens were prepared from Epikote 828 using commercial triethylene-tetramine (TETA) as curing agent. Distilled water was used in sorption experiments. (18 refs.)

115396 Effect of surface stresses on ductility and fatigue strength of wear resisting coatings. K.Roser, H.-P.Kehrer (Siemens AG, Zentrale Fertigungsaufgaben, Munchen, Germany).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.84-90

In order to increase the wear resistance of tools and components, coatings and surface treatments are applied in increasing extent. For this purpose a great variety of layers with different properties are available. In addition to the increased wear resistance, layers also change the mechanical properties of the

parts. However, very little work has been done in this field. The present work is concerned with the effect of wear resistant coatings on ductility and fatigue strength of leaf-springs. These results are completed by X-ray stress measurements in the surface region of the specimens. (12 refs.)

115397 Application of DSL photoetching for defect revealing in epitaxially grown GaAs samples. J.L.Weyher (Dept. of Solid State III, Faculty of Sci., Catholic Univ., Nijmegen, Netherlands).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.273-7

Shows that the DSL (diluted Sirtl-like etchants with laser illumination) method is useful in examining GaAs epitaxial heterostructures. Two types of samples, namely LPE DH laser and VPE FET structures have been subjected to the repeated photoetching and micrography of identical areas. This was done in order to establish: the resolution of the method, the possibility to etch in selective manner layers of different chemical composition and finally the manner in which the defects change during treatment. The mixtures which do not attack GaAs without illumination [10] have been used to reveal defects only within the surface area limited by illumination. (13 refs.)

115398 SiC-coatings as protective layers for carbon fibers and adhesion promoters for superconducting niobium carbonitride. K.Brennfleck, E.Fitzer (Inst. für Chemische, Tech. Univ. Karlsruhe, Karlsruhe, Germany), M.Deitrich.

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.370-5

The adhesion between HM-carbon fiber (HM=high modulus) and a niobium carbonitride layer is poor if the deposition temperature is low. During heating up and cooling down crack formation in the layer and spalling of parts of the layer is observed especially with increasing layer thickness (>100 nm), resulting in a decreasing critical current density J_c with increasing layer thickness. Furthermore the reactive hydrogen in the process attacks the surface of the C substrate resulting in a decreased tensile strength of the fiber. With SiC ($\alpha=4.5\cdot10^{-60}C^{-1}$) as interlayer the mentioned adhesion problems are expected to be lowered. The effectiveness of SiC as a protective layer for the carbon fiber and adhesion promoter for the niobium carbonitride has therefore been investigated. (6 refs.)

115399 Observations on the growth and impact of intermetallic compounds on tin-coated substrates. M.E.Warwick, S.J.Muckett (Internat. Tin Res. Inst., Greenford, England).

Circuit World (GB), vol.9, no.4, p.5-11 (1983).

Tin and solder coatings interact with substrates commonly used in the electronics industry to produce layers of intermetallic compounds at temperatures above and below the melting point of the coatings. Observations on the rates of compound growth at room temperature for durations of up to 12 years are reported and related to the published results for shorter times at higher temperatures. Recent results concerning the effect of intermetallic compound growth on the solderability of coatings and on the strength of soldered joints are presented. In both cases it is apparent that retarding the rate of compound growth could be useful and the use of barrier layers for this purpose is considered. (13 refs.)

115400 Mass decrement examination of construction materials during chemical cleaning of equipment with hydrofluoric acid. J.Gemza, M.Kowalczewski.

Energetyka (Poland), vol.37, no.4, p.162-4 (April 1983). In Polish. [received: Sept. 1983]

The paper presents the methods and results of mass decrement examination during chemical cleaning with hydrofluoric acid of some tens of steel grades used for power plant equipment. The suitability of the M-B inhibitor for chemical cleaning of all examined grades of steel has been stated. Optimum physical and chemical parameters for the chemical cleaning process with hydrofluoric acid have been determined (bath temperature, acid concentration, flow speed of the solution). (no refs.)

115401 A study of friction and wear resistance of two-layer TiN+Mo vacuum-plasma coatings. V.M.Matsevityi, B.A.Polyanin, M.S.Borushko, L.M.Romanova.

Elektron. Obrab. Mater. (USSR), no.3, p.29-33 (1983). In Russian. English translation in: *Electrochem. Ind. Process. & Biol. (GB)*

An examination is made of some results of a study of the frictional characteristics and wear resistance of single-layer TiN and two-layer TiN+Mo vacuum-plasma coatings with different levels of surface roughness. The wear tests were conducted on a friction machine in an environment of aviation spirit ($t=60^{\circ}C$) using the plane-cylinder arrangement with a speed of slip of 1 m/s. The control specimen was a cylinder or quenched steel Kh12M. It was found that, independently of coating composition or surface roughness, the value of the coefficient of friction was within the limits 0.11-0.13. The TiN+Mo coatings by comparison with those of TiN gave lower values of friction coefficient under low loads, and higher values of bulk wear. (1 ref.) *A.J.B.*

115402 The protection against corrosion of low-voltage heavy-duty fuse contacts. M.Altenhuber.

Elektrotech. Z. ETZ (Germany), vol.104, no.14, p.708-10 (July 1983). In German.

Tin, silver, or nickel deposits are generally used on the lower contacts and contact blades of low-voltage heavy-duty fuses as a protection against corrosion. The requirements of these contact surfaces are low contact resistance, ability to resist corrosion, long life in deleterious atmospheres, safety in extreme thermal conditions, and high mechanical strength of the surface layer. Investigations with nickel show that over an extended period the growth of oxide had little effect on the contact resistance even in strongly corrosive surroundings, the results with tin were similar. The susceptibility to corrosion of silver surfaces in sulphurous atmospheres is well known. Nickel showed the best thermal and mechanical qualities, tin had the lowest mechanical values and there is the danger of the welding together of contacts under extreme current loading. (8 refs.) *A.G.P.*

115403 Scaling of materials for hot gas tubing in an air-cooled solar tower power station under thermal cycling between 623 and 1073K. J.Ebberink, G.Hulmann (Internat. Atomreaktorbau GmbH, Bergisch Gladbach, Germany).

Werkst. & Korros. (Germany), vol.34, no.8, p.385-91 (Aug. 1983). In German.

The corrosion behaviour of two heat resistant alloys X 12 CrNi2521 (1.4845) and X 10NiCrAlTi3220 (1.4876) is studied. These alloys are model alloys for hot air pipes of a gas cooled solar tower power station. The maximum operating temperature is 1073K (solar operation), the minimum is 623K (fossil operation) during cloudy periods and at night. The experimental simulation device for cyclic temperature exposure between 623K and 1073K is described and experimental results are discussed. After 7000 cycles with the temperature gradient of <7K/s growth, composition and adherence of corrosion layers on the materials are determined. The post examinations of the exposed specimens show the better corrosion behaviour of X 12CrNi2521 not only after isothermal exposure at 1073K but also after thermal cyclic exposure between 623 and 1073K. (8 refs.)

115404 Electrolytical corrosion behaviour of iron-, nickel- and cobalt-base metallic glasses. U.Linker, W.Plieth (Inst. für physikalische Chem., Freien Univ. Berlin, Berlin, Germany).

Werkst. & Korros. (Germany), vol.34, no.8, p.391-7 (Aug. 1983). In German.

The corrosion behaviour of the three amorphous metals Fe₄₀Ni₄₀B₂₀, Ni₇₈Si₈B₁₄ and Co₃₈Ni₁₀Fe₃Si₁B₁₆ was investigated in 0.5 M sulfuric acid and in a boric acid/borax buffer solution. Cyclic voltammograms of the three alloys were measured between hydrogen and oxygen evolution. In case a passive region occurred the corrosion rate in this region was increased by two or three orders of magnitude. Otherwise a potential region with small net current density was observed between hydrogen evolution and active dissolution. This is explained by inhibition of the cathodic partial current density of the hydrogen evolution reaction. All three materials showed increased susceptibility to local corrosion. (21 refs.)

115405 Rust formation on iron—a model. H.Worch, W.Forker, D.Rahner (Tech. Univ. Dresden, Dresden, Germany).

Werkst. & Korros. (Germany), vol.34, no.8, p.402-10 (Aug. 1983). In German.

A model is presented on the basis of which the phenomenological variety of rusting can be reduced to a few basic processes. The first step of the formation of rust results in the transfer reaction of iron(II)-ions from the metal surface into the adherent boundary layer, the ions being surrounded there by water molecules or hydroxide ions. Here or after their diffusion into the adherent electrolyte solution they are oxidized to Fe(III)-ions by oxygen or other oxidants, eventually also electrochemically. The nuclei of the structures of FeOOH modifications develop from hydrogen bonded iron hydroxo- and/or -aquo-complexes by transposition of the iron ions and water loss. If only Fe(III)-ions participate in the nucleation process, then the stable oxides or oxyhydroxides in relation to the solution are formed. The metastable structures result from simultaneous participation of Fe(II)- and Fe(III)-ions. (42 refs.)

115406 Results of apparent atomic oxygen reactions on Ag, C, and Os exposed during the shuttle STS-4 orbits. P.N.Peters, R.C.Linton, E.R.Miller (Space Sci. Lab., NASA/Marshall Space Flight Center, Huntsville, AL, USA).

Geophys. Res. Lett. (USA), vol.10, no.7, p.569-71 (July 1983).

Films selected for anticipated reaction with atomic oxygen, namely carbon, silver, and osmium, were exposed during the Shuttle STS-4 mission. A silver film 225 ± 5 nm thick was converted to a transparent blue-green interference film 355 ± 5 nm thick. Both carbon and osmium films 10-30 nm thick apparently formed volatile oxides and disappeared, except where well shielded. A calculated total of approximately 7×10^{19} oxygen atoms per cm² struck the surfaces, which could have removed on the order of 3 μ m of material if only 10% reacted. The absence of apparent effects on adjacent thin and thick gold films is offered as evidence that sputtering is not responsible. (18 refs.)

115407 Continuous hot dip plating process for improved anticorrosion steel strips. K.Nishimura, K.Katayama, T.Kimura, T.Yamaguchi (Ichikawa Works, Nissin Steel Co. Ltd., Tokyo, Japan). *Hitachi Rev. (Japan)*, vol.32, no.2, p.77-82 (April 1983). [received: Aug. 1983]

Improved anticorrosive technology for continuous hot dip plated steel strips has been realized in actual production. Metal plating of uniform thickness has been achieved for steel strips by preventing strip oscillations and levelling bowed strips that are produced at the gas wiping process. Also, a technique has been developed for producing hot dip one-side aluminized steel strips that are superior in anticorrosion to galvanized steel strips. These technologies are significant for improving anticorrosion characteristics of steel strips. (3 refs.)

115408 Cast alloy resists corrosion by hot acids and oxidizing agents. F.G.Hodge (Cabot Corp., Kokomo, IN, USA).

Ind. Res./Dev. (USA), vol.25, no.7, p.82-5 (July 1983). Describes the development of Ni-based C-4C alloy which features high resistance to corrosion as cast, without having to be wrought. Properties of this alloy are tabulated and its practical application in manufacturing Du Pont pumps is described. (no refs.)

115409 Diffusion-coupled active dissolution in the localized corrosion of stainless steels. R.C.Newman, H.S.Isaacs (Corrosion Sci. Group, Brookhaven Nat. Lab., Upton, NY, USA).

J. Electrochem. Soc. (USA), vol.130, no.7, p.1621-4 (July 1983). Examines the anodic dissolution of stainless steels in environments relevant to localized corrosion in neutral chloride solutions. There is a maximum active dissolution rate, for a given potential, which is not associated with the most concentrated localized environment. This observation seems to be significant with respect to the stability of localized corrosion in these alloys. Results of this kind are capable of explaining the existence of a critical pit solution, a protection potential against pitting, multiple steady states, low frequency electrochemical noise and differences between open circuit and potentiostatic behavior. (12 refs.)

115410 The dealloying of a Cu-8.90% Al solid solution. M.J.Pryor (Metals Res. Labs., Olin Corp., New Haven, CT, USA).

J. Electrochem. Soc. (USA), vol.130, no.7, p.1625-7 (July 1983). Mass balance experiments on the dealloying of Cu-Al solid solution were carried out in 0.5 M NaCl solution at 25°C at potentials ranging from +0.50 to -0.50 V_{SHE}. There is substantial and effective dealloying of the CuAl solid solution starting at a potential of 0.00 V with the selectivity of dealloying (i.e. the enhancement of solute concentration found in the total corrosion product), increasing as the potential is depressed to -0.50 V. The experiments confirm the widely held view that Cu-Al solid solutions are somewhat more resistant to dealloying than Cu-Zn solid solutions. (10 refs.)

115411 Corrosion by alternating current: polarization of mild steel in neutral electrolytes. D.-T.Chin, P.Sachdev (Dept. of Chem. Engng., Clarkson Coll. of Technol., Potsdam, NY, USA).

J. Electrochem. Soc. (USA), vol.130, no.8, p.1714-18 (Aug. 1983). The authors' laboratory had previously undertaken a series of investigations of the effect of AC on the corrosion of metals. Sixty cycles sinusoidal AC was superimposed onto an oxygen diffusion cell, and the measurement of corrosion current was compared to the actual weight loss of the specimens in soil. It was found that sinusoidal AC enhanced the corrosion of aluminium, copper, mild steel, and a 50-50% tin-lead alloy. At high AC levels, severe pitting corrosion occurred on copper and mild steel specimens. Subsequent polarization measurements for mild steel in a neutral sodium sulfate solution revealed that sinusoidal AC enhanced the corrosion current, shifted the corrosion potential toward the negative direction, and destroyed the passivity of mild steel at the passive potentials. The effect was similar to the addition of chloride ions to sulfate solutions. In the present work, the polarisation measurement has been extended to neutral sodium chlorate, sodium nitrate, and sodium perchlorate solutions. Anions can exert profound influence on the passivation mechanism. (8 refs.)

115412 Oxidation of Cu₃Sn and Cu₆Sn₅ films in room air from 175° to 250°C. H.G.Tompkins, J.E.Bennett, J.A.Augis, T.M.Paskowski (Bell Labs., Columbus, OH, USA).

J. Electrochem. Soc. (USA), vol.130, no.8, p.1758-62 (Aug. 1983). Stoichiometric single-phase samples of Cu₃Sn and Cu₆Sn₅ were fabricated by sputter deposition. These were subsequently heated in air for various time and temperatures. For most of the time-temperature combinations, the resulting film was tens of angstroms thick and primarily an Sn oxide containing some copper. The film growth can be described kinetically with a logarithmic rate law. For the higher temperatures for longer times, when the Cu-to-Sn ratio in the center of the oxide film reached about 1:1, the film growth mechanism changed. This resulted in films several hundreds of angstroms thick which were primarily copper oxide. (28 refs.)

115413 Surface enrichment of nitrogen during passivation of a highly resistant stainless steel. Y.C.Lu, R.Bandy, C.R.Clayton, R.C.Newman (Brookhaven Nat. Lab., Upton, NY, USA).

J. Electrochem. Soc. (USA), vol.130, no.8, p.1774-6 (Aug. 1983). A stainless steel with 0.44 wt.% N and 6.1 wt.% Mo has been shown to have exceptional resistance to localized corrosion. This resistance is superior to that of commercial alloys based on Fe-Cr-Ni-Mo, and at least equal to that of more expensive Ni-Mo-Cr alloys. The alloy also represents a significant improvement on laboratory materials with somewhat lower N or Mo concentrations. The authors have analyzed the surface of the alloy after passivation, and have obtained evidence for a surface enrichment of N. The role of Mo remains obscure. (7 refs.)

115414 Reactive ion etching of copper films. G.C.Schwartz, P.M.Schaible (IBM, East Fishkill Facility, Hopewell Junction, NY, USA).

J. Electrochem. Soc. (USA), vol.130, no.8, p.1777-9 (Aug. 1983). The authors have demonstrated that it is feasible to reactively ion etch (RIE) copper films. The etch rate is about an order of magnitude higher than the sputter etch rate. There is no undercut of an inert mask and the patterns formed have vertical sidewalls. (2 refs.)

115415 Anodic protection of mild steel in sulphuric acid. T.P.Sastry, V.V.Rao (Dept. of Chem., SV Regional Coll. of Engng. & Technol., Surat, India).

J. Indian Inst. Sci., vol.64, no.1, p.61-9 (Jan. 1983). [received: Sept. 1983] Corrosion of mild steel in dilute sulphuric acid can be controlled to an acceptable level by anodic protection. Analysis of potentiostatic polarization curves for mild steel in sulphuric acid of different concentrations and at different temperatures reveals the parameters necessary for application of anodic protection to this system. A comparison of the corrosion rates of the unprotected and the anodically protected mild steel is made. The efficiency of anodic protection in controlling corrosion is determined: protection efficiencies in most of the cases are a very high order (99%). (17 refs.)

115416 Effecting the corrosion relationship of corroding element-cladding material of ZrNb1 by mechanical surface treatment. G.Naumann (Zentralinstitut für Kernforschung Rossendorf, Bereich, Dresden, Germany).

J. Nucl. Mater. (Netherlands), vol.116, no.2-3, p.147-56 (June 1983). In German.

The reactivity of the outer surface of cladding material of the alloy Zr-1% Nb is significantly increased above the well-known state of chemically or electrochemically polished specimens by abrasive surface treatments. Out-of-reactor oxidation in water resulted in heterogeneous oxide films on liquid honed and belt ground samples. An effect of intensity of mechanical treatment on the degree of the surface reactivity increase was found in voltammetric and potentiostatic investigations. The change of surface activity is due to different electronic conduction of the oxide film. The results are explained on the basis of Thiessen's tribochemical model (1966). Increased reactivity is a consequence of tribochemical reactions including the interacting materials, molecules of sorption layers, and the surrounding atmospheric milieu. The production and distribution of intermetallic reaction products are supposed to play an important role in this process. The forces of mechanical loading determine the induced excess energy, which controls both probability and selection of the tribochemical reactions. (29 refs.)

115417 A new gas equilibration method for the measurement of carbon potential: carbon potential in austenitic 316 stainless steel at 1000°C. M.Handa, I.Takahashi, T.Tsukuda, T.Iwai (Div. of Nuclear Fuel Res., JAERI, Ibaraki-ken, Japan).

J. Nucl. Mater. (Netherlands), vol.116, no.2-3, p.178-83 (June 1983). A new method for the determination and control of the carbon potential of a sample material using CH₄/H₂ gas equilibration was developed. The carbon potential of the sample could be controlled in a wide range with an accuracy of about ±0.1 kcal/mol by adopting several kinds of reference mixtures, in which the temperature of the reference material, metal/metal-carbide mixture set, was changed. The carbon potential in austenitic 316 stainless steel at 1000°C was measured successfully by this method. (19 refs.)

115418 Inhomogeneous plastic deformation and its relevance to iodine stress corrosion cracking susceptibility in irradiated Zircaloy-2 tubing. T.Onchi (Central Res. Inst. of Electric Power Industry, Iwato-Kita, Komae-shi, Tokyo, Japan), H.Kayano, Y.Higashiguchi.

J. Nucl. Mater. (Netherlands), vol.116, no.2-3, p.211-18 (June 1983). Evidence from tensile tests on specimens derived from Zircaloy-2 tubing of current 8×8 BWR type design and irradiated to 3.2×10¹⁹ and 3.0×10²⁰ n/cm² (E>1 MeV) showed that inhomogeneous plastic deformation occurred in the temperature range 300-350°C for the higher neutron fluence, but not for the lower one. Dislocation channelings were also identified by transmission electron microscopy for the specimen irradiated to the higher fluence and strained at around 320°C, but not for the lower fluence. On the basis of the results, an attempt was made to explain the influence of neutron irradiation on the iodine stress corrosion cracking (SCC) susceptibility of Zircaloy tubing, suggesting that a drastic increase of SCC susceptibility at neutron fluences above 10²⁰ n/cm², hypothesized by Lunde and Videm, could be successfully interpreted in terms of the occurrence of dislocation channels. (18 refs.)

115419 Stress corrosion cracking of aged Al-5Zn-4Mg alloy in 3.5% NaCl solution. P.Gopalan (Dev. Group, Hindustan Aeronautics Ltd., Bangalore, India), T.S.Panchapagesan, Kishore, E.S.Dwarakadasa.

J. Electrochem. Soc. India, vol.32, no.1, p.17-21 (Jan. 1983). [received: Sept. 1983]

Specimens of high strength Al-5Zn-4Mg alloy have been subjected to dynamic SCC under constant strain rate tensile loading in 3.5% NaCl solution. Alloys tested in peak aged and overaged conditions reveal that the resistance to SCC improves as the specimen is overaged. The effect of strain rate is significant at low values. Fractures in presence of corrodent, exhibit apparently brittle failures, often obscured by corrosion products. Microstructure of the alloy (studied by TEM) is found to closely control the SCC behaviour. An attempt has been made to correlate the SCC behaviour with structure. A hydrogen embrittlement model of cracking has been used to explain the observed fractographic features. (15 refs.)

115420 Inhibitive action of some amines towards corrosion of 70/30 brass in sulphuric acid. Pushpa Gupta (Inst. of Tech., Banaras Hindu Univ., Varanasi, India), R.S.Chaudhary, T.K.G.Namboodhiri, B.Prakash, B.B.Prasad.

J. Electrochem. Soc. India, vol.32, no.1, p.27-31 (Jan. 1983). [received: Sept. 1983]

Effect of aniline, o-nitroaniline, p-nitroaniline, o-chloroaniline, p-chloroaniline, dibenzyl amine, N-butyl amine, and triethyl amine on corrosion of 70/30 brass in 1% H₂SO₄ solution has been investigated by weight loss, solution analysis and potentiostatic techniques. All the inhibitors studied show poor efficiency and are anodic inhibitors. Aniline, p-nitroaniline, triethyl amine and N-butyl amine have been found to be effective for decreasing the dezincification rate of 70/30 brass in 1% H₂SO₄ solution. The cause of obtaining poor inhibition efficiency with these compounds has been explained on the basis of molecular structures. (12 refs.)

115421 Determination of corrosion rates in high purity water employing coulometric method. K.S.Rajagopalan, N.Krithivasan, S.Thangathirupathy, M.E.K.Janki (Central Electrochem. Res. Inst., Karaikudi, India).

J. Electrochem. Soc. India, vol.32, no.1, p.34-40 (Jan. 1983). [received: Sept. 1983]

The coulometric method was successfully applied to rapid evaluation of metal corrosion rate in solution where a known amount of charge was supplied to a test piece and the potential decay curve recorded was analysed to obtain the corrosion rate. This method avoids some of the essential shortcomings of the polarisation resistance method. Experiments in hydrochloric as well as sulphuric acids of different concentrations with carbon steel yielded corrosion rates comparable with other methods. The method could be successfully applied for the determination of corrosion rates of carbon steel in double distilled water and the results compared very well with weight loss measurements. The influence of the presence of anions like chloride and sulphate at ppm levels was also studied. (10 refs.)

115422 Ellipsometric evaluation of various pretreatments on zircaloy-2. S.V.Phadnis, P.K.Chauhan, H.S.Gadiyar (Metal Div., Bhabha Atomic Res. Centre, Bombay, India).

J. Electrochem. Soc. India, vol.32, no.1, p.41-6 (Jan. 1983). [received: Sept. 1983]

The oxide films developed on zircaloy-2 as a result of various pretreatments, namely (i) mechanical polishing, (ii) etching in HF-HNO₃ solution, (iii) anodization in 1.0% H₂SO₄ at 45 volts, (iv) anodization in 1.0% KOH at 45 volts, and (v) oxidation in 1500 psi steam at 400°C for 10 minutes have been studied for their refractive indices and thicknesses by ellipsometry. The real part 'n' of refractive indices n(1-ik) of all the films was found to be 2.0±0.6, while absorption coefficient 'k' varied. The absorption coefficient for the film formed after anodization in KOH was 0.24 while on those after other pretreatments was in range (0.02-0.06). Thicknesses of films on etched and

mechanically polished zircaloy-2 were 37.3 Å and 55 Å respectively while those of anodized in H_2SO_4 , KOH and oxidised in steam were 1906.3 Å, 691.5 Å and 447.7 Å respectively. An attempt has been made to correlate these film properties with the long term corrosion behaviour of zircaloy-2 in high temperature water. (12 refs.)

115423 Benzotriazole as an inhibitor to corrosion of mild steel in sulphuric acid. P.N.Giriya Shankar, K.I.Vasu. *J. Electrochem. Soc. India*, vol.32, no.1, p.47-51 (Jan. 1983). [received: Sept. 1983]

Corrosion of mild steel in sulphuric acid media was studied by galvanostatic polarization technique. Benzotriazole at concentrations up to 25 mM was found to be a better inhibitor in 1N H_2SO_4 than in 2N H_2SO_4 . A plot of percentage area covered by the inhibitor against the inhibitor concentration reveals that benzotriazole absorbs according to Temkin's rule in 1N H_2SO_4 , while the absorption of the inhibitor in 2N H_2SO_4 follows the Langmuir isotherm. (9 refs.)

115424 A typical and short case study on the effect of pollution on corrosion. E.Elayaperumal. *J. Electrochem. Soc. India*, vol.32, no.1, p.65-6 (Jan. 1983). [received: Sept. 1983]

An engineering fabrication plant has been storing structural steels successfully in an open-yard in the plant of 2 or 3 decades. But in the last few years unacceptable corrosion has been noticed in the steel stored in the open yard. Corrosion has been occurring in spite of application of a certain paint. The unusual corrosion has been ascribed to the several new industries which have come up during the past few years in and around the plant. The emission for these industries not only pollute the air but also lead to corrosion of the structural steels in the neighbouring areas. The air in these surroundings contains corrosive ingredients. The earlier used paint system apparently is not designed to withstand corrosion by these industrial pollutants. The following principal coating resins are considered suitable for the above purposes: 1. Alkyds, 2. Vinyis, 3. Epoxy, and 4. Zinc-rich. (no refs.)

115425 Non-equilibrium phases in laser-processed Fe-0.2 wt.% C-20 wt.% Cr alloys. P.A.Molian (Dept. of Mech. Engng., Iowa State Univ., Ames, IA, USA), W.E.Wood.

Mater. Sci. & Eng. (Switzerland), vol.60, no.3, p.241-5 (Sept. 1983). The microstructures and microhardness of laser-processed Fe-0.2 wt.% C-20 wt.% Cr alloys were investigated as a function of melt depth in single and multiple (overlapping) laser passes. The single-laser-pass alloys exhibited duplex austenite-ferrite structures with no evidence of carbide precipitation. Melt depths of up to 600 µm did not influence this microstructure. The multiple-laser-pass alloys consisted of lath martensite-ferrite structures in deep (about 600 µm) penetration melts and austenite-ferrite structures in shallow (about 120 µm) penetration melts. The transformation of austenite to martensite in multiple-laser-pass alloys, observed only in deep penetration melts, was explained as due to the effects of tempering temperature, time and quench rate obtained during subsequent laser passes. Conventional furnace heat treatments of single-laser-pass alloys substantiated these conclusions. (1 ref.)

115426 Influence of an increase in phosphorus content on the corrosion resistance of austenitic stainless steels type Z 2 CND 17-12. J.C.Charbonnier, T.Jossic, B.Thomas (Inst. de Recherches de la Siderurgie Francaise, St. Germain-en-Laye, France). *Mem. & Etud. Sci. Rev. Metall. (France)*, vol.80, no.7-8, p.349-53 (July-Aug. 1983). In French.

Results of tests carried out on four laboratory castings, each of 25 kg, with P contents varying between 0.001 and 0.040 wt.% are presented. Factors considered include intercrystalline corrosion, pitting corrosion, cavity corrosion and electrochemical behaviour in acid environment. (4 refs.)

115427 Observations of nodule growth during the oxidation of pure binary iron-aluminum alloys. P.Tomaszewicz, G.R.Wallwork (School of Metall., Univ. of New South Wales, Kensington, NSW, Australia).

Oxid. Met. (USA), vol.19, no.5-6, p.165-85 (June 1983). Oxidation studies were carried out in oxygen at 800°C, on a series of pure binary iron-based alloys with between 1.9 and 9.8 wt.% aluminum. The results are presented in conjunction with the existing literature and these permit the development of a classification of scale morphologies based on alloy composition. Alloys with less than 2.4 wt.% aluminum form bulky stratified scales composed of Fe_2O_3 and Fe_3O_4 with FeAl_2O_4 and Al_2O_3 at the scale-metal interface. Alloys with between 2.4 and 6.9 wt.% form an external alloy substrate. Only alloys with greater than 6.9 wt.% aluminum form completely protective Al_2O_3 scales. Models based on oxide nucleation are presented for the growth of bulky scales and also the iron oxide nodules. (23 refs.)

115428 Effect of sulfur dioxide on the oxidation of thin films of tin. C.I.Muneera, S.Varghese (Dept. of Phys., Univ. of Kerala, Kerala, India), V.Unnikrishnan Nayar.

Oxid. Met. (USA), vol.19, no.5-6, p.187-99 (June 1983). The oxidation of thin films of tin in SO_2 -air atmospheres containing 10%, 20%, 30%, 40%, 50%, and 60% SO_2 have been investigated at room temperature. Reaction kinetics were studied by the variation in resistance of thin films and growth patterns by metallography. Addition of SO_2 causes an increase in the oxidation rate of thin films of tin. Probable reactions at lower and higher percentages of SO_2 have been discussed. (28 refs.)

115429 Acidic and basic fluxing of Ni-base superalloys in a 90Na₂SO₄-10K₂SO₄ melt at 1173K. W.T.Wu (Inst. of Metal Res., Acad. Sinica, Shenyang, China), A.Rahmel, M.Schorr.

Oxid. Met. (USA), vol.19, no.5-6, p.201-29 (June 1983). The influence of the electrode potential on the corrosion behavior of a series of Ni-base superalloys has been investigated in a (mole %) 90Na₂SO₄-10K₂SO₄ melt at 1173K. Acidic fluxing occurs at positive potentials and basic fluxing at negative potentials. A protective scale is formed in an intermediate (neutral) potential range on high chromium-containing alloys such as IN-738LC, IN-939, IN-597, and IN-657. The breakthrough potentials for acidic and basic fluxing depend on the composition of the alloy. Alloys with low chromium contents such as IN-100 and IN-713 LC do not form stable protective scales at any potential. Numerous sulfide phases have been identified in the scale and subscale, depending on potential, severity of attack, and material composition. NaCrS₂ only forms under basic fluxing conditions. Its presence can therefore be considered as an indication that basic fluxing conditions have existed. (16 refs.)

115430 Influence of the mechanical pretreatment of the surfaces on the adhesive strength of steel-grey cast iron joints. P.Fahrenschon. *Plaste & Kautsch. (Germany)*, vol.30, no.7, p.403-5 (July 1983). In German. For milled rails with an adhering harder strip the surface roughness of the two adhering components is of less significance than their metallographic structure, with regard to their shear strength. (11 refs.) R.S.

115431 Effect of waterglass impregnation upon hardenability of porous sintered steel. H.-J.Maurer, W.Bodden (Schunk & Ebe GmbH, Giessen, Germany).

Powder Metall. Int. (Germany), vol.15, no.3, p.122-5 (Aug. 1983). Various sintered steels with densities between 5.9 Mg/m³ and 7.4 Mg/m³ were tested after impregnation with liquid waterglass subsequent to sintering. A special hardening method is used to expel the crystal water from the waterglass. The hardened waterglass now affects the pores of the sintered steel part in such a way that diffusion of the hardening gases into the part is very much limited. Thus it becomes possible to apply a hard layer that is strictly limited to the surface areas of sintered steel parts of a density from 6.5 Mg/m³ upwards. The special advantage of this method is, in addition to maintaining a tough core, that very limited dimensional changes occur in the sintered parts. (5 refs.)

115432 Chemical deposition of metallic tin upon copper substrates. G.F.Paus, R.C.V.Piatti, J.J.Podesta (Instituto de Investigaciones Fisicoquimicas Teoricas y Aplicadas (INIFTA), Argentina), La Plata.

Rev. Teleg. Electron. (Argentina), vol.71, no.837, p.59-60 (Jan.-Feb. 1983). In Spanish.

Reports work on the auto deposition of metallic Sn on Cu substrates (copper-clad plastic laminates, printed circuit boards) by immersing them in solutions of SnCl_2 , HCl, $\text{H}_2\text{N.CSNH}_2$ and NaH_2PO_2 in distilled water at temperatures between 30° and 90°C for periods between 5 and 120 minutes. The results of salt spray, weathering and humidity tests upon the samples are given, showing that the method provides coatings of good corrosion resistance, solderability and appearance. Similar experiments were made with autodeposition of acid nickel, alkaline nickel and gold. (no refs.) C.J.O.G.

115433 Structure of the oxide films of VT14 alloy formed in treatment in air at 850°C. G.G.Maksimovich, V.N.Fedirko, A.T.Lizun, L.A.Bunin (G.V. Karpenko Physicochem. Inst., Acad. of Sci., Lvov, Ukrainian SSR).

Sov. Mater. Sci. (USA), vol.18, no.6, p.468-70 (Nov.-Dec. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.6, p.13-16 (Nov.-Dec. 1982). Investigates the influence of alloying elements on the structure of the scale on VT14 alloy after treatment in air at 850°C with hold times of 1, 5, and 10 h. A 1-h hold at 850°C created a scale primarily of TiO_2 rutile and Al_2O_3 oxide, and the Al_2O_3 layer was located at the gas-scale interface. With an increase in hold time to 10 h, according to micro-X-ray spectral analysis, TiO_2 oxide and Al_2O_3 oxide located at the surface with MoO_3 and V_2O_5 oxides uniformly distributed over the whole volume became dominant in the structure of the scale. Therefore, in the formation on VT14 alloy at 850°C of a lamellar scale of complex composition all of the alloying elements participate. (9 refs.)

115434 Problems of the life of constructional materials in nitrogen and hydrogen-containing media. A.L.Bichuya (G.V. Karpenko Physicochem. Inst., Acad. of Sci., Lvov, Ukrainian SSR).

Sov. Mater. Sci. (USA), vol.18, no.6, p.479-81 (Nov.-Dec. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.6, p.25-8 (Nov.-Dec. 1982). An analysis is made of those factors which influence the high-temperature life of constructional materials in nitrogen and hydrogen containing media, particularly in ammonia. It is concluded that the observed reduction in life may occur as a result of corrosion damage related to nitriding, and also of hydrogen embrittlement occurring as the result of penetration of hydrogen formed in dissociation of the adsorbed gaseous phase on the metal being deformed. (13 refs.)

115435 Local corrosion of martensitic stainless steel in a medium containing chloride ions and hydrogen sulfide. I.I.Vasilenko, M.F.Alekseenko, G.D.Levitskaya, A.I.Radkevich, Z.N.Mukhina (G.V. Karpenko Physicochem. Inst., Acad. of Sci., Lvov, Ukrainian SSR).

Sov. Mater. Sci. (USA), vol.18, no.6, p.491-4 (Nov.-Dec. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.6, p.39-42 (Nov.-Dec. 1982). A quantitative analysis was made of the products of H_2S corrosion of a martensitic stainless steel, making it possible to determine the rate of solution of the individual alloying elements as well as the steel as a whole. Steel 15Kh12N2MVFBa hardened from 1020°C and tempered 660°C was investigated. The corrosion rate of the steel was found to be 8 mg/(m².h). Iron, chromium and nickel were found in the solution in the ratio 18.8:13.4:1. Ions of the carbide-forming elements were not found. It therefore follows that carbide-forming elements may be used as alloying elements without loss of corrosion resistance. (13 refs.)

115436 Some problems of investigation of the cyclic crack resistance of materials in liquid media. V.V.Panasnyuk, L.V.Ratyeh, I.N.Dmytrakh (G.V. Karpenko Physicochem. Inst., Acad. of Sci., Lvov, Ukrainian SSR).

Sov. Mater. Sci. (USA), vol.18, no.6, p.494-9 (Nov.-Dec. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.6, p.42-9 (Nov.-Dec. 1982). Within the limits of problems of fracture mechanics new approaches and methods of determining the cyclic crack resistance of materials under conditions of the action of liquid corrosive media are discussed and certain results obtained using these methods are presented. Cyclic crack resistance tests on 20SF steel in 3% NaCl solution were carried out using the method described. (31 refs.)

115437 Inhibitors for the protection of steel from acid corrosion at high temperature and pressure. A.K.Mindyuk, N.A.Kravchuk, O.A.Sirotyuk, V.F.Malakhov (G.V. Karpenko Physicochem. Inst., Acad. of Sci., Lvov, Ukrainian SSR).

Sov. Mater. Sci. (USA), vol.18, no.6, p.518-21 (Nov.-Dec. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.6, p.69-72 (Nov.-Dec. 1982). Presents the results of investigations of the corrosion of steel (steel of strength group D) in 12% HCl solution and of its protection by KhOSP-10, KhOSP-N, and KhOSP-A inhibitors at temperatures of 100, 120, 140, and 160°C and a pressure of 30 MPa for 3 h. The 25 mm diameter×2 mm samples were cut from casing pipe. The samples were placed in the high-pressure chamber of a special unit with an electric heater and the electric heaters of the high-pressure chamber and the working solution preliminary heating chamber were turned on simultaneously. After heating to 90°C the medium was pumped from the preliminary heating chamber into the high-pressure chamber, where it was heated to the necessary temperature and was subjected to pressure with the help of a manual press. After holding at the established conditions for 3 h, the electric heater was turned off, the pressure was reduced by the manifold, the samples were removed, and they were cleaned and weighed. The error in weighing was 0.1 mg with a sample weight of about 5.6 g each. The test data was averaged for two to four samples. (7 refs.)

115438 High-temperature salt corrosion cracking of titanium alloy semifinished products. V.S.Sinyavskii, V.V.Usova, S.I.Lunina, S.A.Kushakevich, E.A.Makhmutova, Z.K.Khanina.

Sov. Mater. Sci. (USA), vol.18, no.6, p.521-4 (Nov.-Dec. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.6, p.72-5 (Nov.-Dec. 1982). The high temperature NaCl corrosion cracking of the Ti alloys VT-20, VT6, VT14 and OT4-1 was investigated on tensile samples. The influence of the

form of the semifinished product, the anisotropy of the corrosion-mechanical properties, and heat treatment on the resistance of the alloys to corrosion cracking were studied. It is concluded that the sensitivity of the alloys to corrosion cracking may be judged indirectly from the change in mechanical properties. (11 refs.)

115439 Optimization of the parameters of obtaining noncarbide-forming coatings. V.I.Korshun (Dnepropetrovsk Chemicotechnol. Inst., Ukrainian SSR).

Sov. Mater. Sci. (USA), vol.18, no.6, p.525-6 (Nov.-Dec. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.6, p.75-7 (Nov.-Dec. 1982). A method is developed for the computer calculation of the optimum depth of the decarburized zone, and times of decarburization and coating application on steel. (9 refs.)

115440 Production of bimetallic contact elements by a diffusion impregnation method. M.S.Goikhan (G.V. Karpenko Physicomech. Inst., Acad. of Sci., Lvov, Ukrainian SSR).

Sov. Mater. Sci. (USA), vol.18, no.6, p.527-9 (Nov.-Dec. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.6, p.77-9 (Nov.-Dec. 1982). The method of diffusion impregnation of copper in molten sodium containing silver and alloying elements was used to produce bimetal electrical contact elements capable of successfully competing with those produced by hot pressing and rolling. (4 refs.)

115441 Assessment of residual stresses in coatings applied to P/M parts. S.S.Ermakov, A.M.Shmakov, V.M.Studentsov, A.I.Neumoin (Leningrad Polytech. Inst., Leningrad, USSR).

Sov. Powder Metall. & Met. Ceram. (USA), vol.22, no.1, p.17-20 (Jan. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.1, p.19-21 (Jan. 1983). [received: Aug. 1983] A study was made of the physicomechanical characteristics of coatings applied to sintered materials and of the properties of such coating/basis systems. It is concluded that by varying the composition of the coating, the density of the base material, and the coating-to-base thickness ratio, it is possible to improve the elastic properties of parts and ensure a favourable distribution of residual stresses in the coating. (10 refs.)

115442 Anodic oxidation of iron and cathodic reduction of the anodic film: a review. J.L.Delplancke (Metall.-Electrochimie, Univ. Libre de Bruxelles, Brussels, Belgium).

Surf. Technol. (Switzerland), vol.20, no.1, p.71-81 (Sept. 1983). The different theoretical models used to describe the electrochemical behaviour of iron in the two most studied electrolytes (a borate buffer solution and a sulphate solution) and the study of the cathodic reduction of the anodic film in a borate buffer solution are dealt with in this review. (80 refs.)

115443 New fields of application of plasma spraying in energy technology. P.C.Wolf.

Waerme (Germany), vol.89, no.3, p.42-5 (June 1983). In German. Describes vacuum plasma spraying as a surface protection technique for boilers, gas turbine blades and other equipment subject to corrosion, erosion and wear. The process is computer controlled. The spraying material is Metco 444 (73.5% Ni with Cr, Al, Mo, Fe), or WC/Co, NiCr, CrC, or (for gas temperatures of over 1200°C) CoCr or NiCoCr alloy. (7 refs.) J.S.

115444 Mechanism of adherence of porcelain enamels—adhering factors of enamels on extra low carbon steels. F.Imoto (Faculty of Engng., Shizuoka Univ., Hamamatsu-shi, Japan), K.Matsudo, T.Shimomura, T.Kurokawa. *Yogyo-Kyokai-Shi (Japan)*, vol.91, no.6, p.272-80 (1983). In Japanese.

Experiments have been carried out to understand the effects of several factors on the adherence of enamels. The microstructure of the steel-enamel interface of the fired enamel was also investigated. It is confirmed that enameling steel (extra low carbon rimmed steel) containing 0.023% copper is suitable for the base of the direct-on enamel and also provides good adherence to the regular ground cast enamels. It is shown that the pretreatment is effective in most cases. Concentration profiles of iron across the steel-enamel interface show simple decreasing curves in all cases. There is no correlation between such a profile and the adherence index of the specimen. An 'interlocking' structure was observed in the steel-enamel interface. During the firing process, the thickness of this structure increased probably by the action of local electric cells on the steel surface whose cathodes are composed of 'smut' (pickling residue) and precipitates from nickel flashing or adherence-promoting agents. As the thick structure develops, the adherence index increased. (11 refs.)

115445 Anodic oxidation of zirconium: Some aspects of the role of foreign ions. C.Panagopoulos.

Univ. Nottingham, England thesis, 1983
The galvanostatic anodization of zirconium in various solutions was studied. The oxide growth kinetics was found to depend upon the nature of the electrolyte. The electric field of zirconium anodization in alkaline solutions was found to decrease with increasing pH of the electrolyte for similar anodizing conditions, i.e. applied current density, temperature and formation voltage. The oxide composition examined by XPS technique was shown to vary with the anodizing conditions. In particular, the oxidation state and the distribution profile of the electrolyte anion in the oxide were clearly determined by the nature of the anion. The breakdown voltage of growing zirconium oxide was fundamentally dependent upon the anodizing conditions, i.e. applied current density, temperature and concentration and nature of the electrolyte. However, the mechanism of oxide breakdown was thought to be determined by several factors; internal stress in the oxide, electron space charge and chemical, electronic and thermal events taking place at the oxide-solution interface. The temperature rise during zirconium anodization increased with increasing applied current density. Finally, the series capacitance and resistance of zirconium oxide in contact with alkaline solutions were found to be a linear function of $\log f$ at a limited range of measuring frequency.

115446 Carbide precipitation in nickel-base model alloys and its influence on the ductility and fracture behaviour at room temperature. K.P.Mohr, H.Schuster, H.Nickel.

Report JUL-1845, Kernforschungsanlage, Julich, Germany (May 1983), 98 pp.

The influence of carburization with internal carbide formation on the room temperature tensile properties was determined for nickel-base model alloys of different compositions. The relationship between carbide volume fraction and the loss of ductility was systematically investigated. The embrittlement was found to be severe for volume fractions greater than about 0.03 if the carbides were formed principally on grain and twin boundaries. Cracks were propagated unhindered in the continuous, grain boundary carbide films formed in alloys containing Cr or Mo and caused intergranular fracture with rupture elongations of similar magnitude to that of the carbide phase itself. Grain boundary carbide precipitates which were not continuous led to less severe ductility loss. (83 refs.)

115447 Intergranular stress corrosion cracking of Ni-Cr-Fe Alloy 600 tubes in PWR primary water - Review and assessment for model development. Y.S.Garud, T.L.Gerber.

Report EPRI-NP-3057, Electr. Power Res. Inst., Palo Alto, CA, USA (May 1983), 80 pp.

Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.

A review and assessment of primary-side intergranular stress corrosion cracking (IGSCC) of Ni-Cr-Fe Alloy 600 tubes and related experimental observations are summarized, and the need for a quantitative model to predict the IGSCC is established. A promising approach to quantitative model development is presented, and the analytic-experimental work needed for the model development is suggested. Recommendations for collection of field data from steam generator operation to supplement the model development and its implementation are included.

115448 Thermodynamics and kinetics of the gas phase and pack aluminide coating formation on iron and steel. B.Nciri, L.Vandenbulcke (Univ. of Orleans, Orleans, France).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.141-7

The pack aluminization process of nickel and nickel-base alloys have been extensively studied and used to form protective coatings which extend the life of superalloys in the oxidation, corrosion and erosion environment encountered in gas turbines. On iron and steel, this process has been less studied, but such aluminide or chromaluminide coatings should prevent corrosion in an aggressive chemical environment at mid-temperature (700-800°C), in a sulfur atmosphere for example. The gas-solid diffusion model which includes the multi-component equilibria of the gaseous phase with the pack and the substrate, permits the authors to point out the influence of the relative rates of gas transport and solid-state diffusion on the pack-aluminization process. The surface composition of the coatings and their growth rate depend on the temperature and the aluminium activity in the pack, for a given activator. Fairly good agreement is obtained between the theoretical study and the experimental results in the pack. Theoretical predictions for deposition in the gas phase, on substrates out of contact with the pack, can be qualitatively deduced. (6 refs.)

115449 The development of CVD oxide coatings for the protection of metal surfaces. J.T.K.Clark, A.I.Foster, M.L.Sims, M.A.M.Swidzinski, D.Young (BP Res. Centre, British Petroleum Co. plc, Sunbury-on-Thames, England).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.385-94

Describes the development of a new type of surface coating for metallic substrates, based on relatively low temperature CVD processes. As resistance to chemical attack was a prime requirement, non-reactive oxides were chosen as the coating. Limitations in the heat treatments to which many steel/alloy components can be subjected have necessitated the development of two coatings. These are: titania (TiO₂) deposited at 300-400°C; usable up to ≈500°C; and silica (SiO₂) deposited at 600-800°C; usable up to ≈1000°C. Titania coating was developed initially to impart titanium-like corrosion resistance to lower grade metals such as mild (carbon) and low alloy steels. It is the inert and impervious surface oxide (TiO₂) that provides titanium metal with its corrosion resistance. Silica coating was developed as an inert diffusion barrier to prevent gas phase attack of steel surfaces used at high temperatures. (14 refs.)

115450 Role of CVD in providing wear resistant films. H.E.Hintermann (Lab. Suisse de Recherches Horlogeres, Neuchatel, Switzerland).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.467

Summary form only given. The adhesion, or rather the mechanical properties of the coating/substrate composite, is characterized using the scratch test method. A compilation of friction and wear data from pin-on-disk experiments are reported on TiC, TiN, Cr₂C₃, SiC, Al₂O₃, in dry and humid air. Furthermore the results of some studies on the effect of CVD coatings on the load carrying capacity of the (partial) elastohydrodynamic lubricant film and the boundary lubricant film, applying the IRG transition diagram for lubricated steel point contacts, are reported. Finally the usefulness and feasibility of TiC coated bearing elements in (i) oil lubricated high speed ball bearings in gyros, and (ii) unlubricated slow moving ball bearings at elevated temperature in vacuum or inert atmosphere (He) are demonstrated. (no refs.)

115451 The decarburization of steel during the CVD of TiC. P.J.M.van der Straten, M.M.Michorius, G.Verspui (Philips Centre for Mfg. Technol., Eindhoven, Netherlands).

Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.553-67

When TiC is deposited on carbon-containing steels using H₂, CH₄ and TiCl₄ containing gas mixtures, the carbon of the TiC layer originates from the CH₄ gas as well as from the steel substrate itself. The contribution of carbon from the steel dominates when the carbon activity in the steel is relatively high. In thin sections and especially in the case of small substrate dimensions severe decarburization may occur, resulting in a loss of hardness of the steel and a decreasing growth rate of TiC. These problems can be diminished by a carburizing treatment before the CVD procedure, by using a high CH₄/TiCl₄ ratio during the deposition of TiC and by employing steels which suffer less from decarburization. (inc. sample preparation for examination, metallographic techniques, ion and electron microprobe techniques, Auger and photoelectron techniques, defectoscopy; for measurement in the mechanics of solids and rheology, see 46.30R)

115452 The coefficient of reflection of ultrasonic waves from an adhesive bond interface. A.Pilarski (Inst. of Fundamental Technol. Res., Polish Acad. of Sci., Warsaw, Poland).
Arch. Acoust. (Poland), vol.8, no.1, p.41-53 (1983).
 Reports on an attempt to explain the existence of a relation between the reflection coefficient and mechanical strength of an adhesive bond, based on a model of a bond with finite rigidity. On the basis of formulae derived, a correlation relation was determined from experimental results between the modulus of the pressure reflection coefficient of a plane ultrasonic wave incident normal to the interface of an adhesive bond of lucite with epoxy resin, and the tensile strength of the bond. (9 refs.)
 115453 An analytical method of evaluating angles in Brookes' formula for effective resolved shear stress on slip systems in crystals. V.P.Bhatt, C.F.Desai, R.C.Shah (Phys. Dept., MS Univ. of Baroda, Baroda, India).
Res. Mech. (GB), vol.9, no.1, p.35-40 (1983).
 A simple relation has been evolved for the analytical evaluation of indenter-orientation dependent angular variables in Brookes' formula for the effective resolved shear stress on a slip system of a crystal produced by a hardness-indenter. Its merits over the stereographic method are considered. (1 ref.)
 115454 Automated time-of-flight studies of the defect detection trial plates 1 and 2. G.J.Curtis, B.M.Hawker (Materials Phys. Div., AERE, Harwell, England).
Br. J. Non-Destr. Test. (GB), vol.25, no.5, p.240-8 (Sept. 1983).
 The defect detection trials provided a definitive test of the ultrasonic time-of-flight technique when instrumented into a multi-probe automated detection and sizing system. The specific problem tackled was the examination of a simulated PWR vessel girth weld, austenitically clad and containing deliberately implanted defects. The design and function of the time-of-flight scanner is described. Its detection and sizing capability is examined. (13 refs.)
 115455 CEBG inspection of plates 1 and 2 in UKAEA defect detection trials. K.J.Bowker, J.M.Coffey, D.J.Hanstock, R.C.Owen, J.M.Wrigley (Sci. Services Dept., CEBG, Manchester, England).
Br. J. Non-Destr. Test. (GB), vol.25, no.5, p.249-55 (Sept. 1983).
 Summarises the CEBG's participation in the UKAEA 'Defect Detection Trials' exercise in which four large test specimens, modelling parts of a PWR pressure vessel and containing deliberately introduced defects, were examined by ultrasonic methods. The CEBG, in collaboration with Babcock Power Ltd., inspected Plates 1 and 2, which modelled the main seam welds. The inspection procedure and the equipment used are outlined, taking one particular defect for illustration. A notable aspect of the procedure is that it employs only essentially conventional ultrasonic techniques. The plates have now been partially sectioned to give more detailed information on the defects although full destructive examination has yet to take place and the authors compare the ultrasonic results with the best estimates for the defects actually present. (2 refs.)
 115456 An in-service inspection method: the use of focused probes for the detection and sizing in DDT plates 1 and 2. A.M.Birac (French Atomic Energy Commission, Paris, France), G.Cattiaux, P.Morisseau, G.Pincemaille, R.Saglio.
Br. J. Non-Destr. Test. (GB), vol.25, no.5, p.258-62 (Sept. 1983).
 As part of the UKAEA defect detection trial programme to evaluate the nondestructive testing methods used during the in-service inspection (ISI) of PWR vessels, CEA-STA-SCND performed an ultrasonic examination of two test-plates. Each plate was bisected across its full width by a full-thickness butt-weld in which calibrated defects of various natures, dimensions, orientations had been inserted. It was required that the implementation of control, the equipment and the subsequent data analysis represent as nearly as possible the French procedure in force during the pre-service and in-service inspection of a PWR vessel. To evaluate the influence of examiners on the results, the examinations have been carried out twice by two independent terms. (8 refs.)

115457 Beam spread variations with change of angle. B.Watson (Wells-Krautkramer Ltd., Letchworth, England).
Br. J. Non-Destr. Test. (GB), vol.25, no.5, p.263-4 (Sept. 1983).
 An apparent anomaly in beam spread charts of angle probes with constant parameters is discussed. It is recommended that for the US pulse reflection method of inspection, the reflected mode calculations and beam shapes should be preferred. (1 ref.)
 115458 Application of novel techniques of medical imaging to the nondestructive analysis of carbon-carbon composite materials. N.More, B.Basse-Cathalinat, C.Baquey, F.Lacroix, D.Ducassou (Centre d'Elaboration et d'Experimentation de Matériaux et Systemes Implantables, INSERM, Bordeaux, France).
Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.531-6 (1 Sept. 1983).
 Rigorous control of all stages of the fabrication of a composite material is vital. It is best if this control uses nondestructive methods, so allowing the same item to be studied during the different stages of its manufacture. Much research has already been done to perfect such investigations in medicine, so providing a minimum of trauma to the patient. Most of these medical applications use radioactive isotopes. The authors describe the application of currently available techniques, employed in nuclear medicine for the analysis of the density and porosity of carbon-carbon composite materials. Two most powerful medical techniques are applied to measure variations of density of a composite material. These are transmission computed tomography using X-rays and the absorption of photons. The quantitative measurement of porosity can be derived from a scintigraphic technique which allows a detailed noninvasive study of the interior of the composite and the spatial variation of porosity at every stage of its fabrication. For each type of investigation, the principle of the method, a description of the apparatus and several examples of results obtained are presented. The advantages and limitations of these techniques which complement those currently available are discussed, together with future possibilities for nondestructive control of industrial processes. It is likely that their proven success in medicine will be extended to the other fields described. (11 refs.)
 115459 Determination of the polarization resistance from impedance measurements. F.Mansfeld, M.W.Kendig.
Werkst. & Korros. (Germany), vol.34, no.8, p.397-401 (Aug. 1983).
 Four different methods for determining the polarization resistance R_p^{ac} from impedance data are discussed. These methods are suitable for online corrosion monitoring. Their use is illustrated for iron in tapwater and in neutral, aerated Na₂SO₄ containing various inhibitors. R_p^{ac}-values obtained with the CIRFIT-method are compared with R_p^{dc} which is obtained from a linear sweep through E_{corr}. The integration method has the advantage of computation speed. (15 refs.)
 115460 Specimen size dependence of low frequency fatigue tests in high-pressure hydrogen. B.Roebeck (Div. of Materials Applications, NPL, Teddington, England).
Fatigue Eng. Mater. & Struct. (GB), vol.6, no.2, p.177-88 (1983).
 Fatigue data required for estimates of cracked component lifetimes are conventionally obtained by cyclic loading of specimens manufactured to a specific geometry. Crack growth in the specimen results in an increase in the stress intensity factor range and crack growth curves are calculated from the variation of crack length with time. An environmental fatigue study of the effect of high pressure hydrogen on the low cycle fatigue of a medium strength steel has shown that, due to effects of elapsed time in the environment and effects of specimen size, in certain circumstances this procedure may not yield geometry-independent results which can be applied with confidence to cracked components. It is concluded that to obtain useful crack growth data in cases where fracture is influenced by diffusion or other strongly time dependent processes might require a modified approach to fracture mechanics testing procedures. (14 refs.)
 115461 Stress activated Raman scattering and microcrack detection. M.Ciftan (Phys. Dept., Duke Univ., Durham, NC, USA), R.G.Brown, E.Saibel.
Int. J. Eng. Sci. (GB), vol.21, no.11, p.1285-93 (1983).
 A new technique for the detection of microcrack precursors and for the study of the dynamics of crack propagation is proposed. The technique uses laser Raman scattering off of adsorbed surface species to detect microcrack precursors via variations in the Raman spectrum associated with the stresses localized within such precursors. The authors give extensive theoretical justification and detail several approaches designed to substantiate the plausibility of the technique proposed. This technique can become a valuable tool for the detection of microcrack precursors as well as studies of phenomena including adsorption, catalysis, adhesion, wear and the dynamics of stress-corrosion cracking. (23 refs.)
 115462 Affecting the comparison with an index-value by the choice of the evaluation method for variable tests of random samples. G.Loschau.
Mater. Test. (Germany), vol.25, no.8, p.276-9 (Aug. 1983). In English.
 To unify and clarify the valuation of variable tests common treatments of test results are initially summarized. Based on this, an exemplary presentation of different usual quality specifications follows in a gradual order of the decision intensity. Therefore the judgement strength of the required index-value with respect to the choice of the evaluation method is illustrated by selected numerical examples. (13 refs.)
 115463 Non-destructive measurement of plastic anisotropy of sheets by ultrasonics. K.Goebbels, H.J.Salzburger.
Mater. Test. (Germany), vol.25, no.8, p.279-81 (Aug. 1983). In German.
 With two ultrasonic probes whose distance is fixed, the time of travel of surface waves has been measured as a function of the direction of rolling of the sheet. 13 cold- and hot-rolled samples were examined. For sheet of less than 3 mm thickness only orientated waves give some indication of plastic anisotropy with regard to the angle between the direction of wave propagation and that of rolling of the sheet. (11 refs.) R.S.
 115464 Decomposition of austenitic phase in work hardened steel samples, using hardness measurements. H.Reimers.
Mater. Test. (Germany), vol.25, no.8, p.267-70 (Aug. 1983). In German.
 Describes measurements of hardness on fatigue tested steel samples over distances up to 20 millimeters, in order to track austenitic/martensitic transitions away from the fracture line. Comparisons between intentional and work hardened samples are presented and the use of X-ray crystallographic methods is mentioned. Sample preparation and properties are described in detail. (2 refs.) G.M.E.
 115465 Gel electrode imaging of fatigue cracks in titanium. W.J.Baxter (Phys. Dept., General Motors Res. Labs., Warren, MI, USA).
Scr. Metall. (USA), vol.17, no.8, p.1023-6 (Aug. 1983).
 The initial experiments on aluminum alloys demonstrated that the gel electrode is very sensitive: fatigue cracks as short as 10 μm in length were detected, while fatigue deformation was detected and measured earlier than

1% of the fatigue life (Baxter, 1982). It is shown that the technique offers a similar sensitivity for the detection and imaging of fatigue cracks in titanium. The images are clearly visible, particularly with the aid of a pocket magnifier, while closer examination of the image with a low power (50X) optical microscope reveals detailed information on secondary cracking, as well as the presence of small microcracks ahead of the tip of the main crack. Direct comparison of the gel electrode image with scanning electron microscope images of the specimen itself, shows that cracks as short as 20 μm in length are detectable. (4 refs.)

115466 An analytical description of fatigue failure curves by portions. S.Ya.Yarema, L.S.Mel'nychuk, B.A.Popov (G.V. Karpenko Physicomech. Inst., Acad. of Sci., Lvov, Ukrainian SSR). *Sov. Mater. Sci. (USA)*, vol.18, no.6, p.506-8 (Nov.-Dec. 1982). Translation of: *Fiz.-Khim. Mekh. Mater. (USSR)*, vol.18, no.6, p.56-8 (Nov.-Dec. 1982). Proposes an approach to constructing model (kinetic equations) of fatigue crack growth the parameters of which are convenient to interpret as characteristics of the fatigue crack resistance of a material. (6 refs.)

115467 Determination of the particle-size distributions of powders by mercury porosimetry. V.S.Pugin, P.A.Kornienko, N.P.Pavlenko (Inst. of Materials Sci., Acad. of Sci., Ukrainian SSR). *Sov. Powder Metall. & Met. Ceram. (USA)*, vol.22, no.1, p.30-2 (Jan. 1983). Translation of: *Poroshk. Metall. (USSR)*, vol.22, no.1, p.33-5 (Jan. 1983). [received: Aug. 1983] Examines the possibility of determining the particle-size distributions of powders by mercury porosimetry, using integral curves of pore-size and volume distribution in porous bodies formed by loosely poured powders. (4 refs.)

115468 Determination of longevity under a two-frequency load (review). I. V.I.Trufiyakov, V.S.Koval'chuk (E.O. Paton Inst. of Electric Welding, Acad. of Sci., Kiev, Ukrainian SSR). *Strength Mater. (USA)*, vol.14, no.9, p.1165-72 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.9-15 (Sept. 1982). (37 refs.)

115469 Results of an investigation of the service life of heat-resistant materials under repeated static load. L.P.Lozitskii, A.N.Vetrov, V.A.Ivanenko (Inst. of Mech. Engng. Problems, Acad. of Sci., Kiev, Ukrainian SSR). *Strength Mater. (USA)*, vol.14, no.9, p.1173-8 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.15-20 (Sept. 1982). The authors describe the results obtained in testing steels for the length of life under a repeated static load on a device adjusted for automatic load application. The specimens were tested with cyclic synchronisation of temperature and mechanical load. (5 refs.)

115470 Representation of fatigue damage to a component in terms of reliability theory. A.E.Bozhko (Inst. of Mech. Engng. Problems, Acad. of Sci., Kharkov, Ukrainian SSR). *Strength Mater. (USA)*, vol.14, no.9, p.1179-82 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.20-3 (Sept. 1982). The author shows that it is possible to determine, on the basis of reliability theory, the degree of damage to an article and its service life, using the corresponding characteristics of the structural elements of which the article consists. (3 refs.)

115471 Effect of step duration on the evaluation of the fatigue limit of welded steel structures. F.P.Udodov, E.M.Moskaleva, V.M.Gnezdilov. *Strength Mater. (USA)*, vol.14, no.9, p.1183-9 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.23-8 (Sept. 1982). Investigations were conducted into the effect of step duration on the evaluation of the fatigue limit of flat specimens and welded beams using the fracture criterion i.e. the passage of the crack through the entire thickness of the plate. (12 refs.)

115472 Predicting the long-term creep of organic-fiber-reinforced plastics. E.A.Sokolov, R.D.Maksimov (Inst. of Polymer Mech., Acad. of Sci., Riga, Latvian SSR). *Strength Mater. (USA)*, vol.14, no.9, p.1209-13 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.45-8 (Sept. 1982). The authors studied the problem of predicting the creep of a unidirectional organic fiber reinforced plastic from the results of tests at high-temperature. It was found that the results of accelerated temperature tests in tension could be used for this purpose. (17 refs.)

115473 Relationship between parameters of elastic-wave propagation and rupture-strength characteristics of structural materials. B.A.Konyukhov, B.S.Perel'man, A.L.Uglov, V.I.Unylov. *Strength Mater. (USA)*, vol.14, no.9, p.1214-17 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.49-51 (Sept. 1982). The authors examined the problem of constructing a scalar estimate of the rupture strength of materials using acoustic measurements. Appropriate empirical findings are presented, it is found that acoustic methods make it possible to construct algorithms to evaluate the amount of damage sustained by a material subjected to long-term constant loads and to determine the remaining life of a test specimen or structural element at any moment of time. (5 refs.)

115474 Selection of ceramic material specimen dimensions for thermal stability tests. Ya.L.Grushevskii (Inst. of Strength Problems, Acad. of Sci., Kiev, Ukrainian SSR). *Strength Mater. (USA)*, vol.14, no.9, p.1228-32 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.59-63 (Sept. 1982). The author considers a possible approach to the selection of absolute dimensions of a hollow cylindrical specimen and its thermal loading schedule. Strict modeling in specimens of the thermal stress state for ceramic structures is not generally accomplished since there is not always geometric similarity. Therefore it is possible to limit the selection of radii and heating rate of a specimen at which changes in temperature and thermal stresses with time over its outer surface will be close to that occurring in the structure being considered. In order to solve the problem posed it is necessary to determine the value of the greatest level of tensile stresses which it is possible to realize by thermal loading of a specimen made of the test material. (9 refs.)

115475 Determination of fracture-toughness characteristics under a pulsed loading. G.V.Stepanov, V.A.Makovei (Inst. of Strength Problems, Acad. of Sci., Kiev, Ukrainian SSR). *Strength Mater. (USA)*, vol.14, no.9, p.1252-6 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.80-4 (Sept. 1982). The results of mechanical tests of materials, including data derived from fracture-toughness tests, are used for a computed estimate of the serviceability of design elements under operating conditions. The operating reliability of designs fashioned from materials with cracks or cracklike defects that are present in the initial material or that form during service is estimated from fracture-toughness characteristics. (10 refs.)

115476 Effect of stored elastic energy on breaking stress. A.I.Korshunov, V.P.Vashchenkov.

Strength Mater. (USA), vol.14, no.9, p.1265-8 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.91-2 (Sept. 1982). The authors' experiments have shown that the pliability of the specimen-machine system, and thus also the stored elastic energies, does not affect the breaking stress in static loading on condition that similarity in mechanical loading is ensured. The effect of the stored elastic energy on the breaking stress is apparently connected with the difference in the loading rate in tests with different pliability. (12 refs.)

115477 Plotting stress-strain diagrams by recalculation of the computer diagram. A.I.Korshunov, T.N.Kravchenko, O.M.Savel'eva. *Strength Mater. (USA)*, vol.14, no.9, p.1268-71 (Sept. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.9, p.93-5 (Sept. 1982). The authors show how it is most promising and advantageous to obtain stress-strain diagrams by recalculation of computer diagrams which represent the dependence of an axial tensile load P applied to the specimen on the strain $\Delta\epsilon$ of the system specimen-machine. The essence of the recalculation consists in extracting the strain of the specimen alone from the total strain of the system specimen-machine. (7 refs.)

115478 Determination of certain elastic characteristics of materials with the use of parabolic interpolation of strain curves. Yu.D.Skripnik (Inst. of Strength Problems, Acad. of Sci., Kiev, Ukrainian SSR). *Strength Mater. (USA)*, vol.14, no.11, p.1527-31 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.86-9 (Nov. 1982). [received: Sept. 1983]

On the basis of approximation of the initial portion of the strain curve by a quadratic parabola an equation is proposed for determining the modulus of normal elasticity of materials using as the original data the two experimental points ($\epsilon_1/2, \sigma(\epsilon_1/2)$) and ($\epsilon_1, \sigma(\epsilon_1)$). The coefficient of loss of strength, which together with the modulus of normal elasticity is responsible for the strain curve in the interval up to the elastic limit and makes it possible to calculate the tangential and secant moduli at any point of this interval, that is, at practically any stresses used in structure, is proposed as a characteristic of the material. It is shown that the proportional limit σ_{pr} is determined by the modulus of normal elasticity E and the coefficient of loss of strength P . (3 refs.)

115479 Software for automatic loading controls in strength testing. V.I.Litvak, V.M.Gal'perin. *Strength Mater. (USA)*, vol.14, no.11, p.1569-73 (Nov. 1982). Translation of: *Probl. Prochn. (USSR)*, vol.14, no.11, p.120-4 (Nov. 1982). [received: Sept. 1983]

The following may be said regarding the realization of special software (SSW). (1) This software system can be used for automatic load controls (ALC) of multiple units even without the time-sharing facilities available with modern computers. However, the performance is considerably improved by time sharing in conjunction with the basic software. The SSW is then to be considered as a target program for the computer. (2) Implementation of the SSW requires a large memory volume. Overlay structures provide the best means of organizing memory loading with allowance for the speeds of the various memories. The best computers for the purpose are the SM control ones, e.g. the SM-4 in extended form (with disks and tapes). (3) The modules, apart from the monitor segments, are written in a high-level language such as FORTRAN IV, which makes the program simple to understand. The information exchange with the operator is performed in interactive mode with set phrases. (6 refs.)

115480 Acoustic emission in the deformation of concrete (review). G.B.Muravin, G.S.Pavlovskaya, A.D.Likhod'ko (All-Union Sci.-Res. Inst. for Transport Construction, Moscow, USSR). *Sov. J. Nondestr. Test. (USA)*, vol.18, no.12, p.925-34 (Dec. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.12, p.3-13 (Dec. 1982). [received: Sept. 1983]

Works devoted to the study of the acoustic emission of concrete and to investigation of the possibility of its practical use for nondestructive testing of reinforced concrete structures are considered. (46 refs.)

115481 Consideration of certain acoustic-emission characteristics in large thick-walled high-pressure vessels. V.M.Geller, M.B.Gitis, V.N.Sosedov (All-Union Sci.-Res. Inst. of Nondestructive Testing, Kishinev, USSR). *Sov. J. Nondestr. Test. (USA)*, vol.18, no.12, p.934-8 (Dec. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.12, p.13-17 (Dec. 1982). [received: Sept. 1983]

Two forces are discussed as an analog for an acoustic-emission source during the formation of microcracks in the thick walls of high-pressure vessels. The use of directional receivers for Rayleigh waves is shown to be advisable in some cases. (8 refs.)

115482 Higher stiffness for the vibratory system of an acoustic durometer. V.A.Prikhod'ko, D.A.Tursunov (Donets Sci.-Res. Inst. of Ferrous Metall., Donetsk, Ukrainian SSR). *Sov. J. Nondestr. Test. (USA)*, vol.18, no.12, p.950-3 (Dec. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.12, p.30-3 (Dec. 1982). [received: Sept. 1983]

It is shown to be advisable, theoretically, to improve the stiffness of the vibratory system of an acoustic durometer by changing from a resonance-sensitive element in the form of a thin uniform rod to one having a variable cross-section. (6 refs.)

115483 Influence of magnetomechanical damping on resonance electromagnetic-acoustic conversion in ferromagnets. R.S.II'yasov, V.A.Komarov (Inst. of Metal Phys., Acad. of Sci., USSR). *Sov. J. Nondestr. Test. (USA)*, vol.18, no.12, p.954-7 (Dec. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.12, p.34-8 (Dec. 1982). [received: Sept. 1983]

The variation of the logarithmic decrement of elastic oscillations as a result of magnetoelastic losses is investigated in connection with resonance electromagnetic-acoustic (EMA) conversion in silicon-iron single-crystal samples cut in different crystallographic directions. It is shown that this effect has an appreciable influence on the curves of the EMA signal amplitude as a function of the polarizing field. (4 refs.)

115484 Conversion of zero-order Lamb-wave modes into an electromagnetic field in ferromagnetic metals. V.A.Komarov, R.S.II'yasov, N.I.Shakshin (Inst. of Metal Phys., Acad. of Sci., USSR). *Sov. J. Nondestr. Test. (USA)*, vol.18, no.12, p.958-64 (Dec. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.12, p.38-45 (Dec. 1982). [received: Sept. 1983]

The electromagnetic field produced in air over a conducting ferromagnetic plate, of infinite extent in both dimensions in the plane and polarized by a magnetic field, from traveling and standing zero-order Lamb modes (modes s_0 and a_0) is calculated, along with the magnetic fluxes of the electromagnetic field in the plate from the same modes. It is shown that overlay sensors are

best recommended for obtaining information in terms of the magnetoelastic constants. (17 refs.)

115485 Ultrasonic inspection of the structure of G13FL steel parts. A.E.Ivanskii, Yu.P.Bashkirov, E.B.Dobreitsin, A.M.Lyubimov (F.E. Dzerzhinskii Ural Car building Plant, USSR). *Sov. J. Nondestr. Test. (USA)*, vol.18, no.12, p.965-6 (Dec. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.12, p.46-7 (Dec. 1982). [received: Sept. 1983]

G13FL steel, which is characterized by comparatively low thermal conductivity, a high alloy content, and a quite high linear solidification rate, is distinguished by an increased tendency toward columnar crystallization, which has a significant detrimental effect on its service properties. For inspection of structure the authors have tested an ultrasonic method based on the fact that in steels attenuation of ultrasonic oscillations is determined by their dispersion at the boundaries of grains and structural constituents. It was established that within the limits of a single part the degree of columnar structure may vary significantly. This was taken into consideration in developing an inspection procedure during production. (6 refs.)

115486 Sensitivity of X-ray computer tomography in the inspection of thin layers, glued joints, cracks, laminations, and coatings. E.I.Vainberg. *Sov. J. Nondestr. Test. (USA)*, vol.18, no.12, p.969-73 (Dec. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.12, p.49-54 (Dec. 1982). [received: Sept. 1983]

Investigates the nonlinear effects arising in the inspection of multilayered structures by the method of X-ray computer tomography. Analytical relationships are obtained for calculating the sensitivity of inspection in dependence on the geometry and contrast of flaws and on the thickness of the inspected section. Experimental results are presented. (4 refs.)

115487 Effectiveness of intensifying screens in a mosaic semiconductor transducer, and the aperture characteristics of sensors. V.S.Melikhov, I.M.Rubinovich (Sci. Res. Inst. of Electronic Introscopy, Tomsk, USSR). *Sov. J. Nondestr. Test. (USA)*, vol.18, no.12, p.974-9 (Dec. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.12, p.54-60 (Dec. 1982). [received: Sept. 1983]

Presents the results of the theoretical evaluation of the front, rear, and lateral intensifying screens in the mosaic semiconductor transducer of a betatron introscope. It is shown that with a silicon layer 1 cm thick and a dose of 100 R/min ahead of the beam trap, the use of these screens makes it possible to attain a sensitivity of 1.1% when the steel is 30 cm thick. The aperture characteristics of the sensors are calculated, and this makes it possible to evaluate the possible degree of improvement of the detectability of flaws by the method of aperture correction. (7 refs.)

115488 Automatic device for establishing the specified regime of X-ray flaw detectors and frequency doubler for electronic stopwatch. S.I.Korneev, P.S.Shchukin.

Sov. J. Nondestr. Test. (USA), vol.18, no.12, p.980-1 (Dec. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.12, p.60-1 (Dec. 1982). [received: Sept. 1983]

The portable X-ray apparatus RUP-150/300-10 is used for examining materials and products under conditions of plant or departmental X-ray flaw detection laboratories. An operator requires at least 10 or 15 min to establish the specified regime of the X-ray apparatus. The scale division of the electromechanical time relay in the apparatus is 15 sec. Apparatus with short exposure times (5-20 sec) cannot therefore be used. The suggested improvement provides broader possibilities of using the apparatus. For this purpose the apparatus was provided with a device permitting automatic control of the voltage on the anode of the X-ray tube, and a doubler of the industrial frequency of the mains for starting the electronically counting frequency meter measuring the exposure time. (no refs.)

115489 Magnetic, electrical, and mechanical properties of 12KhN3A and 12Kh2N4A steels and of case-hardened layers on them. I.A.Kuznetsov, N.M.Skripova (A.M. Gor'kii State Univ., Ural'sk, USSR). *Sov. J. Nondestr. Test. (USA)*, vol.18, no.12, p.985-90 (Dec. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.12, p.65-71 (Dec. 1982). [received: Sept. 1983]

Investigations were conducted into the magnetic, electrical, thermo-electrical, and mechanical properties of case-hardening steels 12KhN3A and 12Kh2N4A and of case hardened layers on them, saturated to various degrees with carbon, in relation to the quenching and tempering temperatures. The conditions of the nondestructive measurement of the thickness and hardness of the case-hardened layer on components by measuring the electromagnetic properties were examined. (6 refs.)

115490 Magnetic inspection of the hardness of steel ShKh15 pipes. O.S.Kononov, R.M.Brusentsova, A.A.Tovpinets, V.I.Roitman (Nikopol'sk Southern Pipe Plant of the 50th Anniversary of the Great October Socialist Revolution, USSR).

Sov. J. Nondestr. Test. (USA), vol.18, no.12, p.999-1000 (Dec. 1982). Translation of: *Defektoskopiya (USSR)*, vol.18, no.12, p.80-1 (Dec. 1982). [received: Sept. 1983]

Presents a method of nondestructive hardness inspection involving coercive force meters. In order to use the magnetic method for inspection of mechanical properties of a material it is necessary to determine experimentally in advance the correlations between these parameters and the readings of the coercive force meter. (4 refs.)

115491 Changes in the strain energy and the surface structure generated during the rotatory bending fatigue test for smooth and notched carbon steel specimens. C.Minamisawa, Y.Ishi-da (Dept. of Mech. Engng., Nat. Defense Acad., Yokosuka, Japan).

Sci. & Eng. Rep. Natl. Def. Acad. (Jpn.) (Japan), vol.20, no.2, p.145-57 (June 1982). In Japanese. [received: Aug. 1983]

Deals with the changes in the strain energy and in the surface structure generated during rotatory bending fatigue tests for two kinds of carbon steel specimens with smooth surfaces and different diameters and for the other two kinds of specimens different radii of circumferential notches. If the plastic strain energy accumulation is plotted against the number of cycles on a log-log paper, four nodal points appear as dividing the process of fatigue in five stages. The several microcracks such as the intrusions appear at the fourth nodal point, therefore the authors suggest that the machine parts corresponding to the specimen ought to be replaced by a new one at the fourth nodal point in order to prevent a fracture accident. (9 refs.)

115492 A torsion testing machine for measurement of shear strength of foam. N.J.Baldwin.

Report MRL-TN-469, Defence Sci. & Technol. Organ., Mater. Res. Labs., Melbourne, Vic., Australia (Dec. 1982), 12 pp.

A torsion machine has been developed to measure shear strength and shear modulus of foam. The machine is compact, portable, easy to use and is an essential link in quality assurance of foam core material for the Australian Minehunter Catamaran.

115493 Influence of magnetization on eddy current inspection of ferromagnetic tubes. V.Kelha, R.Peltonen.

Report 183, Tech. Res. Centre Finland, Instrum. Lab., Espoo (May 1983), 31 pp.

The eddy current method is commonly used for inspecting metal tubes during manufacture. Inservice inspection, however, has been limited to testing of non-ferromagnetic tubes due to the inherent magnetic noise. It has been shown that even mild steel tubes, if magnetically saturated, can be satisfactorily inspected using the eddy current method. By using a laboratory electromagnet and a magnetizing field 2.4 to 360 kA/m, various artificial defects, through holes 0.5 to 2.5 mm in diameter, a conical hole and a groove on the outer surface of the tube, were detected by an internal differential eddy current probe. The signal level and the signal-to-noise ratio increased remarkably with increasing magnetization. (6 refs.)

115494 Acoustic emission: Past experience within ECSC contracts and future trends. M.Mirabile.

Report EUR 7887 EN, Comm. European Communities, Luxembourg (1983), vi+31 pp. Contract 7210-GA/411.

After having introduced the basic elements of acoustic emission as a new NDT method, the survey report deals with mechanical and metallurgical factors affecting materials emissivity, location technique and accuracy, and possible future applications according to the presently available results. It is emphasized that the materials emissivities may be compared only when specimen geometry and test temperature are the same. It is further recognized that a three-point bend specimen and a temperature near the fracture appearance transition temperature (FATT) are the most suitable conditions for promoting a high AE activity. Differences in the tendency of several steels to release elastic energy, are attributed to the different microstructural parameters controlling yield strength and FATT. Thus, the role of pearlite colony size in ferritic-pearlite steels, and that of carbide size and distribution in quenched and tempered steels are discussed, together with the effect of second-phase non-metallic inclusions. In addition to the mechanical and metallurgical factors the several fracture mechanisms are also considered as sources of different AE activities. Brittle and ductile failure under monotonic load generate AE energy pulses which can be quantitatively correlated with the applied load and length of present cracks. (50 refs.)

115495 Operation of the EPRI nondestructive evaluation center. Annual report - 1982. T.A.Nemzek, R.M.Stone, P.L.Schoenecke, F.V.Ammirato, F.L.Becker, M.Behravesh, S.D.Brown, D.E.MacDonald, G.L.Pherigo, G.H.Wilson, III.

Report EPRI-NP-2985, Electr. Power Res. Inst., Palo Alto, CA, USA (April 1983), 114 pp.

Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.

Describes a project to design, construct, organize and operate the EPRI Non-destructive Evaluation (NDE) Center, a dedicated facility for providing field-qualified NDE equipment, procedures, and personnel training to the electric utility industry. The entire scope of this work is presented, with major emphasis placed on the activities in 1982, the facility's first full year of operation.

115496 Steam generator U-bend eddy-current NDE. S.Brown.

Report EPRI-NP-3010, Electr. Power Res. Inst., Palo Alto, CA, USA (April 1983), 80 pp.

Available from Research Report Center, Box 50490, Palo Alto, CA 94303, USA.

Details are provided of a study that evaluated an eddy-current bobbin coil method for estimating the ovality of row 1 U-bend opposite-side transitions and conventional bobbin coil and alternate pancake array probe eddy-current inspection methods to detect primary-side cracking in Westinghouse Series 51 row 1 U-bends. Tests results corroborate earlier results, which found no discernible correlation between the eddy-current inspection signal and tube ovality. The pancake array coil proved superior to the conventional bobbin coil probe for U-bend crack detection.

115497 A high accuracy micro hardness tester. Yang Di, Yang Hwi-Quei, Yang Gwei Gien (Mech. Div., Nat. Inst. of Metrology, Beijing, China).

Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.563-9

A high accuracy micro hardness tester was developed successfully in 1979 as a national micro hardness reference scale for loading, load duration and unload. The measuring microscope used in this tester is possessed of unique measuring model and higher magnification than conventional tester to assure the aim accuracy. The tester possesses very good rigidity and fashion. The hardness accuracy of the tester is $\pm 1.0-3.0\%$ when load is 1000-5 ogf. (no refs.)

115498 Neutron radiography facility using ^{252}Cf neutron source.

N.D.Tyufyakov (All-Union Res. Inst. of Radiation Engng., Moscow, USSR). *Neutron Radiography*. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.673-80

The paper represents the layout and description of the transportable neutron radiography facility using ^{252}Cf neutron source as well as the results of the optimization studies of the radiation head parameters. The effects of the moderator sizes and neutron energy spectra for a number of the radionuclide neutron sources on the spatial distribution of slow neutrons in the moderator are discussed. The experiments were carried out using sources of such types as ^{252}Cf , $^{238}\text{PuBe}$, ^{238}PuB , $^{238}\text{PuLiF}$. The author discusses the form of the ^{252}Cf neutron source that allows one to attain the maximum slow neutrons flux in the neutron beam obtained from the radiation head. (7 refs.)

115499 Neutron and gamma simultaneous radiography using a ^{252}Cf isotopic neutron source. N.Wada (JAERI, Ibaraki-ken, Japan), T.Yasui, Y.Yoshida.

Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.681-8

In the ^{252}Cf -based thermal neutron radiography, a thermal neutron beam always contains some gamma radiation. Attempts are made to obtain neutron and gamma radiographs simultaneously. A combination of scintillator and film, showing a superior gamma-discrimination is used as a thermal neutron image recorder. A combination of lead foil and film, insensitive to thermal neutrons, is used as a gamma image recorder. These recorders are held together in a single cassette and are exposed at the same time. Successful neutron and gamma radiographs which might aid interpretation of the radiographic images are obtained. On the basis of the study, a mobil neutron radiography equipment capable of using 1 mg of ^{252}Cf is designed and fabricated, with which the practical effectiveness of the new technique is being evaluated. (2 refs.)

115500 Application of neutron radiation inspection at the Pantex Plant. J.P.Cassidy (Mason & Hanger, Silas Mason Co. Inc., Amarillo, TX, USA). Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.707-16. A neutron radiographic capability has been established at the Pantex Plant in Amarillo, Texas. A 3 MeV Van de Graaf accelerator is employed as the neutron source. Neutron radiation inspection techniques have been developed to detect and observe discontinuities in explosive materials encased in aluminum, lead, steel and combinations of these casement materials. These data demonstrate that the capability exists for obtaining satisfactory neutron radiographs of many explosive-loaded components. Additional work will be performed in order to further determine applicable capabilities of the 3 MeV Van de Graaf accelerator. (no refs.)

115501 Improvement of efficiency of n,α converters to realize NR with relatively low n flux sources. M.Fantini (Kodak-Pathe Res. Lab., Paris, France). Neutron Radiography. Proceedings of the First World Conference, San Diego, CA, USA, 7-10 Dec. 1981 (Dordrecht, Netherlands: Reidel 1983), p.727-8. The recording of neutronic images on plastic polymer films is carried out via α particles. Boron and lithium are the only n,α conversion elements having a high yield. High yield converters are obtained with layers of elements containing boron or lithium very finely dispersed in a binder. The surface of these screens must be as smooth as possible and be in perfect contact with the image detecting film. The sensitivity to α particles of cellulose nitrate CN 85 films is higher than 95%. It is understood that sensitivity to neutrons can be increased only by using n,α converter screens having a maximum yield. Every effort has been made in order to make neutronography possible from relatively weak sources that can be used in the industry. (no refs.)

115502 Characterization of the matrix glass transition in carbon-epoxy laminates using the CSD test geometry. S.S.Sternstein, P.Yang (Rensselaer Polytech. Inst., Troy, NY, USA). Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.39-51. A test geometry is described which has several useful attributes: the geometry is very sensitive to matrix behavior; both transient (creep and stress relaxation) and dynamic mechanical tests are readily performed over a wide range of timescales; the test geometry provides viscoelastic dispersion data which are independent of angular orientation of the sample; consequently sample alignment problems are eliminated; the same test geometry may be used to provide information on delamination strength; relatively small test specimens are required; the test geometry is sufficiently sensitive to matrix changes to allow its use for postcuring, humidity, crosslink density and other matrix change studies. (7 refs.)

115503 On feasibility of accelerated creep measurements in some polymeric materials. A.Franceschini, A.Momo, P.Campagna (Centro Ricerche Fiat SpA, Orbassano, Italy). Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.369-76. The principle of time-stress equivalence, previously applied in the case of polypropylene and polypropylene toughened with rubber, is successfully applied to an amorphous thermoplastic, polycarbonate: the creep curves at different stress levels can be superimposed in one normalized master curve. A computer program is set up, which in many cases allows the analysis of empirical data. Master curves are also obtained in the case of Sheet Moulding Compounds; but their interpretation and use as a prediction method is not completely developed, because of an odd dependence of the shift factor on the stress. (10 refs.)

115504 An optical technique for measuring fiber orientation in short fiber composites. S.H.McGee, R.L.McCullough (Dept. of Chem. Engng., Univ. of Delaware, Newark, DE, USA). Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.425-36. A technique for measuring the state of fiber orientation in short fiber composites using a Fraunhofer diffraction apparatus is described. A theoretical analysis is compared to diffraction patterns produced from masks with known state of orientation, and the agreement was found to be excellent. Samples from sheet moulding compounds are analyzed to demonstrate processing induced fiber orientation in the material. (4 refs.)

115505 Consideration on the fatigue damage of specimens used for composite critical components qualification. A.Brivio, G.Parenti, G.Samanni, V.Wagner, C.Zanotti. Role of the Polymeric Matrix in the Processing and Structural Properties of Composite Materials. Proceedings of a Joint US-Italy Symposium, Capri, Italy, 15-19 June 1981 (New York, USA: Plenum 1983), p.607-24. Tests were carried out on glass fibre reinforced epoxy laminates. It is concluded that the described method of fatigue testing is adequate for material qualification and design purposes, because the derived S-N curves are conservative with respect to the true fatigue characteristics of the laminate. The online monitoring of the specimen deformation in the central region, which is a promising extension of the stiffness tests above described, should be useful to show the degradation processes happening outside the end tabs region during fatigue tests. (8 refs.)

115506 The measure of fracture toughness of cemented carbide by means of CVD coated layers. Z.Goffer, R.Porat (Iscar Ltd., Nahariya, Israel). Proceedings of the 4th European Conference on Chemical Vapour Deposition, Eindhoven, Netherlands, 31 May-2 June 1983 (Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983), p.76-83. When measuring fracture toughness of cemented carbide, the main problem is controlling the precrack length. While measuring transverse rupture strength the tensional stress is applied perpendicular to the crack surface. The mode of crack makes it possible to distinguish fracture toughness. In tests made on samples with a brittle coating, low stress was found to cause a precrack in the coating layer, and this precrack continues as a fracture in the insert body itself. With thicker coatings, the precrack is lengthened and the transverse rupture strength is reduced. Therefore, an applied CVD coating to a standard transverse rupture strength bar makes it possible by measuring the coating thickness to determine the length of the precrack. Experiments were made with straight cemented carbide (WC+Co) and with multi-carbides (WC+TiC+TaC+NbC+Co). Fracture toughness of cemented carbides is a function of their composition and the mean-free-path (mfp) of the binder. Comparing the fracture toughness values against mfp shows two family types, as does examination of the short rod samples by TerraTek fractometer. (8 refs.)

81.90 OTHER TOPICS IN MATERIALS SCIENCE

115507 Drying of porous granular materials. A.Hallstrom, R.Wimmerstedt (Dept. of Chem. Engng., Lund Univ., Lund, Sweden). *Chem. Eng. Sci. (GB)*, vol.38, no.9, p.1507-16 (1983). Drying characteristics have been measured for two types of granular compound fertilizer and for granular mono calcium phosphate. Air was forced through a fixed bed, and the humidity of the air leaving the bed was analysed by means of an infrared photometer. All results confirm the assumption of vapour diffusion as the rate determining mechanism. Experiments with varying temperature and air humidity show that the dependence of the drying rate on those parameters may be calculated from the sorption isotherms. These were measured for all three materials. Experiments also show that the drying rate is inversely proportional to the granule radius squared. A shrinking core model was successfully used for predicting the drying behaviour of two of the materials. For the third materials the drying rate fell rapidly, and the shrinking core mode was used with a correction function. (13 refs.)

115508 Metallurgy of interfaces in hardmetal/metal diffusion bonds. E.A.Almond (NPL, Teddington, England), A.M.Cottenden, M.G.Gee. *Met. Sci. (GB)*, vol.17, no.4, p.153-8 (April 1983). [received: Sept. 1983] A study has been made of the metallurgical reactions that control the diffusion bonding of WC-Co hardmetal butt-joints interlayered with Ni, Co, and steel at 1300°C. Vapour transport appears to make a significant contribution to the growth of the bonded regions during the early stages of the process, and the rates of growth are in reasonable agreement with predictions from sintering theories for single component systems. The chemical reactions that occur at the bond interface with Co and steel interlayers are sensitive to differences in the C contents of the interlayers and of the hardmetal binder phase. With low C interlayers the hardmetal near the interface is transformed to an η phase structure. (19 refs.)

115509 Effect of the composition of binding materials on the properties of carbon pastes. T.S.Zamazan, Z.A.Mikhalkuk, A.G.Khoruzhii (Ukrainian Sci.-Res. Inst. of Refractories, Ukrainian SSR). *Refractories (USA)*, vol.23, no.11-12, p.591-3 (Nov.-Dec. 1982). Translation of: *Ogneupory (USSR)*, vol.23, no.11, p.38-41 (Nov. 1982). The effect of a sinter with a softening temperature of $\geq 200^\circ\text{C}$ on the adhesion properties of the paste was studied. It is established that the addition of 8% of such a sinter to a carbon paste at a preparation temperature of $\geq 130^\circ\text{C}$ increases the ultimate shear strength of the join by more than 50% (from 4.0 to 6.4 MPa). The controlling effect of a carboniferous sinter with a softening temperature of $\geq 200^\circ\text{C}$ on the viscosity of a carbon paste prepared and applied at a temperature of 80°C is shown. A carbon paste which does not run out from the vertical joints of the lining of blast furnaces and containing 4-6% of carboniferous sinter with a softening temperature of 200-300°C or more has been developed. (3 refs.)

115510 Adhesives in the electrical and electronic industries—a competitive ‘fix’. I.De Iorio, F.Rossi.
Tecnol. Elett. (Italy), no.4, p.84-8 (April 1983). In Italian. [received: Sept. 1983]
Epoxies and cyanoacrylics are the two most widely used forms of industrial adhesive, with anaerobics and urethanes of more limited application. The physical properties and the surface preparation necessary for these adhesives are described. Some illustrative examples lead to the conclusion that further advances in adhesive techniques may be expected. (no refs.) *M.P.R.*

115511 ‘Adhesion of metals’ experiment simulation and ground-based reference tests results. F.Rossitto (CESNEF, Politecnico di Milano, Milano, Italy), P.G.Sona, G.Grugini, G.Ghersini.
Proceedings of the 4th European Symposium on Materials Sciences under Microgravity (ESA SP-191), Madrid, Spain, 5-8 April 1983 (Paris, France: ESA 1983), p.347-51
The IES340 experiment ‘Adhesion of metals’ is reviewed and the status of the UHV Chamber facility is presented. The phenomenological model used in the computer simulation is discussed together with ground reference test results. The method for extracting the value of the surface energy per unit surface area from the experimental data is also presented. (1 ref.)

82.20 CHEMICAL KINETICS

115512 Dissipative structures in 1D and 2D chemically reacting systems. P.Nandapurkar, V.Hlavacek (Dept. of Chem. Engng., State Univ. of New York, Buffalo, NY, USA).
Z. Naturforsch. Teil A (Germany), vol.38A, no.9, p.963-73 (Sept. 1983).
A transient analysis of the 1D and 2D reaction-diffusion equations associated with the model reaction of Prigogine and Lefever (1968) (Brusselator model), including diffusion of the initial (substrate) component, has been performed. For low system lengths and for fixed boundary conditions, the steady state low amplitude solutions are unstable. For zero flux boundary conditions a multiplicity of symmetric solutions with the same wave number may exist, the majority of them being unstable. The diffusion of initial components induce relaxation oscillations in space both for fixed as well as zero flux boundary conditions. The amplitude of the oscillation increases as the diffusion coefficient of the initial component decreases. For conditions of relaxation oscillations the spatial profiles result in single or multiple propagating fronts. High system lengths (or low diffusion coefficient of intermediate components), for both zero flux and periodic boundary conditions, may give rise to a multipeak incoherent wave pattern. For periodic boundary conditions a multiplicity of waves has been observed. Numerical simulation of the 2D-spatial structures reveal certain similarities between the 1D and 2D cases. (16 refs.)

115513 Calculation of product distributions by perturbation of the transition state. E.Pollak (Chem. Phys. Dept., Weizmann Inst. of Sci., Rehovot, Israel), P.Pechukas.
J. Chem. Phys. (USA), vol.79, no.6, p.2814-21 (15 Sept. 1983).
Two algorithms are presented for a direct determination of the boundary between reactive and unreactive portions of phase space in collinear collisions. These algorithms provide a fast and highly accurate determination of classical reactant and product distributions. Since boundary trajectories originate at variational transition states, this method provides new insight to an old problem: the relationship between product and reactant state distributions and the transition state of a chemical reaction. (23 refs.)

115514 Comments on two treatments of symmetry rules in chemical reactions. H.Metiu (Dept. of Chem., Univ. of California, Santa Barbara, CA, USA), G.C.Schatz, J.Ross.
J. Chem. Phys. (USA), vol.79, no.6, p.2854-6 (15 Sept. 1983).
In the paper the authors compare a recently presented approach to the determination of symmetry rules for chemical reactions based on adiabatic electronic states (Deguchi, 1982) to earlier work in which a quasideadibatic representation was used. The adiabatic approach is shown not to lead directly to Woodward-Hoffmann symmetry rules, and a number of the conclusions of the adiabatic work are shown to be incorrect and inconsistent. An indirect approach for deriving the Woodward-Hoffman rules in the adiabatic representation is presented which uses the connection between the adiabatic and quasideadibatic representations to relate barrier height to the quasideadibatic electronic matrix elements. (15 refs.)

115515 Indeterminacy in kinetic-model parameters due to non-Hamiltonian structure of the multipath linear reaction graph. V.A.Evstigneev, G.S.Yablonskii (Inst. of Catalysis, Acad. of Sci., Novosibirsk, USSR).
Theor. & Exp. Chem. (USA), vol.18, no.6, p.632-6 (Nov.-Dec. 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.6, p.688-94 (Nov.-Dec. 1982). [received: Sept. 1983]
The authors examine the scope for determining all the parameters in a kinetic model. They consider a complex catalytic reaction occurring by a multipath linear mechanism in which all stages are reversible. The reaction mechanisms for the intermediate substances are then represented by a linear scheme, while the corresponding stationary kinetic model is a system of linear algebraic equations (it is assumed that the concentrations of the observable substances are constant). They also assume that all the elementary reactions are of different types. They then show that even in this idealized case one can have a situation where not all the parameters can be determined. 82.30 SPECIFIC CHEMICAL REACTIONS; REACTION MECHANISMS

115516 Evidence for stereoselectivity in the copper (2⁺)-valine system. N.Al-Ani, A.Olin (Dept of Inorganic & Phys. Pharmaceutical Chem., Univ. of Uppsala, Uppsala, Sweden).
Chem. Scr. (Sweden), vol.22, no.3, p.105-7 (1983).
The complex formation between Cu²⁺ and D-valine, L-valine and (L+D)-valine has been investigated by potentiometric methods with respect to stereoselectivity. By carrying out identical experiments, except for the kind of ligand, a small but significant difference could be established between the extent of complexation with optically active ligand and racemate. From this difference the equilibrium constant for the reaction Cu(L-valine)₂+Cu(D-valine)₂⇌2Cu(L-valine) (D-valine) was found to 3.8. Hence the formation of the mixed complex is slightly disfavoured compared to the statistical case, where the constant is 4. (8 refs.)

115517 Reactions of α, β-unsaturated cyclic ketones with thioureas and ammonium thiocyanate. J.Mirek, T.A.Holak (Inst. of Chem., Jagiellonian Univ., Krakow, Poland).
Chem. Scr. (Sweden), vol.22, no.3, p.133-5 (1983).
2-(α-hydroxybenzyl)-cyclohexanone reacts with NH₄SCN yielding 4-phenyl-3,4,5,6,7-hexahydro-2(1H)-quinazolinethione. Mono- and di-benzylidene-cyclopentanones (cyclohexanones) in the base catalyzed reaction with thiourea gave the derivatives of 1,3,4,5,6,7-hexahydro-2H-cyclopentapyrimidine-2-thiones and 3,4,5,6,7,8-hexahydro-2(1H)-quinazolinethiones respectively, while benzylthiourea and dibenzyl-idencyclohexanone produced an oxo-quinazoline. In the reaction of 2-arylidene-5-alkylidencyclopentanones with thiourea with C-4 alkyl derivatives of 7-(arylmethylene)-1,3,4,5,6,7-hexahydro-2H-cyclopenta-pyrimidine-2-thiones are obtained. (14 refs.)

115518 Proton affinity. R.Ponec, J.Kucera (Inst. of Chem. Process Fundamentals, Czechoslovak Acad. of Sci., Prague, Czechoslovakia).
Chem. Scr. (Sweden), vol.22, no.3, p.152-4 (1983).
A method of decomposition of protonation energy based on the Longuet-Higgins theory of proton affinity was proposed. This method, representing an alternative to Morokuma's (1976) decomposition scheme, was applied on the CNDO level to the detailed analysis of proton affinity in a series of aliphatic amines. (6 refs.)

115519 Search for the laser-induced crossed beam reaction of excited I₂ (B¹Π) with Hg. M.M.Oprysko, F.J.Aoiz, R.B.Bernstein, M.A.McMahan (Dept. of Chem., Columbia Univ., New York, NY, USA).
Chem. Phys. (Netherlands), vol.79, no.3, p.341-50 (15 Sept. 1983).
A search for the laser-induced crossed beam reaction I₂^{*}+Hg→Hgl+I has been conducted at total energies ≤4 eV (translational energies ≤2.5 eV). The I₂ molecules are prepared in the B(3Π_{0g}) state within the scattering region via 514.5 nm Ar⁺ laser excitation. The fraction of I₂^{*} molecules in the I₂ beam was ≈4×10⁻³. No significant yield of Hgl in excess of that from the ground-state reaction was detected over the entire range of scattering angles. The experiment yields an upper limit for the ratio of the cross section for the excited-state reaction relative to that of the ground state, estimated to be ≤0.5 at a total energy of 3.9 eV. Assuming 'backward' (rebound) scattering for the excited-state reaction, this upper bound is reduced to ≤0.04. (27 refs.)

115520 Kinetics and detection of F(2P) atoms in a discharge flow system. M.A.A.Clyne, A.Hodgson (Dept. of Chem., Queen Mary Coll., London, England).
Chem. Phys. (Netherlands), vol.79, no.3, p.351-60 (15 Sept. 1983).
A new technique for the detection of F(2P) atoms in a discharge flow system is described. The fast reaction F+Br₂→BrF+Br has been used, in the presence of excess Br₂, to rapidly convert the F atoms to BrF. The BrF is then detected by laser-induced fluorescence, excited on the 5-0 or 7-0 band-heads of the B³Π(0⁺)-X²Σ⁺ transition using a pulsed, tunable dye laser. Using this sensitive spectroscopic marker technique, concentrations of F(2P)≥3×10⁹ cm⁻³ can be detected. This method has been used to measure the rates of reaction of F(2P) atoms with CH₄ and CHF₃ under pseudo-first order conditions with [Reagent]≫[F]. The following rate constants were obtained at 298K and 1 Torr pressure (in cm³ molecule⁻¹ s⁻¹ with errors quoted at 1σ), in good agreement with the literature values: k₂=(6.6±0.4)×10⁻¹¹ for the reaction F+CH₄→HF+CH₃ and k₃=(1.5±0.1)×10⁻¹³ for the reaction F+CHF₃→HF+CF₃. (30 refs.)

115521 The reaction of hydrogen atoms with silyl radicals; the decomposition pathways of chemically activated silanes. K.Worsdorfer, B.Reimann, P.Potzinger (Max-Planck-Inst. fur Strahlenchem., Mulheim, Germany). *Z. Naturforsch. Teil A (Germany)*, vol.38A, no.8, p.896-908 (Aug. 1983). The reactions of hydrogen atoms with silane and the methylated silanes—with the exception of tetramethylsilane—have been investigated in a fast flow reactor. Under the experimental conditions hydrogen abstraction from the Si-H bond is followed by combination of hydrogen atoms with the corresponding silyl radicals. The molecules formed in this way are activated by about 375 kJ/mol of vibrational energy. Two decomposition channels have been unequivocally identified, namely the elimination of molecular hydrogen and of methane, both the substrate under formation of the respective silylenes. In a subsequent step, silylene inserts into the substrate activated molecule competes with decomposition and dominates the kinetics in the case of trimethylsilane. With methyl- and dimethyl-silane, methyl radicals are observed as an additional reaction product. On the basis of RRKM calculations it is unlikely that they originate from a direct decomposition of the activated molecules. Absolute values for the room temperature rate constants of the abstraction reactions are given; for $H + CH_3SiH_3$, Arrhenius parameters have been determined. (32 refs.)

115522 Simulation of amplitude behaviour in the Ag^+ perturbed excitable Belousov-Zhabotinsky reaction by the Oregonator model. P.Ruoff (Dept. of Chem., Univ. of Oslo, Oslo, Norway). *Z. Naturforsch. Teil A (Germany)*, vol.38A, no.9, p.974-9 (Sept. 1983). Potentiometric measurements with platinum and silver electrodes of Ag^+ induced oscillations in the oxygen-inhibited excitable Belousov-Zhabotinsky system are reported. Calculations based on the Oregonator model lead to the conclusion that the platinum electrode's potential is composed of two contributions, the $Ce(III)/Ce(IV)$ redox couple which dominates at low Ag^+ flow rates and the contribution of $HBrO_2$, $HOBr$ and BrO_2 which dominates at higher Ag^+ addition rates. (27 refs.)

115523 Thermal behavior of cyclohexaphosphates of certain polyvalent metals (Cu, Co, Ni, Mn, Ba). E.V.Lazarevski, L.V.Kubasova, N.N.Chudinova, I.V.Tananaev (N.S. Kurnakov Inst. of General & Inorganic Chem., Acad. of Sci., USSR). *Inorg. Mater. (USA)*, vol.18, no.9, p.1322-7 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1544-9 (Sept. 1982). [received: Sept. 1983]

The thermal conversions of hydrates of Cu, Co, Ni, Mn, and Ba cyclohexaphosphates with composition $M_3P_6O_{18} \cdot nH_2O$ were studied by the methods of thermogravimetry, X-ray phase analysis, paper chromatography, and IR spectroscopy. It was shown that dehydration is accompanied by hydrolytic decomposition of the circular anion and intermediate liberation of diphosphates $M_2P_2O_7$ and free phosphoric acid, which interact at 450-600°C, forming cyclotetraphosphates $M_4P_4O_{12}$. (10 refs.)

115524 Thermal behavior of cyclohexaphosphates of certain polyvalent metals (Cd, V, Ga). E.V.Lazarevski, L.V.Kubasova, N.N.Chudinova, I.V.Tananaev (N.S. Kurnakov Inst. of General & Inorganic Chem., Acad. of Sci., USSR). *Inorg. Mater. (USA)*, vol.18, no.9, p.1327-33 (Sept. 1982). Translation of: *Izv. Akad. Nauk SSSR Neorg. Mater.*, vol.18, no.9, p.1550-6 (Sept. 1982). [received: Sept. 1983]

It was established that the thermal dehydration of cadmium and yttrium cyclohexaphosphates leads to the formation of anhydrous polyphosphates. (7 refs.)

115525 The effect of metal π -complexation on the properties of organic molecules and ions. W.E.Watts (Dept. of Chem., New Univ. of Ulster, Coleraine, N Ireland). *Indian J. Phys. Part B*, vol.57B, no.3, p.4-6 (June 1983). The authors study the change in reactivity on π -attachment of transition metals to cyclobutadiene, cyclopentadienyl, benzene and cycloheptatrienyl. (no refs.)

115526 The self conversion of liquid ortho-hydrogen. R.Stevenson (Phys. Dept., McGill Univ., Montreal, Canada). *Indian J. Cryog.*, vol.6, no.4, p.196-8 (1981).

At 300K hydrogen has an equilibrium composition of 25% of the para- and 75% of the ortho-modification. At the temperature of liquid hydrogen, the equilibrium concentration is greater than 99% para-, but unless a catalyst is used liquid hydrogen initially retains its room temperature composition and undergoes a slow conversion from the ortho- to the para-form with a time constant of 3.29 days. The mechanism which causes the conversion from the ortho- to the para-form has been obscure. There appears to be a basic law underlying all chemical reactions, namely that a chemical reaction takes place in the frame of reference of the molecule involved rather than in the laboratory frame of reference. With that in mind, it is noted that hydrogen in solution undergoes rotational and translational motion in the quadrupolar electric fields of the carbon disulphide molecules and the octupolar fields of the carbon tetrachloride and hence sees a relativistic magnetic field of the order of VE/c^2 , where V is the velocity of a proton of the hydrogen, E is the internal local field of the liquid, and c is the velocity of light. An estimation for the conversion reaction in liquid hydrogen is attempted. The excess concentration of the para- or ortho-modifications decays according to $\exp(-ct)$, where c is the rate constant of the reaction. For liquid ortho-hydrogen, $c = 3.52 \times 10^{-6} \text{ sec}^{-1}$, which is comparable to the rate constants in the other diamagnetic liquids. (7 refs.)

115527 The 1,2 hydrogen shift as an accompaniment to ring closure and opening: ab initio MO study of thermal rearrangements on the C_2H_3N potential energy hypersurface. L.L.Lohr, Jr., M.Hanamura, K.Morokuma (Dept. of Chem., Univ. of Michigan, Ann Arbor, MI, USA). *J. Am. Chem. Soc. (USA)*, vol.105, no.17, p.5541-7 (24 Aug. 1983).

Ab initio electronic structure calculations employing both 4-31G and DZP (double- ζ plus polarization) basis sets have been made for equilibrium geometries and transition states involved in thermal rearrangements on the C_2H_3N potential energy hypersurface. The principal rearrangements studied are those involving vinyl nitrene, 2H-azirine, methyl isocyanide, and acetonitrile. From the computed energies of stationary points and from the pathways connecting these points, several conclusions are drawn. First, singlet vinyl nitrene, although possessing a nonplanar equilibrium geometry, can undergo a ring closure with only a modest activation energy to form 2H-azirine. Second, the combined 1,2 hydrogen shift and ring opening required to form acetonitrile from 2H-azirine proceeds optimally but indirectly via methyl isocyanide as an intermediate. Thus hydrogen transfer precedes C-N bond breakage, necessitating a subsequent ring closure and reopening. Third, although no direct pathway leading from 2H-azirine to acetonitrile was located, there is a higher energy but direct pathway leading to acetonitrile from an excited singlet state of vinyl nitrene. (39 refs.)

115528 Ab initio CI study of chemical reactions of singlet and triplet NH radicals. T.Fueno, V.Bonacic-Koutecky, J.Koutecky (Inst. fur Phys. Chem., Freie Univ. Berlin, Berlin, Germany).

J. Am. Chem. Soc. (USA), vol.105, no.17, p.5547-57 (24 Aug. 1983). Reactions of the NH radical in its low electronic states ($^2\Sigma^-$, $^4\Delta$, $^1\Sigma^+$, and $^3\Pi$) with hydrogen and ethylene have been investigated by the multireference double-excitation (MRD) CI method employing mainly the 4-31G basis set. The 4-31G** basis set has been utilized for special points of interest. The relative energies of these low-lying states calculated by this method are in satisfactory agreement with the experimental data. The insertion of $NH(^3\Pi)$ into H_2 is predicted to proceed maintaining the planar (C_{2v}) symmetric structure with an extremely low-energy barrier. $NH(^4\Delta)$ inserts into hydrogen and cyclo-adds to ethylene with no barrier at all. The minimum-energy path for the addition of $NH(^3\Sigma^-)$ to ethylene has been searched for. The activation barrier height is calculated to be not larger than 24 kcal/mol. The CH_2CH_2NH radical has various local energy minima, among which the face-to-face (FF) singlet diradical is the most stable. Cyclization of the singlet FF diradical to form the ground-state aziridine has virtually no energy barrier. The singlet and triplet diradical states in the face-to-edge (FE) conformation are correlated with the first excited singlet (S_1) and the lowest triplet (T_1) state of aziridine, respectively. Implications of these results are discussed in comparing the reactivities of CH_2 and O as isoelectronic homologues of NH. (34 refs.)

115529 Ionization potentials, electron affinities, and molecular orbitals of 2-substituted norbornadienes. Theory of 1,2 and homo-1,4 carbene cycloaddition selectivities. K.N.Houk, N.G.Rondan, M.N.Paddon-Row, C.W.Jefford, Phan Thanh Huy, P.D.Burrow, K.D.Jordon (Dept. of Chem., Univ. of Pittsburgh, Pittsburgh, PA, USA). *J. Am. Chem. Soc. (USA)*, vol.105, no.17, p.5563-9 (24 Aug. 1983).

The ionization potentials, electron affinities, and π orbital shapes of 2-substituted norbornadienes have been determined by photoelectron spectroscopy, electron-transmission spectroscopy, and ab initio molecular orbital calculations, respectively. The deductions made about the electronic structures of 2-methoxy-, (trimethylsiloxy)-, chloro-, cyano-, (methoxycarbonyl)-, and phenylnorbornadienes permit a detailed interpretation of the reactivities and selectivities observed experimentally in carbene cycloadditions to these molecules. A substituent at C-2 of norbornadiene not only affects the 2-3 π bond but also influences the 5-6 π bond due to through-space interactions between π orbitals. The orbital energy changes and polarization induced by 2-substituents provide a compelling rationale of the variations in 1,2 and homo-1,4 cycloadditions of carbenes to these species, and confirm the electrophilic nature of both of these cycloadditions. (35 refs.)

115530 Electrochemical and spectral characterization of iron mono- and dinitrosyl porphyrins. D.Lancon, K.M.Kadish (Dept. of Chem., Univ. of Houston, Houston, TX, USA). *J. Am. Chem. Soc. (USA)*, vol.105, no.17, p.5610-17 (24 Aug. 1983).

The electrochemistry of (TPP)Fe^{II}(NO) and (OEP)Fe^{II}(NO) was investigated in nine nonaqueous solvents. In weakly binding solvents, such as dichloromethane or benzonitrile, five diffusion-controlled electron-transfer reactions were observed. Three of these reactions were oxidations. The remaining two reactions involved reversible electroreductions, either at the Fe(II) center or at the porphyrin ring. In strongly binding solvents, such as Me_2SO or pyridine, similar redox reactions were observed, but a number of chemical reactions were coupled to the electron-transfer steps. Formation of dinitrosyl complexes from either the unnitrosylated or mononitrosyl Fe(II) and Fe(III) complexes was characterized, and several stability constants measured. Finally, competitive ligation between different solvents and NO as axial ligand in each solvent system was studied along the series of oxidized, neutral, and reduced complexes. (39 refs.)

115531 Reactions of energetic tritium atoms with ethyl fluoride over an extensive pressure range. Y.-N.Tang, E.-C.Wu, J.W.Anderton, R.R.Clark (Dept. of Chem., Texas A&M Univ., College Station, TX, USA). *J. Chem. Phys. (USA)*, vol.79, no.5, p.2181-9 (1 Sept. 1983).

Recoil tritium reactions with ethyl fluoride have been studied over a pressure range of six orders of magnitude. The results show that subsequent to T-for-H substitution, the fraction of collisionally stabilized C_2H_4TF ranges from 0.05 at 10^{-2} Torr to 0.91 in the liquid. The low pressure results indicate that 95% of the C_2H_4TF molecules being formed possess an excitation energy of 65 kcal mol⁻¹ or higher. The high pressure and liquid phase studies suggest that about 15% of the excited molecules have energies distributed in a very long and narrow tail at the high energy end. (41 refs.)

115532 Three-body association reactions of NO^+ and O_2^+ with N_2 . C.V.Speller, M.Fitaire, A.M.Pointu (Lab. de Phys. des Gaz des Plasmas, Univ. Paris-Sud, Orsay, France). *J. Chem. Phys. (USA)*, vol.79, no.5, p.2190-9 (1 Sept. 1983).

The cluster ions $NO^+(N_2)_n$, $n \leq 5$, and $O_2^+(N_2)_n$, $n \leq 6$ were observed in a N_2-O_2 gas mixture irradiated by a particles. The temperature dependence of equilibrium constants K for association reactions $X^+(N_2)_{n-1} + 2N_2 \rightleftharpoons X^+(N_2)_n + N_2$, $X = NO, O_2$, was determined using high-pressure mass spectrometry. With $X = NO$, the enthalpies and entropies of clustering ($-\Delta H^\circ$, kcal/mol; $-\Delta S^\circ$, cal/mol K) are found to be (4.4; 13.3) and (3.9; 12.6) for $n=1$ and 2, respectively. Estimation of K at 204K yields 1.1×10^{-2} ($\pm 30\%$) Torr⁻¹ for $n=3$ and $\sim 4 \times 10^{-3}$ Torr⁻¹ for $n=4$. For $X = O_2$, the ($-\Delta H^\circ$, $-\Delta S^\circ$) values, for $n=1,2,3$ are (5.20; 15.8), (4.3; 3.8), and (3.46; 12.1), respectively. The value of K ($n=4$) is estimated to be $\sim 4 \times 10^{-2}$ Torr⁻¹ at 184K, and $\sim 7 \times 10^{-3}$ Torr⁻¹ at 204K; for $n=5$, K is $\sim 1 \times 10^{-2}$ Torr⁻¹ at 184K. The results for $n=1$ are compared with previously reported measurements. (31 refs.)

115533 Temperature dependence of associative detachment reactions. A.A.Viggiano, J.F.Paulson (Air Force Geophys. Lab., Hanscom AFB, MA, USA). *J. Chem. Phys. (USA)*, vol.79, no.5, p.2241-5 (1 Sept. 1983).

The temperature dependences of the rate coefficients for the associative detachment reactions $O^- + NO$, $S^- + CO$, and $S^- + O_2$ have been measured. All rate coefficients varied as $T^{-0.74 \pm 0.1}$. In addition, the rate coefficients and branching ratios for the reactions $O^- + C_2H_2$ and $O^- + C_2H_4$ have also been studied as a function of temperature. Both reactions were found to have a large associative detachment channel over the entire temperature range 140-494K. (35 refs.)

115534 The reaction $H_2 + D_2 \rightleftharpoons 2HD$. A long history of erroneous interpretation of shock tube results. A.Lifshitz, M.Bidani, H.F.Carroll (Dept. of Phys. Chem., Hebrew Univ., Jerusalem, Israel). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2742-7 (15 Sept. 1983).

An ultraclean 2 in. i.d. single pulse shock tube coupled to an atomic resonance absorption system was constructed in order to determine hydrogen atom concentration by Lyman- α absorption. The tube was baked to 300°C and pumped down to $\sim 10^{-7}$ Torr. Ultrapure argon could be shock heated to $\sim 2500K$ with no spurious H atom absorption. The system was constructed in order to study the kinetic of chemical reactions which are strongly catalyzed

by H atoms, under the conditions where no such atoms are present. Specifically, the role of H atoms in the $H_2 + D_2 \rightarrow 2HD$ exchange reaction was studied. Mixtures of hydrogen and deuterium diluted in argon were shock heated to 1375-1760K; samples were then taken from the tube and analyzed mass spectrometrically for the ratio $[HD]/[D_2]$. 1400K was the highest temperature at which no spurious H atom absorption was observed in a shocked mixture of 1% H_2 -1% D_2 . At 1400K, under the conditions of no absorption, no, or $\leq 1\%$ HD conversion was obtained. At higher temperatures Lyman- α absorption was detected and more HD conversion was observed. A comparison between these results and results obtained previously in conventional systems suggests that the high HD conversion observed in the past was caused by hydrogen atoms generated from impurities. The existence of a molecular mechanism in the H_2 - D_2 exchange reaction is highly doubtful. (28 refs.)

115535 Thermally induced nucleation. I. A new way to obtain activation energies for unimolecular reactions. J.L.Katz, J.G.Ruggiero, Jr. (Dept. of Chem. Engng., Johns Hopkins Univ., Baltimore, MD, USA), R.Patch, D.Warren, F.H.Ebetino. *J. Chem. Phys. (USA)*, vol.79, no.6, p.2763-70 (15 Sept. 1983).

Thermal diffusion cloud chambers have been used to study a variety of physical chemical phenomena, particularly homogeneous nucleation. A new and potentially valuable application of the diffusion cloud chamber—the monitoring of thermally allowed reactions—is presented. It is shown that a low concentration of benzocyclobutenol dissolved in nonane will induce temperature dependent nucleation. At constant temperature the rate of nucleation decays exponentially over time. Exponential decay constants obtained from rates of nucleation, when plotted in Arrhenius fashion, give an activation energy of 31 kcal/mol—the same value reported for the racemization of a chiral benzocyclobutenol derivative. (46 refs.)

115536 Reaction velocities and the affinity decay rate. M.Garfinkle (Dept. of Materials Engng., Drexel Univ., Philadelphia, PA, USA). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2779-85 (15 Sept. 1983).

Reaction velocities are calculated for several chemical reactions with diverse mechanisms from thermodynamic considerations alone. These are compared to reaction velocities computed in the conventional manner from mechanistic considerations. The comparisons indicate that a linear phenomenological relationship between chemical affinity and reaction velocity cannot be justified and that there exists a basic compatibility between the thermodynamic and the mechanistic approach to reaction kinetics. (23 refs.)

115537 Second order rate constants for intramolecular conversions: application to gas-phase NMR relaxation times. S.H.Bauer, K.I.Lazaar (Dept. of Chem., Cornell Univ., Ithaca, NY, USA). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2808-13 (15 Sept. 1983).

The usually quoted expression for the second order rate constant, for a unimolecular reaction at the low pressure limit, is valid only for strictly irreversible processes. Its application to isomerization reactions (which are to some extent reversible) is demonstrably in error; corrected expressions have been published. Attention is directed to intra molecular conversions over low barriers, for which the inappropriateness of the unidirectional expression becomes obvious. For such isomerizations the authors propose a model which incorporates only operationally observable states, so that an essential conceptual ambiguity is avoided. Use of this model is illustrated for the syn-anti conversions of methyl nitrite, derived from a gas phase NMR coalescence curve (M_c/T_c). The present data suggest that during isomerization the alkyl nitrites may not be completely ergodic on a time scale of 10^{-9} s. A regional phase-space model is proposed which has the appropriate formalism to account for this behavior. (27 refs.)

115538 Product distributions in the reactions of excited noble-gas atoms with hydrogen-containing compounds. J.Balamuta, M.F.Golde, Yueh-Se Ho (Dept. of Chem., Univ. of Pittsburgh, Pittsburgh, PA, USA). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2822-30 (15 Sept. 1983).

Dissociation and ionization of small H-containing molecules following energy transfer from electronically excited ($^3P_{0,2}$) states of Ar, Kr, and Xe have been studied in discharge-flow systems using the atomic resonance fluorescence and the saturation ion-current techniques. Chemi-ionization is observed in all reactions in which Penning ionization is exothermic, but molecular dissociation is the major channel in all cases. Elimination of H atoms is strongly favored over both loss of H_2 and cleavage of central bonds of larger molecules, in contrast to the known vacuum-UV photochemistry of several of the molecules. When strongly exothermic, elimination of two H atoms in a single reactive event is a major and, in some cases, the dominant channel. (32 refs.)

115539 Investigation of various ways of forming CsH by irradiating a Cs+H₂ mixture with laser light. J.P.Visticot, M.Ferray, J.Loizingot, B.Sayer (Inst. de Recherche Fondamentale, CENS, Gif-sur-Yvette, France). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2839-47 (15 Sept. 1983).

A detailed study of the formation of CsH by the laser photoexcitation of cesium atoms is presented. It is shown that, under the authors' experimental conditions, CsH can be formed not only from the Cs(7P) state but also from the Cs(6D) state and that the 6D level appears to be even more efficient than the 7P level. CsH formation has also been observed when rubidium impurities present in the medium are photoexcited. In this situation, excitation transfer from excited Rb atoms to Cs atoms is not sufficient to explain the observed rate of CsH formation; consequently most of the CsH appears to be formed in an indirect process requiring no excited Cs atom and perhaps involving vibrationally excited H_2 molecules. (20 refs.)

115540 A multiconfigurational self-consistent field study of the D_{2h} dissociation of excited-state ethylene. D.Feller, E.R.Davidson (Dept. of Chem., Univ. of Washington, Seattle, WA, USA). *J. Phys. Chem. (USA)*, vol.87, no.15, p.2721-2 (21 July 1983).

A semiquantitative potential curve is calculated for the D_{2h} dissociation of the first excited 1A_g state of ethylene to two 1A_1 methylenes. Contrary to previous work, the Rydberg nature of the excited 1A_g state is found to lead to a stable ethylene minimum and a barrier to dissociation. (13 refs.)

115541 Thermal decomposition of $Eu_2(SO_4)_3 \cdot 8H_2O$ studied by high resolution luminescence spectroscopy. H.G.Brittain (Dept. of Chem., Seton Hall Univ., South Orange, NJ, USA). *J. Less-Common Met. (Switzerland)*, vol.93, no.1, p.97-102 (1983). (Proceedings of the Sixteenth Rare Earth Research Conference, Tallahassee, FL, USA, 18-21 April 1983).

The thermal decomposition of hydrated europium sulfate was monitored by high resolution photoluminescence studies of the decomposition products. By application of the luminescence method, information can be gleaned from the fine structure within the europium(III) bands regarding the number of europium(III) species existing in the sample. In addition, some idea of the site symmetry of the emitting europium(III) species can be deduced from a detailed analysis of the spectra. Examination of the luminescence spectra revealed that dehydration of the europium(III) sulfate yields a multitude of hydrated intermediates, and these eventually form a well-defined anhydrous sulfate. The data indicate the presence of a hitherto unsuspected intermediate

$Eu_2O(SO_4)_2$ in the decomposition of the anhydrous $Eu_2(SO_4)_3$ to a well-defined $Eu_2O_2SO_4$ end product. (7 refs.)

115542 Electronic structure and chemical conversions of peroxides. II. MINDO/3 calculations of reaction mechanism in noncatalytic epoxidation of olefins by hydroperoxides. V.N.Kokorev, N.N.Vyshinskii, V.P.Maslennikov, I.A.Abroniin, G.M.Zhidomirov, Yu.A.Aleksandrov (Sci.-Res. Inst. of Chem., N.I. Lobachevskii Gor'kii State Univ., Gorkii, USSR). *J. Struct. Chem. (USA)*, vol.23, no.6, p.830-7 (Nov.-Dec. 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.6, p.13-21 (Nov.-Dec. 1982). [received: Sept. 1983]

By the SCF MO LCAO method in the MINDO/3 valence approximation with variation of all independent variables, the initial compounds, transition states (TS) and products have been calculated for a series of reactions of noncatalytic epoxidation of olefins by hydroperoxides. The geometric and electronic characteristics of the TSs, as determined by the procedure of McIver and Komornicki (1972), showed that the reaction proceeded through a concerted mechanism with an asymmetric, highly polar TS. The MINDO/3-calculated values of the activation energies, are in good agreement with the available experimental values. The calculations show that in the initial phase of the epoxidation reaction, the formation of a labile prereaction olefin-hydroperoxide intermediate is possible. (22 refs.)

115543 Different nature of outer-sphere complex formation between chloroform and bis-(N-phenyl-salicylaldimine)/Cu(II) and its adduct with pyridine. E.P.Talzi, V.M.Nekipelov, N.V.Kozyrev, K.I.Zamaraev (Inst. of Catalysis, Acad. of Sci., USSR). *J. Struct. Chem. (USA)*, vol.23, no.6, p.956-8 (Nov.-Dec. 1982). Translation of: *Zh. Strukt. Khim. (USSR)*, vol.23, no.6, p.158-60 (Nov.-Dec. 1982). [received: Sept. 1983]

The coordination of $CHCl_3$ to $Cu(Salim)_2$ and $Cu(Salim)_2Py$ at $25^\circ C$ has been studied using NMR. It was found that, in the complexes with $Cu(Salim)_2$, the $CHCl_3$ molecules are arranged out of the plane of the chelate while, with $Cu(Salim)_2Py$, chloroform also forms equatorial outer-sphere complexes. The results are explained by the fact that the planar structure of the chelate is distorted during the axial coordination of pyridine as a result of which the formation of hydrogen bonds between the oxygen atoms of the complex and the hydrogen atoms of the $CHCl_3$ molecules becomes possible. (14 refs.)

115544 Proton transfer in complexes of water with hydrogen halides in aprotic solvents. A.A.Pankov, V.Yu.Borovkov, V.B.Kazanskii. *J. Appl. Spectrosc. (USA)*, vol.37, no.5, p.1306-8 (Nov. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.5, p.824-7 (Nov. 1982). [received: Sept. 1983]

For a study of the protonation of water in the absence of specific solvation the authors undertook an IR spectroscopic investigation of complexes of water with strong mineral acids HCl and HBr in aprotic solvents. (8 refs.)

115545 Dissociation of Cn^+ into atomic excited states after acceleration in a tandem accelerator. H.G.Berry (Phys. Div., Argonne Nat. Lab., Argonne, IL, USA), L.Engstrom, R.Hellborg, S.Huldt, C.Jupen, A.Trigueiros, I.Martinon. *Phys. Lett. A (Netherlands)*, vol.97A, no.5, p.187-90 (29 Aug. 1983).

A Cn^+ beam produced by stripping Cn^- in the terminal of a Pelletron Tandem accelerator was dissociated in a thin carbon foil. Optical observations of ultraviolet transitions C III-C IV and IV-N V showed intensity variations as a function of foil thickness. The results indicate an enhancement of population to the neighboring partner projectile for some but not all excited states. (13 refs.)

115546 Influence of electronic structure of a cation-radical skeleton, the nature of the anion attached to it, and the nature of the medium on reaction kinetics of one-electron oxidation of triphenylantimony by cation radicals of substituted triphenylamines. V.G.Koshechko, V.E.Titov, V.D.Pokhodenko (L.V. Pisarzhevskii Inst. of Phys. Chem., Acad. of Sci., Kiev, Ukrainian SSR). *Theor. & Exp. Chem. (USA)*, vol.18, no.6, p.648-53 (Nov.-Dec. 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.6, p.705-10 (Nov.-Dec. 1982). [received: Sept. 1983]

In the case of reactions of this type it was interesting to find the factors influencing the reactivity of the cation radicals. In the present work, therefore, the authors studied by the spectrophotometric method the influence of the electronic structure of the cation-radical skeleton of the radical-oxidant, the nature of the anion attached to it, and the nature of the medium on the kinetic parameters of the oxidation of triphenylantimony (Ph_3Sb) by cation radicals of substituted triphenylamines. (20 refs.)

115547 Theoretical investigation of the cyclodimerization of acetylene and the stability of Hartree-Fock solutions. M.N.Glukhovtsev, B.Ya.Simkin, I.A.Yudilevich (Rostov State Univ., Rostov, USSR). *Theor. & Exp. Chem. (USA)*, vol.18, no.6, p.669-72 (Nov.-Dec. 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.6, p.726-9 (Nov.-Dec. 1982). [received: Sept. 1983]

An analysis of the stability of the Hartree-Fock (HF) solutions can serve as a basis for the classification of organic reactions and is used as a comparatively simple method for the determination of the type of a given reaction. However, up to the present time, actual calculations have only been carried out in the case of model reactions using idealized geometry and a hypothetical reaction pathway. Meanwhile, variation of all the degrees of freedom in the reaction process can even change the qualitative conclusions. The aim of the work was to carry out a theoretical investigation of the cyclodimerization of acetylene by calculation of the minimum energy reaction path using the MINDO/3 method with variation of all the internal geometric parameters and to analyze the stability of the solutions which were obtained. (18 refs.)

115548 Correlation diagrams of states for certain 'forbidden' reactions. Yu.V.Mitrenin (Tomsk Polytech. Inst., Tomsk, USSR). *Theor. & Exp. Chem. (USA)*, vol.18, no.6, p.692-6 (Nov.-Dec. 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.6, p.750-4 (Nov.-Dec. 1982). [received: Sept. 1983]

Correlation diagrams of states (CDS) were constructed and potential barriers (PB) were estimated for several 'forbidden' reactions, including those whose 'forbiddances' are usually not revealed from the CD of the molecular orbitals. By 'forbiddance' is usually meant a high potential barrier due to quasi-intersection of potential energy surfaces (PES). These PB's can be both high and low, and, therefore, the terminology of 'forbiddance' in some cases does not reflect the essence of the matter. Therefore, the numerical estimate of PB is better. Since the CD's of molecular orbitals do not give an unambiguous possibility for constructing the CDS and do not reveal all the types of quasi-intersections, it is necessary to search for direct methods of constructing the CDS. The authors used the possibilities of the valence bond (VB) method for this purpose. (11 refs.)

82.35 POLYMER REACTIONS AND POLYMERIZATION

- 115549 The gamma ray-induced crosslinking of polyacrylamide in the solid state. G.Burillo (Univ. Nacional Autonoma de Mexico, Mexico City, Mexico), T.Ogawa. *J. Polym. Sci. Polym. Lett. Ed. (USA)*, vol.21, no.8, p.615-20 (Aug. 1983). Although there are many studies on the radiation-induced crosslinking of polymers, very little has been reported on the crosslinking of polyacrylamide. Previously, the authors studied the gamma ray-induced gelation of aqueous solution of polyacrylamide and reported that the molecular weight is a very important factor for crosslinking, and later they reported that the water content in the polymer is an important factor for crosslinking in the solid state. In order to obtain more information on the mechanism of crosslinking and to obtain basic data for the optimum conditions for gel formation, the gamma ray irradiation of polyacrylamide was carried out under various conditions, and the results are reported. 82.40 CHEMICAL KINETICS AND REACTIONS: SPECIAL REGIMES

- 115550 Fluorescence measurements of OH in a turbulent flame. M.Azzazy, J.W.Daily (Univ. of California, Berkeley, CA, USA). *AIAA J. (USA)*, vol.21, no.8, p.1100-6 (Aug. 1983). Laser-induced fluorescence spectroscopy has been used to measure OH concentration probability density functions (PDFs) in a turbulent premixed flame. The methane-air flame is stabilized on a rod flame holder located downstream of a turbulence producing grid. Measurements in both the streamwise and transverse directions have been made for a variety of flow conditions. The PDFs display a single peaked behaviour throughout the flame, with the broadest structure in the center of the flame. A simple limit analysis shows that the observed behaviour of the PDF is consistent with expected behaviour for an intermediate radical specie over the range of flame, optical, and turbulence length scales present in the experiment. (8 refs.)
- 115551 Acoustic signature from flames as a combustion diagnostic tool. M.K.Ramachandra, W.C.Strahle (Georgia Inst. of Technol., Atlanta, GA, USA). *AIAA J. (USA)*, vol.21, no.8, p.1107-14 (Aug. 1983). A nonintrusive acoustic technique has been developed to obtain the fluctuating heat release rate distribution in open premixed turbulent flames. Propane-air flames of equivalence ratio 0.6, 0.8, and 1.0 with a 16.4 mm diam burner and a 11.55 m/s mean flow speed have been employed. The flame sound pressures in the near field were measured in an anechoic chamber. With the acoustic spectra and the input, the heat release rate spectral information was obtained by numerically using an augmented Glearkin method to solve a Fredholm integral equation of the first kind. Computed results have been qualitatively verified by C_2 emission studies. The experimentally observed correspondence between mean and RMS C_2 emission intensity implies that the shape of the mean heat release distribution can, in principle, be deduced by the acoustic technique. (15 refs.)

- 115552 Structure and extinction of convective diffusion flames with general Lewis numbers. S.H.Chung, C.K.Law (Dept. of Mech. & Nuclear Engng., Northwestern Univ., Evanston, IL, USA). *Combust. & Flame (USA)*, vol.52, no.1, p.59-79 (Aug. 1983). The structure and extinction of quasi-one-dimensional diffusion flames with general Lewis numbers for both fuel and oxidiser are analysed using large activation energy asymptotics for the model problems of spherically symmetric droplet combustion, counterflow combustion, and stagnation point combustion over a condensed fuel. General matching and jump conditions up to the first order of expansion are derived. It is shown that by suitably redefining certain parameters the structure equations for all cases can be brought to the same form as that of Linan (1974) so that his numerically generated extinction Damkohler number correlation can be readily used. Combining this with the authors' own numerical result of the reactant leakage correlation, the extinguishability of a given system can be assessed. The present extinction criterion with general Lewis numbers also provides improved accuracy in the determination of overall kinetic constants through correlation of experimental extinction data. (16 refs.)
- 115553 The visible shape and size of a turbulent hydrocarbon jet diffusion flame in a cross-wind. G.T.Kalghatgi (Shell Res. Ltd., Res. Centre, Chester, England). *Combust. & Flame (USA)*, vol.52, no.1, p.91-106 (Aug. 1983). The results of an extensive wind-tunnel study into the shapes and sizes of hydrocarbon jet diffusion flames in a horizontal cross-wind are presented. The shape of a turbulent diffusion flame in a cross-wind can be described by the frustum of a cone, which, in turn, can be defined by five different parameters of shape. When the burner axis is normal to the wind, each shape parameter can be related to the burner diameter, the burner exit velocity, the cross-wind speed, and the density of the burner gas by one equation. When the burner axis is not normal to the wind, the experimental results still follow an identifiable pattern and can be used to estimate flame shapes and sizes. (13 refs.)
- 115554 Diagnostic possibilities on the basis of premixed flame noise levels. G.Petela, R.Petela (Inst. Tech. Cieplnej, Politech. Slaska, Gliwice, Poland). *Combust. & Flame (USA)*, vol.52, no.2, p.137-47 (Sept. 1983). On the basis of an assumed turbulent premixed gaseous flame model a useful formula is derived for the flame noise intensity, which is considered as an effect of combustion intensity fluctuations and flame zone turbulence. The observed similarity between the change in the flame noise spectrum amplitude and the energy release rate suggests the possibility of a diagnostic interpretation of the noise in terms of combustion intensity. This information becomes less clear, however, when the flame turbulence is strongly developed. The mutual relation between combustion intensity, flame zone turbulence, and amplitude of noise spectrum components suggests an analogy with the basic diagnostic formula. (28 refs.)
- 115555 Transient catalytic combustion on a flat plate. A.Fakheri, R.O.Buckius (Dept. of Mech. & Industrial Engng., Univ. of Illinois, Urbana, IL, USA). *Combust. & Flame (USA)*, vol.52, no.2, p.169-84 (Sept. 1983). The transient two-dimensional heterogeneous combustion of fuel on a catalytic flat plate is studied. The solutions are obtained for the three different wall boundary conditions of an isothermal, a perfectly conducting plate, and an adiabatic plate. The laminar boundary layer equations are transformed, and the resulting equations are solved numerically. Equations are nondimensionalized to make the results as general as possible. For a perfectly conducting plate, a universal approach is used which shows the solution of the transport equations to be single valued and that the multiple solutions are caused only by the form of the rate expression. General solutions are found for an isothermal plate which are applicable to any first order reaction or a fuel lean mixture with second order reaction. Solutions for an adiabatic plate show a high temperature region is formed down the plate which moves up. Ignition delay time and ignition distance are found to have the same dependence on the flow and kinetic parameters, except that the ignition delay time does not depend on the free-stream velocity. The results are obtained for CO as well as H_2 oxidations. (18 refs.)
- 115556 Inhibition of acetaldehyde cool flames. J.C.Jones, B.F.Gray (School of Chem., Macquarie Univ., North Ryde, NSW, Australia). *Combust. & Flame (USA)*, vol.52, no.2, p.211-13 (Sept. 1983). Recent studies of the cool flame behaviour of acetaldehyde-oxygen mixtures have all used the continuous stirred tank reactor, thus enabling the observation of limit cycles, multistability, repeated ignitions, and so on. Although a number of studies have dealt with the extinction or inhibition of normal (hot) flames by additives the relevance of the latter to the inhibition of the onset of combustion is not clear. The authors report results obtained with a variety of inhibitors on both the cool flame limits and the heat release rates in the steady (nonoscillatory) slow combustion reaction. (5 refs.)
- 115557 Effect of diameter on the burning rate of polystyrene. K.Kishore, K.Mohandas (Dept. of Inorganic & Phys. Chem., Indian Inst. of Sci., Bangalore, India), I.Spilda. *Combust. & Flame (USA)*, vol.52, no.2, p.215-16 (Sept. 1983). The myriad of test methods used to determine the burning rates of polymeric materials generally overlooks the effect of the size of the samples. Each of the test methods insists on a particular geometry for the test specimen, and this leads to a wide variation in the area of burning surface from one test to another. The authors have studied the influence of rod diameter on the rate of burning of polystyrene (PS). (7 refs.)
- 115558 Toxicologic and physicochemical characterization of high-temperature combustion emissions. E.R.Kirchner, P.F.Dunn, C.B.Reed (Argonne Nat. Lab., Argonne, IL, USA). *Aerosol Sci. & Technol. (USA)*, vol.2, no.3, p.398-400 (1983). Particles and combustion gases produced by two different high-temperature combustors, which burned pulverized coal and a No.2 fuel oil-fly ash slurry, respectively, at adiabatic flame temperatures greater than 2400K, were characterized. Effluent samples were taken at locations along the product gas stream and within the stack. Measurements of the particle size distributions, number concentrations, and gas species concentrations were made. The toxicity and mutagenicity of the effluent particles were determined. A large number of submicrometer particles were found in both cases of high-temperature combustion. The product emissions differed significantly in their particle size distribution and final chemical composition from those of conventional combustion systems having lower combustion temperatures. (18 refs.)
- 115559 Resonant electron scattering by metastable nitrogen. I.Cadez (Cooperative Inst. for Res. in Environmental Sci., Univ. of Colorado, Boulder, CO, USA). *Planet. & Space Sci. (GB)*, vol.31, no.8, p.843-8 (Aug. 1983). The resonant electron impact quenching of metastable molecules might be important for understanding the phenomena in the upper atmosphere. In order to obtain information about the relative importance of this scattering event the resonant cross sections for electron scattering by metastable nitrogen

in the $A^3\Sigma_u^+$ state are calculated using the 'boomerang' model and quenching rates for this state are evaluated for the altitudes of 130, 170 and 210 km. (12 refs.)

(see also 42.55K Chemical lasers; 78.60P Chemiluminescence)

115560 Beam-gas study of chemiluminescent reactions of Sn, Ge, and Si with F_2 . W.J.Rosano, J.M.Parson (Dept. of Chem., Ohio State Univ., Columbus, OH, USA). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2696-709 (15 Sept. 1983). Electronic chemiluminescence (CL) has been observed for the reactions of tin, germanium, and silicon with fluorine utilizing a beam-gas configuration. Only electronic states of the metal monofluorides which are energetically allowed in a single reactive collision of the metal atoms $\text{SnF}(A^2\Sigma^+)$, $\text{GeF}(A^2\Sigma^+)$, and $\text{SiF}(A^2\Sigma^+, A^2\Sigma^-)$ have been observed, in contrast with the results of previous flame studies in which other high lying electronic states have been reported. Pressure and temperature variations of the CL indicate a first-order dependence with respect to metal and fluorine. Simulation of the $A^2\Sigma^+-X^2\Pi$ systems has been obtained by nonlinear least-squares fit of the experimental spectra. Vibrational populations of the $A^2\Sigma^+$ states are found to be inverted, with the appearance of double maxima. Adiabatic correlation, with respect to overall electronic symmetries of the reactants and products, indicates all reactant surfaces lead to ground-state products. However, molecular orbital arguments indicate the presence of one diabatic surface connecting reactants and electronically excited products. (64 refs.)

(see also 66.10 Ionic conduction in liquids; for electro-osmosis, see 82.65)

115561 Polymer films on electrodes. XIII. Incorporation of catalysts into electronically conductive polymers: iron phthalocyanine in polypyrrole. R.A.Bull, F.-R.Fan, A.J.Bard (Dept. of Chem., Univ. of Texas, Austin, TX, USA). *J. Electrochem. Soc. (USA)*, vol.130, no.7, p.1636-8 (July 1983). Tetrasulfonated iron phthalocyanines (FePcS) can be incorporated into electronically conducting polypyrrole by electrochemical polymerization of pyrrole in the presence of FePcS. The FePcS modified glassy carbon electrodes catalyzed the reduction of O_2 at potentials 250 to 800 mV less negative than at bare glassy carbon or at polypyrrole-coated glassy carbon not containing FePcS. Rotating ring-disk experiments indicated some hydrogen peroxide formation at most pHs. However, at high pH essentially exclusive reduction of O_2 to H_2O was observed at potentials 250 mV less negative than at a non-catalyzed electrode. (13 refs.)

115562 Influence of halide ions, mainly iodide ions upon the kinetics of anodic oxidation of zirconium in 0.1 M potassium tartrate. A.N.Chary (Dept. of Chem., Osmania Univ., Hyderabad, India), Ch.Anjaneyula, K.S.Sastry. *J. Electrochem. Soc. India*, vol.32, no.1, p.32-3 (Jan. 1983). [received: Sept. 1983] The influence of halide ions on the kinetics of anodic oxide film formation on zirconium in 0.1 M potassium tartrate have been studied at a constant current density of 8 mA/cm² and at room temperature. At higher concentration of halide ions (≥ 0.1 M) there is no film formation and deleterious effects are observed. However there is a film formation and improvement in the kinetics of anodic oxidation at lower concentrations (0.001 M) of halide ions. In the presence of iodide ions the kinetics give interesting results. (10 refs.)

115563 Photoelectrochemical properties and optical quenching of photocurrent in $\text{Bi}_{12}\text{SiO}_{20}$ single crystals. K.Kochev, K.Tzvetkova, M.Gospodinov (Central Lab. of Solar Energy & New Energy Sources, Bulgarian Acad. of Sci., Bulgaria). *Mater. Res. Bull. (USA)*, vol.18, no.8, p.915-19 (Aug. 1983). The photoelectrochemical properties of reduced $\text{Bi}_{12}\text{SiO}_{20}$ (BSO) single crystals have been investigated for the first time. The flatband potential determined from the C-V measurements is $U_{fb} \approx 0.9$ V vs. SCE. The photosensitivity is observed up to 0.5 μm in the visible range of the spectrum. The optical quenching of the photocurrent in the BSO-electrolyte-Pt cell has been investigated. This effect appears for wavelengths in the range 0575+1.1 μm . From the infrared threshold of the spectrum, it was defined that the sensitizing centres of the BSO crystals are located at 11 eV above the valence band. (8 refs.)

115564 Irreversible loss of adatoms on Ag electrodes during potential cycling determined from surface enhanced Raman intensities. J.F.Owen, T.T.Chen, R.K.Chang (Center for Laser Diagnostics, Yale Univ., New Haven, CT, USA), B.L.Laube. *Surf. Sci. (Netherlands)*, vol.131, no.1, p.195-220 (Aug. 1983). Surface enhanced Raman scattering of adsorbates ($\text{Ag}^0\text{-Cl}^-$, H_2O and pyridine) on Ag electrodes in 1M KCl and 1M $\text{KCl}+0.05\text{M}$ pyridine electrolytes was monitored continuously with an optical multichannel analyzer system as the electrode potential was cycled over various ranges within nonfaradic regions of the oxidation-reduction cycle. A systematic investigation was performed of the potential dependence of SERS of pyridine in 1M $\text{KX}+0.05\text{M}$ pyridine electrolytes, where $\text{X}=\text{F}, \text{Cl}, \text{Br}$ and I . Since the surface coverage of the adsorbates is reversible with potential cycling within a potential range, it was possible to determine potential dependences of the irreversible loss in the SERS enhancement factor which occurs as the electrode potential is ramped toward the potential of zero charge (PZC). The results provide strong support for the role of adatoms on the electrode surface in the overall enhancement mechanism. There is evidence that the strongly bound adsorbates immobilize the adatoms at positive potentials but allow the adatoms to migrate and become lost at surface defects as the potential approaches the PZC where the adsorbates are less tightly bound. (34 refs.)

115565 The preparation and properties of metallic optically transparent electrodes. L.J.J.Janssen (Dept. of Chem. Tech., Eindhoven Univ. of Technol., Eindhoven, Netherlands), A.T.Kuhn. *Surf. Technol. (Switzerland)*, vol.20, no.1, p.41-9 (Sept. 1983). The uses of optically transparent electrodes (OTEs) are briefly discussed together with the different types of OTE. The review is focused on metallic OTEs and a survey of the various types, their means of preparation and their optical and electrical properties is included. (22 refs.)

82.50 PHOTOCHEMISTRY AND RADIATION CHEMISTRY
(see also 33.50 Fluorescence, phosphorescence; radiationless transitions)

115566 Time resolved photoacoustic spectroscopy applied to properties of picosecond transients. L.J.Rothberg, M.Bernstein, K.S.Peters (Dept. of Chem., Harvard Univ., Cambridge, MA, USA). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2569-76 (15 Sept. 1983). Time resolved photoacoustic spectroscopy represents a promising new approach to the study of time resolved absorption with picosecond time resolution. The sensitivity of photoacoustic detection permits investigation of dilute and fluorescent samples which are difficult to study by conventional flash photolysis. Theory shows that quantitative measurements of important transient properties and new insights into photochemical and photophysical dynamics can be obtained by measuring heat deposition as a function of probe fluence. Experimental determinations of absorption and stimulated emission cross sections, and lower limits for rates of nonradiative relaxation of highly excited states, are presented. (16 refs.)

115567 Relative quantum yield of $\text{I}^*(^2\text{P}_{1/2})$ in the tunable laser UV photodissociation of $\text{i-C}_3\text{F}_7\text{I}$ and $\text{n-C}_3\text{F}_7\text{I}$: effect of temperature and exciplex emission. J.E.Smedley, S.R.Leone (Dept. of Chem., Univ. of Colorado, Boulder, CO, USA). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2687-95 (15 Sept. 1983). Wavelength-specific relative quantum yields of I^* from pulsed laser photodissociation of $\text{i-C}_3\text{F}_7\text{I}$ and $\text{n-C}_3\text{F}_7\text{I}$ in the range 265-336 nm are determined by measuring the time-resolved infrared emission ($\lambda=1.135 \mu\text{m}$) from the atomic $\text{I}(^2\text{P}_{1/2} \rightarrow ^2\text{P}_{3/2})$ transition. The quantum yields of I^* from $\text{i-C}_3\text{F}_7\text{I}$ and $\text{n-C}_3\text{F}_7\text{I}$ are constant and appear to be unity from 265-298 nm but decrease to 0.57 and 0.40, respectively, at 336 nm. The lower quantum yields suggest the existence of two distinct bands in this region of the absorption continua. To determine the quantum yields a correction is made for enhanced emission due to formation of exciplexes between I^* and the parent (i- or $\text{n-C}_3\text{F}_7\text{I}$) species. The exciplex emission increases linearly with parent gas pressure, but decreases with increasing temperature. For both molecules the integrated absorption in the long wavelength region (>290 nm) increases substantially with temperature, while at selected wavelengths the quantum yields are found to remain constant with temperature. The results are discussed in terms of the development of solar-pumped iodine lasers. (34 refs.)

115568 Laser flash photolysis of benzene. VIII. Formation of hot benzene from the S_2 state and its collisional deactivation. N.Nakashima, K.Yoshihara (Inst. for Molecular Sci., Okazaki, Japan). *J. Chem. Phys. (USA)*, vol.79, no.6, p.2727-35 (15 Sept. 1983). Time-resolved absorption spectra of gaseous benzene have been observed in the time range from 0 to 4 μs with an ArF laser (193 nm) as an excitation source, which pumps the S_2 state. The absorption strength in the transient spectrum observed immediately after excitation with a 10 ns pulse decreases monotonically from 210 to 290 nm. This spectrum is postulated to be due to $\text{B}^*(\text{S}_0)$ (a hot benzene with internal energy 624 kJ/mol). The transient spectrum can be simulated as part of the $\text{S}_3(^1\text{E}_{1g}) \rightarrow \text{S}_0$ transition at 3390K on the basis of the Sulzer-Wieland model. The agreement between calculated

and observed molar extinction coefficients of $B^{**}(S_0)$ indicates that the yield of internal conversion from S_2 to $B^{**}(S_0)$ is close to unity. Deactivation processes have been detected from $B^{**}(S_0)$ to a thermal equilibrium state in inert gas baths. The time profile of absorption intensity due to collisional deactivation is nonexponential and depends upon observing wavelength, being faster at longer wavelength. The deactivation processes are explained in terms of a simple energy transfer model, which assumes that the removal energy per collision depends on the internal energy of the hot molecule. Internal conversion from S_2 to $B^{**}(S_0)$ is suggested to be the initial step in the photochemical reactions of gaseous benzene. The absorption spectrum and collisional deactivation processes following excitation with a KrF laser (248 nm), which pumps the S_1 state, have been analyzed in the same way. (27 refs.)

115569 The mechanism of the cross linking of poly(vinyl alcohol) by ammonium dichromate with UV-light. L.Grimm, K.-J.Hilke, E.Scharrer (Philips GmbH, Aachen, Germany). *J. Electrochem. Soc. (USA)*, vol.130, no.8, p.1767-71 (Aug. 1983). The phosphor raster of color TV screens is produced by the exposure of photosensitive coats to ultraviolet light. On the basis of existing papers and the authors' own experiments, a model is presented showing the mechanism of the photosensitive reaction between poly(vinyl alcohol), ammonium dichromate, and water. A complex redox reaction takes place between the three components, leading to chromium (III) ions and poly(vinyl alcohol) cleavage products with terminal carboxyl groups. There is interaction to chelate complexes, thus resulting in a three-dimensional poly(vinyl alcohol) network insoluble in water. (28 refs.)

115570 Pulse-radiolytic investigation of CS_2 reduction. O.Brede, R.Mehner, E.Hoyer (Zentralinst. für Isotopen- und Strahlenforschung, Akad. der Wissenschaften, Leipzig, Germany). *Radiochem. & Radioanal. Lett. (Switzerland)*, vol.58, no.2, p.117-28 (19 Aug. 1983). In aqueous solution of *t*-butanol (4.3 molar) e_{aq}^- reacts with CS_2 with a rate constant of $3.3 \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$ forming $CS_2^{\cdot -}$. The carbon disulfide radical anion has an optical absorption spectrum with peaks at $\lambda = 275 \text{ nm}$ ($\epsilon = 2 \times 10^4 \text{ dm}^3 \text{ mol}^{-1} \text{ cm}^{-1}$) and $\lambda = 330\text{-}340 \text{ nm}$ ($\epsilon = 8 \times 10^3 \text{ dm}^3 \text{ mol}^{-1} \text{ cm}^{-1}$). In acidic solution $CS_2^{\cdot -}$ is protonated to CS_2H^{\cdot} with $k_5 = 1.3 \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$ which has an absorption spectrum peaking at $\lambda = 320 \text{ nm}$ ($\epsilon = 10^4 \text{ dm}^3 \text{ mol}^{-1} \text{ cm}^{-1}$). $CS_2^{\cdot -}$ reacts with oxygen with $k_6 = 1.9 \times 10^9 \text{ dm}^3 \text{ mol}^{-1} \text{ s}^{-1}$. (9 refs.)

115571 Mass spectrometric study of the volatile products from the radiolysis of polyethylene. E.G.Stetsenko, T.Z.Kolmaz, G.N.P'yankov, B.G.Mischanchuk, I.P.Samchenko, M.M.Aleksankin (L.V. Pisarzhevskii Inst. of Phys. Chem., Acad. of Sci., Kiev, Ukrainian SSR). *Theor. & Exp. Chem. (USA)*, vol.18, no.6, p.696-9 (Nov.-Dec. 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.6, p.754-7 (Nov.-Dec. 1982). [received: Sept. 1983] The purpose of the investigation is to examine the mechanism of polymer degradation. During the manufacture of products, air bubbles are formed in the bulk of the polymer. Atmospheric oxygen gradually oxidizes molecules located on the internal surface of the bubbles, so that the surface becomes coated by oxygen-containing functional groups viz. hydroxyl carboxyl hydroperoxyl, etc. These parts of the polymer molecules would seem to be more liable to degradation involving the detachment of the terminal fragments than the hydrocarbon chains. The active particles having oxygen-containing functional groups which are formed during degradation have the possibility of escaping into the gas phase where their secondary reactions also take place. If the reactions (e.g., radical recombination) are exothermic, then microheating of adjacent parts of the polymer occurs and their volume increases as a result of the increase in temperature and pressure within the bubbles. The amount of oxygen in the bubbles is small, but it is the initiator of the breakdown of the polymer. With the detachment of an active particle e.g., the oxygen-containing radical CH_2OH^{\cdot} , a radical site remains on the surface which would appear to be capable of further reactions. A strong argument in favor of the above hypothesis would be the detection of oxygen-containing compounds in the composition of the volatile radiolytic products. For this purpose the authors used field mass spectroscopy, which enables trace amounts of a component to be identified in a sample. They analyzed the products evolved on heating polyethylene to 70-80°C. (5 refs.)

82.55 RADIOCHEMISTRY

115572 Cage effect in recoil studies. K.Berci. Report KFKI-1983-91, Hungarian Acad. Sci., Budapest (1983), 16 pp. The role of the cage effect is one of the most discussed questions of hot atom chemistry in condensed organic systems. So far no direct evidence is available for assessing the exact contribution of thermal recombinations occurring in the liquid cage to the stabilization processes of recoil atoms. However, some conclusions can be drawn from experimental observations concerning the influence on product yield of hot atom recoil spectra, the effects of density, phase and long range order of the medium as well as from comparing systems providing cage walls of different chemical reactivities towards the recoil atom. Recent developments in this field are reviewed primarily based on the investigations of recoil halogen reactions in aliphatic and aromatic hydrocarbons and their haloderivatives. (37 refs.)

82.60 CHEMICAL THERMODYNAMICS

(see also 05.70 Thermodynamics)

115573 Thermodynamic stability of complex oxides in alkali metals. M.N.Ivanovskii, V.A.Morozov, A.L.Shimkevich, B.A.Shmatko. *High Temp. (USA)*, vol.20, no.6, p.867-70 (Nov.-Dec. 1982). Translation of: *Teplofiz. Vys. Temp. (USSR)*, vol.20, no.6, p.1098-101 (Nov.-Dec. 1982). [received: Sept. 1983]

The temperature dependence of the thermodynamic potential of oxygen impurities in a Na-K eutectic circulating in a stainless steel loop is investigated by the EMF method. It is established that on heating this dependence reveals an anomalous transition of the melt from a state of saturation of the oxygen impurities to a state corresponding to the thermodynamic potential of a $NaCrO_3$ phase, and vice-versa on cooling. A model is proposed which explains this phenomenon by a second-order phase transition between crystalline modifications of complex oxides of the Na-K melt. (12 refs.)

115574 Heats of formation and ionization potentials of some α -aminoalkyl radicals. T.J.Burkey, A.L.Castelano, D.Griller (Div. of Chem., Nat. Res. Council of Canada, Ottawa, Ontario, Canada), F.D.Lossing. *J. Am. Chem. Soc. (USA)*, vol.105, no.14, p.4701-3 (13 July 1983). Heats of formation and ionization potentials of α -aminoalkyl radicals, $R_2NCR_2^{\cdot}$, were derived from measurements of the appearance energies for the fragmentations of a series of ethylenediamines. Stabilization energies, E_s , are high and increase with increasing C- or N-alkylation; the converse applies to ionization potentials, IP. For example, in the case of $H_2NC(Me)_2$, $E_s = 17 \text{ kcal mol}^{-1}$ and $IP = 5.4 \text{ eV}$. (31 refs.)

115575 The standard molar enthalpies of formation of $I^-(aq)$ and $HI(g)$ at 298.15K. C.E.Vanderzee, M.E.Sprengel (Dept. of Chem., Univ. of Nebraska, Lincoln, NE, USA). *J. Chem. Thermodyn. (GB)*, vol.15, no.9, p.869-79 (Sept. 1983).

The enthalpy of reaction of $Cl_2(g)$ with $HI(aq)$ and auxiliary enthalpies of mixing of $HCl(aq)$ with $(I_2 + 14.4 HI)$ solutions were measured by solution calorimetry. The results were combined with auxiliary data from the literature to yield the standard molar enthalpy of formation $\Delta_f H_m^\circ(I^-, aq, 298.15K) = -(56.62 \pm 0.14) \text{ kJ mol}^{-1}$. Values from other calorimetric studies, gas-phase equilibria, and e.m.f. studies were reviewed and recalculated. From consideration of all of the values, our recommended values are: $\Delta_f H_m^\circ(I^-, aq, 298.15K) = -(56750 \pm 70) \text{ J mol}^{-1}$; $\Delta_f H_m^\circ(HI, g, 298.15K) = (26500 \pm 70) \text{ J mol}^{-1}$. (37 refs.)

115576 Rate of nucleation of a constant-composition compound in an alloy. D.E.Temkin (Central Sci.-Res. Inst. of Ferrous Metall., USSR). *Sov. Phys.-Crystallogr. (USA)*, vol.28, no.2, p.140-2 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.240-3 (March-April 1983). [received: Sept. 1983] The author finds the stationary rate of nucleation of a constant-composition compound in a dilute supersaturated solution. The coefficient of diffusion of the clusters in the space of dimensions (necessary in order to calculate the nucleation rate) is obtained from the known relation between this coefficient and the macroscopic growth rate of a nucleus (crystal seed). In the description of growth, account is taken of diffusion in the initial phase and of the kinetics of the chemical reaction at the interphase boundary. (10 refs.)

82.65 SURFACE PROCESSES

115577 Electronic excitation in electron bombardment enhancement of chemical reactions. C.I.H.Ashby (Sandia Nat. Labs., Albuquerque, NM, USA). *Appl. Phys. Lett. (USA)*, vol.43, no.6, p.609-11 (15 Sept. 1983).

The role of electronic excitation in the electron bombardment enhancement of surface reactivity of graphite with hydrogen has been identified. The correlation between the electron and photon enhanced reactivities of a graphite surface is consistent with electrons exciting the 4.8-eV Π -valence to Π^* -conduction transition responsible for photoenhanced reactivity. An electron impact study has shown that low-energy electrons excite the same low-energy transitions observed in optical studies. Secondary electrons produced by electron bombardment are of appropriate energies to excite these transitions. Similar processes are expected to be operative in other chemical systems exhibiting photoenhanced reactivity. (12 refs.)

115578 Langevin analysis of the diffusion model for surface chemical reactions. D.L.Freeman, J.D.Doll (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA). *J. Chem. Phys. (USA)*, vol.79, no.5, p.2343-50 (1 Sept. 1983).

An analysis is presented of the magnitude of some of the potential sources of error in a recently developed diffusion model of surface chemical reactions. Using single absorber Langevin simulations, comparisons are made between the diffusion equation model and the Fokker-Planck equation for the rates of diffusion controlled surface chemical reactions. The diffusion equation is found to predict rates in good agreement with the Fokker-Planck equation for physical values of the diffusion constant. For unphysically large diffusion constants, the rates predicted by the diffusion equation are found to be in error. By employing multiple absorber Langevin simulations errors in the single absorber approximation used in the diffusion model of surface reactions are examined. The single absorber model is found to be accurate for weakly bound adsorbates. For strongly bound adsorbates rate expressions derived from a two-dimensional model are found to be appropriate. The relative rates of Eley-Rideal and Langmuir-Hinshelwood mechanisms are also studied by multiple absorber Langevin simulations. The ratios of the Eley-Rideal to the Langmuir-Hinshelwood rate is found to be in good agreement with the predictions of the diffusion equation model for physically reasonable diffusion constants. The time dependent solution to be the diffusion equation considered in a previous publication is given in an appendix. (15 refs.)

115579 The role of metal-zeolite interactions in indirect liquefaction catalysis. V.U.S.Rao (Pittsburgh Energy Technol. Center, USDOE, Pittsburgh, PA, USA).

Phys. Scr. (Sweden), vol.T4, p.71-8 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).

The conversion of synthesis gas ($\text{CO} + \text{H}_2$) to gasoline range ($\text{C}_5\text{-C}_{11}$) hydrocarbons can be performed with bifunctional catalysts containing the medium pore zeolite ZSM-5 and a Group VIII element such as Fe or Co. The ZSM-5 has pore openings about 5.5 Å in diameter, and its shape-selective action restricts the product molecules to $\leq \text{C}_{11}$. In the case of Fe-ZSM-5 catalysts, the catalytic behaviour of the following preparations have been compared with each other: Impregnation using (a) metal nitrate solutions and (b) the carbonyl $\text{Fe}_2(\text{CO})_{12}$. Infrared studies on adsorbed pyridine showed that cobalt-ZSM-5 catalysts prepared by nitrate solution impregnation contain significantly decreased Brønsted acidity with concomitant increase in Lewis acidity. The information obtained from magnetic and spectroscopic studies regarding the interaction of the metal component with the zeolite is related to the catalytic activity of the bifunctional catalysts. In particular, methods of identifying metal species within and outside the zeolite pores are discussed. (26 refs.)

115580 Trajectory approach to the hydrogen evolution reaction. S.Holloway (Inst. für Theoretische Phys., Freien Univ. Berlin, Berlin, Germany), J.W.Gadzuk.

Phys. Scr. (Sweden), vol.T4, p.98-91 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).

A classical trajectory analysis for the discharge reaction step in the hydrogen evolution reaction is presented. The construction of an adiabatic potential energy surface is discussed with emphasis on the solvent motion and the charge transfer process. Corrections to absolute rate theory reaction probabilities arising from dynamical effects are presented as a function of applied potential. (17 refs.)

115581 Decomposition of HCOOH on gold studied by XPS and TDS spectroscopies and its behaviour under very low energy electron excitation. M.Chtaib, J.P.Delrue, R.Caudano (Lab. de Spectroscopie Electronique, IRIS, FNDP, Namur, Belgium).

Phys. Scr. (Sweden), vol.T4, p.133-7 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).

XPS and TDS have been jointly used to study the adsorption at low temperature (110K) and the thermal decomposition of formic acid on a polycrystalline gold surface. When increasing progressively the temperature from 110K, XPS measurements reveal changes in the binding energy of C 1s and O 1s lines suggesting the evolution of molecular HCOOH to a formate ion which readily decomposes to H_2 and CO_2 products at approximately 190K. Additional results of the evolution of the XPS C_{1s} and O_{1s} lines of formic acid under the impact of a low energy electron beam (≤ 5 eV) are presented. They suggest that the electrons help to remove the acid hydrogen of the molecule leading to the formate. (5 refs.)

115582 Gas permeability of polyacetylenes with bulky substituents. T.Higashimura, T.Masuda (Dept. of Polymer Chem., Kyoto Univ., Kyoto, Japan), M.Okada.

Polym. Bull. (Germany), vol.10, no.1-2, p.114-17 (June 1983).

In search of new materials for oxygen-enrichment membranes, high polymers of acetylenes with bulky substituents were synthesized with Mo- or Ta-based catalysts, and their permeability coefficients to oxygen (P_{O_2}), nitrogen (P_{N_2}), and carbon dioxide were determined at 25°C. Polymer membranes of the aliphatic acetylenes were highly permeable to oxygen. Polymers of the aromatic acetylenes were less oxygen-permeable, giving P_{O_2} in the order of 10^{-10} , slightly larger than that for polystyrene. (12 refs.)

115583 Gas permeation through composite two-layer systems and the graphical solution. N.Kishimoto, T.Tanabe, H.Yoshida (Nat. Res. Inst. for Metals, Tsukuba Labs., Ibaraki, Japan).

Thin Solid Films (Switzerland), vol.106, no.3, p.225-38 (19 Aug. 1983).

The gas permeation behaviour in a two-layer composite material has been investigated. When a thin layer has a diffusion time comparable with that of the other layer in the two-layer system, the gas permeability for the system cannot be expressed as a simple function of the diffusivity and the solubility. In order to derive the diffusivity of the surface layer from the diffusion behaviour of the composite material, the authors employed a graphical method and the concept of an 'almost characteristic' parameter for diffusion in the two-layer composite material. They also take into account the discontinuity in the solubility at the interface between the two layers. After the theoretical analysis is described, application to the permeation of hydrogen through oxidized metals is discussed. (5 refs.)

115584 Reaction of trimethylhalosilanes with the silica surface. V.A.Tertykh, L.A.Belyakova, A.M.Varvarin, L.A.Lazukina, V.P.Kukhar' (L.V. Pisarzhevskii Inst. of Phys. Chem., Acad. of Sci., Ukrainian SSR). *Theor. & Exp. Chem. (USA)*, vol.18, no.6, p.661-5 (Nov.-Dec. 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.6, p.717-22 (Nov.-Dec. 1982). [received: Sept. 1983]

The authors present experimental data on the study of the conditions of the title reactions, and the mechanism of the reaction of trimethylbromo- and trimethyliodosilanes with active centers on the silica surface. (18 refs.)

82.70 DISPERSE SYSTEMS

(for flow behaviour, see 47.55K)

115585 Particle wall loss rates in vessels. J.C.Crump, R.C.Flagan, J.H.Seinfeld (Dept. of Chem. Engng., California Inst. of Technol., Pasadena, CA, USA).

Aerosol Sci. & Technol. (USA), vol.2, no.3, p.303-9 (1983).

Aerosol particle wall loss rates were determined experimentally in a spherical continuous stirred tank reactor. The particle size and mixing rate dependences agree with the theoretical results of Crump and Seinfeld (1981) in which the particle loss coefficient β is related to particle diffusivity D , particle settling velocity v , the coefficient of the eddy diffusivity k_e was found to be proportional to the $3/2$ power of the volumetric flow rate, in accordance with theoretical expectations. Results of a similar nature may be expected to hold in vessels of arbitrary shape. (8 refs.)

115586 Simulation of condensation aerosol growth by condensation and evaporation. T.H.Tsang, J.R.Brock (Chem. Engng. Dept., Univ. of Texas, Austin, TX, USA).

Aerosol Sci. & Technol. (USA), vol.2, no.3, p.311-20 (1983).

A new numerical method is reported for the solution of the condensation-evaporation equation, a first-order hyperbolic equation. The solution and properties of the nonlinear integrodifferential equation arising when the mass of the condensing vapor is conserved are discussed. For aerosol evolution in the conserved case there develops an asymptotic regime analogous to the asymptotic behaviour found for the coagulation process. (27 refs.)

115587 Factors affecting the collision of aerosol particles with small water drops. K.H.Leong, K.V.Beard, J.J.Stukel, P.K.Hopke (Univ. of Illinois, Urbana, IL, USA).

Aerosol Sci. & Technol. (USA), vol.2, no.3, p.341-9 (1983).

The factors influencing the collision of aerosol particles with small water drops at low collision efficiencies are examined. The gravitational force and velocity slip of air on the drop surface affect the collision efficiency in the range of values of 10^{-4} - 10^{-2} . The efficacies of the different computational models are compared for ratios of particle radius to drop radius of less than 0.1. The accuracy of the numerical scheme in the trajectory model can be verified by comparing the efficiencies obtained of submicrometer particles with the convective-diffusion model. (22 refs.)

115588 Comparative size distribution measurements on chain aggregates. G.Kasper, D.T.Shaw (Lab. for Power & Environmental Studies, State Univ. of New York, Buffalo, NY, USA).

Aerosol Sci. & Technol. (USA), vol.2, no.3, p.369-81 (1983).

Size distribution measurements of polydisperse iron oxide chain aggregates (600-1300 Å thick with aspect ratios up to 700) were made and compared, using an aerosol centrifuge, a cascade impactor, and an electrical aerosol analyzer, with supporting data from electron microscopy. Number and volume frequency distributions are compared and analyzed on the basis of means and widths only. Appropriate conversions between aerodynamic and mobility equivalent diameters are made. Preferred particle orientation due to flow field and electrostatic field is taken into account. An estimate for the increase of average charge per fiber over that of spheres is given for the EAA's diffusion charger. (15 refs.)

115589 Theoretical study of equilibrium bipolar charge distribution on nonuniform primary straight chain aggregate aerosols. Hsu-Chi Yeh, Yung-Sung Cheng (Inhalation Toxicology Res. Inst., Lovelace Biomedical & Environmental Res. Inst., Albuquerque, NM, USA).

Aerosol Sci. & Technol. (USA), vol.2, no.3, p.383-8 (1983).

A general theory describing the equilibrium bipolar charge distribution for straight chain aggregate aerosols consisting of primary spheres of different diameters was derived from a theory previously developed for linear chain aggregate of uniform spheres. The present theory is based on the assumptions that (1) the individual primary particles of a straight chain aggregate are charged independently, (2) the probability that a particular primary particle has acquired q elementary charges is governed by the Gaussian distribution predicted by Boltzmann's law, based on particle size; and (3) the resultant charge of a straight chain aggregate is the algebraic sum of the charges carried by the constituent primary spheres. The present theory can be stated as follows: The equilibrium bipolar charge distribution of straight chain aggregate aerosols with nonuniform primary spheres can be expressed by

Boltzmann's law with an equivalent diameter such that $d_{el} = \sum_{i=1}^n d_i$. The limitations imposed by the assumptions are also discussed. (14 refs.)

115590 Time-resolved studies of fluorescence quenching in a water-in-oil microemulsion. N.J.Bridge, P.D.I.Fletcher (Univ. Chem. Lab., Univ. of Kent, Canterbury, England).

J. Chem. Soc. Faraday Trans. 1 (GB), vol.79, pt.9, p.2161-9 (Sept. 1983).

Nanosecond time-resolved spectrofluorimetry has been used to study the kinetics of quenching of acridinium-ion fluorescence by Co^{2+} and Br^- ions in a water-in-oil microemulsion stabilised by AOT [sodium 1,4-bis(2-ethylhexyl)-sulphosuccinate]. Analysis of the fluorescence decay curves leads to the determination of the aggregation number of the water droplets and the second-order rate constants for quenching in the dispersed water phase, both as functions of the water-to-surfactant mole ratio, W_0 . Quenching by both Br^- and Co^{2+} ions is impeded, relative to the diffusion-controlled process in aqueous solutions of high ionic strength, but the rate constant for Co^{2+} quenching increases with W_0 , whereas that for Br^- decreases. This behaviour can be explained in terms of the distribution of ions and the variation of microviscosity within the reverse micelle. (16 refs.)

115591 Diffuse transmission and reflection by a thick weakly absorbing layer with close particle packing. G.S.Dubova, A.Ya.Khairullina.

J. Appl. Spectrosc. (USA), vol.37, no.5, p.1313-16 (Nov. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.5, p.832-6 (Nov. 1982).

[received: Sept. 1983]

The authors consider the coefficients of diffuse reflection and transmission in relation to packing density for large weakly absorbing soft particles such as erythrocytes, chloroplasts, and dispersion filters in the region of the transmission band, etc. The results given have been obtained for erythrocytes with various specimens differing in size, particle shape, and optical constants, and therefore they are applicable to media with analogous characteristics. (23 refs.)

115592 Measurement of sedimentation potential generated in aqueous electrolyte solutions of alkali halides. H.Hirakawa, T.Takeishi (Faculty of Engng., Kagoshima Univ., Kagoshima, Japan).

Oyo Buturi (Japan), vol.52, no.7, p.619-25 (July 1983). In Japanese.

A sedimentation-potential-generating apparatus has been improved to realize precise measurement. From the theoretical discussion, it is found that the total mass of the moving parts consisting of a sample solution, its measuring container, a copper electromagnetic shield made in the form of a thin cylinder, a connecting rod, and the intrinsic mass of the moving parts must be decreased, and that the mass of the sample solution should be equal to the total mass of the remaining moving parts. Therefore, the apparatus is so designed that the shield is divided into two parts, a moving shield and fixed one whereby the total shield mass is lightened, and the measuring container is also lightened. The apparatus has been applied to measure the sedimentation potentials of twenty alkali halide solutions. The results show that the rate of change of the sedimentation coefficient due to atomic weight is approximately proportional to the transport number. (11 refs.)

82.80 CHEMICAL ANALYSIS AND RELATED PHYSICAL METHODS OF ANALYSIS

115593 X-ray fluorescence analysis of Fe, Mn, Cr and V in natural silicate crystals. O.L.Dias, A.R.Pereira Leite Albuquerque, S.Isotani (Inst. de Fisica, Univ. de Sao Paulo, Sao Paulo, Brazil).

An. Acad. Bras. Cienc. (Brazil), vol.55, no.2, p.173-8 (June 1983).

Concentrations of Fe, Mn, Cr and V were determined in samples of beryl, topaz, tourmaline and spodumene by measuring the first order K_α fluorescence lines. The intensity of these lines were calibrated by using beryl as the standard matrix. The matrices were prepared in the form of pressed pellets with 4:1 mixture of beryl and boric acid, where transition metal oxides were added. (10 refs.)

115594 An atomic spectroscopy bibliography for January-June 1983.

115595 Simultaneous recording of analyte and background absorbance from the Perkin-Elmer Model 5000 spectrometer using the Model 3600 Data Station. M.T.C.de Loos-Vollebregt, R.A.M.Oosterling, F.B.Boudewijn, L.de Galan (Lab. voor Analytische Scheikunde, Tech. Hogeschool Delft, Delft, Netherlands).

At. Spectrosc. (USA), vol.4, no.4, p.160-2 (July-Aug. 1983).

The system described in the present paper is a simple, inexpensive extension of the possibilities of the Perkin-Elmer Model 5000. The simultaneous plot of background absorption and the total absorbance signal or the background-corrected atomic absorbance signal is very helpful to the analyst during development of a temperature program for the analysis of complex samples. The authors have developed additional hardware and software to transfer the AA and BG signals simultaneously to the Data Station. Background correction is performed in the Data Station to yield AA-BG. A plot of any two out of the three signals can be obtained within one run. (5 refs.)

115596 Techniques in surface microscopy and analysis. J.M.Walls (Dept. of Phys., Loughborough Univ. of Technol., Loughborough, England).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.368, p.28 (1983). [received: Sept. 1983] (SPIE Proceedings on Microscopy Techniques and Capabilities, London, England, 21-22 Sept. 1982).

Summary form only given, as follows. A number of techniques are now available for the characterization of solid surfaces. The scanning electron microscope has firmly established its role in industry and elsewhere for routing high resolution studies of surface structure and topography and the addition of energy dispersive X-ray (EDX) analysis provides the technique with a powerful and complementary method of elemental analysis. More recently, techniques such as the scanning Auger microprobe (SAM), X-ray photoelectron spectroscopy (XPS or ESCA), and secondary ion mass spectrometry (SIMS) have become available which combine spatial resolution (of varying utility) with an ability to determine the composition of the outermost atomic layers (with varying precision and sensitivity). The remarkable depth resolution of these methods may also be exploited when used with surface sectioning techniques (such as sputter-etching) to provide composition-depth profiles. The author aims to introduce the principles and analytical procedures of these techniques and to illustrate their areas of application with examples of commercial importance in materials characterization, failure analysis, quality assurance and production problem solving. (no refs.)

115597 Analytical capabilities of transmission electron microscope (TEM) systems. P.Hagemann, M.N.Thompson (Philips, Sci. & Industrial Equipment Div., Electron Optics Applications Lab., Eindhoven, Netherlands).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.368, p.29-34 (1983). [received: Sept. 1983] (SPIE Proceedings on Microscopy Techniques and Capabilities, London, England, 21-22 Sept. 1982).

Lists the principle sources of information in electron microscopy which become available due to the electron specimen interaction. The authors further describe the main electron optical and detector components and indicate how special operation modes of a transmission electron microscope based analytical system are obtained. Finally some of the possible applications are demonstrated on stainless steel and palladium catalyst specimens. (no refs.)

115598 Laser instrumentation: analytical uses are growing. B.Spadaro.

InTech (USA), vol.30, no.7, p.59-62 (July 1983).

Ability to sense chemical and physical variables without direct contact or sampling has been an incentive for developing laser-based instrumentation. Systems are now widely employed for composition analysis—including pollution monitoring and particle determining—as well as for temperature and pressure measurement. (23 refs.)

115599 Determination of the concentration distribution of admixture from ratemeter response by continuous analysis. P.Habrman (Vysoka Skola Banska, Ostrava, Czechoslovakia).

Jad. Energ. (Czechoslovakia), vol.29, no.8-9, p.294-7 (Aug.-Sept. 1983). In Slovenian.

A comparison of ratemeter and counter response by using Z-transformation is given. The method is demonstrated by determination of tin in tungsten by means of continuous X-ray spectrometric analysis. (5 refs.)

115600 Material analysis by means of high energy ion beams. F.Fujimoto (Coll. of General Education, Univ. of Tokyo, Tokyo, Japan).

J. Vac. Soc. Jpn. (Japan), vol.26, no.2, p.120-35 (1983). In Japanese.

Outlines physical analyses using hundreds or more keV energy generated from an accelerator, including discussion of ion backscattering, channelling and blocking phenomena, the determination of impurity atom location, lattice defects and their density measurements, the study of surface structure using high-energy ion beams, the detection of light atoms, ion-excited X-ray generation, and particle-induced X-ray emission analysis. (32 refs.) K.B.

115601 Statistical analysis of some gas chromatography measurements.

K.Kafadar, K.R.Eberhardt (NBS, Washington, DC, USA).

J. Res. Natl. Bur. Stand. (USA), vol.88, no.1, p.37-46 (Jan.-Feb. 1983). [received: Sept. 1983]

The National Bureau of Standards has certified Standard Reference Materials (SRMs) for the concentration of polychlorinated biphenyls (PCBs) in hydrocarbon matrices (transformer and motor oils). The certification of these SRMs involved measurements of extremely small concentrations of PCBs made by gas chromatography. Despite the high accuracy of the measurement technique, the correlated data cannot be analyzed in a routine independent manner. A linear model for the measurements is described; its complexity encourages the use of simpler exploratory methods which reveal unexpected features and point the way towards obtaining valid statistical summaries of the data. (2 refs.)

115602 Phase separation of phosphonated polystyrenes in the solid state. IV. Influence of this phenomenon on their flame retardancy properties [ESCA observations]. A.Chiotis, G.Clouet, J.Brossas (Centre de Recherches sur les Macromolécules, Univ. Louis Pasteur, Strasbourg, France), L.Hilaire.

Polym. Bull. (Germany), vol.10, no.1-2, p.101-4 (June 1983).

The authors point out, using the ESCA method, that the repartition of phosphorus atoms of phosphonated telechelic polystyrenes in the solid state, is not homogeneous. On the other hand, a correlation is established between the P/C ratio in a thin superficial layer of the polymer and flammability data. (9 refs.)

115603 Time-resolved photoelectron spectroscopy for the study of dynamic surface species. F.Steinbach, J.Schutte (Inst. für Phys. Chem., Univ. Hamburg, Hamburg, Germany).

Rev. Sci. Instrum. (USA), vol.54, no.9, p.1169-74 (Sept. 1983).

The principle and experimental setup of time-resolved photoelectron spectroscopy are outlined. In comparison to conventional molecular beam relaxation spectroscopy a reaction channel is analyzed not only at the end but prior to the end. In at least three points time-resolved photoelectron spectroscopy is superior to photoelectron spectroscopic experiments under static and direct current adsorption conditions; (1) a general increase in detection power of transient adsorbates and contaminations; (2) the possibility to discriminate by individual relaxation time between species that cannot be resolved in their binding energy; and (3) a significant simplification of the mathematical formalism in comparison to conventional molecular beam relaxation spectroscopy and a more straightforward understanding of the results, in particular the chemical identification of transient species. This is illustrated with time-resolved UV-photoelectron spectra of intermediate adsorbed carbon in the catalytic decomposition of methanol on iron and with time-resolved X-ray photoelectron spectra of intermediate adsorbed oxygen in adsorption and catalysis of methanol/oxygen mixtures on iron. (26 refs.)

115604 Simple apparatus for concentration determinations in binary-gas mixtures. J.S.Brooks, R.B.Hallock (Dept. of Phys. & Astron., Univ. of Massachusetts, Amherst, MA, USA). *Rev. Sci. Instrum. (USA)*, vol.54, no.9, p.1199-201 (Sept. 1983).

A sound resonator is described which allows concentration measurements in binary-gas mixtures. The apparatus is particularly useful for relative measurements between a mixture and a pure gas. (6 refs.)

115605 U and Th analysis of LSI constituent materials—SIMS analysis using highly concentrated separation methods. N.Honma (Technol. Div., NTT, Tokyo, Japan), S.Kurosawa, I.Kawashima. *Rev. Electr. Commun. Lab. (Japan)*, vol.30, no.3, p.503-10 (May 1982). [received: Aug. 1983]

Quantitative analytical methods for U and Th were investigated with high sensitivity. U and Th contents were analyzed in about 30 different kinds of LSI constituent materials. It was found that materials which included relatively high U and Th concentration were alumina ceramics (100 ppb~1 ppm), plastic packages (10 ppb~5 ppm) and Mo metal (100 ppb). Other materials contained less than 10 ppb U and Th. Based on analytical results, LSI constituent materials purification methods were discussed. (7 refs.)

115606 Chromatographic-mass spectrometric study of antitumor preparations (oxazaphosphorines) using electron impact and chemical ionization. Yu.P.Reva, F.A.Medvedev (All-Union Sci. Res., Inst. of Hygiene & Toxicology of Pesticides, Polymers, & Plastics, Kiev, Ukrainian SSR). *Theor. & Exp. Chem. (USA)*, vol.18, no.6, p.699-702 (Nov.-Dec. 1982). Translation of: *Teor. & Eksp. Khim. (USSR)*, vol.18, no.6, p.757-60 (Nov.-Dec. 1982). [received: Sept. 1983]

One of the most refined methods of analyzing organic compounds is by chromatography-mass spectrometry, which possesses a high sensitivity and selectivity which is particularly important in the study of pharmacokinetics and the metabolism of medical preparations. The oxazaphosphorines—cyclophosphamide (CP) (2-bis(2-chloroethyl)amino)tetrahydro-2H-1,3,2-oxazaphosphorine 2-oxide) (a), isophosphamide (b), and triphosphamide (c)—are applied in clinical chemotherapy for the medical treatment of malignant neoplasms and as immunodepressants. In order to elucidate the mechanism of the action of CP, it is necessary to know the character of its distribution in the organs, tissues, and subcellular structures. With the object of developing a chromatographic-mass spectrometric method of determining CP as the trifluoroacetate (TFACP), the fragmentation of TFACP by electron impact and by chemical ionization has been studied. (5 refs.)

115607 Quantitative electron probe analysis: problems and solutions. T.Kitazawa, H.Shuman, A.P.Somlyo (Pennsylvania Muscle Inst., Univ. of Pennsylvania, Philadelphia, PA, USA). *Ultramicroscopy (Netherlands)*, vol.11, no.4, p.251-61 (1983).

Quantitative electron probe microanalysis of thin films was evaluated with a series of sulfur-containing proteins, and a method is given for correcting errors due to changes in detector calibration (centroid position and resolution). The correlation coefficient between the results of electron probe analysis and the stoichiometric concentrations of sulfur was 0.998. Shifts in detector calibration that affect particularly elements having overlapping peaks are shown to be correctable by including the first and second derivative of the characteristic peak in the multiple least squares fitting routine used to determine the number of characteristic X-rays in the spectrum. This method allows the accurate measurement of low concentrations of Ca in the presence of high concentrations of K normally encountered in biological specimens. A systematic small error in the quantitation of Na is reported and shown to be due to digital filtering of this region of the continuum that has a relatively high curvature; methods for correction are proposed. (24 refs.)

115608 Development of an automatic sample-changer and control instrumentation for isotope-source neutron-activation analysis. A.H.Andeweg, J.I.W.Watterson.

Report M53, Council for Miner. Technol., Randburg, S. Africa (15 March 1983), 34 pp.

An automatic sample-changer was developed at the Council for Mineral Technology for use in isotope-source neutron-activation analysis. Tests show that the sample-changer can transfer a sample of up to 3 kg in mass over a distance of 3 m within 5 s. In addition, instrumentation in the form of a three-stage sequential timer was developed to control the sequence of irradiation transfer and analysis. (1 ref.)

86.00 ENERGY RESEARCH AND ENVIRONMENTAL SCIENCE

86.10 ENERGY RESOURCES AND THEIR UTILISATION

(inc. economic aspects; for nuclear engineering and nuclear power studies, see 28.00)

115609 Alternative energy resources.

Regul. & Mando Autom. (Spain), vol.17, no.130, p.48-9 (July-Aug. 1983). In Spanish.

Reports on the current position of research into alternative energy resources, with special reference to work in the UK. The JET project at Culham is expected to be put into service in June 1984 and by 1990 to demonstrate whether energy from nuclear fusion is a practical proposition; in any case it is unlikely to make any impact upon the world energy situation before the middle of the 21st century. The British CEBG has installed a 200 kVA wind generator at Carmarthen Bay; a machine of several thousand kVA is projected for 1985 and a farm of similar machines, possibly off-shore, for 1990. It reports experiments on geothermal energy in hot rocks Cornwall, where 80°C is reached at 2000 m, and on a project for drilling to 6000 m and a temperature of 200-220°C. (no refs.) *C.J.O.G.*

86.10D Wind energy

115610 Wind energy inventory for European North of USSR. V.A.Minin, I.P.Stepanov.

Power Eng. (J. Acad. Sci. USSR) (USA), vol.21, no.1, p.98-105 (1983). Translation of: *Izv. Akad. Nauk SSSR Energ. & Transp.*, vol.21, no.1, p.106-14 (1983).

A refined method is presented for calculating the aerological and energy characteristics of wind. Ten-year series of eight standard observations of wind speed at 164 meteorological stations have been processed and the results used to give the basic elements of the wind energy inventory for the European North of the USSR. The areas most promising from the viewpoint of utilization of wind energy are indicated and the wind energy resources estimated. (12 refs.)

86.10F Tidal and flow energy

(inc. water-wave energy)

115611 Tidal power reviewed. E.M.Wilson (Dept. of Civil Engng., Univ. of Salford, Salford, England).

Int. Water Power & Dam Constr. (GB), vol.35, no.9, p.13-16 (Sept. 1983).

Despite regular rises in the cost of oil and coal, and despite continued opposition to the construction of nuclear powerplants, the development of tidal power projects had, until recently, hardly advanced since La Rance was commissioned. However, the completion of Annapolis Royal this year may now lead to a general resurgence of interest and perhaps construction. Details of this pilot power plant are presented and a review of tidal power and its possibilities is presented. (no refs.)

115612 Operation and control of a 2 GW wave-energy scheme. H.W.Whittington, J.R.Jordan (Dept. of Electrical Engng., School of Engng., Edinburgh, Scotland).

IEE Proc. A (GB), vol.130, no.6, p.340-9 (Sept. 1983).

The potential for sea-wave-energy exploitation is high in waters around the UK. Generating stations would typically be 2000 MW in rating, about 30 km long and be situated 10-15 km offshore, the energy being transmitted as electricity in submarine power cables. For such developments to be economic, a high degree of plant availability is necessary so that the maximum amount of energy can be converted and transmitted ashore. An approach is described which bases control, operating and maintenance around comprehensive condition monitoring of generating plant. Details are given of how information from such instrumentation can be used not only for health monitoring of plant, but also as an aid to operation and to scheduling and design of maintenance procedures. (11 refs.)

The experimental and theoretical evaluation of a twin-flap wave-energy absorbing device See Entry 115702

86.10K Solar energy

115613 Heat-accumulation systems for solar power plants. R.B.Akhmedov, M.E.Voronkov, V.A.Pozharnov, V.M.Chakhovskii (G.M. Krzhizhanovskii State Sci. Res. Power Inst., USSR).

Appl. Sol. Energy (USA), vol.18, no.4, p.17-22 (1982). Translation of: *Geliotekhnika (USSR)*, vol.18, no.4, p.16-19 (1982). [received: Aug. 1983]

The principal types of heat accumulators for solar power plants are considered. Energy-accumulation systems with supply-water, steam-water, and phase-transition accumulators are described. A number of chemical reactors for accumulation of solar power are given. (8 refs.)

115614 Heat pipe for parabolocylindrical solar installation. I.I.Kokhova, V.Ya.Sasin, A.A.Borodkin, S.F.Ergashev (G.M. Krzhizhanovskii State Sci. Res. Power Inst., USSR).

Appl. Sol. Energy (USA), vol.18, no.4, p.23-9 (1982). Translation of: *Geliotekhnika (USSR)*, vol.18, no.4, p.21-6 (1982). [received: Aug. 1983]

The authors describe an experimental study of a full-scale heat pipe with an operating temperature of 300°C, intended for use in parabolocylindrical solar installations. (11 refs.)

115615 Technology of fabrication of concentrators from wedge-shaped mirror-glass elements. G.Ya.Umarov, D.N.Alavutdinov, A.Abdurazizov, A.Abdullaev, A.K.Alimov (S.V. Starodubtsev Physicotech. Inst., Acad. of Sci., Uzbek SSR).

Appl. Sol. Energy (USA), vol.18, no.4, p.30-2 (1982). Translation of: *Geliotekhnika (USSR)*, vol.18, no.4, p.26-8 (1982). [received: Aug. 1983]
It is reported that temperatures on the order of 1400K can be obtained in the focal spot by using the concentrator described. (2 refs.)

115616 Mathematical analysis of the performance of cylindrical-parabolic solar concentrators. A.J.Al-Khalili (Dept. of Electrical Engng., Concordia Univ., Montreal, Quebec, Canada), R.A.Al-Ashoor.

Appl. Energy (GB), vol.15, no.1, p.43-55 (1983).
Attention is devoted to the application of cylindrical-parabolic solar concentrators in the intermediate temperature range for which wide receivers are used. Suitable indices that describe the performance of the concentrator are defined and evaluated. The effect of each individual parameter on total concentrator performance is investigated. The results of the analysis are presented as a set of graphs which can be used easily when designing parabolic concentrators. (3 refs.)

115617 Solar energy: a short and medium-term myth. F.Sardinha.

Electr. Energ.-Electron. (Portugal), no.189, p.286-98 (July 1983). In Portuguese.
The aim of the paper is to present a brief, but justified, economic study of solar energy utilization, with its impracticalities being clearly pointed out. (7 refs.)

115618 Training leads to good solar installations. T.V.McLaughlin, H.T.Roman (Public Service Electric & Gas Co., Newark, NJ, USA).

Electr. World (USA), vol.197, no.2, p.97-8 (Feb. 1983).
Solar water heating installation deficiencies uncovered in prior demonstration projects are avoided by a training facility run by a utility to teach contractors proper installation techniques. The contractors install two types of solar water heaters sold by the utility as part of a solar-water-heater promotion program. (no refs.)

115619 Solar and wind energy for water pumping. A.Fritzsche, K.Speidel (Dornier System GmbH, Friedrichshafen, Germany).

Naturwissenschaften (Germany), vol.70, no.8, p.396-402 (Aug. 1983). In German.
Water pumping by means of wind and solar energy becomes more and more attractive by reason of increasing energy prices. Water supply for remote villages especially in developing countries needs hydraulic energy of about 1 to 50 kWh per day. The use of renewable energies like solar and wind seems to be technically successful and has a good chance to be competitive with conventional energy sources like diesel or electricity in regions with mean wind speeds above 4-5 m/s or high insolation of about 5 kWh/day annual average. (7 refs.)

115620 Active solar energy systems—possibilities of application. A.Arata (Univ. Tecnica Federico Santa Maria, Valparaiso, Chile).

Scientia (Chile), vol.46, no.156-157, p.6-11 (Jan.-Dec. 1981). In Spanish. [received: Sept. 1983]
The economic possibility of using active solar energy systems as a solution to the present energy problems is explored. The characteristics of solar energy are outlined and alternatives to solar energy are briefly discussed. The characteristics of indirect solar energy systems are described and compared with those of traditional heating systems. The economic viability of solar energy systems are discussed and the conclusion is reached that solar energy can be considered as an alternative to traditional heating systems only for low temperature heating, at least in the short term. (no refs.) *S.M.H.*

115621 Experimental study of solar energy use for air heating by means of integral structural elements of a building. P.Sarmiento (Univ. Tecnica Federico Santa Maria, Valparaiso, Chile).

Scientia (Chile), vol.46, no.156-157, p.12-18 (Jan.-Dec. 1981). In Spanish. [received: Sept. 1983]
A study is made of the behaviour of a heating system integral with the construction of a building. It is designed on the basis of information obtained from previous research made by the author. The system is described and technical and economic conclusions are presented. (3 refs.) *S.M.H.*

115622 Utility impacts assessment of residential passive solar systems. R.A.Wood, M.D.Siegel.

Report EPRI-EM-3092-SY, Electr. Power. Res. Inst., Palo Alto, CA, USA (March 1983), 44 pp.
Available from Res. Rep. Center (RRC), Box 50490, Palo Alto, CA 94303, USA.

Summarizes a project undertaken to provide the electric utility industry with a tool to use in analyzing the advantages and disadvantages of passive solar residential construction within a service area. The methodology created to accomplish this is discussed as well as the results of tests conducted in cooperation with seven participating utilities.

115623 Research in progress: batteries made of plastics. J.Lund.

Eltek. Aktuell Elektron. (Sweden), vol.26, no.13, p.58-60 (Sept. 1983). In Swedish.
Describes research at present in progress at the Royal Technical University of Stockholm, Sweden, into plastics based storage batteries. The article describes the characteristics of polyacetylene, doping techniques, porous films and electric current limitation. The article concludes with details of the funding of the project. (no refs.) *H.J.P.*

86.30E Primary cells

115624 Lithium and alkaline portable power. R.Forsyth (Duracell (UK), Crawley Ltd., England).

Commun. Int. (GB), vol.10, no.8, p.72 (Aug. 1983).
The power source for portable equipment has always presented an important design problem in that conflict arises between making the pack smaller and yet getting more power from it. Some of the recent development such as the Flat-Pak alkaline battery and the lithium battery type LO26SX are considered. (no refs.)

115625 Zinc electrode morphology in alkaline solutions. II. Study of alternating charging current modulation on pasted zinc battery electrodes. J.McBreen, E.Gannon (Dept. of Energy & Environment Brookhaven Nat. Lab., Upton, NY, USA), D.-T.Chin, R.Sethi.

J. Electrochem. Soc. (USA), vol.130, no.8, p.1641-5 (Aug. 1983).
For pt.I see ibid., vol.129, p.2677 (1982). The dependence of the faradaic conductance and the morphology of pasted zinc electrodes on the charging method has been investigated. The charging methods included DC (3-125 mA-cm²) and DC (3-125 mA-cm²) with superimposed square waves of AC of various amplitudes and frequencies (0.1-5000 Hz). In the case of DC charging, the faradaic conductance goes through a maximum at ~75 mA-cm². The decrease in the faradaic conductance at higher current densities (100 mA-cm²) is related to the formation of dense zinc deposits on the electrode surface. At low DC (<30 mA-cm²), superimposition of AC promotes growth of zinc close to the current collector and results in small amounts of dispersed hexagonal zinc deposits on the current collector. Except where dense deposits are formed at high current density, the remainder of the zinc deposit has a very fine structure. Pulsed charging at low current densities (<30 mA-cm²) is beneficial in that it increases the electrode faradaic conductance and promotes growth of the zinc deposit close to the current collector. The relaxation time for the double layer in pasted zinc electrodes is ~50 msec. This indicates that the optimum frequency for pulsed charging is between 1 and 10 Hz. (22 refs.)

The synthesis of densified CMD from Mn-NH₄-carbamate and its discharge properties in ZnCl₂ batteries See Entry 115125

86.30F Secondary cells

115626 Capacity of encapsulated lead batteries grows. W.Liander.

Eltek. Aktuell Elektron. (Sweden), vol.26, no.13, p.62-3 (Sept. 1983). In Swedish.
Describes a range of maintenance-free Pb batteries manufactured by Sonenschen of West Germany. The article covers batteries with a capacity of up to 1350 Ah, and discusses various plate alloys, the Dryfit 600 battery, including a version for use in conjunction with solar cells and design of battery rooms. (no refs.) *H.J.P.*

115627 Reactions at the anode during storage of partially discharged Li/SO₂ cells. K.M.Abraham, L.Pitts (EIC Labs. Inc., Newton, MA, USA).

J. Electrochem. Soc. (USA), vol.130, no.7, p.1618-20 (July 1983).
Although the Li/LiBr, CH₃CN/SO₂ cell is one of the most advanced among the nonaqueous Li cells, concerns of safety have precluded it from being widely accepted. Partially discharged and stored Li/SO₂ cells and batteries have a greater propensity for safety hazards, especially in use under harsh conditions such as high current pulses, temporary short-circuits and overdischarges. In an effort to understand the underlying chemistry the authors have analyzed cells which had been stored for about one year at room temperature after a partial discharge corresponding to ~50% of their rated capacity. Because of the great concern in the user community for the safety of partially discharged and stored Li/SO₂ cells, the authors communicate some of their preliminary analytical results obtained from these cells. They believe that the results have considerable practical relevance. (10 refs.)

115628 Statistical analysis of lithium iron sulfide status cell cycle life and failure mode. E.C.Gay, J.E.Battles, W.E.Miller (Chem. Technol. Div., Argonne Nat. Lab., Argonne, IL, USA).

J. Electrochem. Soc. (USA), vol.130, no.8, p.1646-50 (Aug. 1983).
Groups of 12 or more identical Li-alloy/FeS cells fabricated by Eagle-Picher Industries Incorporated and Gould Incorporated were operated at Argonne National Laboratory in the status cell test program to obtain data for statistical analysis of cell cycle life and failure modes. The cells were full-size electric vehicle battery cells (150-350 A-hr capacity) and were cycled at the 4 hr discharge rate and 8 hr charge rate. The end of life was defined as a 20% loss of capacity or a decrease in the coulombic efficiency to less than 95%. Seventy-four cells (6 groups of identical cells) were cycle life tested, and the results were analyzed statistically. The ultimate goal of this analysis was to predict cell and battery reliability. Testing of groups of identical cells also provided a means of identifying common failure modes which were eliminated by cell design changes. Mean time to failure for the cell group, and corrective actions are discussed. (5 refs.)

115629 Electrodeposition of zinc on glassy carbon from ZnCl₂ and ZnBr₂ electrolytes [batteries]. J.McBreen, E.Gannon (Dept. of Energy & Environment, Brookhaven Nat. Lab., Upton, NY, USA).

J. Electrochem. Soc. (USA), vol.130, no.8, p.1667-70 (Aug. 1983).
The initial stages of the electrocrystallization of zinc from 3M ZnCl₂ and 3M ZnBr₂ on glassy carbon has been investigated using cyclic voltammetry, the potential step method, and scanning electron microscopy. Particular care was taken to ensure electrolyte purity and to eliminate resistance effects in the measurements. The nucleation overvoltage in 3M ZnCl₂ was ~17 and ~12 mV in 3M ZnBr₂. In 3M ZnCl₂, the current transients from the potential step measurements could be fitted to a simple model that assumes instantaneous nucleation followed by growth of three dimensional centers under kinetic control. A similar mechanism is operative for 3M ZnBr₂ at low overvoltages. At higher overvoltages, the current transient is governed by mixed kinetic and diffusion control and cannot be fitted to a simple model. The lower nucleation overvoltage and the faster kinetics in 3M ZnBr₂ is correlated

with the lower stability constants for the zinc bromide complexes. Erroneous results are obtained when resistance effects are not accounted for. (31 refs.)

86.30G Fuel cells

115630 A 50 kW phosphoric-acid fuel-cell power system. K.Kishida, E.Nishiyama, I.Hirata, Y.Hamasaki.
Mitsubishi Denki Giho (Japan), vol.57, no.5, p.28-32 (1983). In Japanese.
Their unique principle of operation is the basis for expectations that fuel cells will emerge as the basis of a new power-generation system. As one link in the development of a multi-megawatt phosphoric-acid fuel-cell power system, Mitsubishi Electric has designed, manufactured, and operated a 50 kW system to study dynamic characteristics and optimize design. The article reports on the system configuration and the initial operating results in terms of a discussion of the characteristics of the electrical cell, fuel processor, inverter, and the overall system. (3 refs.)

86.30J Photoelectric conversion: solar cells and arrays

115631 Sputtered Schottky barrier solar cells on p-type GaAs. M.E.Edweeb, E.J.Charlson, E.M.Charlson (Electrical Engng. Dept., Univ. of Missouri, Columbia, MO, USA).
Appl. Phys. Lett. (USA), vol.43, no.6, p.572-4 (15 Sept. 1983).
Schottky barrier solar cells have been produced on single crystal p-type GaAs by sputtering gold to form the barrier. The rectifying action for the gold sputtered p-type device is unique to the method since normal thermal evaporated gold onto p-type produced Ohmic contacts. The opposite behavior was observed for n-type GaAs. Barrier heights have been measured for both p-type (sputtered) and n-type (thermal) diodes using current-voltage and capacitance-voltage methods and are 0.90 and 0.95 eV, respectively. The power conversion efficiencies without AR coatings have values of 6.56% (p) and 5.58% (n). Deep level transient spectroscopy has been used to identify the trap center concentrations and energy levels for both diodes to account for the relatively large dark currents in the p-type (sputtered) diodes. (15 refs.)

115632 Deep level impurities and current collection in CdS/CdTe thin-film solar cells. L.C.Isett (Res. Labs., Eastman Kodak Co., Rochester, NY, USA).
Appl. Phys. Lett. (USA), vol.43, no.6, p.577-9 (15 Sept. 1983).
Current collection in thin-film CdS/CdTe solar cells prepared by close-spaced sublimation is limited to the depletion region. The width of the depletion region is altered by minority-carrier trapping under light bias. The deep levels responsible for this phenomenon have been identified by deep level transient spectroscopy (DLTS). Heat treatment at 373K changes the energy distribution of the deep levels. Heat treatment with illumination produces an energy level distribution greatly different from that produced by heat treatment without illumination. The observed photocapacitance changes are understood in terms of the emission rates measured in DLTS. (10 refs.)

115633 Wavelength-selective absorption enhancement in thin-film solar cells. Ping Sheng, A.N.Bloch, R.S.Stepleman (Exxon Res. & Engng. Co., Linden, NJ, USA).
Appl. Phys. Lett. (USA), vol.43, no.6, p.579-81 (15 Sept. 1983).
The authors present the general principle of wavelength-selective enhancement of absorption in thin-film solar cells by a periodic grating substrate. By exact numerical calculation they demonstrate that substantial short-circuit current gains are realizable in thin-film amorphous silicon ($a\text{-SiH}_x$) solar cells. In particular, for a 0.5- μm -thick $a\text{-SiH}_x$ solar cell, optimal texturing of an Ag substrate to form a one-dimensional reflective grating can yield a 2-mA/cm² enhancement over the flat substrate case. For a two-dimensional cross-hatched grating substrate the enhancement is estimated to be 3.5-4 mA/cm². (8 refs.)

115634 New types of high efficiency solar cells based on a-Si. Y.Hamakawa, K.Fujimoto, K.Okuda, Y.Kashima, S.Nonomura, H.Okamoto (Faculty of Engng. Sci., Osaka Univ., Osaka, Japan).
Appl. Phys. Lett. (USA), vol.43, no.7, p.644-6 (1 Oct. 1983).
Three types of new structure a-Si solar cells having more than 9% efficiency are presented. The first one has a high optical reflection back electrode metal alloyed with optically transparent n-type $\mu\text{-Si}$ deposited on the conventional glass substrate a-SiC/a-Si heterojunction solar cell. The second type structure is an inverted p-i-n solar cell having Ag/TiO_2 /a-Si metal-insulator-semiconductor type back surface electrode which more efficiently collects longer wavelength photocarriers just above the band edge. The third structure demonstrated here has a-Si/polycrystalline tandem junction to pick up the energy of longer wavelength photons passing through the front side of the a-Si solar cell. All key technologies proposed here are practical and offer more promised real alternatives for the fabrication of high efficiency a-Si solar cells. (18 refs.)

115635 Heterojunction formation in (CdZnS)/CuInSe₂ ternary solar cells. R.K.Ahrenkiel, L.L.Kazmerski, R.J.Matson, C.Osterwald, T.P.Massopust (Solar Energy Res. Inst., Golden, CO, USA), R.A.Mickelsen, W.S.Chen.
Appl. Phys. Lett. (USA), vol.43, no.7, p.658-60 (1 Oct. 1983).
The electrical properties of (CdZnS)/CuInSe₂ solar cells have been investigated by combining electron beam induced current measurements and capacitance-voltage measurements on the same device. In the as-grown device, the CuInSe₂ is lightly doped n type. After baking to about 225°C in vacuum, the CuInSe₂ converts to p type forming the heterojunction. Oxygen does not appear to be necessary for type conversion to occur. (12 refs.)

115636 High-efficiency Si solar cells by beam processing. R.T.Young (Helionetics Inc., San Diego, CA, USA), G.A.van der Leeden, R.L.Sandstrom, R.F.Wood, R.D.Westbrook.
Appl. Phys. Lett. (USA), vol.43, no.7, p.666-8 (1 Oct. 1983).
Utilizing two recently developed beam processing techniques, i.e. gas discharge implantation and XeCl excimer laser annealing p-n junction silicon solar cells with total area (~2 cm²) AM1 efficiencies as high as 16.5% have been made. These cells are of a particularly simple structure, fabricated without any sophisticated processing steps, and subjected to no high-temperature treatment. (11 refs.)

115637 Solar converters based on degenerate semiconductor-semiconductor p-n heterojunctions. S.Yu.Pavelets (Inst. of Semiconductors, Acad. of Sci., Ukrainian SSR).
Appl. Sol. Energy (USA), vol.18, no.4, p.1-4 (1982). Translation of: *Geliotekhnika (USSR)*, vol.18, no.4, p.3-5 (1982). [received: Aug. 1983]
It is reported that the use of strongly degenerate copper chalcogenide Cu_{1-x}S as the p component in HJ is the most efficient method of creating barrier structures based on polycrystalline layers. (10 refs.)

115638 Photoconverters based on InP-CdS heterostructure. E.S.Baleka, E.V.Gilan, L.V.Gorchak, A.D.Kotoroga, A.G.Cheban (Sci. Res. Inst. of Current Sources, Kishinev, Moldavian SSR).
Appl. Sol. Energy (USA), vol.18, no.4, p.5-7 (1982). Translation of: *Geliotekhnika (USSR)*, vol.18, no.4, p.5-7 (1982). [received: Aug. 1983]
Reports the findings of studies of photoconverters based on p-InP-n-CdS heterostructure with a useful area of up to 2 cm². (6 refs.)

115639 Solar elements based on polycrystalline cadmium telluride. S.A.Azimov, Sh.A.Mirsagatov, S.A.Muzafarova (S.V. Starodubtsev Physicochem. Inst., Acad. of Sci., Uzbek SSR).
Appl. Sol. Energy (USA), vol.18, no.4, p.8-12 (1982). Translation of: *Geliotekhnika (USSR)*, vol.18, no.4, p.7-11 (1982). [received: Aug. 1983]
It is shown that ITO is a suitable material for creating p-n heterojunctions based on cadmium telluride. (6 refs.)

115640 Production and some properties of photoelements based on layers of polycrystalline silicon. M.S.Saidov, Z.N.Alad'ina, R.Aliev, V.P.Chirva (U.A. Arifov Inst. of Electronics, Acad. of Sci., Uzbek SSR).
Appl. Sol. Energy (USA), vol.18, no.4, p.13-16 (1982). Translation of: *Geliotekhnika (USSR)*, vol.18, no.4, p.12-15 (1982). [received: Aug. 1983]
The authors describe production conditions for layers of n-type polycrystalline silicon with a small-grain structure, as well as measurements of parameters of photoelements based on such layers, with a p⁺-n junction created by ion implantation of boron. (6 refs.)

115641 Al_xGa_{1-x}As/GaAs thin window concentrator solar cells by LPE plus vapour phase diffusion. R.Romero (Havana Univ., Havana, Cuba), O.V.Sulima.
Cryst. Res. & Technol. (Germany), vol.18, no.8, p.1053-7 (1983).
Zinc diffusion from the vapour phase on a previously grown LPE Al_xGa_{1-x}As/nGaAs sample is discussed for thin window concentrator solar cell manufacture. A high cell shunt resistance and a low series resistance are achieved together with improved optical parameters via an impressed electric field in the emitter. Dark current components are rather low and 21.8% conversion efficiency is measured at AM 1.3. When the photogenerated short circuit current density is 8 A.cm⁻², the fill factor is 0.77 and open circuit voltage is 1140 mV. (14 refs.)

115642 Electro-optical sensors used for inspection and quality control of solar panels. R.W.Paulson, H.Decker, J.Hodor, J.Barney (Lockheed Missiles & Space Co. Inc., Sunnyvale, CA, USA).
Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.360, p.228-36 (1982). [received: July 1983] (Robotics and Industrial Inspection, San Diego, CA, USA, 24-27 Aug. 1982).
Electro-optical sensors are moving rapidly forward in assisting in the fabrication of large solar arrays. Solar power requirements for space missions are increasing and reusable arrays would be most desirable. The technology developed over the past few years is now being applied to fabricate very large light folding reusable arrays. Inspection and quality control are most important. Three areas of sensor applications, and in some cases automation, are described in the paper. The first deals with perhaps the most critical item in fabricating an array, that is, the bonding of the individual solar cells to the circuit. Soldering has been used on many arrays reliably in the past, but for these very light arrays welding is most practical. Although laser welds have been made, parallel gap electronic welding is most popular. The problem has been in getting a physically strong and good electrical bond each time. Sensors and automation have solved this problem and will be discussed. An infrared microscope has in the past proved useful in failure analysis, bonding techniques development and engineering, but always has been restricted to what could be placed on a microscope stage. A new videoized remote sensing infrared microscope that can be on a full solar array panel is described. Lastly, a robot bubble inspection system is shown. (1 ref.)

115643 Optimization of GaAs photocell properties using a thin Al_xGa_{1-x}As interlayer. J.Safrankova, P.Kordos.
Elektrotech. Cas. (Czechoslovakia), vol.34, no.5, p.318-26 (1983). In Slovak.
The possibilities of GaAs photocell parameters optimization are investigated using a thin Al_xGa_{1-x}As interlayer. Theoretical it is shown that the Au-(n)AlGaAs-(n)GaAs structures with the AlGaAs interlayer of certain properties show an increase of the open-circuit voltage U_{oc} and of the efficiency, respectively, in comparison with simple Au-(n)GaAs structures. Results are experimentally confirmed on the structures prepared by isothermal liquid phase epitaxy. An enhancement of U_{oc} by 55 to 65% has been achieved on structures with 100 nm thick compositional graded Al_xGa_{1-x}As interlayer without change in the short-circuit current value I_{sc} . (9 refs.)

115644 A note on the correct evaluation of junction capacitance of a solar cell. S.Deb, M.K.Mukherjee, K.Maitra, B.Ghosh, B.K.Panigrahi (Dept. of Electronics & Telecommunication Engng., Jadavpur Univ., Calcutta, India).
Int. J. Electron. (GB), vol.55, no.3, p.449-55 (Sept. 1983).
In the fabrication of low-cost solar cells one has often to contend with finite series and shunt resistances. These tend to give misleading values of the junction capacitance as measured with an ordinary bridge. The problem is discussed analytically and graphically plots are given for determination of the true values from the measured ones. Practical use of these plots is discussed and illustrated with the help of experiments on thin-film Cu₂S-CdS solar cells. (5 refs.)

115645 Photovoltaics in action.
Int. Power Generation (GB), vol.6, no.6, p.34-6 (July-Aug. 1983).
Electricity generated directly from sunlight is contributing to the economic and social development of many Third World Countries. Photovoltaic systems have been found to be reliable, trouble-free and economical alternative sources of energy where utility grid power is unavailable, or where the cost of extending power lines has proven prohibitive. A major developer, manufacturer and international supplier of the photovoltaic equipment that converts sunlight directly into electricity is Solar Power Corporation of Woburn, Massachusetts, which is an affiliate of Exxon Corporation. Photovoltaic cells, placed in modules and arranged in arrays—combined with power control devices and energy storage—provide reliable electrical power in remote locations not readily accessible to commercial power lines, or operating and maintenance personnel. (no refs.)

115646 Theoretical analysis of solar cells based on graded band-gap structures. G.Sassi (Dipartimento di Fisica, Univ. degli Studi, Milano, Italy).
J. Appl. Phys. (USA), vol.54, no.9, p.5421-7 (Sept. 1983).
The performance of p-n graded energy gap solar cells has been calculated for Ga_{1-x}Al_xAs structures present in either the front region, the base, or both. The graded gap structure in the base is assumed to exist with a high energy gap gradient next to the junction or with a low one along a large portion of the base itself. All the possible configurations in which the built-in fields aid the minority carrier collection are analyzed with a practical theoretical model. The results indicate that the best cell has a high energy gap gradient in the front region and a low energy gap gradient in a large region of the base. This is due to an inverse window effect occurring in the base if the energy gap

variation in it is too high. The optimum junction depths for the various configurations are determined as well, and it is shown how the value of these depths is not a critical parameter, as it can vary widely with little influence on the conversion efficiency of the devices. Finally, the results are analyzed versus the surface recombination velocity S and it appears that these graded energy gap structures are suitable only for $S \gg 10^4$ cm/sec. (14 refs.)

115647 Study of deep-level defects and annealing effects in undoped and Sn-doped GaAs solar cells irradiated by one-MeV electrons. S.S.Li, W.L.Wang (Univ. of Florida, Gainesville, FL, USA), R.Y.Loo, W.P.Rahilly. *Solid-State Electron. (GB)*, vol.26, no.9, p.835-40 (Sept. 1983).

DLTS and C-V techniques have been employed to determine the defect energy levels and density, carrier capture cross sections, lifetimes and diffusion lengths in the Sn-doped and the undoped GaAs solar cells irradiated by one-MeV electrons under different electron fluences (10^{14} to 10^{16} cm $^{-2}$), fluxes (2×10^9 , 4×10^{10} e/cm 2 -s), and annealing conditions ($150 \leq T \leq 230^\circ\text{C}$). The results show that density of both electron and hole traps will in general increase with increasing electron fluence and flux, and decrease with increasing annealing temperature and annealing time. Some distinct difference in defect spectrum was observed in the undoped and the Sn-doped GaAs solar cells studied. The low temperature thermal annealing and the recombination enhanced annealing processes are found to be very effective in reducing the density of deep-level defects induced by one-MeV electrons. (9 refs.)

115648 An EBIC equation for solar cells. K.L.Luke (Dept. of Phys. Astron., California State Univ., Long Beach, CA, USA), O.von Roos. *Solid-State Electron. (GB)*, vol.26, no.9, p.901-6 (Sept. 1983).

When an electron beam of a scanning electron microscope (SEM) impinges on an n-p junction, the generation of electron-hole pairs by impact ionization causes a characteristic short circuit current I_{SC} to flow. The I_{SC} , i.e. EBIC (electron beam induced current) depends strongly on the configuration used to investigate the cell's response. The authors consider the case where the plane of the junction is perpendicular to the surface. An EBIC equation amenable to numerical computations is derived as a function of cell thickness, source depth, surface recombination velocity, diffusion length, and distance of the junction to the beam-cell interaction point for a cell with an ohmic contact at its back surface. It is shown that the EBIC equation presented here is more general and easier to use than those previously reported. The effects of source depth, ohmic contact, and diffusion length on the normalized EBIC characteristic are discussed. (7 refs.)

115649 Mutual influence of wide- and narrow-gap photocells in the operation of multistage n-GaAs-p-AlGaAs-n-AlGaAs heterojunction solar cells. A.M.Allakhverdiev, Yu.M.Zadranov, V.D.Rumyantsev (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Semicond. (USA)*, vol.17, no.3, p.276-7 (March 1983). Translation of: *Fiz. & Tekh. Poluprovodn. (USSR)*, vol.17, no.3, p.446-8 (March 1983). [received: Sept. 1983]

An investigation was made of the load current-voltage characteristics of the component photocells in monolithic two-stage n-p-n AlGaAs heterojunction solar energy converters. It was found that the luminescence, which appeared in the wide-gap photocell because of the shunting of the load by the p-n junction, increased the rate of excitation of the narrow-gap photocell. Moreover, spreading of the current over the shared p-type region gave rise to an additional voltage drop which governed the dependence of the form of the load current-voltage characteristics of one of the photocells on the flow of the current in the other photocell. (5 refs.)

115650 Investigation of complementary p-n-p and n-p-n solar cell stages. V.M.Andreev, O.O.Ivent'eva, E.P.Romanova, V.S.Yuferev (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR). *Sov. Phys.-Tech. Phys. (USA)*, vol.28, no.2, p.196-8 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.320-4 (Feb. 1983). [received: Sept. 1983]

Theoretical and experimental test results are reported for solar cell stages with complementary p-n-p and n-p-n heterostructures. Calculations reveal that efficiencies of 40-45% are attainable in such photocells. The parameters of the heterostructures corresponding to equal currents in the different stages are calculated, so that complementary pairs of photocells can be combined in a battery. GaAs-AlAs heterostructures were used to fabricate p-n-p and n-p-n solar cell stages, and the calculated parameters have been confirmed by test results. (11 refs.)

115651 Studies of electroluminescence in pAlGaAs-pGaAs-nGaAs heterophotocells with distributed parameters. Kh.K.Aripov, N.S.Koroleva, V.R.Larionov, T.A.Nuller, V.D.Rumyantsev (A.F. Ioffe Physicotech. Inst., Acad. of Sci., Leningrad, USSR).

Sov. Phys.-Tech. Phys. (USA), vol.28, no.2, p.202-4 (Feb. 1983). Translation of: *Zh. Tekh. Fiz. (USSR)*, vol.53, no.2, p.329-32 (Feb. 1983). [received: Sept. 1983]

Electroluminescence techniques for studying defects and internal resistive losses are illustrated using pAlGaAs-pGaAs-nGaAs heterophotocells which convert unconcentrated sunlight into electricity. A laboratory technique for testing heterophotocells is proposed which involves measuring the photocurrent I_{ph} when the cell is illuminated by simulated low-intensity sunlight (in order to find the absolute photosensitivity of the p-n junction) and observing the spatial electroluminescence intensity distribution at the normal working current while simultaneously measuring the forward voltage over the cell. (7 refs.)

115652 pAlGa $_{1-x}$ As-pGaAs-nGaAs heterostructure concentrator photocells synthesized by liquid-gas-phase epitaxy. A.M.Allakhverdiev, V.M.Andreev, I.I.Mokan, R.Romero, O.V.Sulima, B.S.Yavich.

Sov. Tech. Phys. Lett. (USA), vol.8, no.11, p.575-7 (Nov. 1982). Translation of: *Pisma v Zh. Tekh. Fiz. (USSR)*, vol.8, no.21-22, p.1335-9 (Nov. 1982). [received: Sept. 1983]

Heterostructure photocells were fabricated by a method involving fabrication of an n-type GaAs layer by liquid-phase epitaxy, growth of a wide-gap Al $_x$ Ga $_{1-x}$ As layer by gas-phase epitaxy with metal-organic compounds, and formation of a p-n junction by zinc diffusion from the vapor phase. These photocells combine the advantages of liquid- and gas-phase epitaxy. They raise the possibility that this hybrid technique may find widespread use in large-scale manufacture of solar batteries. (7 refs.)

115653 Multiwavelength analyzer for the determination of diffusion lengths. G.E.Davis, M.Jansen (Electrical Sci. & Engng. Dept., Univ. of California, Los Angeles, CA, USA).

Sol. Cells (Switzerland), vol.9, no.4, p.269-80 (Sept. 1983).

A new method for the non-destructive determination of diffusion lengths in the base region of solar cells is described. The method involves the measurement of the short-circuit current produced when the cell is illuminated at two different wavelengths. Only the relative powers (illumination) need be determined. The light source provides alternately one wavelength and then the other. This is accomplished through the use of two light-emitting diodes driven by the opposite phases of a square wave. The difference and the sum of the solar cell short-circuit currents are measured and can be used to

determine the diffusion length. The energy can easily be focused to a small spot and the diffusion length as a function of position can be determined by a scanning technique. Using this method, Motorola ribbon-to-ribbon polycrystalline Si solar cells were analyzed. The average value of the diffusion length agreed well with the surface photovoltage diffusion length measurements. In addition, the multiwavelength analyzer showed spatial variations of more than an order of magnitude in diffusion length across given samples. (9 refs.)

115654 Photovoltaic properties of In/trans-polyacetylene/Electrodag + 502 Schottky barrier cells. J.Kanicki, E.Vander Donckt, S.Boue (Collectif de Chimie Organique Phys., Univ. Libre de Bruxelles, Brussels, Belgium).

Sol. Cells (Switzerland), vol.9, no.4, p.281-8 (Sept. 1983).

The electrical properties of In/trans-polyacetylene/Electrodag + 502 Schottky barrier cells were examined in the dark and under monochromatic and white light irradiation. The experiments were performed between -77 and $+110^\circ\text{C}$. The In/trans-polyacetylene contact is strongly blocking. The photocurrent is proportional to the light intensity and the open-circuit photovoltage is an exponential function of light intensity. Owing to the low quantum yield for carrier production and collection, the fraction of light energy transformed into electrical energy is rather low (about 0.025%) under white light illumination. (13 refs.)

115655 Measurement of the open-circuit photovoltage decay in a silicon solar cell. M.K.Madan, V.K.Tewary (Birla Inst. of Technol. & Sci., Pilani, India).

Sol. Cells (Switzerland), vol.9, no.4, p.289-93 (Sept. 1983).

Experimental results are presented for the open-circuit photovoltage decay in a Si p-n junction solar cell for monochromatic light of five different wavelengths and for composite light. Analysis of the results in terms of the existing theories gives a reasonable estimate of the minority carrier lifetime and other material parameters of the solar cell. (6 refs.)

115656 Quality factors of solar cell arrays. M.Shechter (School of Engng., Tel Aviv Univ., Tel Aviv, Israel), J.Appelbaum, G.Yekutieli.

Sol. Cells (Switzerland), vol.9, no.4, p.295-309 (Sept. 1983).

Solar cells are aggregated in series and parallel combinations into an array to produce desired voltage and power levels. The solar cells are non-identical in their parameters; therefore the array power output is lower than the power output of the individual cells operating separately. The quality of the array is reduced as a result of larger dispersions in the cell parameters. Therefore, measures of the array quality are important for the design and analysis of photovoltaic systems. Three quality factors are defined and derived analytically for the array: the array matching factor AMF, the relative power loss RPL and the array curve fill factor CCF $_a$. (2 refs.)

115657 AlGaAs/GaAs cascade solar cell computer modeling under high solar concentration. M.F.Lamorte (Res. Triangle Inst., Research Triangle Park, NC, USA), D.H.Abbott.

Sol. Cells (Switzerland), vol.9, no.4, p.311-26 (Sept. 1983).

A computer modeling program was used to study a two-junction AlGaAs/cascade solar cell under air mass 1.5 spectral conditions, up to 500 suns solar concentration and in a temperature range 300-600K. The cascade structure used in the study is one of a number that are currently under development. Computer modeling results are graphically presented showing the behavior of the efficiency, photovoltage, photocurrent density and forward current density under the combined influence of high solar concentration and temperature. In addition, normalized temperature coefficients, current mismatch parameters, and the power utilization ratio are determined and their behavior discussed. The major conclusions drawn from the study are that the band gap combination of this structure is very nearly optimum for operation in the 450-550K temperature range and that the normalized temperature coefficient of efficiency improves significantly with increasing solar concentration. (23 refs.)

115658 Rooftop photovoltaic arrays: electric shock and fire health hazards. P.D.Moskowitz, E.A.Coveney, S.Rabinowitz, J.I.Barancik (Dept. of Energy & Environment, Brookhaven Nat. Lab., Upton, NY, USA).

Sol. Cells (Switzerland), vol.9, no.4, p.327-36 (Sept. 1983).

Electric shocks and fires represent two different ways for rooftop photovoltaic energy systems to affect public health adversely during installation, operation or removal. Analysis of a US Department of Energy residential application demonstration project suggests that the voltage generated by six modules connected in series could be sufficient to cause ventricular fibrillation and possibly death. Extrapolation of these results to future installations is limited by lack of failure mode data for various designs representing state-of-the-art module and rooftop applications. Two causes of fire include (i) electrical fires from short circuits and (ii) spontaneous combustion from heat build-up in dead air space. Crude upper-boundary estimates for fire-related risk are less than one reportable fire and less than 10^{-2} deaths per year per 10 MW $_p$ cumulative installed capacity. Although the marginal risk to society from these hazards may be low, the potential risk to exposed individuals is high. Continued evaluation of safeguard effectiveness merits further consideration. (20 refs.)

115659 Grating solar cells: an experimental comparison of alternative structures. D.J.Thomson, H.C.Card (Dept. of Electrical Engng., Univ. of Manitoba, Winnipeg, Manitoba, Canada).

Sol. Cells (Switzerland), vol.9, no.4, p.337-44 (Sept. 1983).

An experimental investigation of majority carrier grating solar cells, as originally proposed by Green, has been made and a comparison is drawn with minority carrier cells fabricated and tested under identical conditions. The collecting junctions between the metal grid and the silicon represent 'peaked' Schottky barriers in the majority carrier devices. Active area efficiencies for air mass 1 solar illumination (both simulated and natural sunlight) are 11.4% and 14.0% respectively for majority and minority carrier cells of about 1 cm 2 area on crystalline silicon. Spectral response data are also presented, and further comparisons are made with cast polycrystalline Si grating solar cells and with commercial diffused p-n junction solar cells. (15 refs.)

115660 The effective lifetime in semicrystalline silicon. S.C.Jain (Solid State Phys. Lab., Delhi, India), R.Janssens, G.Cheek, P.Depauw, R.Mertens, R.Van Overstraeten.

Sol. Cells (Switzerland), vol.9, no.4, p.345-52 (Sept. 1983).

The short-circuit current density J_{sc} and dark saturation current density J_0 in a semicrystalline Si solar cell are given by infinite series. If $S_{eff}W/2D_n$ (where S_{eff} is the effective recombination velocity at the grain boundary, W the grain width and D_n the diffusion constant) is small the minority carrier profile can be described as a part of a cosine curve. In this case, the series is rapidly convergent and the concept of an effective lifetime τ_{eff} can be used. The boundary condition at the junction has an important influence on the carrier profile and makes the series for J_{sc} more rapidly convergent than the series for J_0 . In general, therefore, a semicrystalline silicon solar cell cannot be described by one single τ_{eff} except when $S_{eff}W/2D_n$ is small and both series are rapidly convergent. Variations in S_{eff} with illumination make the boundary conditions at the grain boundary non-linear. The solutions obtained in the paper are valid (1) when S_{eff} is so large that the recombination current is

insensitive to S_{eff} and (2) at high illumination intensities where variations in S_{eff} with illumination are small. For other illumination intensities the problem cannot be solved analytically. (8 refs.)

115661 The significance of interference effects in thin film $\text{Cu}_2\text{S}/\text{CdS}$ solar cells. C.Van De Walle, P.De Visschere (Lab. voor Elektronica, Ghent, Belgium).

Sol. Cells (Switzerland), vol.9, no.4, p.353-8 (Sept. 1983).

The generation rate of electron-hole pairs in the Cu_2S layer of a thin film $\text{Cu}_2\text{S}/\text{CdS}$ solar cell is calculated according to a semicoherent model. In this model the coherent addition of light waves is strictly limited to the Cu_2S layer. In contrast with the results of a fully coherent model, in which coherent addition is assumed throughout the whole structure, the interference effects have no significant influence on the photocurrent. (7 refs.)

115662 Point-contact silicon solar cells. R.M.Swanson.

Report EPRI-AP-2859, Electr. Power Res. Inst., Palo Alto, CA, USA (May 1983), 120 pp.

Available from Res. Rep.Center (RRC), Box 50490, Palo Alto, CA 94303, USA.

Describes a new type of silicon photovoltaic cell called the point-contact cell. A discussion of the new cell is provided as well as an analysis of the modeling results and a comparison of the theory and experiment. Necessary future cell development is discussed. The appendixes include the modeling approach, photogeneration in point-contact cells, series resistance cell optimization and design, and limit calculations.

115663 A one-volt p-InP/n-CdSe regenerative photoelectrochemical cell. P.G.P.Ang, A.F.Sammells (Eltron Res. Inc., Naperville, IL, USA).

J. Electrochem. Soc. (USA), vol.130, no.8, p.1784-6 (Aug. 1983).

The authors report on a two-photoelectrode regenerative PEC cell which has shown a combined photovoltage in excess of one volt. The cell consists of n-CdSe as the photoanode and p-InP as the photocathode in an aqueous sulfide/polysulfide electrolyte. All work reported here is with single-crystal materials. (24 refs.)

115664 Investigations of thermochemical energy storage with sulfuric oxides. O.A.Leiyeh.

Report JUL-1847, Kernforschungsanlage, Jülich, Germany (May 1983), 156 pp. In German.

The thermochemical storage system using reversible chemical reactions seems to be attractive especially for solar energy. In this study a system using the catalytic decomposition/recombination of sulphuric oxides has been investigated for electricity production in small plants. The decomposition reaction of SO_3 is used to gather the solar energy concentrated by a field of parabolic dishes. The exothermal recombination of SO_2 and O_2 provides the energy, which can be used to generate steam required for electricity production. Two concepts have been studied and optimized. The first one using a gas turbine showed a small efficiency because of the high amount of energy needed for compressing the gases. The second concept using a steam turbine was optimized for different system parameters and showed an efficiency of about 35% for the whole energy storage system and electricity production. The energy stored during 8 hours of daylight operation is sufficient to meet electricity production demands around the clock. An economical evaluation of the system showed that the system is still not competitive with other electricity producing systems such as diesel generators which are presently being used in isolated rural areas. The material problems involved in this special process remain still to be solved. (66 refs.)

86.30R Thermal energy conversion (heat engines and heat pumps)

115665 Use of the earth heat for the heating of a signal cabin. W.Eggert, G.Grossohmichen.

Eisenbahntechnik (Germany), vol.31, no.6, p.237-8 (June 1983). In German. The construction and the function of a test plant of the German State Railway is described, which is used for the heating of the signal cabin with push button geographical circuitry 'Biesdorfer Kreuz'. The test plant works with two small-heat pumps type WW 12. Thereby the possibility is shown to substitute the electric direct heating by a heat pump plant. Favourable energetic effects may be reached by the application of microelectronic control. (1 ref.)

115666 Simulation of the heating process of a building with an earth-collector heat pump. V.Eberhard, W.Kast (Tech. Hochschule Darmstadt, Darmstadt, Germany).

HLH (Heiz. Luftung Klimatech. Haustech.) (Germany), vol.34, no.8, p.320-1 (Aug. 1983). In German.

In connection with work in progress on the energy consumption of various heating systems, a numerical simulation is described for a building heated from a heat pump supplying a hot water, floating heat store and feeding hot

water to radiators. The results of the calculations on the earth collector are given and discussed. (no refs.) P.G.R.

115667 Fluorocarbon turbine utilizing waste heat of hot water. An application to a heat pump system. T.Nakanishi, S.Inoue, K.Yoshikawa, T.Kato, H.Yanagi, H.Shimoda, H.Araki, M.Ohsone.

Hitachi Zosen Tech. Rev. (Japan), vol.44, no.1, p.19-28 (March 1983). In Japanese.

Much attention has been given to the development of a heat and power recovery system using organic fluid from low temperature waste heat. For this study, a turbine using refrigerant R-114 was constructed and applied to drive a compressor in a compression type heat pump system as a means of recovering power from low temperature (70°C) waste water. (1) The results obtained show satisfactory turbine performance with maximum output of 116 kW and internal efficiency of 85%. (2) The turbine speed control system with an electronic governor and adjustable stator blades shows good characteristics with relatively high efficiency over the wide operating speed. (3) The design procedure proved itself reliable in the shaft-sealing, rotor-vibration and other mechanical performance areas. (4) In the heat pump system, efficient operation was obtained using the turbine speed control for partial load of the heat pump. (6 refs.)

115668 van't Hoff-van der Waals osmotic pressure and energy transformers. C.Zener (Carnegie-Mellon Univ., Pittsburgh, PA, USA), W.Levenson.

Proc. Natl. Acad. Sci. USA, vol.80, no.14, p.4577-9 (July 1983).

The authors find the van't Hoff relations between osmotic pressure, freezing point depression, and boiling point elevation provide a clue on how, by using salt solutions, one may lower the cost of extracting power from low-grade heat sources. In particular, the ratio of 7 between the heat of evaporation and the heat of freezing of pure water suggests a chemical system that raises 7-fold the temperature difference between heat source and heat sink, while decreasing by the same factor the heat flux. Heat exchangers dominate the cost of heat engines operating upon low-grade heat. Their area for a fixed power output is inversely proportional to the available temperature differential. Herein lies the potential for a great cost reduction. The authors show that the simple van der Waals concept of a gas of hard elastic spheres suffices to understand the colligative properties of salt solutions, at least up to the concentration of the eutectic composition. This concept enables them to physically interpret the thermodynamic processes during the concentration of salt solutions by evaporation and during the mixing of ice and solid salt hydrates at their eutectic temperature. (8 refs.)

115669 A single screw high performance heat pump. B.Zimmern, E.Kallmann (Omphale SA, Puteaux, France).

Proceedings of Four Contractors' Meetings on Heat Pumps (EUR 8077 EN), Brussels, Belgium, 28-29 April & 12-13 May 1982 (Luxembourg: Comm. European Communities 1982), p.40-50

In order to build a heat-only air-water heat pump, for the heating of a medium size collective housing, a single screw compressor with 25-30 kW shaft power is being designed and tested. Such heat pumps, possibly complemented by a conventional combustion or resistor heating for the coldest days, can bring significant energy savings in regions with temperate climates, as in most countries of the EEC. A first set of unsuccessful tests have been run in 1980 with the PC compressor structure initially contemplated; early 1981, a more conventional design, the CP type, has proven to have the potential required provided a number of specific improvements are implemented. The compressor uses an injection of condensed refrigerant as a sealing and a cooling media. It is equipped with a continuous capacity control system, used in such a way that efficiency can be improved from full load down to half load by means of an 'economiser'. The first results obtained at Omphale are shown, pending complete counter-check through Electricite de France in their Testing Laboratories. They show that there is a good probability to reach the technical and economic targets set for the contract. (no refs.)

115670 Improving domestic heat pumps capacity control. H.Martin-Neuville, M.Reybillet, J.P.Patureau (Bertin & Cie Energetics Div., Plaisir, France).

Proceedings of Four Contractors' Meetings on Heat Pumps (EUR 8077 EN), Brussels, Belgium, 28-29 April & 12-13 May 1982 (Luxembourg: Comm. European Communities 1982), p.51-67

The work carried out so far under the present contract has been primarily devoted to setting up a versatile, fully instrumented test bench with the following essential features: sophisticated data acquisition using a minicomputer SILEX. Programs have been developed to allow acquisition, storage and processing of 32 parameters at frequencies up to 500 Hz. Fast phenomena (on/off cycles, house temperature regulation) over long periods of time can thus be properly analyzed, simulation of a typical house heating system thus reproducing in a controllable manner the thermal interaction between heat pump, radiator heat distribution system, house and climatic environment. This feature allows one to investigate various types of regulation with the aim of improving the match between heat pump and house. Along this line, preliminary tests using condensing temperature control suggest a significant improvement over standard house temperature regulation (13% and 21% gain on average COP at 7°C and 15°C outside air temperature, respectively). (no refs.)

115671 Optimized operation of a frozen air heat exchanger by using a microcomputer controlled expansion valve. R.Pleiningner, M.Kuhn (Inst. für Umweltschutz, Univ. Dortmund, Dortmund, Germany).

Proceedings of Four Contractors' Meetings on Heat Pumps (EUR 8077 EN), Brussels, Belgium, 28-29 April & 12-13 May 1982 (Luxembourg: Comm. European Communities 1982), p.68-82

Herein the first results of operating a frozen air heat exchanger as a part of a monovalent heat pump system (air water) controlled by a microcomputer are presented. We will be reporting about the operation of a microcomputer controlled expansion valve, which allows any superheating temperature in all positions of operation of the stable range. The important parameters of the optimization of the evaporator operation are the superheating temperature, the fan operation/air flow rate and the defrosting procedure. The various air flow rates (adjusted by varying the r.p.m. of the fan), have only little importance to the coefficient of performance. But down to air temperatures of 1.5°C it is possible to defrost the evaporator only by the fan, which is highly interesting in terms of energy conservation. A new criterion tested in practical operation for initiating the defrost procedure by using a calculated/estimated heat transfer coefficient is presented. (7 refs.)

115672 Heat pumps for heat recovery from paper dryers, producing process steam from the dryer exhaust air. D.L.Hodgett, W.Friedel (Bat-telle-Inst. e.V., Frankfurt am Main, Germany).

Proceedings of Four Contractors' Meetings on Heat Pumps (EUR 8077 EN), Brussels, Belgium, 28-29 April & 12-13 May 1982 (Luxembourg: Comm. European Communities 1982), p.165-80

The work carried out during the first six months of the project was concerned with the development of heat pump and heat transformer concepts and of a computer code capable of modelling all of those, using $H_2O/LiBr$ as working pair. Subroutines for humid air and water/steam for simulation of the heat source and sink were also completed and the specification of paper hood operating conditions to be used as a reference system for assessment of the possible systems was agreed with the industrial sponsor. Finally a preliminary comparison of the possible systems was made based on the thermodynamic performance for a reference paper machine. (6 refs.)

115673 Development of an absorption heat pump for industrial application. J.Berghmans (Katholieke Univ, Leuven, Leuven, Belgium).

Proceedings of Four Contractors' Meetings on Heat Pumps (EUR 8077 EN), Brussels, Belgium, 28-29 April & 12-13 May 1982 (Luxembourg: Comm. European Communities 1982), p.181-3

A feasibility study is undertaken for the development of absorption heat pumps for industrial application. This study includes a search for suitable working pairs and the design of heat pump components. Where necessary missing fluid properties are determined experimentally. In the design phase considerable attention is given to the development of accurate component models and the application of techniques enhancing heat transfer. (6 refs.)

115674 Earth as a storage medium and a heatsource for heatpump. M.Fordsmann (European Heatpump Consultors Ltd., Charlottenlund, Denmark).

Proceedings of Four Contractors' Meetings on Heat Pumps (EUR 8077 EN), Brussels, Belgium, 28-29 April & 12-13 May 1982 (Luxembourg: Comm. European Communities 1982), p.214-28

The system which is being studied both in theory and in practice consists of a heat accumulator with vertical pipes, an unshielded solar collector of small size, and a heatpump, that will both heat and cool the house. The dimensioning work is concluded, and the construction work is being carried out. The air/water heat pump for the domestic water has been installed. (2 refs.)

115675 Investigation into a complete earth to water heat pump system in a single family dwelling focussing on the application of a vertical subsoil heat exchanger. J.W.J.Bouma, A.D.Koppenol, H.van der Ree (TNO-MT, Apeldoorn, Netherlands).

Proceedings of Four Contractors' Meetings on Heat Pumps (EUR 8077 EN), Brussels, Belgium, 28-29 April & 12-13 May 1982 (Luxembourg: Comm. European Communities 1982), p.229-41

The heat pump system involved operates in the bivalent-parallel mode. The dwelling is fitted with a floor heating system. The previously developed computerised predictive method for heat extraction from the soil and heat pump performance has been applied for the design of the subsoil heat exchanger. Calculations have been performed for seven tubes with a length of 10 m, 15 m and 20 m respectively in relation to the actual heating demand of the dwelling. Preliminary results show that 20 m-tubes yield higher SPF's, whereas in the case of 10 m-tubes the quasi-stationary state of the earth in a natural manner is obtained quicker. (10 refs.)

115676 Heating of a laboratory hall by means of a soil heat pump combined with unshielded solar collectors. J.M.De Hoe, B.Geeraert.

Proceedings of Four Contractors' Meetings on Heat Pumps (EUR 8077 EN), Brussels, Belgium, 28-29 April & 12-13 May 1982 (Luxembourg: Comm. European Communities 1982), p.242-69

Experimental results of a 500 m² laboratory hall heated during the season 1980/81 by three soil heat pumps using only 620 m² soil surface for the double layer horizontal pipe heat exchanger buried at low depth (0.6 m and 1.2 m). The energy demand has been lowered to 45% of the demand in case of resistance heating. Experimental results correspond to predicted ones. (7 refs.)

115677 Domestic heat pump with deep hole ground source evaporator. J.R.Goulburn, J.Fearon (Dept. of Mech. & Industrial Engng., Queen's Univ., Belfast, N Ireland).

Proceedings of Four Contractors' Meetings on Heat Pumps (EUR 8077 EN), Brussels, Belgium, 28-29 April & 12-13 May 1982 (Luxembourg: Comm. European Communities 1982), p.270-83

A programme of ground source heat pump investigations commenced in 1974. Initially, horizontal coils at a moderate depth were installed and results similar to other investigators obtained. Large ground areas were required for significant outputs, and this led to the next stage, where vertical coils were experimented with on a small scale. The performance of these coils was encouraging, and led to the design and installation of a ground source heat pump of 8.9 kW output which required a moderate ground area. This heat pump was installed in a house on the university site, and its performance and the thermal behaviour of the soil measured. Throughout the ground coil experiments described the refrigerant has been directly evaporated in the ground (i.e. no secondary medium was used). Co-operation with a Company called Roots led to installations and experiments with diesel engine driven ground source heat pumps of 50 kW output, using waste heat recovery from the diesel engines. These units are intended to be used in the first instance in horticultural applications. (no refs.)

115678 Design and development of absorption heat pumps. I.E.Smith, C.O.B.Carey, G.F.Smith (School of Mech. Engng., Cranfield Inst. of Technol., Cranfield, England).

Proceedings of Four Contractors' Meetings on Heat Pumps (EUR 8077 EN), Brussels, Belgium, 28-29 April & 12-13 May 1982 (Luxembourg: Comm. European Communities 1982), p.285-96

Investigations and measurements have been carried out concerning the vapour pressure, viscosity, density, thermal conductivity, solubility and thermal stability of solutions of lithium bromide and zinc bromide in 2:1 molar ratio in methanol over more extended temperature ranges than have hitherto been reported, suitable for a heat pump operating at an evaporator temperature of -10°C and an absorber temperature of 70°C . An experimental test rig consisting of an evaporator and adiabatic packed bed adsorber has been successfully operated delivering 250 W at a temperature of 74°C with the methanol evaporating at -10°C . At a temperature of 190°C the methanol-bromide mixture has been found to be unacceptably unstable, with two moles of methanol undergoing dehydration to produce one mole of dimethyl ether. This product behaves as a non-condensable gas in the system and reduces its capacity to an unacceptably low level. A 3 kW, absorption heat pump has been fabricated out of industrial glassware and when fully instrumented and thermally insulated will be used to measure the performance of candidate working fluids and absorbents. (3 refs.)

115679 Compression heat pumps operating with non-azeotropic fluid mixtures. Cl.Ramet, A.Rojey, H.Baglione, L.Reigne, J.Durandet (Inst. Francais du Petrole, Rueil-Malmaison, France).

Proceedings of Four Contractors' Meetings on Heat Pumps (EUR 8077 EN), Brussels, Belgium, 28-29 April & 12-13 May 1982 (Luxembourg: Comm. European Communities 1982), p.297-311

Non azeotropic fluid mixtures in compression heat pumps applied to space heating make it possible to improve the coefficient of performance and/or to increase the thermal capacity, by using specific optimized mixtures for each of these two cases. The report describes the basic principles of the advantages of using fluid mixtures, the IFP experimental work and the application of mixtures to commercial Leroy-Somer heat pumps. In the development step, priority was given to the increase in the thermal capacity, without any change in the layout of the heat pump. The obtained capacity increase reached 28% for water-to-water units and 24% for air-to-water units, with a maintained or even improved COP. These results are encouraging, because they enable a substantial cost reduction of about 10% of the heat pumps. (no refs.)

115680 Absorption-resorption heat pump for space heating investigation of solute-solvent pairs. J.Cheron, A.Rojey, J.Durandet (Inst. Francais du Petrole, Rueil-Malmaison, France).

Proceedings of Four Contractors' Meetings on Heat Pumps (EUR 8077 EN), Brussels, Belgium, 28-29 April & 12-13 May 1982 (Luxembourg: Comm. European Communities 1982), p.312-27

Absorption-resorption cycles widen the range of solute-solvent pairs to be used in heat pumps for space heating. Non toxic, inexpensive, non-flammable and easily available fluids have been studied. CO_2 appears to be a good fluid because of its properties. Many solvents are able to absorb CO_2 . Results are described and show that some additional experimental data are needed for the investigation of solute-solvent pairs better suited for space heating. Thermodynamic models have been developed for the simulation of solute-solvent pairs, and good prediction has been demonstrated even for enthalpic values. A test loop (1 kW at the generator) is under construction. (9 refs.)

115681 Development of a periodically working absorption heat pump. H.B.Grabenhenrich, K.F.Knoche (Lehrstuhl für Tech. Thermodynamik, RWTH Aachen, Aachen, Germany).

Proceedings of Four Contractors' Meetings on Heat Pumps (EUR 8077 EN), Brussels, Belgium, 28-29 April & 12-13 May 1982 (Luxembourg: Comm. European Communities 1982), p.328-33 In German.

In periodically operating heat pumps the generation, condensation and evaporation of the vapour occur at different times. This method which has been abandoned in the absorption cooling is rather favorable for absorption heating processes because a solution pump can be completely avoided and also the control of such a device is rather simple. Heat transfer in the absorber is the most critical step in periodically working absorption heat pumps. First results on heat transfer coefficients are presented. (no refs.)

115682 Thermoelectric exhaust air/water heat pump for space heating. P.Dubois, R.Ravelet, M.Berthet (Lab. de Marcoussis, Generale d'Electricite, Marcoussis, France).

Proceedings of Four Contractors' Meetings on Heat Pumps (EUR 8077 EN), Brussels, Belgium, 28-29 April & 12-13 May 1982 (Luxembourg: Comm. European Communities 1982), p.334-46

The reported work on thermoelectric heat pumps has been conducted on extracted air/water pumps for space heating. It includes: sintering of thermoelectrical pellets, design, fabrication and test of a column with 34 pellets, design and cost studies of a pump for space heating of a well insulated dwelling; computation of energy savings. (no refs.)

115683 Systematic construction and development of an economical; low loss and controllable solvent pump for absorption heat pumps. K.-H.Schrader (Stiebel Eltron GmbH & Co., Holzminden, Germany).

Proceedings of Four Contractors' Meetings on Heat Pumps (EUR 8077 EN), Brussels, Belgium, 28-29 April & 12-13 May 1982 (Luxembourg: Comm. European Communities 1982), p.347-60

Suitable solvent pumps for absorption heat pumps are available on the market only in the form of expensive piston-membrane types. The testing of alternative types available on the market brought to light the problems of shaft seals and the resistance of well-known elastomers to the materials used. The best pumping properties were observed with annular gear pumps, whereby the annular gear pump of a particular hydraulic pump manufacturer was most convincing with regard to smooth running, dimensions and volumetric efficiency. The project will now be continued in cooperation with this firm and a further specialist firm for electric motors. In the medium term, an intermediary solution consisting of annular gear pumps with slide ring seals and flanged, reversible electric motor has been realised. In the long term, development is taking place in the direction of fully hermetic systems in a single housing, using a reversible, slotted tube motor. (14 refs.)

115684 The development of a directly fired heat pump for domestic and light commercial application. D.T.G.Strong (Glynwed Group Services Ltd., Shirley, Solihull, England).

Proceedings of Four Contractors' Meetings on Heat Pumps (EUR 8077 EN), Brussels, Belgium, 28-29 April & 12-13 May 1982 (Luxembourg: Comm. European Communities 1982), p.375-89

A prototype gas fired heat pump has been produced based upon the use of a miniature turbomachine operating on a Rankine/Rankine Cycle. Problems and experience gained with the laboratory prototypes are identified with particular reference to the following: high speed gas bearings, differential thermal expansion, test rig and instrumentation, feed pump and working fluid. Current work associated with optimising the gas bearings, turbo-compressor, feed pump and control system are outlined together with an indication of the future development plan. (no refs.)

115685 Heat-engineering design method for a passive solar heating system (steady state). R.R.Avezov, K.B.Babakulov (S.V. Starodubtsev Physicotech. Inst., Acad. of Sci., Uzbek SSR).

Appl. Sol. Energy (USA), vol.18, no.4, p.33-9 (1982). Translation of: *Geliotekhnika (USSR)*, vol.18, no.4, p.29-34 (1982). [received: Aug. 1983] The balance equations for individual surfaces and volumes and for the structure as a whole are set up and solved. The theoretical data are compared with experiment. (8 refs.)

115686 Temperature conditions of the refrigerating chamber of an adsorption solar refrigerator. B.M.Achilov, V.V.Chugunkov (S. Ordzhonikidze Bukhara State Pedagogical Inst., USSR). *Appl. Sol. Energy (USA)*, vol.18, no.4, p.40-4 (1982). Translation of: *Geliotekhnika (USSR)*, vol.18, no.4, p.34-8 (1982). [received: Aug. 1983] The authors describe a method of calculating the nonsteady temperature conditions for the chamber of a solar refrigerator. (3 refs.)

115687 Experimental study of the operation of a domestic continuous-operation solar refrigerator. N.Ch.Dursunov (V.V. Kuibyshev Samarkand Cooperative Inst., USSR). *Appl. Sol. Energy (USA)*, vol.18, no.4, p.45-7 (1982). Translation of: *Geliotekhnika (USSR)*, vol.18, no.4, p.38-40 (1982). [received: Aug. 1983] (4 refs.)

115688 Full-scale tests of a solar hothouse with subsurface irrigation and heat accumulation. A.B.Vardiashvili, M.Muradov, E.Khasanov, A.A.Vardiashvili, A.Temurkhanov (Kh. Alimdzhan Karshinsk State Pedagogical Inst., USSR). *Appl. Sol. Energy (USA)*, vol.18, no.4, p.48-51 (1982). Translation of: *Geliotekhnika (USSR)*, vol.18, no.4, p.40-3 (1982). [received: Aug. 1983] The authors consider a combined solar hothouse/dryer with subsurface irrigation and with a heat accumulator. It is established that, when the moisture content of the soil is raised, there is an increase in its heat conduction and intensified heat transfer from the air to the soil. (5 refs.)

115689 Antireflection coatings for metallized surfaces of solar elements and thermal collectors. M.M.Koltun, I.P.Gavrilova (All Union Sci. Res. Inst. of Current Sources, USSR). *Appl. Sol. Energy (USA)*, vol.18, no.4, p.52-7 (1982). Translation of: *Geliotekhnika (USSR)*, vol.18, no.4, p.44-8 (1982). [received: Aug. 1983] It is shown that, of the metals considered, only Ni has favorable values of the optical constants such that a zero minimum coefficient of reflection can be obtained by using antireflection coatings. (1 ref.)

115690 Engineering method of calculating solar radiation and radiation absorbed by a collector. M.D.Rabinovich (Regional Sci. Res. & Design Inst. of Standard & Experimental Planning, Kiev, Ukrainian SSR). *Appl. Sol. Energy (USA)*, vol.18, no.4, p.71-6 (1982). Translation of: *Geliotekhnika (USSR)*, vol.18, no.4, p.59-64 (1982). [received: Aug. 1983] The author presents computer calculations of the spatial characteristics of flat solar-energy collectors, and a procedure for utilizing them in calculations. Calculations and a procedure are given for optimal arrangement of collectors on a plane. (11 refs.)

115691 Solar lemon-growing facility with heat accumulator. Ch.Sh.Tursunov, M.Khasanova, T.Sodikov (S. Ordzhonikidze Bukhara State Pedagogical Inst., USSR). *Appl. Sol. Energy (USA)*, vol.18, no.4, p.77-9 (1982). Translation of: *Geliotekhnika (USSR)*, vol.18, no.4, p.65-6 (1982). [received: Aug. 1983] It is shown that large-scale lemon-growing facilities heated by solar energy can be constructed in the southern regions of Central Asia. (no refs.)

115692 Method of calculating incoming radiation in shed-type block hothouses. Yu.N.Yakubov, A.Imamkulov (S. Ordzhonikidze Bukhara State Pedagogical Inst., USSR). *Appl. Sol. Energy (USA)*, vol.18, no.4, p.80-5 (1982). Translation of: *Geliotekhnika (USSR)*, vol.18, no.4, p.67-70 (1982). [received: Aug. 1983] The authors derive analytic expressions for determining the mutual shadowing factors and incoming radiation for shed-type block hothouses. (3 refs.)

115693 Recent advances in natural-circulation, solar-energy water heater designs. B.Norton, S.D.Probert (School of Mech. Engng., Cranfield Inst. of Technol., Bedford, England). *Appl. Energy (GB)*, vol.15, no.1, p.15-42 (1983). Details are given of mathematical simulations and experimental determinations of system performance. Various methods of successfully incorporating a thermosyphon solar-energy water heater into a building are discussed. Recent approaches to the design of compact and indirect types are also described. The viability and acceptability of systems in several countries are reported. (97 refs.)

115694 Effect of a thermal trap on the performance of a solar sand collector. N.K.Dhiman, G.N.Tiwari (Centre of Energy Studies, Indian Inst. of Technol., New Delhi, India). *Appl. Energy (GB)*, vol.15, no.1, p.57-69 (1983). The effects of different parameters—e.g the thickness of the trap material, the flow rate of the water and the depth of the heat-retrieval plane—on the water temperature have been investigated. A comparison of the present system with a conventional solar sand collector was also made. (7 refs.)

115695 Conductive heat transfer in salt gradient stabilized solar ponds. A.K.S.Thakur (Dept. of Phys., Univ. of Sokoto, Sokoto, Nigeria). *Int. Commun. Heat & Mass Transfer (GB)*, vol.10, no.4, p.335-40 (July-Aug. 1983). Deals with heat transfer in salt gradient solar ponds. Spatial variations in thermal properties have been considered and the resulting one dimensional heat conduction equation with a source term, is solved explicitly to obtain a closed form mathematical expression for temperature distribution in the non-convected zone present analysis is not restricted to any one typical profile in thermal properties. (14 refs.)

115696 Solar radiation intensity and its use in parabolic collectors. J.Giman. *Elektrotech. Cas. (Czechoslovakia)*, vol.34, no.5, p.359-69 (1983). In Slovak. The following parameters which affect the effectiveness of solar conversion systems in Czechoslovak conditions are dealt with: solar radiation intensity; the length of insolation in Czechoslovakia based on meteorological records; geometrical parameters of the parabolic collectors, and the nominal and dynamic effectiveness of the collector systems. It is concluded that solar power is an effective source of energy for domestic space and water heating as well as for various industrial applications. (6 refs.) *E.D.*

115697 Investigations on active and passive systems of solar energy utilisation in a manufacturing bay. N.Schadler, W.Kast (Tech. Hochschule Darmstadt, Darmstadt, Germany). *HLH (Heiz. Luftung Klimatch. Haustech.) (Germany)*, vol.34, no.8, p.321-2 (Aug. 1983). In German. The investigations were carried out on a solar heating installation in an industrial assembly bay in Darmstadt comprising an active system incorporating four air collectors with roof mounted absorbers, ducting system and heat stores, and a passive system consisting of a transparent surface on part of the south facing wall. The brief experience gained so far suggests that the calculated contribution of 44% by the solar system to the energy requirement over a heating period will be achieved. (no refs.) *P.G.R.*

115698 Selective solar absorption of chemically etched aluminum-silicon films. G.A.Niklasson, H.G.Craighead (Bell Labs., Holmdel, NJ, USA). *J. Appl. Phys. (USA)*, vol.54, no.9, p.5488-90 (Sept. 1983). Electron-beam evaporated aluminum-silicon composites were chemically etched in a NaOH solution. This treatment produced a textured surface with high solar absorptance and low thermal emittance. The optical properties were qualitatively described by a graded refractive index model. (28 refs.)

115699 Comparison of collector performance measured in a solar simulator. H.Hettinger. *Report EUR 8347 EN*, Comm. European Communities, Luxembourg (1983), 13 pp. The thermal performance of a solar collector is characterized by its instantaneous efficiency in various working conditions. This efficiency curve can be obtained outdoor or using solar simulators. In outdoor measurements, the test conditions have to be restricted in order that the influence on the collector performance of meteorological factors (wind, solar irradiance, sky temperature, angle of incidence, ambient temperature, humidity, etc.) remain within a known limit. As a result of these restrictions, outdoor tests take often much time to complete and the reproducibility of the results is very problematic. For a comparison of collector efficiencies it is important to make tests under both steady state and repeatable operating conditions. This is possible using a light simulator in a climatic chamber. During the last two years, a great number of collector performance measurements have been performed using the solar simulator LS-1 in the CCR Ispra. In this report, a short description of theory and experiment is given, along with the results of thermal efficiency measurements with a selection of 38 solar collectors of 13 different manufacturers. The collectors under investigation are all single glassed liquid heating flat plate collectors which are conceived for domestic hot water production.

115700 Absorber surfaces and durability of solar heat collectors. W.Bogaerts, A.Van Haute, M.Pacolet. *Report EUR 8353 EN*, Comm. European Communities, Luxembourg (1983), 70 pp. Commercially or potentially available selective and nonselective absorber surfaces for solar heat collectors are reviewed and the state-of-the-art of solar collector corrosion processes is outlined. The review of available published literature has indicated that lack of quantitative information exists at the present time relative to corrosion of collector surfaces. Available information (mostly qualitative) on durability aspects and corrosion of solar receiver surfaces is described to indicate potential corrosion problem areas and corrosion prevention possibilities. An outline of appropriate durability tests is presented. (177 refs.)

115701 Fundamental research on multi-hull-type floating wave energy converter. M.Kobayashi, H.Nakagawa, N.Matsubara. *Mitsui Zosen Tech. Rev. (Japan)*, no.118, p.52-62 (April 1983). In Japanese. The author propose a new multi-hull-type floating wave energy converter which consists of multi-floating bodies with asymmetrical cross section and connecting bars. Wave energy absorption by this converter is induced from the relative motions between the floating bodies and the connecting bars in waves. The method to calculate the hydrodynamic forces and moments on each floating body was developed by using the Okusu method, and the equation of motions of floating bodies and connecting bars in waves was derived. For the twin-hull-type wave energy converter which consists of two Salter-Duck floats and a connecting bar, theoretical calculations by this method and model experiments were carried out. It is found that the results obtained by the present method are in good agreement with the ones by model experiments. The twin-hull-type will give more stable wave energy absorption than the single-hull-type. (14 refs.)

115702 The experimental and theoretical evaluation of a twin-flap wave-energy absorbing device. R.M.Scher, A.W.Troesch (Dept. of Naval Architecture & Marine Engng., Univ. of Michigan, Ann Arbor, MI, USA), G.Zhou. *Ocean Eng. (GB)*, vol.10, no.5, p.325-45 (1983). A series of model experiments with a twin-flap wave-energy absorbing device is described, and the results compared with numerical predictions based on theoretical work reported by Srokosz and Evans (1979). Measurements were made of absorption efficiency, flap motion responses, and total flap forces (mooring forces), all with the supporting structure held fixed, with normal wave encounter. Both 2-D and finite-length flap experiments were conducted. Generally, fair agreement is obtained between theory and experiments. Maximum efficiencies approaching 100% (as predicted analytically) were confirmed by experiments. Some conclusions are drawn with regard to a twin-flap power generating system. (9 refs.)

115703 Determination of concentrations of selected radionuclides in surface soil in the US. T.E.Myrick, B.A.Berven, F.F.Haywood (Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

Health Phys. (GB), vol.45, no.3, p.631-42 (Sept. 1983).

Background radionuclide concentrations in surface soil across the US have been measured by the Oak Ridge National Laboratory (ORNL). These measurements have been made as part of the ORNL program of radiological surveillance at inactive uranium mills and sites formerly utilized during Manhattan Engineer District and early Atomic Energy Commission projects. The background soil sampling program involved determination of ^{226}Ra , ^{232}Th and ^{238}U concentrations in surface soil samples for comparative purposes to determine the extent of contamination present at the survey sites and surrounding off-site areas. The sampling program to date has provided background information at 356 locations in 33 states. The nationwide average concentrations of ^{226}Ra , ^{232}Th and ^{238}U in surface soil were determined to be 1.1, 0.98 and 1.0 pCi/g, respectively. This paper summarizes the results of these background measurements and provides a brief analysis of regional differences and similarities in data values. (9 refs.)

115704 Hydrocarbons in water, sediment and mussels from the southern Baltic Sea. R.Law (Fisheries Lab., Min. of Agriculture, Fisheries & Food, Burnham on Crouch, England), E.Andrulewicz.

Mar. Pollut. Bull. (GB), vol.14, no.8, p.289-93 (Aug. 1983).

Samples of water, sediment and mussels (*Mytilus edulis*) from the southern Baltic Sea have been analysed for total hydrocarbons by fluorescence spectroscopy and capillary gas chromatography. The sediment and mussel samples have also been analysed for specific aliphatic and aromatic hydrocarbons by computerized capillary gas chromatography-mass spectrometry. The highest hydrocarbon concentrations in all samples occurred either inshore (particularly in Gdansk Bay) or in deep offshore basins where fine sediment accumulates. (9 refs.)

115705 Evaluation of ocean pollution (experience of the United Nations Program in the West African region). A.G.Rozanov (Shirshov Inst. of Oceanology, Acad. of Sci., Moscow, USSR).

Oceanology (USA), vol.22, no.4, p.434-7 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.4 (1982). [received: Aug. 1983]

Industrial pollution of the Atlantic Ocean off the coast of West Africa was evaluated by UN experts under a project instituted in 1980 on the request of the countries of that region. The procedure used in the project included direct gathering of information from industrial plants about the type of output and the quantity of pollutants discharged into the ocean. Simultaneously, the status of the facilities for the treatment and disposal of hazardous wastes and the prospects for industrial development in terms of its environmental effects are evaluated. The results obtained show that in several West African countries there exist specific coastal areas, sometimes of very large size, in which the present levels of pollutants discharge into the ocean may create an environmental hazard. (11 refs.)

115706 Water quality measurement by observing aquatic animals on mountain streams near Shinshin-so Hut, Doshisha University, 1982. N.Kobayashi (Biological Lab., Doshisha Univ., Kyoto, Japan).

Sci. & Eng. Rev. Doshisha Univ. (Japan), vol.24, no.1, p.29-40 (May 1983). In Japanese.

The biological water quality measurement on mountain streams was carried out in May and November 1982, as a part of investigations upon natural environment around Shinshin-so Hut, Doshisha University. Investigated sites were both rapids and pools on an upper (slow stream), a mid- (few stream) and a down- (rapid stream) streams. Bottom samples were collected in the quadrat (50 cm×50 cm) at the depths of 2-3 cm in May and of 7-10 cm in November. Then, invertebrates were gathered with the naked eye from the bottom samples. The polluted degrees of these water samples were measured by the modified Beck-Tsuda biotic index α method. The measurement showed that the indexes were low (somewhat clean) in spring and high (clean) in autumn generally. The conditions of the collection may have also affected the variation. (17 refs.)

115707 Pollution levels in some Nigerian rivers. P.A.Oluwande, M.K.C.Sridhar, A.O.Bammeke, A.O.Okubadejo (Dept. of Preventive & Social Medicine, Coll. of Medicine, Univ. of Ibadan, Ibadan, Nigeria).

Water Res. (GB), vol.17, no.9, p.957-63 (1983).

Surveys of five rivers in a hot-humid zone of a tropical country (Nigeria) were carried out over 3 years by obtaining samples for physical, chemical and bacteriological analyses. The main characteristics monitored were temperature, turbidity, total, dissolved and suspended solids, pH, dissolved oxygen, BOD, ammonia-nitrogen and the coliform counts. The main characteristics of the liquid waste being discharged into the rivers are determined. (22 refs.)

115708 Factors affecting the concentrations of cadmium, zinc, copper and lead in the sediments of the Vesdre River. C.Houba, J.Remacle (Univ. of Liege, Dept. of Botany, Liege, Belgium), D.Dubois, J.Thorez.

Water Res. (GB), vol.17, no.10, p.1281-6 (1983).

The main factors influencing Cd, Zn, Cu and Pb concentrations in the sediments of the highly polluted Vesdre River (eastern Belgium) are investigated. Only negative correlations are demonstrated between the clay content and heavy metals. The composition of the clay minerals could partially explain this paradox. However, the pretreatment of the minerals might influence the geochemical data obtained from analysis. Iron-hydroxides and phosphates seem to be the main sinks for Pb, Cd and Zn whereas organic components might play a less important role. (24 refs.)

86.70G Atmosphere

115709 The New Jersey project on Airborne Toxic Elements and Organic Substances (ATEOS): A summary of the 1981 summer and 1982 winter studies. P.J.Lioy, J.M.Daisey (Inst. of Environmental Medicine, New York Univ. Medical Center, New York, NY, USA), T.Atherholt, J.Bozzelli, F.Darack, R.Fisher, A.Greenberg, R.Harkov, B.Kebbekus, T.J.Kneip, J.Louis, G.McGarrity, L.McGeorge, N.M.Reiss.

J. Air Pollut. Control Assoc. (USA), vol.33, no.7, p.649-57 (July 1983).

An overview of the purpose, design, and results of the summer 1981 and winter 1982 ATEOS studies is presented. The purpose of the study is to characterize the atmospheric environment at selected population centers in New Jersey, with a special emphasis on airborne species that may pose a human health hazard. The author discusses the seasonal variability in the concentrations, the relative composition of the aerosol at these sites, and the relationships to the sources of the measured airborne pollutants. (26 refs.)

115710 Regional air quality in the Four Corners study region.

D.H.Nochumson (Los Alamos Nat. Lab., Los Alamos, NM, USA).

J. Air Pollut. Control Assoc. (USA), vol.33, no.7, p.670-7 (July 1983).

The results from the regional air quality analysis for the Four Corners Study are discussed. This study was one of five regional studies conducted for the National Commission on Air Quality. Potential regional air quality impacts are evaluated through the year 1995 for alternative energy scenarios under current and alternative regulatory policies. The alternative regulatory policies include emission fees, technology standards, emission ceilings, and prevention of significant deterioration class elimination. The alternatives are compared in terms of their impacts on regional visibility and on the ambient concentrations of SO_2 , SO_4 , and primary fine particulates. The fate of the pollutants is estimated. (19 refs.)

115711 Airborne detection of acidic sulfate aerosol using an ATR impactor. S.A.Johnson, R.Kumar, P.T.Cunningham (Chem. Technol. Div., Argonne Nat. Lab., Argonne, IL, USA).

Aerosol Sci. & Technol. (USA), vol.2, no.3, p.401-5 (1983).

As a first step in determining how aerosol acidity varies with altitude, studies were conducted using a new instrument called an ATR impactor installed aboard the Battelle Pacific Northwest Laboratory's DC-3 aircraft. This instrument combines collection of the aerosol by inertial impaction with infrared spectroscopic analysis by the highly sensitive ATR technique. Results from several series of flights have revealed the occurrence of acidic sulfate aloft, while simultaneously collected ground-level samples contained only neutral ammonium sulfate. Acidic sulfate was detected in aerosol samples collected on four of the five flights conducted in the Chicago area during the spring of 1981. (11 refs.)

115712 Organic and elemental composition of airborne particulate matter in Beijing, spring 1981. J.M.Daisey, T.J.Kneip (New York Univ. Medical Center, Inst. of Environmental Medicine, New York, NY, USA), Wang Ming-xing, Ren Li-xin, Lu Wei-xiu.

Aerosol Sci. & Technol. (USA), vol.2, no.3, p.407-15 (1983).

Selected samples of total suspended particulate matter (TSP) collected in Beijing, China, in March and April 1981 were analyzed for trace elements, extractable particulate organic matter (POM), polycyclic aromatic hydrocarbons, alkylating agents and sulfate. Both the concentration and composition of these aerosol species differed substantially from that of New York City. Concentrations of TSP, Fe, Mn, SO_4^{2-} , POM, alkylating agents, and PAH ranged from a factor of 2 to an order of magnitude higher than those typically seen in New York City and other eastern US cities. Concentrations of benzol(a)pyrene ranged from 2.2 to 31 ng/m³, as compared to the 1980-1981 wintertime average of 0.5 ng/m³ for New York City. Sulfate and organics together constituted only about 13% of the total aerosol mass in Beijing in contrast to the 25%-35% seen in New York City. The greatest proportion of TSP in Beijing appears to originate from windblown dust and coal fly ash, as evidenced by the concentrations of Mn and Fe which were observed. Coal burning for space heating may contribute as much as 200-400 $\mu\text{g}/\text{m}^3$ of the TSP. (18 refs.)

115713 Negative ions—their effect on air pollution. T.S.Ganesh (Digitronics, Bangalore, India).

J. Electrochem. Soc. India, vol.32, no.1, p.105-6 (Jan. 1983). [received: Sept. 1983]

The role of positive and negative ions in the environment is discussed. The use of negative ions as a means of reducing air pollution is recommended. (6 refs.)

86.70L Measurement techniques in environmental science

- 115714** Optical remote monitoring of CH₄ gas using low-loss optical fiber link and InGaAsP light-emitting diode in 1.33- μ m region. K.Chan, H.Ito, H.Inaba (Res. Inst. of Electrical Communication, Tohoku Univ., Sendai, Japan). *Appl. Phys. Lett. (USA)*, vol.43, no.7, p.634-6 (1 Oct. 1983). Purely optical remote monitoring of low-level CH₄ gas is realized for the first time by the method employing a 2-km long-distance, low-loss silica optical fiber link and a compact absorption cell in conjunction with a high radiant InGaAsP light-emitting diode (LED) at 1.33 μ m. Based on the present experiment, the detection limit of CH₄ in air was confirmed to be approximately 2000 ppm, i.e. 4% of the lower explosion limit of CH₄. This result supports the conclusion that the fully optical remote sensing system incorporating ultralow loss optical fiber networks and near infrared LEDs or laser diodes can be extensively used for the detection and surveillance of various inflammable and/or explosive gases in industrial and mining complexes as well as in residential areas. (12 refs.)

Report KFKI-1983-44, Hungarian Acad. Sci., Budapest (1983), 42 pp. In Hungarian. The methods of in situ determination of the environmental dose rate by Ge(Li) spectrometry are discussed. The author reports on the calibration of the Ge(Li) spectrometer available for in situ measurement. The measurements and calculations on the energy and direction dependence of the sensitivity of the given detector are discussed. On the basis of this study the radioactive concentrations of the natural and manmade radionuclides in the soil and the resulted dose rates can be determined by the calibrated measuring system belong to the Paks Nuclear Power Station. (11 refs.)
- 115716** Measurement of the time variational behaviours of aerosols based on size distribution. Y.Matsuo (Faculty of Sci. & Technol., Keio Univ., Tokyo, Japan). Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.377-86 vol.2. Presents a new measurement method of time variational processes of environmental aerosols on the basis of bimodal size distribution model. Collected samples were also analyzed by proton induced X-ray emission analysis (abbreviated: PIXE) for twelve elements. The following field experimental results have been obtained: there exist great differences in behaviour between coarse-sized particles and fine ones bordered at 2 μ m in diameter even in hourly short time duration; fine particles are closely related to the behaviours of gaseous air pollutants; and some fine-sized trace elements have traceability of the combustion sources under the head wind condition. (10 refs.)
- 115717** Flame ionisation detector for analyzing the concentration of total hydrocarbons in automobile exhaust gases. A.Kroncisen, J.Staab (Hartmann und Braun AG, Frankfurt/Main, Germany). Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.395-404 vol.2. Flame ionisation detectors (FID) are sensitive to carbon in hydrocarbons (HC). FID whose essential elements are standardizable and which ensures the reduction of the uncertainties of the HC-measurements to approximately $\pm 2\%$ for measurement of the total hydrocarbons in automobile exhaust is proposed. - 115718** An examination of the environmental half-time for radionuclides deposited on vegetation. C.W.Miller, F.O.Hoffman (Health & Safety Res. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA). *Health Phys. (GB)*, vol.45, no.3, p.731-44 (Sept. 1983). After radionuclides are deposited on vegetation, environmental removal processes combine with radioactive decay to reduce the quantity of initial contamination. The time in which one-half of the radioactivity is removed from vegetation by environmental processes alone is referred to as the environmental half-time, T_w . For long-lived radionuclides, the dose to man via ingestion of contaminated terrestrial foods may be directly influenced by values of T_w , provided that environmental removal processes dominate root uptake and time is sufficiently long between initial exposure of vegetation and harvest. Values of T_w reported in the literature for various radionuclides and methods of deposition are examined. Factors affecting the variability of T_w are related in part of the physicochemical form of the depositing substance, vegetation type and growth form, climate, season, and experimental procedure. For growing vegetation, values of T_w are generally lower than those reported for dormant vegetation. (53 refs.)

- 115721** Thermodynamics of evolution. I. Thermodynamics of dissipative structures. G.Bourceanu, G.Maftei, S.Chirita (Inst. Politehnic, Iasi, Rumania). *Stud. & Cercet. Fiz. (Rumania)*, vol.35, no.8, p.690-714 (1983). In Rumanian. The series of papers about 'Thermodynamics of Evolution' are intended to present the whole theory of the Brussels School, founded by Professor Prigogine on the evolution of prebiotic systems. The first paper 'Thermodynamics of dissipative structures' examines entropy production into open systems, the theorem of minimum entropy production and the stability criterion of nonequilibrium steady states. In the second part of this paper, examples of dissipative structures from hydrodynamics, optics, chemistry and biology are discussed. Finally, evidence is produced to prove that dissipative structures are a general phenomenon in nature. (30 refs.)
- 115722** Thermodynamics of evolution. II. Chemical and biological oscillations and instabilities. G.Maftei, G.Bourceanu, S.Chirita (Inst. Politehnic, Iasi, Rumania), V.Felea. *Stud. & Cercet. Fiz. (Rumania)*, vol.35, no.8, p.715-43 (1983). In Rumanian. For pt.I see ibid., vol.35, no.8, p.690 (1983). Analyses the chemical oscillations and instabilities by means of nonlinear thermodynamics and the theory of differential nonlinear equations by studying the stability of the steady state solutions. In the second part, the paper analyses the conservative oscillations of Lotka-Volterra type and a set of chemical reactions studied experimentally by Belousov and Zhabotinskii, which admit oscillations of limit cycle type. In the last part a set of reactions has been analysed, suggested by the authors, which includes selfcatalytic and cross-catalytic reactions. Since the reactions are produced between molecular species with selfcatalytic properties (of replication), a fidelity factor, ϵ , was introduced, $\epsilon \in (0,1)$. (37 refs.)

87.15 MOLECULAR BIOPHYSICS

(see also 36.20 Macromolecules and polymer molecules)

115723 Study of the parameters of the fluorescent spectra of probes in model conditions [biomembrane application]. V.M.Boitsov (Min. of Health, Moscow, USSR).

Biophysics (GB), vol.27, no.5, p.824-9 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.786-90 (1982). [received: Sept. 1983]

An expression is given for describing the fluorescence spectra of 1-anilino-naphthalene-8-sulphonate and N-phenyl-1-naphthylamine in solvents of different polarity and viscosity which allows one to isolate the homogeneous and inhomogeneous components of the spectra. It is shown that the position of the centre of inhomogeneous widening characterizes better the hydrophobicity of the surroundings than the position of the maximum of the spectrum. A link has been established between the parameters of inhomogeneous widening and the viscosity of the solvent. (10 refs.)

115724 Analysis of the thermodynamic characteristics of the interaction of high potential cytochrome with a bacteriochlorophyll dimer at the reaction centres of the chromatophores of *Ectothiorhodospira shaposhnikovii*. V.P.Shinkarev, A.A.Kononenko, A.B.Rubin (Biology Faculty, Lomonosov State Univ., Moscow, USSR).

Biophysics (GB), vol.27, no.5, p.872-6 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.832-6 (1982). [received: Sept. 1983]

Analyses the kinetics of the dark reduction of cytochrome c_H ($E_7 = 290$ mV) after its photo-induced oxidation in the chromatophores of *E. shaposhnikovii* at 110-210K. A relation is derived describing the process of dark reduction of the cytochrome and allowing one to determine the value of the free energy of electron transport between the cytochrome and the dimer of bacteriochlorophyll of the reaction centre (BChl)₂. Change in the free energy obtained by linear extrapolation to room temperature agrees with the value determined from the results of direct potentiometric titration of the photo-induced redox conversions of c_H and (BChl)₂. (11 refs.)

115725 Lanthanide ions as fluorescent probes for the nucleotides. G.W.Mushrush, G.Yonuschot (Dept. of Chem., George Mason Univ., Fairfax, VA, USA).

J. Lumin. (Netherlands), vol.28, no.3, p.233-9 (Aug. 1983).

The lanthanide ions reacted with the nucleotides to form a complex in which the lanthanides served as sensitive fluorescent probes. By selectively exciting the nucleotide, the quantum efficiency of narrow-line lanthanide ion fluorescence can be calculated. Quantum efficiency values of 0.19 to 0.01 and 0.14 to 0.01 were obtained for Tb³⁺ and Eu³⁺ respectively. For Dy³⁺ and Sm³⁺ the values were too low to measure accurately for most nucleotides. The binding of the lanthanides to the nucleotides can be reversed by prolonged dialysis against cheating agents. Between pH 3 and pH 7 the complex precipitates and approaches a maximum of lanthanide ion fluorescence at pH 5.5. (9 refs.)

115726 Role of the central metal ion and solvent-ligand molecules in the association of metallophosphorylins in binary mixtures of solvents. E.I.Zen'kevich, M.V.Sarzhhevskaya, T.V.Vitovtseva.

J. Appl. Spectrosc. (USA), vol.37, no.5, p.1301-5 (Nov. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.5, p.818-23 (Nov. 1982). [received: Sept. 1983]

The purpose of the authors' work was a spectral-fluorescence investigation of the principles of formation of stable long-wave associates of metallophosphorylins, possessing various active side substituents, in binary solutions when the center of the pigment molecule is substituted by ions of various metals, as well as when the donor-acceptor properties of the solvent-ligand molecules are varied. Of the metalloderivatives, the following were studied: Zn, Mg, Cd, Cu, and Pd-phosphorylins *a* and *b*, chlorin *e*₆, and rhodin *g*₇. (9 refs.)

115727 Computer simulation of the dynamics of hydrated protein crystals and its comparison with X-ray data. W.F.van Gunsteren, H.J.C.Berendsen (Dept. of Chem., Univ. of Groningen, Groningen, Netherlands), J.Hermans, W.G.J.Hol, J.P.M.Postma.

Proc. Natl. Acad. Sci. USA, vol.80, no.14, p.4315-19 (July 1983).

The structure and dynamics of the full unit cell of a protein (bovine pancreatic trypsin inhibitor) containing 4 protein molecules and 560 water molecules have been simulated by using the molecular dynamics method. The obtained structure, atom positional fluctuations, and structure factors are compared with X-ray values. A way of calculating the motional contributions to structure factors is proposed. (35 refs.)

115728 New view of lipid bilayer dynamics from ²H and ¹³C NMR relaxation time measurements. M.F.Brown, A.A.Ribeiro, G.D.Williams (Dept. of Chem., Univ. of Virginia, Charlottesville, VA, USA).

Proc. Natl. Acad. Sci. USA, vol.80, no.14, p.4325-9 (July 1983).

Natural abundance ¹³C spin-lattice (*T*₁) relaxation time measurements are reported for unilamellar vesicles of 1,2-dipalmitoylphosphatidylcholine in the liquid crystalline phase, at various magnetic field strengths. The results are compared to previous ²H *T*₁ studies of multilamellar dispersions. For both the ¹³C and ²H *T*₁ studies, a dramatic frequency dependence of the relaxation was observed. At superconducting magnetic field strengths (4.23-11.7 tesla), plots of the ¹³C *T*₁⁻¹ relaxation rates as a function of acyl chain segment position clearly reveal the characteristic 'plateau' signature of the liquid crystalline phase, as found previously from ²H NMR studies. The dependence of *T*₁⁻¹ on ordering, determined previously from ²H NMR, and the *T*₁⁻¹ dependence on frequency, determined from both ¹³C and ²H NMR studies, suggest that a unified picture of the bilayer molecular dynamics can be provided by a simple relaxation law of the form *T*₁⁻¹ ≈ *Aτ*₁ + *BSC*_H⁻² ω₀^{-1/2}. In the above expression, *A* and *B* are constants, *SC*_H (= *S*_{C-D}) is the bond segmental order parameter, and ω₀ is the nuclear Larmor frequency. (41 refs.)

115729 Surface physics and biological phenomena. I.Lundstrom (Dept. of Phys. & Measurement Technol., Linköping Univ., Linköping, Sweden).

Phys. Scr. (Sweden), vol.T4, p.5-13 (1983). (Nordic Conference on Surface Science, Tampere, Finland, 18-20 Aug. 1982).

Connections between surface physics and biology are discussed. Special attention is paid to protein adsorption on solid surfaces, with relevance to biocompatibility and surface oriented diagnostic methods. Simple models for denaturation of proteins and interaction between antigens and antibodies on surfaces are developed. Some surface oriented biological phenomena are described. It is suggested that electrostatic interaction may be a general cause of changes in the physical properties of excitable membranes. The paper is phenomenological and leaves out a thorough discussion of the use of surface analytical tools on biological phenomena. (33 refs.)

115730 Computer representation of molecular surfaces. N.L.Max (Lawrence Livermore Nat. Lab., Livermore, CA, USA).

IEEE Comput. Graphics & Appl. (USA), vol.3, no.5, p.21-9 (Aug. 1983).

Describes how the recent proliferation of algorithms that produce vector or raster drawings of space-filling models has advanced one's understanding of the 3-D structure of molecules. (26 refs.)

115731 Structure of polylysine-DNA complexes. A.T.Khachatryan, V.A.Ter-Nikogosyan, S.M.Akopyan, M.G.Galustyan, M.A.Novosel (Inst. of Experimental Biology, Acad. of Sci., Erevan, USSR).

Biophysics (GB), vol.27, no.5, p.804-8 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.768-71 (1982). [received: Sept. 1983]

The methods of nuclease digestion and electron microscopy have been used to study the poly-L-lysine+DNA complexes of phage T₂ obtained by direct mixing. On digestion of the complexes by micrococcal nuclease, nuclease-resistant structures were detected containing DNA fragments with a length of ~300, ~600 and ~1200 base pairs. The electron photomicrographs revealed structures outwardly resembling nucleosomes. (6 refs.)

115732 Heterogeneity of the structure of histone dimers (H2A-H2B). S.N.Khrapunov, A.F.Protas, G.D.Berdyshev (Shevchenko State Univ., Kiev, Ukrainian SSR).

Biophysics (GB), vol.27, no.5, p.829-33 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.791-4 (1982). [received: Sept. 1983]

It has been established that at pH 7.4 and 100 mM NaCl only about one-third of the histone dimers (H2A-H2B) is able to bind the fluorescent probe-1-anilino-naphthalene-8-sulphonate. The binding constant is equal to 2.2·10⁴ M⁻¹. The heterogeneity of the structure of the histone dimers (H2A-H2B) may be of great genetic importance and together with other factors may determine the structural changes of the protein core of the nucleosomes and the nucleosome itself. (16 refs.)

115733 Structure of bacteriophage T7. Small-angle X-ray and neutron scattering study. G.Ronto (Inst. of Biophys., Medical Univ., Budapest, Hungary), M.M.Agamalyan, G.M.Drabkin, L.A.Feigin, Y.M.Lvov.

Biophys. J. (USA), vol.43, no.3, p.309-14 (Sept. 1983).

Small-angle X-ray and neutron scattering techniques were applied to bacteriophage T7 solutions at different scattering densities. Scattering curves determined under a variety of experimental conditions were used to derive a set of parameters characterizing the shape, size, and weight of the whole phage particle and of its DNA and protein components. The T7 head has an icosahedral shape with an edge of 37.7±0.5 nm, a volume of (12.0±1.0)×10⁴ nm³, and a small tail amounting to 6-7% of the head volume. The intraphage DNA region is most probably a hollow sphere. The best fit to the data was obtained with a model in which the hollow sphere filled with a protein core with a diameter of 24 nm. The average degree of swelling (i.e. the ratio of the hydrated to the dry volume) of the particle is 2.3; the degree of swelling of the DNA component is higher, 3.2, and that of the protein part is lower, 1.2. (36 refs.)

115734 X-ray structure analysis of thin filaments of a molluscan smooth muscle in the living relaxed state. Y.Tajima, K.Kamiya, T.Seto (Dept. of Phys., Tokyo Metropolitan Univ., Tokyo, Japan).

Biophys. J. (USA), vol.43, no.3, p.335-43 (Sept. 1983).

In the small-angle X-ray diffraction pattern of the living relaxed anterior byssus retractor muscle of *Mytilus edulis*, the thin filaments showed the following features. The 59.8-Å reflection was much stronger and a little farther from the meridian than the 51.9-Å reflection, although they are both contributions of the first-order Bessel function and are comparable with each other in the height from the equator. The 381-Å reflection, given by the second-order Bessel function, was weaker than the 59.8-Å reflection by more than the difference between the peak values of the first- and second-order Bessel functions, and was not so distant radially from the latter as estimated from the amount of peak shift brought about by the alteration of the Bessel order. A model of the thin filament was made on the basis of inverse Fourier transformation of the scattering amplitude, and the above features were explained by the characteristic shape of actin shown in this model. The actin subunits are elongated along the genetic left-hand helix with a pitch of 59.8 Å, and are bonded together along the genetic helix in the inner part of the filament. (29 refs.)

115735 The theory and practice of distance geometry. T.F.Havel (Group in Biophys., Univ. of California, Berkeley, CA, USA), I.D.Kuntz, G.M.Crippen.

Bull. Math. Biol. (GB), vol.45, no.5, p.665-720 (1983).

The mathematics of distance geometry constitutes the basis of a group of algorithms for revealing the structural consequences of diverse forms of information about a macromolecule's conformation. These algorithms are of proven utility in the analysis of experimental conformational data. This paper presents the basic theorems of distance geometry in Euclidean space and gives formal proofs of the correctness and, where possible, of the complexity of these algorithms. The implications of distance geometry for the energy minimization of macromolecules are also discussed. (46 refs.)

115736 Energetic approach to the packing of α-helices. I. Equivalent helices. K.-C.Chou, G.Nemethy, H.A.Scheraga (Baker Lab. of Chem., Cornell Univ., Ithaca, NY, USA).

J. Phys. Chem. (USA), vol.87, no.15, p.2869-81 (21 July 1983).

A mathematical framework has been developed for generating interacting α-helices and for calculating and minimizing the interaction energy between α-helices. Computations were carried out on a system of two equivalent right-handed α-helices, each having the structure CH₃CO-(L-Ala)₁₀-NHCH₃. Ten low-energy packing arrangements were found. The three lowest-energy arrangements, occurring within an energy interval of 1.8 kcal/mol, are nearly antiparallel with orientational torsion angles of -154, 170, and 146°, in order of increasing energy. The other seven arrangements, with energies of 3.3-5.3 kcal/mol above that of the most stable structure, have a variety of orientational torsion angles. The major contribution to the intermolecular energy arises from nonbonded interactions, with a minor contribution from the electrostatic interactions. The latter tend to favor an antiparallel arrangement of two α-helices that are located side by side. This is one of the reasons why the packing with an orientational torsion angle of -154° has the lowest energy among the computed packings. This packing arrangement is observed frequently in globular proteins. In all minimum-energy structures, the two helices are closely packed, with the side-chain CH₃ groups of one helix inter-

calated between those of the other helix. This is indicated by the small distance of closest approach (6.7-7.7 Å) of the helix axes. This distance is about 4 Å less than twice the distance of the van der Waals surface of the methyl groups from the helix axis. While most of the computed packing arrangements are similar to some packings derived in other studies on the basis of geometrical considerations of packing, the latter by itself cannot determine the order of stability of the various arrangements. Some geometrically feasible packing arrangements are of high energy; on the other hand, some low-energy arrangements could not be found from geometrical considerations alone. These results show the importance of energy calculations for studying packing. (25 refs.)

115737 Interior turns in globular proteins. G.D.Rose, W.B.Young (Dept. of Biological Chem., Pennsylvania State Univ., Hershey, PA, USA), L.M.Gierasch.

Nature (GB), vol.304, no.5927, p.654-7 (18 Aug. 1983).

Reverse turns are specific sites in proteins at which the polypeptide chain changes its overall direction. This category of secondary structure enables the chain to turn a corner, and its frequent occurrence is the geometric basis for the ultimate globular shape of the protein. The authors have searched proteins of known structure and find that, on occasion, a turn may be buried within the hydrophobic interior of the molecule. In every instance of a buried turn, one or more solvent molecules were also found in a hydrogen-bonded complex with main-chain atoms of the turn residues. These bound water molecules appear to function as an integral part of the protein structure. (29 refs.)

115738 Maximum-entropy calculation of the electron density at 4 Å resolution of Pfl filamentous bacteriophage. R.K.Bryan, M.Bansal, W.Folkhard, C.Nave, D.A.Marvin (European Molecular Biology Lab., Heidelberg, Germany).

Proc. Natl. Acad. Sci. USA, vol.80, no.15, p.4728-31 (Aug. 1983).

A 4 Å electron-density map of Pfl filamentous bacterial virus has been calculated from X-ray fiber diffraction data by using the maximum-entropy method. This method produces a map that is free of features due to noise in the data and enables incomplete isomorphous-derivative phase information to be supplemented by information about the nature of the solution. The map shows gently curved (banana-shaped) rods of density about 70 Å long, oriented roughly parallel to the virion axis but slewing by about 1/6th turn while running from a radius of 28 Å to one of 13 Å. Within these rods, there is a helical periodicity with a pitch of 5 to 6 Å. The authors interpret these rods to be the helical subunits of the virion. The position of strongly diffracted intensity on the X-ray fiber pattern shows that the basic helix of the virion is right handed and that neighboring nearly parallel protein helices cross one another in an unusual negative sense. (36 refs.)

115739 Spectroscopic and structural properties of metallo-proteins. M.Bacci (Istituto di Ricerca sulle Onde Elettromagnetiche, CNR, Firenze, Italy).

Riv. Nuovo Cimento (Italy), vol.5, ser.3, no.12, p.1-45 (1982). [received: Sept. 1983]

The author outlines the electronic structures of some biologically significant metal ions in several limit geometries and the resulting spectroscopic behaviour with emphasis to electronic absorption, electron spin resonance (ESR), magnetic circular dichroism (MCD), Mossbauer spectra and magnetic susceptibility. The role of the vibronic coupling and tunnelling in biological systems is considered and a critical survey of the so far reported experimental results and theoretical interpretations is given. (202 refs.)

115740 Crystallization and preliminary X-ray investigation of *Micrococcus sp.* decarboxylase. G.N.Tishchenko, I.P.Kuranova, N.V.Konareva, N.A.Gonchar, I.I.Votrin, B.K.Vainshtein (Inst. of Crystallography, Acad. of Sci., USSR).

Sov. Phys.-Crystallogr. (USA), vol.28, no.2, p.179-81 (March-April 1983). Translation of: *Kristallografiya (USSR)*, vol.28, no.2, p.306-9 (March-April 1983). [received: Sept. 1983]

By isothermal distillation of the solvent vapor and ultracentrifugation the authors have obtained crystals of histidinedecarboxylase (HDC) from *Micrococcus sp. n.*, suitable for X-ray diffraction, in the form of short hexagonal prisms measuring 0.5×0.5×0.3 mm. X-ray diffraction revealed two crystalline modifications—hexagonal and rhombohedral, representing two-layer and three-layer packing of molecular trimers. The shape and size of the trimers and the individual protein molecules are determined. The trimer is an oblate ellipsoid of revolution with semiaxes of 53.75 and 44.2 Å and axial ratios of 1:1.082; the monomer is a prolate ellipsoid of revolution with semiaxes of 50.0 and 78.8 Å and axial ratios of 1:1.16. 115741 Absence of the effect of a magnetic field on the dissolving of oxygen in aqueous solutions. T.V.Ushakova, V.A.Livshits, A.N.Kuznetsov (Res. Inst. for Biological Testing of Chem. Compounds, Kupavna, USSR).

Biophysics (GB), vol.27, no.5, p.793-7 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.757-61 (1982). [received: Sept. 1983]

To verify a number of experimental studies the authors have examined the effect of a permanent magnetic field on the solubility and rate of dissolving oxygen in water and 0.1 N NaCl solution. It is shown that the solubility and rate of dissolving of oxygen in water and in aqueous solution of an electrolyte in these systems do not change in magnetic fields of the order 0.1 T, which fully matches theoretical notions and makes it impossible to regard the direct influence of the magnetic field on the molecules of paramagnetic oxygen as one of the possible mechanisms of action of a magnetic field on biological systems. (10 refs.)

115742 Magnetic proton relaxation of aqueous solutions of ribonuclease in the temperature region of intramolecular fusion. Yu.G.Sharimanov, R.Grosescu, G.M.Mrevlishvili (Inst. of Phys., Tbilisi, USSR).

Biophysics (GB), vol.27, no.5, p.809-13 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.772-5 (1982). [received: Sept. 1983]

The thermal denaturing of ribonuclease at n.m.r. frequencies 22, 75 and 90 MHz has been studied by the method of proton magnetic relaxation. It has been established that the character of proton relaxation in solutions of denatured macromolecules is determined by the slow exchange $\tau_M \sim 10^{-2}-10^{-3}$ sec with the molecules of 'rigidly bound' water and the solvent as a whole. (10 refs.)

115743 Photophysical processes in the molecules of retinoids related to visual chromophores. S.L.Bondarev, M.V.Bel'kov, K.I.Salokhiddinov, P.N.Dyl'ko (Inst. of Phys., Acad. of Sci., Minsk, Belorussian SSR).

Biophysics (GB), vol.27, no.5, p.813-17 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.776-9 (1982). [received: Sept. 1983]

Methods of luminescence, pulse fluorimetry and laser photolysis have shown that at 293K in the molecules of retinoids related to the visual chromophores, retinals, the bulk (≥ 90 per cent) of the excitation energy is deactivated by the non-photophysical route. As intermediate state through which the excitation energy is degraded the authors postulate the A_2^* state. With fall in the temperature of the solution from 293 to 85K the quantum yield of fluorescence of the retinoids increases 10-500 times. The $(\pi\pi^*)$ state takes part in the photophysical processes of retinal in 'dry' non-polar solvents. (17 refs.)

115744 Picosecond kinetic absorption and fluorescence studies of bovine rhodopsin with a fixed 11-ene. J.Buchert, V.Stefancic, A.G.Doukas, R.R.Alfano, R.H.Callender, J.Pande (Phys. Dept., City Coll., City Univ. of New York, New York, NY, USA), H.Akita, V.Balogh-Nair, K.Nakanishi.

Biophys. J. (USA), vol.43, no.3, p.279-83 (Sept. 1983).

A synthetic retinal having a fixed 11-cis geometry has been used to prepare a nonbleachable analogue of bovine rhodopsin. Marked differences in the picosecond absorption and fluorescence behavior of this analogue at room temperature, compared with that of natural rhodopsin, were observed. This not only indicates that the 11-cis to trans isomerization of the retinal moiety is the crucial primary event in the photolysis of rhodopsin, but also it establishes that this isomerization must occur on the picosecond time scale or faster. (18 refs.)

115745 Neutron diffraction analysis of cytochrome b_5 reconstituted in deuterated lipid multilayers. E.P.Gogol, D.M.Engelman (Dept. of Molecular Biophys. & Biochem., Yale Univ., New Haven, CT, USA), G.Zaccari.

Biophys. J. (USA), vol.43, no.3, p.285-92 (Sept. 1983).

Cytochrome b_5 was reconstituted with a highly deuterated phospholipid to form ordered multilayers consisting of repeated centrosymmetric pairs of asymmetric lipid-protein bilayers. Lamellar neutron diffraction data were collected to ~ 29 Å resolution, and have been interpreted using models for the interaction of the membrane-binding domain of cytochrome b_5 with the lipid bilayer. A range of different models was examined, and those in which the protein penetrates well into the bilayer, possibly spanning it, are favored. (41 refs.)

115746 Quenching-resolved emission anisotropy studies with single and multiptryptophan-containing proteins. M.Eftink (Dept. of Chem., Univ. of Mississippi, University, MS, USA).

Biophys. J. (USA), vol.43, no.3, p.323-34 (Sept. 1983).

Measurements of the anisotropy of protein fluorescence as a function of an added collisional quencher, such as acrylamide, are used to construct Perrin plots. For single tryptophan containing proteins, such plots yield an apparent rotational correlation time for the depolarization process, which, in most cases, is approximately the value expected for Brownian rotation of the entire protein. Apparent limiting fluorescence anisotropy values, which range from 0.20 to 0.32 for the proteins studied, are also obtained from the Perrin plots. The lower values for the limiting anisotropy found for some proteins are interpreted as indicating the existence of relatively rapid, limited (within a cone of angle $0^\circ-30^\circ$) motion of the tryptophan side chains that is independent of the overall rotation of the protein. Examples of the use of this fluorescence technique to study protein conformational changes are presented. Because multiptryptophan-containing proteins have certain tryptophans that are accessible to solute quencher and others that are inaccessible, this method can be used to determine the steady state anisotropy of each class of tryptophan residues. (57 refs.)

115747 Photon and fluorescence correlation spectroscopy and light scattering of eye-lens proteins at moderate concentrations. C.Andries, W.Guedens, J.Clauwaert (Dept. of Cell Biology, Univ. Instelling Antwerpen, Wilrijk, Belgium), H.Geerts.

Biophys. J. (USA), vol.43, no.3, p.345-54 (Sept. 1983).

The bovine eye-lens protein, α_1 -crystallin, has been studied with photon correlation spectroscopy to obtain the mutual diffusion coefficient, D_m , with fluorescence correlation spectroscopy to determine the tracer diffusion coefficient, D_T , and with light scattering to get the isothermal osmotic compressibility $(\delta\pi/\delta c)_{P,T}$. The concentration dependence of D_m , D_T , and $(\delta\pi/\delta c)_{P,T}$ up to a volume fraction ϕ of the protein of 2.5×10^{-2} has been interpreted on the basis of four different interaction potentials: (a) an extended hard-sphere potential; (b) a shielded Coulomb potential; (c) a shielded Coulomb interaction where the effect of counterions is included; (d) a simple mixed potential. The three parameters D_m , D_T , and $(\delta\pi/\delta c)_{P,T}$ have also been combined in the generalized Stokes-Einstein equation, $D_m = [(\delta\pi/\delta c)_{P,T} \cdot (1-\phi) \cdot (D_T)] / (k_B \cdot T)$. The results indicate that, in the case that photon correlation spectroscopy gives the mutual diffusion coefficient D_m , the applicability of the Stokes-Einstein equation can be questioned; or that, when one assumes the Stokes-Einstein equation to be valid, there is significant discrepancy between the result of photon correlation spectroscopy and D_m . (52 refs.)

115748 Fluorescent tandem phycobiliprotein conjugates. Emission wavelength shifting by energy transfer. A.N.Glazer, L.Stryer (Dept. of Microbiology & Immunology, Univ. of California, Berkeley, CA, USA).

Biophys. J. (USA), vol.43, no.3, p.383-6 (Sept. 1983).

A fluorescent tandem phycobiliprotein conjugate with a large Stokes shift was prepared by the covalent attachment of phycoerythrin to allophycocyanin. The efficiency of energy transfer from phycoerythrin to allophycocyanin in this disulfide-linked conjugate was 90%. A distinctive feature of this phycoerythrin-allophycocyanin conjugate is the wide separation between the intense absorption maximum of phycoerythrin ($\epsilon = 2.4 \times 10^6 \text{ cm}^{-1} \text{ M}^{-1}$ at 545 nm) and the fluorescence emission maximum of allophycocyanin (660 nm). Energy transfer from a donor to a covalently attached acceptor can be used to adjust the magnitude of the Stokes shift. Tandem phycobiliprotein conjugates can be used to advantage in fluorescence-activated cell sorting, fluorescence microscopy, and fluorescence immunoassay analyses. (9 refs.)

115749 Raman spectral studies of bleomycin A_2 and related structural fragments: a probe for bleomycin-DNA interactions. T.B.Freedman, F.S.Santillo, C.G.Zimba, L.A.Nafie, J.C.Dabrowiak (Dept. of Chem., Syracuse Univ., Syracuse, New York, USA).

J. Raman Spectrosc. (GB), vol.14, no.4, p.266-70 (Aug. 1983).

Raman spectra have been obtained for bleomycin A_2 and selected fragments. Virtually all of the features in the bleomycin Raman spectrum can be attributed to the preresonance enhanced vibrational transitions of the 2,4'-bithiazole moiety as determined by comparison to the Raman spectra of bithiazole fragments. The Raman spectrum of bleomycin is dominated by a very intense band at 1542 cm^{-1} that can be approximately assigned as a bithiazole ring stretching mode. This feature may serve as a probe of bithiazole environment in bleomycin-DNA interactions. (26 refs.)

115750 Pulsed laser induced vibrational resonance Raman scattering of chlorophyll *a* dimers. A.de Wilton, L.V.Haley, J.A.Koningstein (Dept. of Chem., Carleton Univ., Ottawa, Ontario, Canada).

J. Raman Spectrosc. (GB), vol.14, no.4, p.288-90 (Aug. 1983). The pulsed laser induced Raman spectrum of dry chlorophyll *a* (Chl *a*) in hexane is reported. This sample is excited with a wavelength which is in resonance with an absorption band of the Chl *a* dimer at 432 nm. The observed resonance Raman excitation profile for several Raman bands shows that two electronic origins of the dimer are located at 434.1 and 435.4 nm and these are assigned to a pair of pseudo exciton levels. Features of this excitation profile are used to discuss the observed Raman spectra. (6 refs.)

115751 NMR study of slowly exchanging imino protons in yeast tRNA^{Asp}. N.Figueroa (Groupe de Biophys., Ecole Polytech., Palaiseau, France), G.Keith, J.-L.Leroy, P.Plateau, S.Roy, M.Gueron.

Proc. Natl. Acad. Sci. USA, vol.80, no.14, p.4330-3 (July 1983). The authors have monitored the exchange of imino and amino protons by NMR after quick transfer of yeast tRNA^{Asp} in ²H₂O solvent. When the concentration of exchange-catalyzing buffer is not too high, one imino proton exchanges considerably more slowly than any other (e.g., 100 hr versus 4 hr for the second-slowest imino proton at 18°C in 15 mM Mg). This provides excellent conditions for identification, by the nuclear Overhauser effect, of the slowest exchanging proton, which the authors show to be the imino proton of the U-8-A-14 reverse Hoogsteen tertiary-structure base pair; other slowly exchanging protons are identified as imino protons from A-U-11 and G-Ψ-13. In preliminary experiments, the authors find that the exchange of these protons is catalyzed by cacodylate or Tris buffer. The lifetimes of two other imino protons, ca. 10 min at 28°C, are buffer independent. Slowly exchanging amino protons have also been observed. Correlation with the exchange of the uracil-8 imino proton suggests that they may be from adenine-14. (21 refs.)

115752 Carbon-13 nuclear magnetic resonance spectroscopy of some biologically active imidazoles. A.A.Al-Badr (Dept. of Pharmaceutical Chem., King Saud Univ., Riyadh, Saudi Arabia).

Spectrosc. Lett. (USA), vol.16, no.8, p.613-19 (1983). Carbon-13 NMR Spectral studies of imidazole and several of its derivatives have been undertaken, using chemical shift relationship, signal multiplicity and chemical shift additivity principles. The effect of the substitution, at all positions, on the chemical shift of the imidazole carbons is discussed. (8 refs.)

115753 Light induced anisotropy of bacteriorhodopsin. N.M.Burykin, N.N.Vsevolodov, T.V.Dyukova, E.Ya.Korchemskaia, M.S.Soskin, V.B.Taranenko.

Ukr. Fiz. Zh. (USSR), vol.28, no.8, p.1269-70 (Aug. 1983). In Russian. Investigates refraction induced by linearly polarised He-Ne laser radiation in 'Biochrome' films. Biochrome films are bacteriorhodopsin in a polymer matrix. The bacteriorhodopsin was obtained from purple membranes of Halobacterium halobium. (5 refs.) V.G.P.

87.16 BIOTHERMICS

115754 Radiosensitizing and cytotoxic effects of hyperthermia on various biological systems. Radiosensitizing and cytotoxic effect of hyperthermia on mouse leukemia La cells. L.V.Shtein, A.G.Konoplyannikov (Sci. Res. Inst. of Medical Radiology, Acad. of Medical Sci., Obninsk, USSR).

Radiobiologiya (USSR), vol.23, no.4, p.489-92 (1983). In Russian. When mouse leukemia cell suspensions were subjected to heating the survival rate of animals decreased exponentially with increasing time of heating. It is shown that an increase of temperature of 1°C in the range 40-45°C is equivalent to a decrease in the heating time by a factor of ~2. The hyperthermia-induced increase in the radiosensitivity of leukemia cells was dependent upon the medium in which the heating was performed. (17 refs.)

115755 The effect of elevated temperature on the vasculature of mouse jejunum. P.Falk (Medical Res. Council Cyclotron Unit, Hammersmith Hospital, London, England).

Br. J. Radiol. (GB), vol.56, no.661, p.41-9 (Jan. 1983). [received: Sept. 1983]. Both local and lower-body heating were employed, using a hot water bath; heating time was kept constant at 1 hour, bath temperatures ranging from 40.0°C to 43.0°C. Animals were sacrificed after heating, the erythrocytes were stained with benzidine and H₂O₂ and the blood vessels revealed by mounting in a clearing resin. The earliest damage seen was the disappearance of capillaries, followed by loss of progressively larger vessels. Loss is interpreted as destruction, not merely as interruption of blood flow. A gradient of sensitivity occurs from the inner layer of the jejunum to the outer, the threshold heating temperature required to produce vascular damage being lowest at the inside. Neither temperature gradient nor early release of gastric juice from the stomach appear responsible for this differential response. The mean length of intact venous tree was employed as a parameter for assessing the damage. (24 refs.)

115756 Thermal denaturing of collagen in solution and fibrils. G.I.Tsereteli (Phys. Faculty, Zhdanov State Univ., Leningrad, USSR).

Biophysics (GB), vol.27, no.5, p.817-23 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.780-5 (1982). [received: Sept. 1983]. Differential scanning calorimetry using rates of heating in the range 0.3 to 25°C/min has been employed to investigate the thermal denaturing of rat skin collagen in the fibrils and aqueous solutions of different concentrations (0.2-98 per cent). It was found that the thermal effect of denaturing in solutions with a concentration above 10 per cent closely depends on the rate of heating: the thermal effect is greater the higher the rate of heating. On slow heating the enthalpy of denaturing H_d is minimal and depends very little on the rate of heating. In collagen fibrils and also in dilute solution the dependence of H_d on ν_H is not observed. In this case the value of H_d (20±2

cal/g) agrees with the value obtained in concentrated solutions on rapid heating and well agrees with the published findings. It is shown that fall in the value H_d in concentrated solutions with fall in the rate of heating is a manifestation of the exothermal process of post-denaturing aggregation of protein. (11 refs.)

115757 Thermodynamic approach to biomass distribution in ecological systems. D.Lurie, J.Valls, J.Wagensberg (Dept. Termodologia, Univ. de Barcelona, Barcelona, Spain).

Bull. Math. Biol. (GB), vol.45, no.5, p.869-72 (1983). In the derivation of the biomass distribution function for an ecological population critical use is made of an energetic constraint on the maximization of biomass diversity. The nature of this constraint is explored in detail using Kleiber's (1932) relation $\sigma(m) = cm^\gamma$ between animal metabolic rate $\sigma(m)$ and body weight m in conjunction with the Prigogine-Wiame (1946) thermodynamic paradigm for specific entropy production in biological stationary states. These two inputs fix the energetic constraint on the maximization of biomass diversity to be the constancy of the mean metabolic rate of the ecosystem. The resulting biomass distribution function is tested against observational data. (4 refs.)

115758 'Prompt' heat shock proteins: Translationally regulated synthesis of new proteins associated with the nuclear matrix-intermediate filaments as an early response to heat shock. T.Reiter, S.Penman (Dept. of Biology, MIT, Cambridge, MA, USA).

Proc. Natl. Acad. Sci. USA, vol.80, no.15, p.4737-41 (Aug. 1983). The response of mammalian cells, such as HeLa cells, to prolonged exposure to increased temperature (termed heat shock) has been well characterized. In these studies new mRNA is synthesized for several proteins whose translation is best seen after a return to 37°C. The authors show here another response to increased temperature of a distinctively different character. A set of at least 50 newly detectable proteins, exclusively associated with the nuclear matrix-intermediate filament (NM-IF) fraction, is synthesized immediately upon exposure to high temperature. These are of very low abundance or nonexistent in the unstressed cell and none appear to correspond to the 'classic' heat shock proteins produced after new transcription. Prior treatment with actinomycin D has little effect on these 'prompt' proteins, and they appear to be made from preexisting mRNAs that are activated at the increased temperature. The protein synthesis in the soluble, cytoskeletal, and chromatin fractions is strongly reduced by the increased temperature, while the labeling of the prompt proteins associated with NM-IF complex rapidly rises severalfold above that in control cells. Additionally these results suggest that the four cell fractions are not arbitrary cell divisions; rather they represent physiologically significant compartments in the cell. (28 refs.)

87.20 MEMBRANE BIOPHYSICS

115759 Conductivity of bilayer lipid membranes of phosphatidic acid with phasic transition induced by temperature and pH. V.F.Antonov, A.N.Vasserman, A.A.Mol'nar, E.T.Kozhomkulov, L.Linke (Second Pirogov Medical Inst., Moscow, USSR).

Biophysics (GB), vol.27, no.5, p.862-7 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.822-6 (1982). [received: Sept. 1983]. The authors have studied the conductivity of bilayer lipid membranes formed from synthetic phosphatidic acid and its thio analogues. It is shown that the conductivity of the bilayer membranes abruptly changes in the temperature region of the phasic transition. The temperature of the conductivity jump falls with shift in pH from the acid to the alkaline region. The amplitude of the jump may reach 1.5 to 2 orders. The jump may also be obtained at a constant temperature by changing the pH of the medium. It is assumed that the observed conductivity jumps may determine the phenomena of thermo- and chemo-reception in biological membranes. (16 refs.)

115760 Voltage-dependent K conductance at the apical membrane of Necturus gallbladder. J.F.Garcia-Diaz, W.Nagel, A.Essig (Dept. of Physiology, Boston Univ. School of Medicine, Boston, MA, USA).

Biophys. J. (USA), vol.43, no.3, p.269-78 (Sept. 1983). The epithelial and cellular effects of clamping the transepithelial potential (V_t , mucosa reference) have been investigated in the Necturus gallbladder. Following initial equilibration at short circuit, tissue conductance g_t was 4.1 ± 1.2 (SD) mS/cm², the apical potential V_a was -76 ± 8 mV, and the apical fractional voltage on brief voltage perturbation ($f_a = \Delta V_a / \Delta V_t$, reflecting the ratio of apical membrane to transcellular resistance) was 0.72 ± 0.11 (21 gallbladders, 34 impalements). On clamping V_t at positive values, V_a depolarized and f_a decreased; at the same time g_t decreased. Clamping V_t at negative values produced converse effects. All of the above changes were related directly to the magnitude of the clamping potential V_t and were

reversed on return to the short circuit state. Effects of V_i on f_o are not due to changes in the extracellular pathway resistances (which, however, contribute to g_i). Furthermore, the effects of V_i on f_o were abolished by the mucosal application of TEA or Ba, or acidification of the mucosal solution. Thus, these experiments disclose the presence of a voltage-dependent apical K conductance that increases with apical membrane depolarization. (50 refs.)

115761 Diffusion in lipid bilayers containing barriers. A.A.Rigos, D.F.Calef, J.M.Deutch (Dept. of Chem., MIT, Cambridge, MA, USA). *Biophys. J. (USA)*, vol.43, no.3, p.315-21 (Sept. 1983). In epithelial cells, a barrier or tight junction restricts the diffusion of lipid probes from the apical to the basolateral side of the outer membrane bilayer. This phenomenon is studied theoretically with the diffusion equation on planar and spherical surfaces. Two models for the tight junction are considered: a penetrable barrier embedded in a monolayer and an impenetrable obstacle in the outer membrane of a bilayer that must be bypassed by flip-flopping between inner and outer membranes. The rate of passing from one side of the cell to the other is calculated for each of these models under steady state conditions. The results are compared with recent fluorescent photobleaching recovery experiments. The theoretical interpretation indicates that it would be difficult to distinguish experimentally between the flip-flop case and the barrier crossing case. Assuming a flip-flop model, large differences in the magnitude of the flip-flop rates of probes are necessary to explain the experimental results as suggested by Dragsten et al. (Nature, vol.294, p.718-22, 1981). (15 refs.)

115762 Gating of ion channels made by a diphtheria toxin fragment in phospholipid bilayer membranes. S.Misler (Dept. of Physiology & Biophys., Albert Einstein Coll. of Medicine, New York, NY, USA). *Proc. Natl. Acad. Sci. USA*, vol.80, no.14, p.4320-4 (July 1983). B45, a fragment containing the major hydrophobic region of diphtheria toxin, increases the conductance of thin lipid membranes by forming ion-conducting channels that are gated by transmembrane voltage, V_m , and the bath pH. Single-channel currents show 'bursting' behavior in the form of rapid transitions between a closed and an open conductance level. The average duration of a current 'burst', as well as the total time a channel is actually open within a burst, decreases with increasing V_m . Analysis of these data suggests that, over a range of V_m , increases in the rate constants for transitions from the open to the closed states largely account for the decline in macroscopic conductance with increasing V_m . Increases in rate constants for transitions from a closed to an open conductance state are more likely to account for the increase in macroscopic conductance with increasing bath pH. (12 refs.)

87.25 CELLULAR BIOPHYSICS

115763 Optical characteristics of individual plant elements and plant canopies grown under radiation regimes of different spectral composition and intensity. A.A.Tikhomirov, F.Ya.Sidko (Biophys. Inst., Acad. of Sci., Krasnoyarsk, USSR). *Appl. Opt. (USA)*, vol.22, no.18, p.2874-81 (15 Sept. 1983). The character of the interaction of radiation with the elements of plant canopies determines the light conditions for their photosynthesis and hence for the formation of the final yield. Investigation of the dependence of the optical properties of canopies on the irradiation conditions makes it necessary to know the variability of the optical properties of both individual phytoelements and whole canopies. If the distribution of radiation within a canopy and the character of transformation of the spectral composition of the radiation penetrating the canopy are known, the efficiency of assimilation of radiant energy can be more accurately estimated. Obtaining such information may be helpful in selecting optimum radiation conditions for canopies of a different structure. This paper examines certain optical characteristics of canopies having different optical densities and their individual phytoelements as well as several characteristics of the radiation field in canopies during their prolonged growth while illuminated with radiant fluxes of different intensities and spectral compositions of photosynthetically active radiation. (17 refs.)

115764 Dependence of the structural lability of the outer membrane of liver mitochondria on the age and sex of rats. V.V.Lemeshko (Gorkii State Univ., Kharkov, Ukrainian SSR). *Biophysics (GB)*, vol.27, no.5, p.877-81 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.837-40 (1982). [received: Sept. 1983] The experiments reported show that with age the structural lability of the outer membrane of the liver mitochondria of male rats evaluated from hypotonic treatment of the organelles increases. In old age the strength of the outer membrane of the mitochondria in the males is considerably less than in the females. (10 refs.)

115765 Simultaneous measurements of proton motive force, ΔpH , membrane potential, and H^+/O ratios in intact *Escherichia coli*. O.H.Setty, R.W.Hendler, R.I.Shrager (Lab. of Appl. Studies, Div. of Computer Res. & Technol., National Inst. of Health, Bethesda, MD, USA). *Biophys. J. (USA)*, vol.43, no.3, p.371-81 (Sept. 1983). An instrument is described that enables the simultaneous monitoring of proton motive force (PMF), membrane potential ($\Delta\psi$), the ΔpH across a membrane, oxidase activity, proton movements, and H^+/O ratios. The authors have studied the relationship existing among these parameters of energy transduction as a critical condition is changed during an experiment. The major findings described include (a) In the pH range of 4.5 to 7.5, increasing the external pH causes an increase in $\Delta\psi$, internal pH, and oxidase activity, a decrease in H^+/O ratio, and a peak-plateau in PMF from pH 5.5 to 6.6 where ΔpH is converted to $\Delta\psi$. (b) An increase in $[\text{K}^+]$ from 1 to 100 mM,

in the presence of 0.5 μM valinomycin, causes the conversion of $\Delta\psi$ to ΔpH , a gradual decline in PMF and an increase in H^+/O ratio, internal pH, and oxidase activity. (28 refs.)

115766 Mathematical model of the velocity field external to a tank-treading red cell. S.P.Sutera, R.Tran Son Tay (Mech. Engng. Dept., Washington Univ., St. Louis, MO, USA). *Biorheology (GB)*, vol.20, no.3, p.267-82 (1983). The velocity field external to a stationary ellipsoidal particle with continuously rotating surface motion driven by a surrounding shear flow is calculated. The configuration is intended to model the so-called 'tank-treading' behavior of mammalian erythrocytes (red cells) when suspended in shear flow. The boundary-value problem posed is based on the model developed by Keller and Skalak (1982) and is solved by adapting Jeffrey's general solution (1922) for the Stokes flow about a rigid, freely rotating ellipsoid immersed in an unbounded viscous flow. Streamlines and velocity profiles in the plane of symmetry are obtained by numerical computations. The flow pattern reveals two free stagnation points near the ends of the particle and the streamlines branching from these points delineate a region of closed streamlines surrounding the particle and two recirculating wakes extending to infinity both upstream and downstream of the particle. The presence of the wakes suggests a mechanism for enhanced diffusion of smaller solute particles in the surrounding fluid. (17 refs.)

115767 The motion of close-packed red blood cells in shear flow. T.W.Secomb, T.M.Fischer, R.Skalak (Dept. of Physiology, Univ. of Arizona, Tucson, AZ, USA). *Biorheology (GB)*, vol.20, no.3, p.283-94 (1983). Experimental and theoretical results are presented concerning the motion of close-packed red blood cell suspensions subjected to steady simple shear flow. The behavior of the suspension was observed microscopically using a cone-and-plate rheoscope. At moderate and high shear rates the cells show a fairly orderly arrangement, each appearing polygonal in the field of view. An idealized theoretical model for the suspension is developed, in which each cell is a 14-sided polyhedron of varying shape, but with constant surface area and volume. Tank-treading motion of the membrane is predicted, and an approximation to the motion is calculated which is consistent with the known mechanical properties of the membrane. It is shown that considerably more energy is dissipated in the membrane than in the cytoplasm during tank-treading. (16 refs.)

115768 Indices of filterability of red blood cell suspensions. R.Skalak (Dept. of Civil Engng. & Engng. Mech., Columbia Univ., New York, NY, USA), M.Hanss, S.Chien. *Biorheology (GB)*, vol.20, no.3, p.311-16 (1983). A number of different experimental techniques have been devised in recent years to use microsieving as a test of the filterability of suspensions of red blood cells. Various indices have been proposed to express the results of these tests. In the present paper a correlation is made of the intrinsic increase in resistance at the level of a single pore in the filter to the macroscopically observed pressure and flow through the entire filter. Further it is shown how a number of different tests may be used to derive the same index. The results apply only to situations in which there is no plugging of pores. (14 refs.)

- 115769 Evaluation of the probability of penetration of paramagnetic ions into the cells by the NMR pulse method.** A.Anisimov, A.S.Yevaretskov (Kazan Inst. of Biology, Kazan, USSR). *Biophysics (GB)*, vol.27, no.5, p.858-62 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.818-21 (1982). [received: Sept. 1983]
- To evaluate the probability of the penetration of paramagnetic ions into the cells in investigations of water exchange through the cell membranes the authors propose measurements of the time of transverse relaxation of the intracellular water in conditions of pulse radiofrequency saturation of longitudinal magnetization. (3 refs.)
- 115770 On oxygen diffusion in a spherical cell with Michaelis-Menten oxygen uptake kinetics.** P.Hiltmann, P.Lory (Inst. fur Math., Tech. Univ. Munchen, Munchen, Germany). *Bull. Math. Biol. (GB)*, vol.45, no.5, p.661-4 (1983).
- Demonstrates that there is one and only one solution to a non-linear singular two-point boundary-value problem which describes oxygen diffusion in a spherical cell. Previous authors have calculated numerical results that differ substantially. Numerical computations using the multiple shooting method support the results of McElwain (1978). (8 refs.)
- 115771 Increased membrane permeability to chloride in Duchenne muscular dystrophy fibroblasts and its relationship to muscle function.** C.N.Pato, M.H.Davis, M.J.Doughty, S.H.Bryant, E.Gruenstein (Depts. of Biological Chem., Pharmacology & Cell Biophys., Coll. of Medicine, Univ. of Cincinnati, Cincinnati, OH, USA). *Proc. Natl. Acad. Sci. USA*, vol.80, no.15, p.4732-6 (Aug. 1983).
- Previous studies have suggested an abnormality in Cl^- metabolism in Duchenne muscular dystrophy (DMD) fibroblasts. In order to further characterize this abnormality, the authors have studied $^{36}\text{Cl}^-$ distribution and permeability in 11 DMD and 12 normal fibroblast lines. Under steady-state conditions Cl^- efflux in fibroblasts is observed to be biphasic, revealing the presence of two major subcellular compartments. Each compartment contains approximately half of the cellular Cl^- . The faster of the two observed efflux components is significantly higher in DMD than in control fibroblasts ($P < 0.001$). To determine the results of a similar increase in Cl^- permeability on skeletal muscle action potentials, the authors have simulated the effects of increased Cl^- conductance on muscle by using a computer model. Effects on the simulated action potential include lower rates of membrane depolarization, lower overpotential, longer duration, and lower input resistance. These effects are similar to those actually observed in DMD muscle. (24 refs.)

87.30 BIOPHYSICS OF NEUROPHYSIOLOGICAL PROCESSES

(exc. perception processes and speech)

- 115772 Electrical discontinuity of tissue substitute models at 27.12 MHz.** J.F.Lehmann, J.A.McDougall, A.W.Guy, C.-K.Chou, P.C.Esselman, C.G.Warren (Dept. of Rehabilitation Medicine, School of Medicine, Univ. of Washington, Seattle, WA, USA). *Bioelectromagnetics (USA)*, vol.4, no.3, p.257-65 (1983).
- Tissue-substitute models consisting of layers of synthetic, electrically equivalent subcutaneous fat, muscle, and bone shaped in conformation with the normal anatomy are used for rapid determination of distribution of temperature and specific absorption rate throughout the tissues when exposed to electromagnetic radiation. The surfaces of the bisected models are approximated during a short exposure period, then separated and scanned with a thermograph. A method was developed to eliminate the electrical discontinuity at the bisected surfaces while alloying separation and subsequent thermographic scanning. A thin layer of silk screen wetted with propylene glycol saturated with sodium chloride was used at the fat interface and a 0.9% sodium chloride solution was used to wet the screen at the muscle interface to eliminate electrical discontinuity during exposure to 27.12-MHz diathermy. Tests showed that in the presence of an electrical discontinuity the heating pattern was grossly distorted. With the method used, the electrical discontinuity is minimized and the subsequent thermographic scanning reveals that the heating pattern is equivalent to that of an intact model. (9 refs.)
- 115773 Absorption of calcium by the squid nerve trunks as a function of the frequency of rhythmic excitation.** G.V.Maksimov, N.V.Kaverina, S.N.Orlov, O.R.Kol's (Biology Faculty, Lomonosov State Univ., Moscow, USSR). *Biophysics (GB)*, vol.27, no.5, p.881-4 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.841-3 (1982). [received: Sept. 1983]
- It has been established that the uptake of ^{45}Ca by squid axons increases on excitation and depends on the frequency of rhythmic stimulation. The maximum uptake of Ca occurs for excitation rhythms of 10 and 30 pulse/sec. In conditions of moderate loads the intensity of Ca uptake is determined by the frequency of stimulation and not by the number of pulses travelling along the

nerve. The link between the intensity of uptake of Ca and the functioning of the Na- and Ca-channels is discussed. (5 refs.)

- 115774 Fluctuation and linear analysis of Na-current kinetics in squid axon.** H.M.Fishman, H.R.Leuchtag, L.E.Moore (Dept. of Physiology & Biophys., Univ. of Texas Medical Branch, Galveston, TX, USA). *Biophys. J. (USA)*, vol.43, no.3, p.293-307 (Sept. 1983).
- The power spectrum of current fluctuations and the complex admittance of squid axon were determined in the frequency range 12.5 to 5000 Hz during membrane voltage clamps to the same potentials in the same axon during internal perfusion with cesium. The complex admittance was determined rapidly and with high resolution by a fast Fourier transform computation of the current response, acquired after a steady state was attained, to a synthesized signal with predetermined spectral characteristics superposed as a continuous, repetitive, small perturbation on step voltage clamps. Linear conduction parameters were estimated directly from admittance data by fitting an admittance model, derived from the linearized Hodgkin-Huxley equations modified by replacing the membrane capacitance with a 'constant-phase-angle' capacitance, to the data. The constant phase angle obtained was $\sim 81^\circ$. At depolarizations the phase of the admittance was 180° , and the real part of the impedance locus was in the left-half complex plane for frequencies below 1 kHz, which indicates a steady-state negative Na conductance. (39 refs.)
- 115775 Molecular mechanism of sodium conductance changes in nerve: the role of electron transfer and energy migration.** C.-Y.Lee (Dept. of Chem., Univ. of Houston, Houston, TX, USA). *Bull. Math. Biol. (GB)*, vol.45, no.5, p.759-80 (1983).
- Shows that the Na conductance changes can be explained quantitatively, based on the following assumptions: (1) there exist in nerve membranes electron transfer (ET) complexes and traps, (2) there is energy migration among them. The gating mechanism is explained in physical terms. Its mathematical expression differs from the Hodgkin-Huxley equations, but resembles the Hoyt formulation. In the present model, the physical parameters for the squid axon can be estimated from currently available experimental data. The density of the ET complexes is on the order of $10^3/\mu\text{m}^2$, and the density of the traps is $10^3/\mu\text{m}^2$. The magnitude of the energy transfer rate between ET complexes is about $10^6/\text{sec}$ at large depolarization and decreases with decreasing depolarizations, as does the Na inactivation rate. The energy gap between the two stable states of the transfer electron in the ET complex is estimated to be around 0.1 eV, which is approximately the same as that for photosynthetic systems. (55 refs.)
- 115776 The dynamics of symmetric nets.** A.Muir, M.W.Warner (City Univ., London, England). *Bull. Math. Biol. (GB)*, vol.45, no.5, p.781-92 (1983).
- The role of symmetry in simplifying the theory of complex neural systems is argued. When the structural symmetries of a network are expressed as an isomorphism group, implications emerge for the dynamics. Various qualitative possibilities concerning stability of uniform motion in homogeneous nets are discussed and an approach to neural hierarchies is outlined. (25 refs.)
- 115777 The influence of unipolar pulse currents on human body.** V.Klimova. *Elektrotech. Obz. (Czechoslovakia)*, vol.72, no.7, p.369-70 (July 1983). In Czech.
- Discusses the effects of fault pulse currents which can arise in electronic instrumentation on heart failure (fibrillation) in relation to the IEC standards. Various types of pulses are considered, namely square pulse, sinusoidal pulse and capacitor discharge pulse. Characteristic variables determined on the basis of studies of the threshold of perceptibility and the threshold of pain are discussed. (1 ref.) E.D.
- 115778 Hopf bifurcation to repetitive activity in nerve.** J.Rinzel (Nat. Inst. of Arthritis, Diabetes, Digestive & Kidney Diseases, Nat. Inst. of Health, Bethesda, MD, USA). *SIAM J. Appl. Math. (USA)*, vol.43, no.4, p.907-22 (Aug. 1983).
- Various nerve axons and other excitable systems exhibit repetitive activity (e.g. trains of propagated impulses) in response to a spatially localized, time-independent stimulus. If the stimulus is too weak, or in some cases too strong, one finds rather a spatially nonuniform, steady response which attenuates with distance from the input site. The authors consider these stimulus-response properties for a qualitative model of nerve conduction, the FitzHugh-Nagumo (parabolic partial differential) equations. For each stimulus amplitude there is a unique steady state solution. At critical stimulus values this steady solution loses stability and a branch of time periodic (spatially nonuniform) solutions appears via Hopf bifurcation. The authors associate this with the onset of repetitive activity. They derive analytic bifurcation formulae and evaluate these for the case of a cubic nonlinearity to determine regions in parameter space where the steady solution is unstable. They interpret physiologically the effect of stimulus form: either voltage or current input, and either spatially localized or spatially uniform stimulus. (11 refs.)
- 115779 A neural network model for the mechanism of feature extraction—a self-organizing network with feedback inhibition.** S.Miyake, K.Fukushima (NHK Broadcasting Sci. Res. Labs., Tokyo, Japan). *Trans. Inst. Electron. & Commun. Eng. Jpn. Part A (Japan)*, vol.J66A, no.6, p.500-7 (June 1983). In Japanese.
- Proposes a self-organizing multilayered neural network model which has modifiable inhibitory feedback connections together with the conventional feed forward connections. If a feature which is already familiar to the network is given to the receptive field of a cell, the cell responds, and consequently the responses of its presynaptic cells are suppressed receiving feedback inhibition. On the contrary, to an unfamiliar feature, the presynaptic cells do not change their responses because of no feedback inhibition. Since the synapses from the presynaptic cells which yield large sustained outputs grow, the cells for detecting novel features quickly develop, and the network acquires a favorable pattern-selectivity. (5 refs.)
- 115780 Mathematical structure of bio-electrical impedance obtained from linear functional point of view.** T.Yamamoto, Y.Yamamoto, E.Mizufune (School of Engng., Okayama Univ., Okayama, Japan). *Trans. Inst. Electron. & Commun. Eng. Jpn. Sect. E (Japan)*, vol.E66, no.6, p.352-8 (June 1983).
- From circle to circle correspondence in mapping theory of the linear function $Z=(ah+b)/(ch+d)$, it is known that Z also describes a circle when its variable h describes a circle or a straight line. From this point of view, the linear functional expression of bioelectrical impedance having a circular locus is discussed in detail. As a result, it became clear that three types h_0 , h_1 and h_2 exist of the variable h and the characteristics of bio-impedance expressions for each of h_0 , h_1 and h_2 are as follows. For the expression by h_0 : (1) a polarization impedance having a constant phase angle appears; (2) the most original equation of bio-impedance can be proposed; (3) the linear or non-linear bio-impedance can be deduced from this original equation; (4) the equivalent circuits satisfying Cole-Cole's circular arc are of two types. For the expressions by h_1 and h_2 : (1) these expressions correspond to the expression using the combination in group theory of the linear function; (2) taking

account of combination, countless equivalent circuits satisfying Cole-Cole's circular arc exist. (10 refs.)

115781 Feature extractions for pattern recognition of body surface isopotential maps [in ECGs]. N.Akamatsu (Faculty of Engng., Tokushima Univ., Tokushima, Japan), S.Ishibashi. *Trans. Inst. Electron. & Commun. Eng. Jpn. Sect. E (Japan)*, vol.E66, no.6, p.403-4 (June 1983). Defines three parameters for feature extraction of body surface isopotential maps. It was found that these parameters marked different characteristics according to the different patterns of the maps. (3 refs.)

115782 Influence of intraocular scattered light on lightness-scaling experiments. W.A.Stiehl, J.J.McCann, R.L.Savoy (Vision Res. Lab., Polaroid Corp., Cambridge, MA, USA). *J. Opt. Soc. Am. (USA)*, vol.73, no.9, p.1143-8 (Sept. 1983). Following Munsell's bisection procedure (see *ibid.*, vol.23, p.394, 1933) the authors established a nine-step gray scale in which each step is an equal increment in lightness. The authors calculated retinal illuminances after intraocular scatter by using the point-spread function of Vos et al. (see *Vision Res.*, vol.16, p.215, 1976). After this correction for intraocular scatter, the authors find a logarithmic relationship between retinal illuminance and achromatic lightness scales that are determined by the bisection method. Additional bisection experiments with a series of different backgrounds corroborate this result. The authors find that lightness depends linearly on the logarithm of scatter-corrected retinal illuminance, with different slopes for backgrounds of different lightness. This study also highlights the importance of using scatter-corrected illuminance in any quantitative model of lightness. (19 refs.)

87.32E Physiology of the eye; nerve structure and function

115783 Transient transport across the blood-retina barrier. J.Larsen (Math.-Tech. Inst., Charlottenlund, Denmark), H.Lund-Andersen, B.Krogsaa. *Bull. Math. Biol. (GB)*, vol.45, no.5, p.749-58 (1983). A mathematical model of the transport of fluorescein across the blood-retina barrier in the transient state and the subsequent diffusion of fluorescein in the vitreous body is presented. The function of the barrier is lumped in a single parameter—the permeability. The sensitivity of this parameter due to changes in the other parameters of the model is given. This establishes the foundation for the quantitative assessment of the barrier function through vitreous fluorophotometry. (14 refs.)

115784 Identification of human oculomotor system for quantitative diagnostics of eye muscle diseases. H.Helmle, G.Jahn, J.Bille (Inst. fur Angewandte Phys., Univ. Heidelberg, Heidelberg, Germany). *Comput. Biol. & Med. (GB)*, vol.13, no.3, p.189-204 (1983). Various discrete parameter estimation methods are explained and applied to the eye muscle model of Collins (1975). Their effectiveness and accuracy are studied. Comparing saccadic eye movements to the motions of a fixation target data for parameter estimation are provided. As a first application, saccades of a subject with a Duane-Syndrome are evaluated. (13 refs.)

115785 Neural mechanisms of pattern vision in the monkey. III. The neurobehavioural basis. S.Yaginuma (Dept. of Behavioral Physiology, Tokyo Metropolitan Inst. for Neurosci., Fuchu, Japan). *J. Inst. Electron. & Commun. Eng. Jpn. (Japan)*, vol.66, no.3, p.241-6 (March 1983). In Japanese. For pt.II see *ibid.*, vol.66, no.2, p.173 (1983). Pattern recognition consists of identifying through sensory systems the two-dimensional shape and feature of objects in an environment. On the basis of neurobehavioural findings from monkeys, central-nervous development in perceptual and understanding processes in making pattern recognition is discussed in this review paper. The article contains: (1) the inferotemporal cortex as a pattern recognition center, (2) dual nervous functions for completing pattern recognition, (3) the output area to the pattern recognition center, (4) the functional interaction between pattern-recognition systems and reception systems, and (5) the role of nervous function of spatial positioning and information selection actions in feature establishment processes. (38 refs.) *K.B.*

115786 Interactions among converging sensory inputs in the superior colliculus. M.A.Meredith, B.E.Stein (Medical Coll. of Virginia, Richmond, VA, USA). *Science (USA)*, vol.221, no.4608, p.389-91 (22 July 1983).

The responses of superior colliculus cells to a given sensory stimulus were influenced by the presence or absence of other sensory cues. By pooling sensory inputs, many superior colliculus cells seem to amplify the effects of subtle environmental cues in certain conditions, whereas in others, responses to normally effective stimuli can be blocked. The observations illustrate the dynamic, interactive nature of the multisensory inputs which characterize the deeper laminae of the superior colliculus. (5 refs.)

115787 Signal transfer among retinal neurons. M.Sakuranaga (Dept. of Phys., Nippon Medical School, Tokyo, Japan), K.-I.Naka. Identification and System Parameter Estimation 1982. Proceedings of the Sixth IFAC Symposium, Washington, DC, USA, 7-11 June 1982 (Oxford, England: Pergamon 1983), p.481-4 vol.1

A new branch of neurophysiology is introduced and discussed where emphasis is placed on the temporal and spatial characteristics of signal processing in a complex circuitry of the nervous system. The generalized methodology based on the Volterra/Wiener approach is stressed to provide a valuable means by which signal transformation is interpreted. Basic concepts are outlined on which the signal transmission within a vertebrate retina is analyzed. Four kinds of mode are elucidated for the signal transfer in the vertebrate retina. (11 refs.)

115788 Spatiotemporal nonlinear analysis of frog horizontal cells. M.C.Citron (Children's Hospital of Los Angeles, Los Angeles, CA, USA), T.E.Ogden, R.B.Melton.

Identification and System Parameter Estimation 1982. Proceedings of the Sixth IFAC Symposium, Washington, DC, USA, 7-11 June 1982 (Oxford, England: Pergamon 1983), p.485-8 vol.1

Describes the shapes of horizontal cell receptive fields in the frog retina were determined using a retinotopic mapping technique based on a 16×16 spatial array of stimuli. Fields derived from first order kernel magnitude were sometimes circular but more often elliptical. Morphologic studies of Golgi stained horizontal cells showed most to be elliptical with a nonrandom orientation tending to orthogonality. It is suggested that this feature makes unlikely an explanation of field eccentricity based on cell alignment. It is noted that cell axons tend to cross the retina in a line and may function as an extended dendrite to provide the eccentric and elliptical receptive fields. (15 refs.)

115789 The contrast gain control and feedback within the retina. R.Shapley (Rockefeller Univ., New York, NY, USA).

Identification and System Parameter Estimation 1982. Proceedings of the Sixth IFAC Symposium, Washington, DC, USA, 7-11 June 1982 (Oxford, England: Pergamon 1983), p.489-94 vol.1

The retina of the cat contains a contrast gain control which measures the average contrast over a wide area of the retina and adjusts the dynamics of retinal signal processing. This mechanism is a feedback mechanism. It seems to be a nonlinear feedback which modulates the gain-bandwidth product of linear feedbacks within the retina. The existence and properties of the contrast gain control have been discovered by applying techniques of nonlinear systems analysis to the study of the retina. (9 refs.)

87.32L Light detection; adaptation and discrimination

115790 Spectral consequences of photoreceptor sampling in the rhesus retina. J.I.Yellott,Jr. (School of Social Sci., Univ. of California, Irvine, CA, USA).

Science (USA), vol.221, no.4608, p.382-5 (22 July 1983). Optical transforms were used to compute the power spectra of rhesus cones treated as arrays of image sampling points. Spectra were obtained for the central fovea, parafovea, periphery, and far periphery. All were consistent with a novel spatial sampling principle that introduces minimal noise for spatial frequencies below the Nyquist limits implied by local receptor densities, while frequencies above the nominal Nyquist limits are not converted into conspicuous moire patterns, but instead are scattered into broadband noise. This sampling scheme allows the visual system to escape aliasing distortion despite a large mismatch between retinal image bandwidth and the Nyquist limits implied by extrafoveal cone densities. (11 refs.)

Picosecond kinetic absorption and fluorescence studies of bovine rhodopsin with a fixed 11-ene See Entry 115744

An analog-digital feedback system for measuring photoreceptor properties with an equal response method See Entry 115989

87.32N Colour detection; adaptation and discrimination

115791 Consequences of spatial sampling by a human photoreceptor mosaic. D.R.Williams, R.Collier (Center for Visual Sci., Univ. of Rochester, Rochester, NY, USA).

Science (USA), vol.221, no.4608, p.385-7 (22 July 1983). The short wavelength color mechanism in the human visual system can distinguish gratings from uniform fields of the same average radiance at spatial frequencies that are twice as high as the highest at which it can resolve bars in the grating. This discrimination above the resolution limit is associated with a splotchy or mottled appearance of the grating similar to two-dimensional noise. The most plausible explanation for the mottled pattern is

that it is a moire pattern produced by aliasing (spatial undersampling) by an irregular and sparse mosaic of short wavelength cones. (15 refs.)

115792 Human information processing and color displays. J.Durrett, C.Zwiener (Center for Automated Systems in Education, Southwest Texas State Univ., San Marcos, TX, USA). Southcon/81 Conference Record, Atlanta, GA, USA, 13-15 Jan. 1981 (El Segundo, CA, USA: Electron. Conventions 1981), p.12-1/1-7. The authors review the existing literature on the influence of color on human information processing as it relates to the use of color displays. The authors then discuss current research efforts at the Centre for Automated Systems in Education (CASE) directed at the empirical study of color displays. This entails the validation and evaluation of hardware, software and courseware systems used in interactive automated systems. Further, CASE investigates the human factors of using such automated systems. The CASE development effort is directed at applying the results of empirical research to automated system use and design to produce optimal human interaction. (18 refs.)

87.32S Psychophysics of vision, visual perception, binocular vision

115793 Hidden information in early visual processing. H.K.Nishihara (Artificial Intelligence Lab., MIT, Cambridge, MA, USA). *Proc. SPIE Int. Soc. Opt. Eng. (USA)*, vol.360, p.76-87 (1982). [received: July 1983] (Robotics and Industrial Inspection, San Diego, CA, USA, 24-27 Aug. 1982). A definition of scale-specific structure follows from the work of Marr and Poggio (1979) on zero-crossings in gaussian-bandpass-filtered images. This paper presents several examples which illustrate the potential value of scale-specific structure for recognition, inspection, and correspondence related tasks. The suitability of the approach for practical systems is discussed, and a recent result suggesting the importance of this 'hidden' information to human stereo vision is presented.

115794 Analysis of Helmholtz-Hering illusion by multiple channel model. T.Morita, K.Fujii (Dept. of Electrical Engng., Osaka Univ., Osaka, Japan), A.Matsuoka. *Jpn. J. Med. Electron. & Biol. Eng. (Japan)*, vol.21, no.2, p.87-92 (April 1983). In Japanese. [received: Sept. 1983] Geometric illusions closely relate to the excellent functions of the human visual system. The authors formerly analyzed typical illusions by a lateral inhibition model assuming that the geometric illusions originated from interactions of neuronal activities in the visual system. They now propose a new model to interpret illusions on the basis of the assumption that the illusions were caused by multiple spatial frequency channels, the existence of which has been proposed in both physiological and psychological visual science. Taking the Helmholtz-Hering illusion as an example, the authors analyze the kinds of channel that produce illusions. It is shown that the new model is effective for the interpretation of the Helmholtz-Hering illusion, and that this illusion originates mainly from the channels having a 1-octave bandwidth and a central frequency of about half of the fundamental frequency of the illusional figure. It will be possible to analyze more complex illusions by this model in the near future. (9 refs.)

115795 Attenuation of Mach bands by adjacent stimuli. F.Ratliff, N.Milkman, N.Rennett (Rockefeller Univ., New York, NY, USA). *Proc. Natl. Acad. Sci. USA*, vol.80, no.14, p.4554-8 (July 1983). Pronounced bright and dark bands are seen at the bright and dark edges of half-shadows and similar distributions of illumination. These are the so-called Mach bands. A pair of vertical Mach bands was generated with a ramp pattern in the central strip of a horizontal tripartite oscilloscope display. This pattern consisted of two uniform fields (one of low luminance, one of high luminance) joined by a gradient of uniform slope. The upper and lower strips were uniform throughout. A coupled pair of pointers could be displayed in these two strips and adjusted by the observer to match the apparent location and width of either of the Mach bands in the central strip. Insertion of a vertical bar in the central strip nearby and on either side of the ramp attenuates the corresponding Mach band. The closer the bar is to the Mach band, the stronger the attenuation. The attenuation is nearly independent of the sign of the contrast of the bar, but it does depend upon the magnitude and sharpness of the contrast. Also, the attenuation is independent of the width of the bar; a narrow line is as effective as a broad bar of the same contrast. No net luminance change is required; a bipolar stimulus with equal parts above and below the mean is as effective as a monopolar stimulus. These results point to two competing physiological mechanisms with different spatial sensitivities—one that generates Mach bands and one that attenuates them. (25 refs.)

87.34 AUDITION

115796 Remote masker summation and background noise limits for industrial monitoring audiometry. K.Keen, R.Waugh (Nat. Acoustic Labs., Sydney, NSW, Australia). *Aust. J. Audiol. (Australia)*, vol.4, no.2, p.33-9 (Nov. 1982). [received: Sept. 1983] The levels of ten noise bands in the range 125-3150 Hz that just mask a 3 kHz test tone were determined experimentally for 20 normal hearing subjects. Summation of these remote maskers appears to follow a 6 dB per doubling of maskers rule. Subjects with hearing impairment at 3 kHz but normal hearing at lower frequencies tend to suffer less masking than normal hearing subjects. These results are used to derive maximum permissible background noise levels for the performance of industrial monitoring audiometry for test frequencies restricted to the 3-6 kHz range. (16 refs.)

115797 The validity of aided thresholds. J.Macrae (Nat. Acoustic Labs., Sydney, NSW, Australia). *Aust. J. Audiol. (Australia)*, vol.4, no.2, p.48-54 (Nov. 1982). [received: Sept. 1983] Two procedures have been suggested for checking the validity of aided thresholds. The first consists of varying the gain of the hearing aid and observing whether the aided thresholds change or not. If they do not change, they are considered invalid. The second consists of measuring the equivalent input noise levels of the aid and applying corrections to them to estimate the invalid aided threshold levels. The finding that invalid aided thresholds improve when the gain of an aid is increased and worsen when the gain is reduced indicated that at least the first procedure would have to be modified. The effects of amplified ambient testroom noise, earmould venting and the internal noise output of a hearing aid on aided threshold levels were therefore calculated

with the aim of evaluating and improving both procedures. Both were improved but the improved version of the first procedure does not work if there is a significant amount of masking from amplified ambient noise or at frequencies below the vent cutoff frequency when venting is used. The improved version of the second procedure works under all conditions and is therefore the better of the two to use. (7 refs.)

115798 An investigation of the auditory brain stem response in subjects with high frequency cochlear hearing loss. A.R.Marshall (Dept. of Otolaryngology, Royal Victorian Eye & Ear Hospital, East Melbourne, Victoria, Australia). *Aust. J. Audiol. (Australia)*, vol.5, no.1, p.11-18 (May 1983). Auditory brain stem responses were obtained from 10 subjects with high frequency cochlear hearing loss. The relationship between audiometric threshold and response latency was investigated, as well as the effect on the response waveforms of increasing the stimulus repetition rate. Results indicated the importance of the 1 to 8 kHz audiometric contour in determining the presence of the responses and their latencies. In addition, it appeared that the adaptation observed with increased stimulus presentation rates is largely a peripheral process. Methods of analysing response waveforms to aid in the differentiation of cochlear and retrocochlear lesions were investigated. Several procedures involving examination of interaural wave latency differences at both slow and fast presentation rates were devised in an attempt to eliminate false positive retrocochlear findings. (27 refs.)

115799 6-kHz notch in noise-induced hearing loss. D.Y.Chung (Workers' Compensation Board of British Columbia, Richmond, BC, Canada). *Can. Acoust./Acoust. Can. (Canada)*, vol.11, no.4, p.17-23 (Oct. 1983). Audiograms from 49711 workers exposed to industrial noise over 85 dB(A) and with no obvious ear pathology were analyzed by sex and age. It was found that the configuration of the mean audiograms shows a notch at 6 kHz instead of 4 kHz reported in previous studies. When the mean audiograms were corrected for presbycusis, the notch shifted from 6 kHz to 4 kHz only for the age groups over 45 years. The reasons for the difference between results of previous studies and this study are discussed. (7 refs.)

115800 Suggested formulae for calculating auditory-filter bandwidths and excitation patterns. B.C.J.Moore, B.R.Glasberg (Dept. of Experimental Psychology, Univ. of Cambridge, Cambridge, England). *J. Acoust. Soc. Am. (USA)*, vol.74, no.3, p.750-3 (Sept. 1983). Recent estimates of auditory-filter shape are used to derive a simple formula relating the equivalent rectangular bandwidth (ERB) of the auditory filter to center frequency. The value of the auditory-filter bandwidth continues to decrease as center frequency decreases below 500 Hz. A formula is also given relating ERB-rate to frequency. Finally, a method is described for calculating excitation patterns from filter shapes. (23 refs.)

115801 Suppression in simultaneous masking. H.Fastl, M.Bechly (Inst. of Electroacoustics, Tech. Univ., Munich, Germany). *J. Acoust. Soc. Am. (USA)*, vol.74, no.3, p.754-7 (Sept. 1983). Suppression, i.e. the decrease of masked threshold caused by the addition of a second masker M2 to a first masker M1, is measured for the case of simultaneous masking. The magnitude of suppression decreases with increasing test tone duration; pulsed maskers elicit somewhat more suppression than continuous maskers. In comparison to suppression effects obtained in nonsimultaneous masking (post-masking, pulsation threshold) suppression in simultaneous masking is considerably smaller and was found only at the lower slopes of the two maskers. Suppression in simultaneous masking would not be predicted by those models of suppression which require nonsimultaneous presentation of maskers and test sound. (34 refs.)

115802 Broadband masking noise and behavioral pure tone thresholds in cats. J.A.Costalupes (Dept. of Biomedical Engng., Johns Hopkins Univ. School of Medicine, Baltimore, MD, USA). *J. Acoust. Soc. Am. (USA)*, vol.74, no.3, p.758-64 (Sept. 1983). The threshold for detection of pure tones in broadband noise was determined for three cats using an auditory reaction time procedure. Critical ratio is defined as the ratio of the signal power at the masked threshold for detection to the spectrum level of the noise. Critical ratios were obtained for 250-, 500-Hz, and 1-, 2-, 4-, 8-, and 16-kHz tones over a wide range of noise intensities. Results indicate that critical ratios increase with the frequency of the tone stimulus. At frequencies below 4 kHz, critical ratios remain constant at moderate and high noise intensities. For frequencies above 4 kHz, critical ratios increase as the level of the masking noise is raised from moderate to high levels. The difference between low- and high-frequency behavior of the level dependence of critical ratios is considered in terms of two possible mechanisms: (1) different mechanisms may be involved in the encoding of low- and high-frequency information by the nervous system or (2) the difference in level dependence may be due to attenuation by the action of the middle ear muscles at high sound levels. (25 refs.)

115803 Time course of adaptation and recovery of channels selectively sensitive to frequency and amplitude modulation. B.W.Tansley, J.B.Suffield (Psychology Dept., Carleton Univ., Ottawa, Ontario, Canada). *J. Acoust. Soc. Am. (USA)*, vol.74, no.3, p.765-75 (Sept. 1983). In a series of experiments the authors investigated the time course of adaptation and recovery of channels in the human auditory system selectively sensitive to frequency and amplitude modulation (FM and AM). They determined the rate of loss of sensitivity to modulation using sinusoidal frequency or amplitude modulation (SFM or SAM) of a 50 dB SL, 500-Hz pure tone carrier over a 30-min period. Adaptation stimuli were modulated at ten times the preadaptation modulation detection threshold, as determined immediately before the 30-min adaptation session. Modulation rates investigated were 2, 4, 8, 16, and 32 Hz. Long exposure to SFM always elevated thresholds for detection of SFM more than this exposure elevated thresholds for detection of SAM. Similarly, adapting to SAM always elevated SAM detection thresholds more than SFM thresholds. Loss of sensitivity during adaptation was relatively slow; asymptotic loss of modulation sensitivity took 20 to 30 min. The recovery of modulation sensitivity after cessation of the modulation component of the adapting stimulus was determined in a second experiment. Recovery was found to be rapid; most of the recovery occurred within the first 60 sec. Their evidence suggests that there exist two types of modulation-sensitive channels in the human auditory system—one selectively sensitive to amplitude modulation and the other to frequency modulation. They appear to have similar time courses for adaptation and for recovery. (18 refs.)

115804 Performance of hearing-impaired listeners under various types of amplitude compression. I.V.Nabelek (Dept. of Audiology & Speech Pathology, Univ. of Tennessee, Knoxville, TN, USA). *J. Acoust. Soc. Am. (USA)*, vol.74, no.3, p.776-91 (Sept. 1983). Speech perception by subjects with sensorineural hearing impairment was studied using various types of short-term (syllabic) amplitude compression. Average speech level was approximately constant. In quiet, a single-channel wide-band compression (WBC) with compression ratio equal to 10, attack time 10 ms and release time 90 ms produced significantly higher scores than a three-channel multiband compression (MBC) or no compression when a non-

sense syllable test (City University of New York) was used. The scores under MBC, WBC, or no compression were not significantly different when the modified rhyme test (MRT) was used. But when overshoots caused by compression were clipped, the MRT scores improved significantly. The influence of MBC on reverberant speech and of WBC on noisy speech were tested with the MRT. Reverberation reduced the scores, and this reduction was the same with compression as without. Noise added to speech before compression also reduced the scores, but the reduction was larger with compression than without. When noise was added after compression, an improvement was observed when WBC had a compression ratio of about 5, attack time 1 ms, and release time 30 ms. Other compression modes (e.g., with high-frequency pre-emphasis) did not show an improvement. The results indicate that WBC with a compression ratio around 5, attack time shorter than 3 ms, and release time between 30 and 90 ms can be beneficial if signal-to-noise ratio is large, or, if in a noisy or reverberant environment, the effects of noise or reverberation are eliminated by using listening systems. (40 refs.)

115805 Acoustically evoked radial current densities in scala tympani. W.E.Brownell, P.B.Manis, M.Zidanic, G.A.Spirou (Dept. of Neuroscience & Surgery, Univ. of Florida, Gainesville, FL, USA). *J. Acoust. Soc. Am. (USA)*, vol.74, no.3, p.792-800 (Sept. 1983). The authors have developed a method for measuring current density within the fluid spaces of the cochlea and report the existence of stimulus evoked radial currents in scala tympani of the guinea pig cochlea. The spatial distribution of electrical potentials in scala tympani was measured along a radial path parallel to the basilar membrane. Click evoked potentials were recorded at successive points separated by a fixed increment as the electrode was either advanced from the spiral ligament or withdrawn from a position near the modiolus. Potential differences were found to exist between recording points and gradients were calculated from the evoked potential measurements. Evoked potential gradients are observed at the same position along the path of the electrode both on advancing and on withdrawing the electrode. The largest potential gradients are located beneath the organ of Corti. Condensation and rarefaction clicks produce radial currents in opposite directions at a given location along the electrode's path. The magnitude and spatial distribution of radial currents is a function of stimulus intensity. Potential gradients of small magnitude are observed at locations other than below the organ of Corti in some penetrations. Control experiments suggest the smaller gradients are artifactual and may result from displacement of the spiral ligament by the recording electrode. The locations, magnitude, and direction of intracochlear ionic flow relate directly to the mechano-electrical transduction process in the organ of Corti. (43 refs.)

115806 Suppression of auditory nerve responses. II. Suppression threshold and growth, iso-suppression contours. E.Javel, J.McGee, E.J.Walsh, G.R.Farley, M.P.Gorga (Boys Town Nat. Inst. for Communication Disorders in Children, Omaha, NE, USA). *J. Acoust. Soc. Am. (USA)*, vol.74, no.3, p.801-13 (Sept. 1983). For pt.I see *ibid.*, vol.69, p.1735 (1981). Two-tone 'synchrony suppression' was studied in responses of single auditory nerve fibers recorded from anesthetized cats. Suppression thresholds for suppressor tones set to a fiber's characteristic frequency (CF) were approximately equal to discharge rate thresholds for CF tones. Suppression thresholds above and below CF were usually lower than the corresponding discharge rate thresholds. However, at all frequencies studied (including CF), suppression thresholds were higher than the corresponding thresholds for discharge synchronization. Across fibers, rates of suppression growth for suppressors at CF were greatest in low-CF fibers and least in high-CF fibers, and there was a systematic decrease in suppression growth rate at CF as CF increased. Within fibers, rates of suppression growth above CF were typically less than at CF, and slopes were monotonically decreasing functions of frequency. Within-fiber rates of suppression growth below CF were variable, but they usually were greater than rates of growth at CF. Iso-suppression contours (frequencies and intensities producing criterion amounts of suppression) indicated that tones near CF are the most potent suppressors at near-threshold intensities, and that the frequency producing the most suppression usually shifts downward as the amount of suppression increases. These data support the notion that synchrony suppression arises primarily as a passive consequence of hair cell activation. (36 refs.)

115807 A model of pitch discrimination process of the human auditory system. S.Kitamori (Numazu Tech. Coll., Numazu, Japan). *Trans. Inst. Electron. & Commun. Eng. Jpn. Part A (Japan)*, vol.J66A, no.7, p.592-5 (July 1983). In Japanese. Investigates a transitional characteristic of pitch discrimination in the human auditory system. A model of the temporal change process of the probability distribution on the psychological continuum of a brief tonal signal is proposed. The computed values of the proportion of correct responses fit the results of the psychological experiment quite well. (9 refs.)

87.36 SPEECH (see also 43.70 Speech communication)

115808 Equivalency of lossless *n*-tubes. L.J.Bonder (Inst. of Phonetic Sci., Univ. of Amsterdam, Amsterdam, Holland). *Acustica (Germany)*, vol.53, no.4, p.193-200 (Aug. 1983). The inverse problem of the lossless speech production model does not have a unique solution, for a continuous set of tubes exists that have the same formant frequencies. This phenomenon is known in literature as articulatory compensation. In this paper the authors describe a method with which one can compute the continuous set of *n*-tubes that have the same formants. It follows that the problem can be handled analytically up to 10-tubes. They

illustrate their analytic method on the basis of 4-tubes. It turns out that the values of the shape parameters of the tubes are restricted to certain intervals. Consequently, for some vowel sounds the corresponding 4-tube configurations must show particular shape characteristics, in spite of the articulatory compensation. (10 refs.)

115809 Changing the shape of lossless *n*-tubes. L.J.Bonder (Inst. of Phonetic Sci., Univ. of Amsterdam, Amsterdam, Holland). *Acustica (Germany)*, vol.53, no.4, p.201-11 (Aug. 1983). The author investigates analytically the acoustical effects of small changes of the shape of lossless *n*-tubes. They derive, by means of a decomposition method, general formant shift formulae for *n*-tubes. This method is not based on the use of eigenfunctions, but on the geometrical interpretation of the *n*-tube formula in the formant space. They give some examples of classes of changes of tube shape with their acoustical effects in the F₁, F₂-plane. (13 refs.)

115810 Multidimensional analysis of alaryngeal voice quality. S.Imai-zumi, S.Boku (Dept. of Otolaryngology, Kinki Univ. School of Medicine, Osaka, Japan), Y.Koike, F.Ohta. *J. Acoust. Soc. Jpn. (E) (Japan)*, vol.4, no.3, p.139-48 (July 1983). Investigates and acoustically defines some of the perceptual parameters which characterize alaryngeal voice quality. Twenty voice samples of vowel /e/ were recorded from 16 alaryngeal and four normal speakers, and were paired, randomized and presented to 20 listeners with normal hearing. The listeners rated the dissimilarities of all combinations of the voices, and these dissimilarities were analyzed by a nonmetric multidimensional scaling method called SMACOF. Five acoustical measures and 21 psychoacoustical ratings were made for each vowel, and these provided the interpretation for the SMACOF solution. The results indicate that at least two dimensions are necessary to describe the alaryngeal voice quality. One is connected with the listeners' preferences for the voices and differentiates the alaryngeal voices from the normal ones. This dimension correlates with the fundamental frequency and the relative spectral level of the high frequency components. Another dimension indicates the abnormalities peculiar to the voices produced with artificial larynges and differentiates them from the normal and esophageal voices. It correlates positively with periodicity in the excitation signal waveform and negatively with aperiodicity in the pitch or in the amplitude. These results suggest some direction toward the enhancement of the alaryngeal voice quality. (20 refs.)

115811 Range ambiguity and pulse interval jitter in the bottlenose dolphin. J.Kadane, R.Penner (Hawaii Lab., Naval Ocean Systems Center, Kailua, HI, USA). *J. Acoust. Soc. Am. (USA)*, vol.74, no.3, p.1059-61 (Sept. 1983).

A common problem of pulse-mode sonar systems which utilize range gating is the range ambiguity caused by echoes from objects at multiple distances returning simultaneously. Research conducted at the Naval Ocean Systems Center, Oahu, Hawaii, investigating bottlenose dolphin echolocation indicate that there is adequate varying of consecutive interpulse intervals (jittering of the repetition rate) to eliminate range ambiguity and range-ambiguous interference in this biological sonar system. (8 refs.)

115812 Mathematical model for vestibulo-ocular reflex. Z.Si-lan (Faculty of Basic Medical Sci., Beijing Medical Coll., Beijing, China), Y.Li-shen, L.Ke-qui, Q.Gao-xi. Identification and System Parameter Estimation 1982. Proceedings of the Sixth IFAC Symposium, Washington, DC, USA, 7-11 June 1982 (Oxford, England: Pergamon 1983), p.307-11 vol.1

A mathematical model for the vestibulo-ocular reflex based on the knowledge of physiology and anatomy is given. The authors describe how it was applied to certain patients who suffered from vestibular diseases examined by various vestibular tests and to normal subjects who revealed different types of vestibular function. According to their post rotational electronystagmography examination, their model parameters can be examined and their traditional parameters can be obtained by system identification and direct measurement respectively. With these parameters, one can establish some discriminant functions from the data of the subjects examined. These discriminant functions can be applied to clinical diagnosis of vestibular diseases and classification of normal vestibular function. (5 refs.)

87.40 BIOMAGNETISM (inc. magnetocardiography)

115813 Future of biomagnetism. M.Kotami. *Jpn. J. Med. Electron. & Biol. Eng. (Japan)*, vol.20, no.7, p.595-6 (Dec. 1982). In Japanese. [received: July 1983]

The heart, brain, arms and lungs generate weak magnetic fields. By measuring these fields diagnoses can be made. To measure the field, a flux-gate type gauss meter or a SQUID gauss meter is used. The minimum measurable flux density of SQUID gauss meters is as low as 10⁻¹¹ T. Recently, in order to obtain further magnetic-field information, mapping techniques to produce cardiac, pulmonary and cerebral magnetograms have been developed. These are briefly summarized in this paper. (11 refs.) K.B.

87.45 BIOMECHANICS, BIORHEOLOGY, BIOLOGICAL FLUID DYNAMICS

115814 Microcontinuum approach to the pulsatile flow in tubes with and without longitudinal vibration [blood flow application]. S.Parvatham (Univ. of Agricultural Sci., Bangalore, India), R.Devanathan. *Bull. Math. Biol. (GB)*, vol.45, no.5, p.721-37 (1983).

A fully developed pulsatile flow in a circular rigid tube is analysed by a microcontinuum approach. Solutions for radial variation of axial velocity and cell rotational velocity across the tube are obtained using the momentum integral method. Simplified forms of the solutions are presented for the relevant physiological data. Marked deviations in the results are observed when compared to a Newtonian fluid model. It is interesting to see that there is sufficient reduction in the mass flow rate, phase lag and friction due to the micropolar character of the fluid. (21 refs.)

115815 Effects of periodic accelerations on blood flow in arteries. V.K.Sud (Dept. of Biophys., All India Inst. of Medical Sci., New Delhi, India), H.E.Von Gierke, I.Kaleps, H.L.Oestreicher. *Bull. Math. Biol. (GB)*, vol.45, no.5, p.857-67 (1983).

Discusses the flow of blood in large arteries under the influence of linear periodic acceleration. The governing equations and boundary conditions are established and analytical solutions for the velocity, fluid acceleration, bulk flow and shear stress are obtained. The results for these physical quantities are computed for the case of an artery the size of a normal human aorta. It is found that the flow field variables are directly proportional to the external accelerating force. The behaviour of the velocity profile along the radial distance at different stages of times at fixed applied acceleration is also shown. (8 refs.)

115816 The bulk rheology of close-packed red blood cells in shear flow. T.W.Secomb (Dept. of Physiology, Univ. of Arizona, Tucson, AZ, USA), S.Chien, K.-M.Jan, R.Skalak. *Biorheology (GB)*, vol.20, no.3, p.295-309 (1983).

A theoretical analysis is made of the dynamical behavior and bulk rheology of close-packed red blood cell suspensions subjected to simple shear flow. The model for the polyhedral cell shapes and tank-treading membrane motion developed in a companion paper (see *ibid.*, vol.20, no.3, p.283-94, 1983) is used. The flow in the thin lubricating plasma layers between cells is analyzed taking into account the mechanical properties of the membrane at the corner regions of sharp membrane curvature. This leads to predictions for the apparent viscosity as a function of hematocrit and shear rate. Good agreement with experimental results is obtained at moderate and high shear rates (above 20 s^{-1}). At lower shear rates, a rapid rise in apparent viscosity has been found experimentally, and the mechanisms leading to this behavior are examined. (12 refs.)

115817 Human blood oscillating axially in a tube. P.D.Richardson, S.Lazzara (Center for Biomedical Engng., Brown Univ., Providence, RI, USA).

Biorheology (GB), vol.20, no.3, p.317-26 (1983). Experiments were performed to study the rheological response of human blood at hematocrit ratios of 0 to 0.45 in axial oscillatory flow in a tube of uniform bore. Three principal regimes of flow were identified, depending on the amplitude of oscillation. At the highest amplitudes (and therefore the largest range of shear rates in the blood) there was turbulent motion and the friction coefficient increased in proportion to the square of the hematocrit. At small amplitudes the friction decreased with increase in amplitude, the rate of decrease increasing with hematocrit. At intermediate amplitudes the friction increased in proportion to the square of the hematocrit. Glutaraldehyde fixation of the red cells caused increase in the friction, and reduced the rate of decrease of friction with amplitude at small amplitudes. With a stenosis of very modest degree and span the friction in normal blood increased disproportionately, and a small blind hole in the lumen of the stenosis caused additional and disproportionate increase in friction. (11 refs.)

115818 Effect of microrheology of blood on the apparent flow instability in a rotational viscometer. Liao Fu-lung, L.Dintenfass (Kanematsu Memorial Inst., Sydney, Australia).

Biorheology (GB), vol.20, no.3, p.327-42 (1983). Flow instability (formation of vortices and a concurrent increase in the apparent viscosity) was studied in the rotational rhombospheroid viscometer of 3° , 5° and 10° gaps over a range of speeds from 10 to 300 RPM. Comparisons between different blood systems were carried out mainly at 250 RPM. Experiments were carried out on blood samples obtained directly from human subjects, or from the Blood Bank, or from horses. Reconstituted suspensions of red cells in albumin or dextran were also used. Apparent flow instability was found to be not solely a function of blood viscosity, but a multiple function of many viscosity factors or blood subphases, including instability-decreasing factors such as haematocrit and aggregation of red cells; and instability-increasing factors such as rigidity of red cells; and thus specific to and characteristic of individual blood samples. (19 refs.)

115819 Local cerebral blood flow increases during auditory and emotional processing in the conscious rat. J.E.LeDoux, M.E.Thompson, C.Iadecola, L.W.Tucker, D.J.Reis. *Science (USA)*, vol.221, no.4610, p.576-8 (5 Aug. 1983).

Local cerebral blood flow was measured in rats by the ^{14}C -labeled iodoantipyrine technique with quantitative autoradiography during the processing of environmental stimuli. Presentation of a tone increased blood flow in the auditory but not the visual pathway. When the animal had previously been conditioned to fear the tone, blood flow additionally increased in the hypothalamus and amygdala. Local cerebral blood flow can thus be used to detect patterns of cerebral excitation associated with transient (30- to 40-second) mental events in experimental animals. (23 refs.)

115820 Nonparametric modeling of respiratory mechanics and gas exchange. V.Z.Marmarelis, S.M.Yamashiro (Dept. of Biomedical & Electrical Engng., Univ. of Southern California, Los Angeles, CA, USA).

Identification and System Parameter Estimation 1982. Proceedings of the Sixth IFAC Symposium, Washington, DC, USA, 7-11 June 1982 (Oxford, England: Pergamon 1983), p.675-80 vol.1

A nonparametric method of modeling respiratory mechanics and gas exchange is presented and compared to existing parametric methods. The nonparametric approach is based on Wiener's theory of nonlinear system identification by use of white-noise test inputs. The sought nonparametric models have the form of nonlinear functional relations between tracheal pressure and flow (in the study of respiratory mechanics), and between tracheal flow and PCO_2 (in the study of gas exchange). The motivation for this modeling study is provided by the recent emergence of high-frequency ventilation as a useful clinical tool. The obtained results increase one's understanding of the quantitative relations between these physiological variables, and allow optimization studies that may lead to improved clinical applications. (20 refs.)

115821 Parameter identification and adaptive control for blood pressure. B.K.Walker (Dept. of Aeronautics & Astronautics, MIT, Cambridge, MA, USA), T.-L.Chia, K.S.Stern, P.G.Katona.

Identification and System Parameter Estimation 1982. Proceedings of the Sixth IFAC Symposium, Washington, DC, USA, 7-11 June 1982 (Oxford, England: Pergamon 1983), p.1413-18 vol.2

The online identification of the defining parameters and the closed-loop adaptive control of the blood pressure response of anesthetized dogs to the infusion rate of a vasoactive drug is considered. The response of mean arterial pressure to the infusion rate of sodium nitroprusside is modelled as a single-input single-output ARMAX process with known delay. Recursive least squares and maximum likelihood techniques are employed for parameter estimation and closed loop control is provided by a minimum variance algorithm. Simulation results and animal experiments indicate that the behavior of the various adaptive controllers is predicted well by theoretical considerations and that the closed loop performance is excellent. (16 refs.)

115822 Online estimation of lung parameters using multiple gases. D.M.Wiberg, J.W.Bellville (Dept. of System Sci. & Anesthesia, Univ. of California, Los Angeles, CA, USA).

Identification and System Parameter Estimation 1982. Proceedings of the Sixth IFAC Symposium, Washington, DC, USA, 7-11 June 1982 (Oxford, England: Pergamon 1983), p.1419-24 vol.2

A noninvasive multiple gas method is used to obtain dynamic estimates of lung blood perfusion, dead space, lung blood distribution, and lung ventilation/perfusion ratios. Shunt can also be estimated if arterial oxygen partial pressure is measured invasively. The estimates are for use in the operating room and intensive care unit, as a measure of cardiopulmonary state. The extended Kalman filter as modified by Lung and Wiberg computes the estimates from gas measurements at the mouth. Multiple inputs and outputs make the estimation complex. (25 refs.)

115823 Modelling of respiratory patterns in the neonatal period. S.Sjöberg (Dept. of Appl. Electronics, Chalmers Univ. of Technol., Gothenburg, Sweden).

Identification and System Parameter Estimation 1982. Proceedings of the Sixth IFAC Symposium, Washington, DC, USA, 7-11 June 1982 (Oxford, England: Pergamon 1983), p.1425-9 vol.2

The evaluation and monitoring of respiratory function is of special importance in the neonatal period. One way to describe so-called respiratory patterns, characteristics of spontaneous breathing, of newborn infants in a more formal way than is normally done today is presented. It is possible to monitor either air flow or lung volume as a function of time and consider this signal as a realization of a random process. The problem of recognizing different respiratory patterns can be formulated as a problem of identification and detection of random processes. Based on some considerations of properties of the respiratory system and observations of lung volume variation, a simple model of respiratory patterns is proposed, and some aspects of the estimation of the model's parameters are discussed. (6 refs.)

115824 A model-based adaptive blood pressure controller. J.B.Slate, L.C.Sheppard (Dept. of Surgery & Biomedical Engng., Univ. of Alabama, Birmingham, AL, USA).

Identification and System Parameter Estimation 1982. Proceedings of the Sixth IFAC Symposium, Washington, DC, USA, 7-11 June 1982 (Oxford, England: Pergamon 1983), p.1437-42 vol.2

Sodium nitroprusside is a fast-acting drug used to reduce blood pressure in hospitalized patients. A wide range of circulatory system responses to the drug is observed. For design of a controller for clinical use, a model of the system related to arterial pressure and its response to nitroprusside was developed and patient-care practices were analyzed. An adaptive, multiple-mode, multirate sampled-data controller was designed using model-based techniques and implemented with a microcomputer system. Simulation results were verified by experiments in the animal laboratory. Results from clinical evaluations with postsurgical patients were superior to the performance of previous automated infusion systems. (7 refs.)

87.50 BIOLOGICAL EFFECTS OF RADIATIONS

(inc. effects of fields)

115825 Behavioral detection of 60-Hz electric fields by rats. S.Stern, V.G.Laties (Dept. of Radiation Biology & Biophys., Univ. of Rochester, Rochester, NY, USA), C.V.Stancampiano, C.Cox, J.O.de Lorge.

Bioelectromagnetics (USA), vol.4, no.3, p.215-47 (1983). Rats partially deprived of food were trained individually to press a lever in the presence of a vertical, 60-Hz electric field and not to press in its absence.

Correct detections that occurred during brief, 3- or 4-s trials occasionally produced a food pellet. The probability of detecting the field was found to increase as field strength increased. The threshold of detection, i.e. the field strength required for detections at a probability of 0.5 after correction for errors, was generally between 4 and 10 kV/m. The range of field strengths between almost zero and almost 100% correctness of detection was approximately 8 kV/m. A logistic function provided a good description of the increase in the detection probability with increasing field strength. These performances occurred reliably in 19 rats, some of which were studied for 2 years. Control procedures showed that the behavior required that the rat be in the electric field; the behavior was not controlled by any of several potentially confounding variables. (37 refs.)

115826 Effect of constant magnetic field (CMF) and γ -radiation on hereditary structures of somatic cells. Combined effect of CMF and γ -radiation on human lymphocytes in vitro. M.Mileva, B.Ivanov, M.Bulanova, T.Pantev (Inst. of Roentgenology & Radiobiology, Sofia, Bulgaria). *Radiobiologiya (USSR)*, vol.23, no.4, p.562-5 (1983). In Russian. Samples of human whole blood were exposed in a CMF (field induction, 0.3 T) for 15, 30, 45, 60, 75, 90, 120, 150, 180, 240, 300 or 360 min. 15 min following exposure, the samples were γ -irradiated with a dose of 0.0516 C/kg (^{137}Cs) at a dose rate of 1.95 A/kg. The following chromosome aberrations were scored: deletions, dicentric, rings, and symmetrical exchanges. Exposure of the blood in a CMF for 15 to 360 min decreased radiation damage to cells as compared with unexposed irradiated samples. The extension of time from 15 to 180 min increased the effect, the smallest amount of chromosome damage being scored at 170-180 min. A 2.8-fold, 3-fold and 3.5-fold decrease was registered in the number of aberrant cells, deletions and dicentric, respectively. With increasing time of exposure (240 min), the radiomodifying effect started decreasing, and with 300-360 min exposure it was the same as that observed at 15-45 min. (9 refs.)

Synergistic effect of γ -radiation and constant magnetic field See Entry 115849

Contribution of γ -radiation to the dose absorbed, and some radiation effects in a radiation field $p(50\text{ MeV})\rightarrow\text{Be}$ See Entry 115923

87.50B Interactions of biosystems with radiations

115827 Experimental determination of whole body average specific absorption rate (SAR) of mice exposed to 200-400 MHz CW. S.V.Marshall, R.F.Brown (Dept. of Electrical Engng., Univ. of Missouri-Rolla, Rolla, MO, USA). *Bioelectromagnetics (USA)*, vol.4, no.3, p.267-79 (1983). A maximum of six live mice, mouse cadavers, prolate spheroids molded from muscle-equivalent tissue, or saline-filled culture flasks, were exposed to continuous wave radiation in a TEM cell at frequencies between 200 and 400 MHz. Whole-body average specific absorption rate (SAR) was determined from power meter measurements of incident, reflected, and transmitted powers. The SARs for both live mice and cadavers were approximately twice that for the prolate spheroid models, and when housed in Plexiglas restraining cages, about $2^{1/2}$ times greater. An error multiplying factor is identified that quantitatively expresses how SAR data obtained by the three-power-meter method becomes progressively more noisy as the irradiation frequency is lowered or as the TEM cell cross section is increased. (6 refs.)

115828 Fluorescence of the leaves of higher plants at raised temperatures. Ye.A.Kuznetsova (Phys. Faculty of Lomonosov State Univ., Moscow, USSR). *Biophysics (GB)*, vol.27, no.5, p.849-52 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.809-11 (1982). [received: Sept. 1983] The temperature dependence of fluorescence ($\lambda\approx 630\text{-}760\text{ nm}$) of the leaves of gymnosperm plants in the state of winter rest and in the spring to summer period, and also green and etiolated leaves of angiosperm plants at different stages of development at 20-95°C has been studied. At $\sim 60^\circ$ the intensity of fluorescence rises like an avalanche, more strongly the younger the leaf of the angiosperm. In the leaves of gymnosperms an intense alavanache-like process is observed only in the winter-spring period. (13 refs.)

115829 An iterative extended boundary condition method for solving the absorption characteristics of lossy dielectric objects of large aspect ratios. A.Lakhtakia, M.F.Iskander, C.H.Durney (Dept. of Electrical Engng., Univ. of Utah, Salt Lake City, UT, USA). *IEEE Trans. Microwave Theory & Tech. (USA)*, vol.MTT-31, no.8, p.640-7 (Aug. 1983). The recently developed iterative extended boundary condition method (IEBCM) has been used to compute the internal fields induced in homogeneous, axisymmetric, lossy dielectric objects of large aspect ratios when exposed to incident planewave radiation. Calculations were made for both the E - and k -polarization cases. The computed results for a prolate spheroidal model of an average man are found to be accurate for frequencies up to 300 MHz, while the use of the popular EBCM was found to be essentially restricted to frequencies less than 70 MHz for these models and exposure conditions. The applicability of the IEBCM to composite bodies has also been examined by studying the irradiation of a capped cylindrical object. This composite object was first partitioned into several overlapping spherical subregions, and, alternatively, into two spherical subregions overlapping with a central cylindrical subregion. (42 refs.)

Electrical discontinuity of tissue substitute models at 27.12 MHz See Entry 115772

87.50C Bioacoustics (sonic and ultrasonic effects on living matter)

115830 The effects of infrasound on human health. S.E.Birnie, F.L.Hall, S.M.Taylor (Dept. of Geography, McMaster Univ., Hamilton, Ontario, Canada). *Can. Acoust./Acoust. Can. (Canada)*, vol.11, no.4, p.46-55 (Oct. 1983). Infrasound is defined as sound with a frequency less than 20 Hz. It is produced by both natural and man-made sources, although very high levels of infrasound must be artificially produced. A number of early papers suggested that infrasound may produce very serious adverse effects on human functioning such as the impairment of task performance, including driving. This paper assesses the literature published since those early reports. Auditory, physiological, and performance effects are discussed. The more recent studies show much less severe effects than those suggested in the first studies. Methodological considerations indicate that the recent studies are much more reliable than the earliest reports. (22 refs.)

115831 Involvement of ultrasonically induced cavitation in the production of hind limb paralysis of the mouse neonate. L.A.Frizzell, C.S.Lee, P.D.Ashenbach, M.J.Borrelli, R.S.Morimoto, F.Dunn (Bioacoustics Res. Lab., Univ. of Illinois, Urbana, IL, USA). *J. Acoust. Soc. Am. (USA)*, vol.74, no.3, p.1062-5 (Sept. 1983). The exposure conditions which produce hind limb paralysis in 10%, 50%, and 90% of mouse neonate specimens exposed to 1-MHz ultrasound at 10°C and at 1- and 16-atm hydrostatic pressure were determined for the intensity range 86-289 W/cm². The change in the exposure duration for 50% of the specimens paralyzed resulting from pressurization to 16 atm was negligible at 86 and 144 W/cm² but was almost a factor of 2 increase at 289 W/cm². Pressurization suppressed the observed half-harmonic received signal at all intensities. These results suggest that cavitation may influence the production of the hind limb paralysis produced in the neonate at 1 atm at 289 W/cm². (12 refs.)

115832 The effect of loud sound and traffic noise on the vestibular system. S.Spellenberg. *KeP- & Hangtech. (Hungary)*, vol.29, no.4, p.111-12 (Aug. 1983). Loud sound e.g. traffic noise can induce nystagmus and vertigo 113-123 dB ISO pure tone has been produced in 5 sec and 86 dB(A) fluctuating traffic noise in 30 minutes in an open sound space, while the behaviour of the vestibular apparatus has been registered on the electronystagmogram (ENG). The examinations have been done with patients with operated and nonoperated otosclerosis, patients with sensorineural defects, patients of chronic otitis and with normal ears. ENG changes were found in 45% of the patients with sensorineural hearing loss but none of the normal hearing patients. The series of examinations show that the intensive pure tone, or, long noise can damage the perifical or the central component of the vestibular system and can cause vertigo. (9 refs.)

6-kHz notch in noise-induced hearing loss See Entry 115799

87.50E Bio-optics (effects of microwaves, light, laser and other electromagnetic waves)

115833 Teratogenicity of 27.12-MHz radiation in rats is related to duration of hyperthermic exposure. J.M.Lary, D.L.Conover, P.H.Johnson, J.R.Burg (Div. of Biomedical & Behavioral Sci., Nat. Inst. for Occupational Safety & Health, Cincinnati, OH, USA). *Bioelectromagnetics (USA)*, vol.4, no.3, p.249-55 (1983). Five groups of pregnant Sprague-Dawley rats were either sham exposed or were irradiated in a 27.12-MHz radiofrequency (RF) field at 55 A/m and 300 V/m on gestation day 9. The absorbed power (approximately 11 W/kg) caused a relatively rapid increase in the rat's colonic temperature. Rats in group I were sham irradiated for 2.5 h at 0 A/m, 0 V/m. In group II RF irradiation was terminated after the rat's colonic temperature reached 41.0°C. In group III the 41.0°C temperature was maintained an additional 2 h by manually varying the incident field strength. In group IV irradiation was terminated after the rat's colonic temperature reached 42.0°C. In group V the 42.0°C temperature was maintained an additional 15 min by varying the field strength. At both temperatures the teratogenic and embryotoxic effects of the RF-induced hyperthermia increased as the exposure duration increased, but the increase was especially noticeable at 42.0°C. The results indicate that the teratogenic and embryotoxic effects of RF-induced hyperthermia are related to both the temperature of the dam during exposure and the length of time the dam's temperature remains elevated. (12 refs.)

115834 Suppression of T-lymphocyte cytotoxicity following exposure to sinusoidally amplitude-modulated fields. D.B.Lyle (Div. of Biomedical Sci., Univ. of California, Riverside, CA, USA), P.Schechter, W.A.Adey, R.L.Lundak. *Bioelectromagnetics (USA)*, vol.4, no.3, p.281-92 (1983). Significant inhibition of allogeneic cytotoxicity of the target cell MPC-11 by the murine cytotoxic T-lymphocyte line CTL-L1 was observed when the 4-h cytotoxicity assay was conducted in the presence of a 450-MHz field sinusoidally amplitude-modulated at 60 Hz. Exposure of the effector cells to the field prior to adding them to the target cells in the cytolytic assay resulted in a similar inhibition, suggesting a direct interaction of the field with the cytolytic T lymphocyte. The inhibition was preferentially expressed during the early allogeneic recognition phase. Field-exposed cytolytic cells recovered their full cytolytic capacity in 12.5 h. A differential susceptibility was observed with modulation frequencies from 0 to 100 Hz. Peak suppression occurred at 60 Hz modulation, with progressively smaller effects at 40, 16, and 3 Hz. The unmodulated carrier wave did not affect the cytotoxicity. Effects with 80- and 100-Hz modulation were smaller than at 60 Hz. These results demonstrate an inhibitory but recoverable effect by certain amplitude modulations of weak nonionizing radiation upon the cell-mediated cytolytic immune response. (34 refs.)

115835 Effect of microwave radiation on cell immunity in conditions of chronic exposure. M.G.Shandala, G.I.Vinogradov, M.I.Rudnev, S.F.Rudakova (A.N. Marzhev Sci. Res. Inst. of General & Communal Hygiene, Kiev, Ukrainian SSR). *Radiobiologiya (USSR)*, vol.23, no.4, p.544-6 (1983). In Russian. CBA male mice and albino mongrel rats were exposed to microwave radiation (2375 MHz) of various intensities for 1 to 3 months. The T-system immunity status was studied in vivo and in vitro. Substantial changes were revealed in the cell immunity system, resulting from the long-term action of microwaves of a non-thermal intensity. Latent lesions manifested with functional loads. (6 refs.)

115836 Extremely low frequency electromagnetic emissions from video display terminals and other devices. M.A.Stuchly, D.W.Lecuyer, R.D.Mann (Non-ionizing Radiation Section, Radiation Protection Bur., Health & Welfare Canada, Ottawa, Ontario, Canada). *Health Phys. (GB)*, vol.45, no.3, p.713-22 (Sept. 1983). Video display terminals (VDTs) are in widespread use and can be found in practically every modern office. Assessment of possible health effects of electromagnetic emissions from these devices is necessary. The intensity of the magnetic field and the frequency spectrum of the emissions at extremely low frequencies (ELF) (5-500 Hz) were measured for a few VDTs and compared with the background field intensities and emissions from other devices. The emissions in the frequency range investigated are of such low intensities that they are very unlikely to have any biological effects, let alone represent a health hazard. (39 refs.)

115837 Infrared contact coagulation. A new therapy for solid tumors. C.Lersch, C.Hammer, O.Ganghoff, W.Brendel, G.Nath (Inst. fur Chirurgische Forschung, Klinikum Grosshadern, Munchen, Germany). *Naturwissenschaften (Germany)*, vol.70, no.8, p.416-7 (Aug. 1983). Infrared contact coagulation (ICC) has been applied so far mainly for blood stanching during operations of parenchymatous organs and to the treatment of hemorrhoids, diseases of the cervix uteri and hemangiomas. The effect of ICC on solid animal tumors has now been evaluated in mice, hamsters and rats. The device used produces infrared radiation from a 250-W Wolfram halogen lamp. The rays are focused by a gold-plated reflector. Adherence of the tissue is prevented by a sapphire monocrystal cooled in iced water before use. The emitted energy (about 1200 J in 10 s) is mainly concentrated at a depth of 2-3 mm. Most of the animals with solid tumors can be cured by ICC. BCG has an additional but no significant effect. On this tumor therapy, BCG alone did not cure any animal. Hints are given that there is a T-cell-dependent immune response against tumor cells after ICC (Winn assay, monitoring of spleen, lymphocytes). This stimulation of the immune system by ICC has to be investigated intensively before ICC is applied in humans for therapy of solid tumors and metastases. (4 refs.)

115838 New results on the prevention of hazards due to electromagnetic fields in the vicinity of high-power. M.Dahme (Inst. für Rundfunktech., München, Germany). *Rundfunktech. Mitt. (Germany)*, vol.27, no.4, p.164-70 (July-Aug. 1983). In German.

As sections of electromagnetic compatibility (EMC), two problem areas of hazards due to electromagnetic fields are discussed. The basis of a biophysical nerve-irritation and heat-effect concept as well as limiting values derived therefrom of hazards to persons due to RF fields are indicated. With a view to the prevention of hazards from the unintended ignition of explosive mixtures by RF fields, some results of calculations on antenna theory are put forward, by means of which the decoupling of energy from the field may be estimated. Limiting values are given for the maximum power that can be taken from the field, such that, if those values are respected, the ignition of explosive mixtures may be considered to be impossible. (6 refs.)

Rooftop photovoltaic arrays: electric shock and fire health hazards See Entry 115658

87.50G Ionizing radiations (u.v., X-ray, gamma-ray; particle radiation effects)

115839 Damages to superhelical structures of nuclear DNA induced by γ -rays and heavy ions. Kh.Abel, G.Erzgraber, K.Langrok (Joint Inst. of Nuclear Res., Dubna, USSR).

Radiobiologiya (USSR), vol.23, no.4, p.435-8 (1983). In Russian. Chinese hamster cells (V79-4), human lymphocytes and mouse ascites cells were exposed to γ -rays and heavy ions (^4He and ^{12}C). Sedimentation of complexes containing DNA was studied after cell lysis by centrifugation in a neutral sucrose gradient. The distinctions noted after irradiation with γ -rays and heavy ions are consistent with the idea of the superhelical organization of DNA into discrete and membrane-bound compact units. According to the estimates made the diameter of these complexes was $\sim 0.2 \mu\text{m}$ and DNA content, about 2×10^9 dalton. (9 refs.)

115840 Enhancement of biological effectiveness of low-energy quantum radiation. Microdosimetric basis for a selective action of ionizing radiation on the chromosomal material of cells. V.F.Stepanenko, T.A.Norets, A.N.Dedenkov (Sci. Res. Inst. of Medical Radiology, Acad. of Medical Sci., Obninsk, USSR).

Radiobiologiya (USSR), vol.23, no.4, p.439-43 (1983). In Russian. Microdosimetric data are presented indicating the possibility of a selective action of ionizing radiation on the chromosomal material of cells from the low-energy electrons and photoelectrons formed, as the result of the photoeffect, on the incorporated or native atoms inside DNA upon irradiation with low-energy quantum radiation ('X-activating' effect). A presumed biological effectiveness of the 'X-activating' effect on B-16 melanocarcinoma, with bromine and iodine incorporated into the DNA molecule, was estimated. (14 refs.)

115841 Radiation damage and recovery of mouse T-cells. Dynamics of suppressor cells after the effect of radiation. A.A.Yarilin, E.F.Polushkina (Sci. Res. Inst. of Medical Radiology, Acad. of Medical Sci., Obninsk, USSR).

Radiobiologiya (USSR), vol.23, no.4, p.454-7 (1983). In Russian. Suppressor and helper T-cells precursors, similar in radiosensitivity ($D_0 = 2.16$ and 2.25 , respectively), are restored almost synchronously and reach a normal level by the end of the 2nd month after irradiation. Suppressor macrophage precursors remain intact at doses of up to 7 Gy; one month after irradiation their level decreases, perhaps because of the death of the radiosensitive precursors. The suppressors damage is one of the factors decelerating the reverse development of the immune response after irradiation. (13 refs.)

115842 Influence of duration of fixation on the yield of chromosome aberrations in human lymphocyte culture exposed to γ -radiation at different mitotic cycle stages. A.V.Sevan'kaev, B.A.Bogatyykh, V.A.Lychev (Sci. Res. Inst. of Medical Radiology, Acad. of Medical Sci., Obninsk, USSR).

Radiobiologiya (USSR), vol.23, no.4, p.471-5 (1983). In Russian. A comparative study was made of the yield of chromosome aberrations in a human lymphocyte culture exposed to ^{60}Co - γ -rays (2 Gy) at different mitotic cycle stages, the cells being fixed after 52 and 60 hr. It was shown that with the latter fixation time (60 hr) the frequency of chromosome aberrations after irradiation in G_1 stage was substantially lower than that with the former one (52 hr) and vice versa, it was higher after irradiation in S and G_2 stages. The authors discuss the probable causes of the distinctions observed. (19 refs.)

115843 Influence of dose-rate and dose fractionation on radiation damage to bone marrow cells forming granulocyte-macrophage colonies in diffusion chambers (CFUdc). V.P.Kaplan, A.I.Kolesnikova, A.G.Konoplyannikov (Sci. Res. Inst. of Medical Radiology, Acad. of Medical Sci., Obninsk, USSR).

Radiobiologiya (USSR), vol.23, no.4, p.476-9 (1983). In Russian. The ability of CFUdc to repair radiation-induced lesions in the irradiated body was studied by the methods of dose fractionation and dose-rate reduction. When the dose-rate was decreased from 1-0.5 Gy/min to 0.02 Gy/min, the mean lethal dose per cell increased from 1.35 to 1.93 Gy. With fractionation of the dose, the known picture of repair of sublethal radiation lesions was obtained, the second survival peak being insignificant. The authors discuss the possible causes of the distinctions in the repair parameters of CFUdc obtained by the two methods. (15 refs.)

115844 Radiosensitivity of bone marrow and spleen CFUdc in mice γ -irradiated in different oxygenation conditions. V.P.Kaplan, A.I.Kolesnikova, A.G.Konoplyannikov, N.I.Michanskaya, L.A.Lepikhina (Sci. Res. Inst. of Medical Radiology, Acad. of Medical Sci., Obninsk, USSR).

Radiobiologiya (USSR), vol.23, no.4, p.480-3 (1983). In Russian. After exposure in vitro and in situ CFUdc of CBA mouse bone marrow and spleen were characterised by comparable parameters of radiosensitivity and oxygen-dependent modification: the values of D_0 for bone marrow and spleen cells were 1.31 and 1.35 Gy (in vitro) and 1.36 and 1.37 Gy (in situ), and the values of the oxygen effect were 2.3 and 2.5, respectively. (8 refs.)

115845 Mathematical model of a simultaneous combined action of ionizing radiation and hyperthermia. V.P.Komarov, V.G.Petin (Sci. Res. Inst. of Medical Radiology, Acad. of Medical Sci., Obninsk, USSR).

Radiobiologiya (USSR), vol.23, no.4, p.484-8 (1983). In Russian. A mathematical model is proposed suggesting that the synergistic action of a combination of ionizing radiation and hyperthermia is substantiated by additional lethal damages arising from the interaction of 'sub-lesions' induced by both agents. The model describes quantitatively the synergism of the combined action of the agents used and predicts the maximal value of the synergistic effect and conditions in which it can be achieved. (9 refs.)

115846 Migration of lymphocytes within the internally irradiated body. Effect of internal γ -irradiation on migrating capacity of splenic lymphocytes labeled with ^{51}Cr . Yu.N.Anokhin, T.A.Norets, A.A.Yarilin, V.F.Stepanenko (Sci. Res. Inst. of Medical Radiology, Acad. of Medical Sci., Obninsk, USSR).

Radiobiologiya (USSR), vol.23, no.4, p.493-6 (1983). In Russian. In experiments on CBA mice it was shown that migration of ^{51}Cr -labeled spleen lymphocytes, injected intravenously, to lymph nodes of intact recipients was suppressed 6-24 months after the administration of a radiopharmaceutical preparation of selenium-75-selenomethionine in a quantity giving doses of 1 Gy and 1.5 Gy to the whole body and lymphoid organs, respectively. Migration of labeled lymphocytes to the liver, kidneys and lungs, as well as their retention in the circulating blood, were increased. As the result of the migration disorders the specific affinity of lymphocytes for peripheral lymphoid tissue decreased. (14 refs.)

115847 Lymphocyte migration under conditions of incorporated irradiation. Effect of incorporated β -irradiation on spleen lymphocyte migration in CBA mice. Yu.N.Anokhin, T.A.Norets, A.A.Yarilin, V.F.Stepanenko (Sci. Res. Inst. of Medical Radiology, Acad. of Medical Sci., Obninsk, USSR).

Radiobiologiya (USSR), vol.23, no.4, p.497-500 (1983). In Russian. The syngenic transfer system was used to study migration of ^{51}Cr -labelled spleen lymphocytes in mice after incorporation of the β -emitter, ^{75}Se -methionine. Migration of ^{51}Cr -labelled lymphocytes to lymph nodes was stably decreased, and to liver, kidneys and lungs increased. The lymphocyte migration impairment was associated with the influence of β -radiation on both the migratory properties of cells and the factors of their microenvironment responsible for lymphocyte migration within the mouse body. No distinctions were observed in the character and manifestation of disturbances of lymphocyte migration after the injection of ^{75}Se -methionine and the γ -emitter, ^{75}Se -selenomethionine. (10 refs.)

115848 Influence of ^{131}I on the osteosarcomogenic effectiveness of ^{90}Sr . V.N.Strel'tsova, V.I.Shelesnova, S.V.Stepanov (Inst. of Biophys., Min. of Health, Moscow, USSR).

Radiobiologiya (USSR), vol.23, no.4, p.501-4 (1983). In Russian. Submits the results of estimation of the osteosarcomogenic effectiveness of ^{90}Sr in a combination with ^{131}I incorporated prior to or after the administration of ^{90}Sr . It was demonstrated that the incidence of osteosarcomas increased in rats who received ^{131}I a week after the administration of ^{90}Sr . (3 refs.)

115849 Synergistic effect of γ -radiation and constant magnetic field. A.M.Kuzin, S.E.Nizkyii (Inst. of Biological Phys., Acad. of Sci., Pushchino, USSR).

Radiobiologiya (USSR), vol.23, no.4, p.510-12 (1983). In Russian. In experiments on *Glicina* Max. L., VNIIS-1 series, it was shown that exposure of seeds to a stable magnetic field (2950 E) 5-20 min after 2 Gy irradiation stabilized and enhanced the stimulatory effect of ionizing radiation. (1 ref.)

115850 Effect of X-radiation on histones and DNA in nuclei of rat bone marrow and liver. Yu.Shyuliova, E.Mishurova (Dept. of General Biology, P.J. Safarik Univ., Kosice, Czechoslovakia).

Radiobiologiya (USSR), vol.23, no.4, p.513-16 (1983). In Russian. A study was made of a change in a total concentration of histones and DNA and a relative content of individual histone fractions in the isolated nuclei of bone marrow and liver of rats 3 h to 14 days following X-irradiation with different doses. A considerable decrease in the concentration of histones and DNA in the nuclei and a change in the relative content of individual histone fractions were observed in the bone marrow. In the liver, these changes were less pronounced. (16 refs.)

115851 Electric conductivity of liver cells as a function of dose at early times after γ -irradiation. B.I.Polivoda (Sci. Res. Inst. of Medical Radiology, Acad. of Medical Sci., Obninsk, USSR).

Radiobiologiya (USSR), vol.23, no.4, p.519-21 (1983). In Russian. The dependence of electroconductivity and electric capacity of isolated liver cells, irradiated in vitro, upon radiation dose (within 100 Gy) was described by an extreme curve characterized by the presence of a 'critical' dose (25 Gy) at which the effect was maximum. The kinetics of changes in the electric parameters, which were measured at early times following irradiation (up to 4 h), has an opposite direction. The possibility is discussed that peroxidation and repair processes in membrane lipids are involved in the effects observed. (8 refs.)

115852 Radiosensitivity of hemopoietic stroma precursors from long-term bone marrow culture. O.A.Gurevich, I.L.Chertkov (Central Inst. of Haematology & Blood Transfusion, Min. of Health, Moscow, USSR).

Radiobiologiya (USSR), vol.23, no.4, p.521-3 (1983). In Russian. Radiosensitivity of hemopoietic stroma precursors from a long-term bone marrow culture was measured by implantation of the adherent cell layer under the renal capsule of syngeneic mice. D_0 was 4.86 ± 0.15 Gy and n was 2.4, i.e. the radiosensitivity of cultured cells was nearly the same as that of stromal precursors from fresh bone marrow. (4 refs.)

115853 Age-related changes in postirradiation recovery of blood system. O.I.Belousova, M.I.Fedotova (Inst. of Biophys., Ministry of Health, Moscow, USSR).

Radiobiologiya (USSR), vol.23, no.4, p.530-4 (1983). In Russian. Reports a study on hybrid (CBA \times C57B1) F_1 mice of ages of 17 and 27 months who had been irradiated with a dose of 4 Gy. It was shown that the postirradiation recovery of haemopoiesis in old mice was the same as in the young (2-3-month-old) mice, and in some respects (for instance, granulocytic and erythroid cells of the bone marrow, and CFUc) the recovery was even more active exhibiting a period of a pronounced hyperregeneration. (9 refs.)

115854 Prediction of modification of acute radiation affection of dogs with red bone marrow being partially shielded. V.L.Gozenbuck, I.B.Keirim-Markus (Inst. of Biophys., Ministry of Health, Moscow, USSR).

Radiobiologiya (USSR), vol.23, no.4, p.546-9 (1983). In Russian. It was shown that shielding of a relatively small area of the bone marrow during acute total-body irradiation of dogs permitted one to obtain a prognosticated constant increase in the survival rate within a wide range of doses exceeding the minimal absolutely lethal ones. (4 refs.)

115855 Correlation between the vestibular analyzer and individual radiosensitivity of rabbits exposed to a dose of 150 Gy. A.Yu.Grigor'ev, V.S.Stepanov (Inst. of Biophys., Ministry of Health, Moscow, USSR).

Radiobiologiya (USSR), vol.23, no.4, p.549-51 (1983). In Russian. The authors have revealed a relationship between the original functional state of the vestibular analyzer of rabbits and their individual radiosensitivity. The coefficient of correlation between the vestibular analyzer sensitivity threshold and the life expectancy after exposure to γ -rays from an electron linear accelerator (7.6 MeV, 150 Gy) was 0.505. (8 refs.)

115856 Physical work capacity of rats after the effect of ionizing radiation. N.I.Arlashchenko, D.Ya.Oparina, V.I.Shein. *Radiobiologiya (USSR)*, vol.23, no.4, p.551-3 (1983). In Russian.

An increase in irradiation dose from 2.5 to 15 Gy was found to lead to a progressive diminution of the dynamic and static physical work capacity of animals. (7 refs.)

115857 On the mechanisms of a change in the coloration of garden rose mutants. K.I.Zykov, Z.K.Klimenko (State Nikitsky Botanical Gardens, USSR).

Radiobiologiya (USSR), vol.23, no.4, p.553-8 (1983). In Russian.

When induced and spontaneous mutations occur in the vegetative reproduction organs of garden roses their coloration changes mainly in heterozygous varieties due to the loss or inactivation of the dominant genes and the phenotypic expression of the recessive ones. The effect of γ -radiation on the vegetative reproduction organs may be an adequate method to use for the genetic analysis of varieties with unknown genotypes. (10 refs.)

115858 Effects of nonuniform distribution of the radiation energy absorbed among elements of the population. A.K.Valeev (B.P. Konstantinov, Leningrad Inst. of Nuclear Phys., Acad. of Sci., Gatchina, USSR).

Radiobiologiya (USSR), vol.23, no.4, p.568-73 (1983). In Russian.

The reaction of a particular element of the population, when this element has absorbed some portion of ionizing radiation energy, and the response of the whole population to a given radiation dose are discussed. Functions of the element reaction are supposed to be increasing or decreasing. Formulae have been obtained describing a correlation between the element reaction as a function of the radiation energy absorbed and the response of the whole population as a function of the radiation dose absorbed. (6 refs.)

115859 Bleomycin and radiation-induced lung damage in mice. C.H.Collis, J.D.Down, A.E.Pearson, G.G.Steel (Radiotherapy Res. Unit, Inst. of Cancer Res., Sutton, England).

Br. J. Radiol. (GB), vol.56, no.661, p.21-6 (Jan. 1983). [received: Sept. 1983] Bleomycin-induced lung damage was assessed using both a functional endpoint and mortality. The extent of lung damage was found to depend on the schedule, mode of administration and dose of the drug. Greater damage occurred following twice-weekly administration than when the same dose was given as a single injection. Intravenous administration resulted in greater damage than intraperitoneal administration. When bleomycin was given with thoracic irradiation lung damage occurred earlier and at lower radiation doses than with radiation alone. Similar responses were obtained whether bleomycin was given four weeks before, or four weeks after irradiation. Thus although there was enhanced damage from the combined treatment, there was no evidence of a time-dependent interaction. (30 refs.)

115860 Comparison of the effects of radiation and hyperthermia on prenatal retardation of brain growth of guinea-pigs. R.A.Wanner, M.J.Edwards (Dept. of Veterinary Clinical Studies, Univ. of Sydney, Sydney, Australia).

Br. J. Radiol. (GB), vol.56, no.661, p.33-9 (Jan. 1983). [received: Sept. 1983] On day 21 of pregnancy guinea-pigs were exposed to hyperthermia or γ -radiation. The effects on prenatal growth and especially brain growth of offspring were compared. Doses of 0.04-0.99 Gy of radiation produced a dose-dependent and irreversible reduction of brain weight in the offspring, but had little effect on body weight. Treatment with hyperthermia resulting in maternal temperatures of 41.8-43.9°C after exposure in a heated incubator for an hour also produced a dose-related microcephaly in the offspring. Comparison of the two agents showed that a dose increment of 0.525 Gy of radiation produced a deficit in brain weight equivalent to an elevation of 1°C in maternal temperature. Using this guinea-pig brain weight assay system a threshold was detected of between 0.05 and 0.10 Gy for retardation of brain growth. (18 refs.)

115861 Inhibition and recovery of the iodine uptake function of rat thyroids after 18 MeV proton irradiation in vivo. B.Mukherjee (Inst. für Strahlungs- und Kernphys., Tech. Univ. Berlin, Berlin, Germany).

Br. J. Radiol. (GB), vol.56, no.661, p.67-8 (Jan. 1983). [received: Sept. 1983] The effects of 18 MeV protons (directly ionising radiation) on the iodine uptake kinetics of rat thyroid glands irradiated in vivo are reported. It was found that a single proton dose of 5.7 Gy in vivo had no effect on the proliferative capacity of the highly differentiated thyroid cells, as the gland masses of the irradiated groups remained unchanged. On the other hand the maximum uptake and the biological half life of ^{131}I in the thyroids of the irradiated group were reduced relative to those of the control group by 55% and 35% respectively. Nevertheless almost a complete recovery of the impairment of these thyroid functions occurred after a rest period of six days. It is therefore important to study the time-dependent recovery processes of the (radio) iodine uptake and retention functions of rat thyroids for various types of irradiation at different dose levels and rest periods. (3 refs.)

115862 Effect of 8-methoxypsoralen and ultraviolet radiation on the electrical stability of liposome membranes. O.M.Parnev, L.N.Bezdetnaya, A.Ya.Potapenko, Yu.A.Vladimirov (Second Pirogov Medical Inst., Moscow, USSR).

Biophysica (GB), vol.27, no.5, p.889-93 (1982). Translation of: *Biofizika (USSR)*, vol.27, no.5, p.848-50 (1982). [received: Sept. 1983]

It is shown that irradiation with near ultraviolet reduces the electrical strength of liposome membranes. The presence of 8-methoxypsoralen on irradiation enhances the effects. Vacuum treatment of the sample or addition of α -tocopherol during irradiation inhibits the fall in electrical strength. It is assumed that 8-methoxypsoralen reduces the electrical stability of the liposome membranes by photosensitizing lipid oxidation. (13 refs.)

115863 Dose-effect relationships for early response to total body irradiation. H.Smith (Nat. Radiological Protection Board, Chilton, Didcot, England).

J. Soc. Radiol. Prot. (GB), vol.3, no.3, p.5-10 (Autumn 1983).

In this review, dose-response relationships are recommended that are considered reasonable for estimating the range of early consequences following the release of radioactive material in a major nuclear accident. The limited human data on the effects of brief exposure to radiation that are used as the basis of this assessment are discussed and estimates made of the frequency of prodromal effects and early death relative to dose. The influence of protracting the dose and of the application of simple treatment are also discussed. (35 refs.)

115864 Discounting in assessment of future radiation effects. B.L.Cohen (Dept. of Phys., Univ. of Pittsburgh, Pittsburgh, PA, USA).

Health Phys. (GB), vol.45, no.3, p.687-97 (Sept. 1983).

There is a question as to whether cancer fatalities to be experienced in the distant future as a result of radioactivity produced today should be treated on a par with those experienced now, or whether there should be discounting in analogy with accounting principles for money to be spent in the future. It is shown that recent trends in cancer cure rates justify about an 0.7% per yr discounting. Other rationales for discounting are developed. Money can and always will be usable for saving lives; setting up a trust fund for future

generations to use for this purpose is much more cost-effective than spending money now to reduce their exposure to radiation. The history of interest rates over the past 5000 yr indicates that at least 3% real annual interest can be expected. It may not be necessary to actually set up a trust fund as its purpose is largely accomplished by the decrease in the public debt when money is not spent. The trust fund approach is mathematically equivalent to discounting lives lost in the far future at 3% per yr. As an alternative to the trust fund, money can be invested in biomedical research. (13 refs.)

115865 Simulated responses to lognormally distributed continuous low radiation doses. J.G.Szekely, K.A.Perry, A.Petkau (Whiteshell Nuclear Res. Establ., AECL Res. Co., Pinawa, Manitoba, Canada).

Health Phys. (GB), vol.45, no.3, p.699-711 (Sept. 1983).

Three previously reported equations, expressing response as a function of both dose and dose rate, for low LET radiation were used to compute distributions of response to continuous, low-level, lognormally distributed doses for populations of variable size up to 5000. The simulations show that, when the response is inversely dependent on dose rate, the mean of the response distribution can either increase or decrease with increasing exposure to radiation, depending on whether or not the dose-dependent term is the dominant one in an equation. In one equation, which defines the response as conjugated hydroperoxide formation in irradiated membranes, the magnitude of the dose-dependent term is reduced the most by superoxide dismutase, an enzymic inhibitor of free radical processes. This results in the means of response distributions decreasing with increasing dose from continuous, low-level radiation. (13 refs.)

115866 Relative efficiencies of three ultraviolet radiation wavelengths for cell killing and transformation in mouse cells in vitro. D.Papadopoulos, B.Muel, R.Latarjet (Inst. Curie Biologie, Paris, France).

Int. J. Radiat. Biol. (GB), vol.44, no.3, p.241-9 (Sept. 1983).

C3H 10 T 1/2 clone 8 mouse cells were irradiated in vitro with three UV wavelengths 280, 254, and 230 nm. Two effects were investigated, survival and malignant transformation, and the relative efficiencies were determined for the three radiations. For transformation, these efficiencies were: 280 nm: 3.9; 254 nm: 5.1; 230 nm: 2.3 (transformations produced by 5 J m⁻² of UV for 1000 surviving cells). For cell killing the efficiencies were, in relative units, 34, 100, and 50 respectively. These efficiencies are in agreement with the hypothesis that the main chromophore for both effects is the nucleic acid, and not the protein moiety of the genome. This conclusion agrees with that previously reached by other investigators, but the present results obtained with the short wavelength 230 nm provide an especially strong new argument. (17 refs.)

115867 Measurement of lymphoblastogenic activity from thorium workers.

C.S.Serio, C.B.Henning, R.E.Toohy, E.L.Lloyd (Radiological & Environmental Res. Div., Center for Human Radiobiology, Argonne Nat. Lab., Argonne, IL, USA).

Int. J. Radiat. Biol. (GB), vol.44, no.3, p.251-6 (Sept. 1983).

Mitogenic stimulation of peripheral blood lymphocyte cultures obtained from 36 thorium workers was studied to determine whether the response of these cells was affected by the individuals' occupational exposure to alpha irradiation. The standard assay involved incubating 2×10^5 lymphocytes per test well for 72 hours in the presence of phytohemagglutinin (PHA), concanavalin A or pokeweed mitogen (PWM). The results showed that there was a significant decrease in lymphocyte responsiveness of former thorium workers grouped by decade of life when compared with controls of the same decade of life for each mitogen tested with the exceptions of PHA in the 41-50 age group and the PWM in the 51-60 age group. The authors are unable to correlate the decreased response observed with the measured body burdens, external gamma exposure, or thoron exhalation rates in these thorium cases. However, other occupational exposures (i.e. various chemicals used in processing thorium) cannot be eliminated as a possible cause. (26 refs.)

115868 Comparative effects of exposure to high-energy electrons and gamma radiation on active avoidance behaviour. W.A.Hunt (Behavioral Sci. Dept., Armed Forces Radiobiology Res. Inst., Bethesda, MD, USA).

Int. J. Radiat. Biol. (GB), vol.44, no.3, p.257-60 (Sept. 1983).

The effects of two types of ionizing radiation was examined on active avoidance behaviour. Male Sprague-Dawley rats were trained to avoid footshock by jumping onto a retractable ledge. When irradiated with high-energy electrons or gamma photons, their performance was degraded in a dose-dependent manner. However, electrons were 1.6 times as effective as gamma photons with ED₅₀s of 62 and 102 Gy, respectively. All animals recovered with 24 min for all doses used. The data suggest that different types of ionizing radiation may not be equivalent when assessing their effect on behaviour. (9 refs.)

115869 Comparative influence of hyperthermia and ionizing radiation on cycle and mitosis lengths in EMT6 mouse tumour cells. M.C.D'Hooghe, D.Hemon, E.P.Malaisie (Inst. de Recherches sur le Cancer, Lille, France).

Int. J. Radiat. Biol. (GB), vol.44, no.3, p.267-74 (Sept. 1983).

With exponentially growing EMT6 mouse tumour cells in vitro, the authors have compared the effects of a dose of ionizing radiation and different temperature-time combinations on the lengths of the cell cycle and of mitosis using time-lapse cinematography on individual cells. The radiation dose and various temperature-time combinations all produced 50 per cent lethality. The hyperthermia treatments between 42 and 45°C all cause a mitosis delay (MD) which was greater than that induced by ionizing radiation. The MD was greater with increasing temperature. In contrast, hyperthermia also induced a mitosis lengthening (ML) but this was only of the same order of magnitude as radioinduced ML. The results argue in favour of different mechanisms underlying thermoinduced MD and ML. (24 refs.)

115870 Hyperthermia in a differentiating murine erythroleukemia cell line: cell killing by heat and radiation. G.P.Raaphorst, E.I.Azzam, J.Borsa, M.Einspinner (Medical Biophys. Branch, Atomic Energy of Canada Ltd., Whiteshell Nuclear Res. Establ., Pinawa, Manitoba, Canada).

Int. J. Radiat. Biol. (GB), vol.44, no.3, p.275-83 (Sept. 1983).

The survival response of Friend erythroleukemia cells (a differentiating cell system) to heat and radiation has been examined. The Friend erythroleukemia cells (FELC) were more heat and radiation sensitive than V79 cells, and the heat and radiation survival curves possessed shoulders, showing the ability of the cells to accumulate sublethal damage. Thermal tolerance was expressed after prolonged heating at 41.0-42.0°C. Thermal radiosensitization by heating at 42.0 or 45.0°C was greatest for simultaneous heat and radiation treatments, and recovery occurred when the cells were incubated at 37°C between the heat and radiation or radiation and heat treatments. Arrhenius analysis of the FELC heat survival data showed that the curve for thermal inactivation possessed a break at about 43.0°C and that the thermal inactivation energies above and below the breakpoint were comparable to those for V79 cells and other cell lines reported in the literature. (30 refs.)

115871 Effect of prolonged heating on the thermal enhancement ratio in X-irradiated murine intestine. J.C.L. Marigold, S.P. Hume (MRC Cyclotron Unit, Hammersmith Hospital, London, England).

Int. J. Radiat. Biol. (GB), vol.44, no.3, p.285-91 (Sept. 1983).
When the jejunum in mice was heated for 20-180 min at temperatures between 40.3 and 42.3°C, followed immediately by X-irradiation, the thermal enhancement ratio (TER) for crypt survival increased and then tended to decline with longer heating times. At the higher temperatures, the TER was higher and the peak value was reached with shorter heating times. The decline in TER with longer heating times may be due to the development of thermotolerance. (27 refs.)

115872 Effect of gamma radiation on enzymatic activity and sulphhydryl groups of human erythrocyte membrane. D. Palecz, W. Leyko (Dept. of Biophys., Inst. of Biochem. & Biophys., Univ. of Lodz, Lodz, Poland).

Int. J. Radiat. Biol. (GB), vol.44, no.3, p.293-9 (Sept. 1983).
The effect of ionizing radiation on human erythrocyte ghost membranes was studied by following changes in membrane -SH groups and activities of four membrane bound enzymes: $\text{Na}^+\text{K}^+\text{Mg}^{2+}$ ATP-ase, $\text{Mg}^{2+}\text{Ca}^{2+}$ ATP-ase, Na^+K^+ ATP-ase, and AChE. Irradiation with up to 100 Gy gamma rays produced a significant decrease in the activity of ATP-ase and an increase in AChE activity. At higher radiation doses a marked decrease in the activities of all the enzymes was observed. A correlation between radiation-induced perturbations in enzyme activities and changes in membrane -SH groups was found. (22 refs.)

115873 Effect of adenine nucleotides and gamma radiation on the transport of TEMPOL across the erythrocyte membrane. Z. Jozwiak, K. Gwozdziński, Z. Heszner (Dept. of Biophys., Inst. of Biochem. & Biophys., Univ. of Lodz, Lodz, Poland).

Int. J. Radiat. Biol. (GB), vol.44, no.3, p.301-5 (Sept. 1983).
The experiments reported show that external adenine compounds bring about changes in the transport of hydrophilic molecules across control and irradiated bovine erythrocyte membranes. Changes in the transport induced by incubation of erythrocytes with nucleotides depend on the type of nucleotide and its concentration. The range of nucleotide concentrations over which the stimulatory effect on the transport occurs is established. (16 refs.)

115874 The effect of ionizing radiation on tryptophan fluorescence of thymocyte and erythrocyte plasma membranes. B.S. Fomenko, I.E. Dovgii, I.G. Akoev (Inst. of Biological Phys., Acad. of Sci., Pushchino, USSR).

Int. J. Radiat. Biol. (GB), vol.44, no.3, p.307-11 (Sept. 1983).
The effect of ionizing radiation on tryptophan fluorescence of thymocyte and erythrocyte plasma membrane preparations was studied. The intensity of tryptophan fluorescence decreased after applying radiation doses up to 15 Gy. The radiosensitivity of thymocyte membranes appeared to be higher than that of the erythrocyte ghosts. Tryptophan radiolysis did not significantly contribute to the effects of radiation. The fraction of tryptophan residues accessible for quenching by I^- decreased from 0.87 in the untreated membranes to 0.63 and 0.49 in membranes after doses of 10 and 250 Gy, respectively. The effective quenching constant and the tryptophan fluorescence polarization increased after irradiation. The mechanisms producing these radiation-induced changes are discussed. (14 refs.)

115875 Radiotoxicity of thallium-201 in mouse testes: inadequacy of conventional dosimetry. D.V. Rao, G.F. Govelitz, K.S.R. Sastry (Univ. of Medicine & Dentistry of New Jersey, Newark, NJ, USA).

J. Nucl. Med. (USA), vol.24, no.2, p.145-53 (Feb. 1983). [received: Sept. 1983]
When Tl-201 is concentrated in mouse testes, the low-energy Auger electrons following its electron-capture decay are found to be much more effective in causing loss of testicular weight and reduction of sperm heads than the energetic beta particles from similarly distributed Tl-204. These results are contrary to expectations based on conventional dosimetry of tissue-incorporated radionuclides, and point to possible underestimation of risks by the currently adopted dosimetric procedures, especially in the case of radionuclides decaying by electron capture and internal conversion. (39 refs.)

115876 'Biological dosimetry' of radionuclides and radiation hazards. M.E. Gauden (Health Sci. Center, Univ. of Texas, Dallas, TX, USA).

J. Nucl. Med. (USA), vol.24, no.2, p.160-4 (Feb. 1983). [received: Sept. 1983]
This discussion on the radiobiology of radionuclides deals mainly with spermatogenic effects in mice testes. The author considers: extrapolation of data on the mouse to man; the accumulation of radionuclides in the germinal epithelium; a test for detecting the effects of small amounts of radionuclides; mutations and surviving spermatogonia. (35 refs.)

115877 Intrinsic resistance to the lethal effects of X-irradiation in insect and arachnid cells. T.M. Koval (Dept. of Radiation Therapy & Nuclear Medicine, Hahnemann Medical Coll., Philadelphia, PA, USA).

Proc. Natl. Acad. Sci. USA, vol.80, no.15, p.4752-5 (Aug. 1983).
Twelve cell lines representing 10 genera of three orders (Diptera, Lepidoptera, and Orthoptera) of the class Insecta and one cell line (Acarina) from the class Arachnida were examined to discern their sensitivity to the lethal effects of X-irradiation. Radiosensitivity was measured by a combination of colony formation and population growth curve techniques. Each of these arthropod cell lines is significantly more radioresistant than mammalian cells, though the degree of resistance varies greatly with order. Dipteran cells are 3 to 9 times and lepidopteran cells 52 to 104 times more radioresistant than mammalian cells. Orthopteran and acarine cells are intermediate in radiosensitivity between dipteran and lepidopteran cells. These cells, especially the lepidopteran, should be valuable in determining the molecular nature of repair mechanisms that result in resistance to ionizing radiation. (25 refs.)

115878 How cells respond to ionising radiation. M.J. Ashwood-Smith (Dept. of Biology, Univ. of Victoria, Victoria, British Columbia, Canada).

Phys. Bull. (GB), vol.34, no.9, p.384-6 (Sept. 1983).
The main biological target for ionising radiation is the deoxyribonucleic acid (DNA) of the cell's nucleus; the radiation breaks the phosphate diester backbone of the double-stranded helical DNA molecule. Breaks in one of the two strands (single-strand breaks) are readily produced by X- and gamma rays. If two separate single-stranded breaks are formed on each of the two strands, and if they are nearly opposite, then the resulting double-stranded breaks are invariably lethal. While such damage through accidental exposure can be highly detrimental, this effect of the radiation can also be extremely beneficial when it is channelled specifically towards such structures as tumours. The author discusses the various factors that influence the effect ionising radiation has on any cell and thus how to tailor it to our needs. (4 refs.)

115879 Model for the accumulation of cases of pulmonary malignancy in time when dose is accumulated in time. C.G. Stewart.

Report AECL-7155, Atomic Energy Canada Ltd., Chalk River, Ont. (May 1983), 13 pp.
These notes are directed primarily at the formulation of the accumulation of resulting cases of pulmonary malignancy with time when a dose of ionizing

radiation (e.g. from airborne short-lived daughters of Rn-222) is protracted in time and when the accumulation of tumours from receipt of the dose occurs after an induction-latent period. The model developed is quite general in that it will allow for the incorporation of the receipt of dose as functions of time, dose-response functions, and functions of time for the accumulation of tumours following and resulting from the receipt of a dose of ionizing radiation. (13 refs.)

115880 Measurement of blood flow. S. Yoshimura, H. Furuhashi, K. Kodaira.

Jpn. J. Med. Electron. & Biol. Eng. (Japan), vol.20, no.7, p.519-21 (Dec. 1982). In Japanese. [received: July 1983]

The methods used for blood flow instrumentation are classified into invasive and noninvasive. The former includes laser Doppler techniques and catheter electromagnetic blood-flowmeters; and radioisotope techniques, plethysmograph techniques, thermography and ultrasonic Doppler techniques fall under the noninvasive method. This paper gives a brief description of these techniques and outlines typical blood flow instrumentation is reviewed. The diagnostic significance of blood flow measurements is reviewed. (no refs.) K.B.

115881 Image processing for medicine. M. Onoe.

Jpn. J. Med. Electron. & Biol. Eng. (Japan), vol.20, no.7, p.532-5 (Dec. 1982). In Japanese. [received: July 1983]

Typical medical images are surface patterns, microscope images, electron-microscope images, X-ray images, radioisotope images, NMR images, ultrasound images, endoscope images and fundus-camera images. This paper reviews their features from the standpoint of clinical application. CT scanning has been applied not only to X-ray imaging but also to radioisotope imaging and NMR imaging; furthermore, ultrasound CT, microwave CT, etc. are being developed successively. Digital radiography (DR) can image only blood vessels. DR equipment comprises X-ray apparatus, a video camera, and a digital computer. (no refs.) K.B.

115882 A method of comparing the areas under receiver operating characteristic curves derived from the same cases. J.A. Hanley, B.J. McNeil.

Radiology (USA), vol.148, no.3, p.839-43 (Sept. 1983).

Receiver operating characteristic (ROC) curves are used to describe and compare the performance of diagnostic technology and diagnostic algorithms. This paper refines the statistical comparison of the areas under two ROC curves derived from the same set of patients by taking into account the correlation between the areas that is induced by the paired nature of the data. The correspondence between the area under an ROC curve and the Wilcoxon statistic is used and underlying Gaussian distributions (binormal) are assumed to provide a table that converts the observed correlations in paired ratings of images into a correlation between the two ROC areas. This between-area correlation can be used to reduce the standard error (uncertainty) about the observed difference in areas. This correction for pairing, analogous to that used in the paired t-test, can produce a considerable increase in the statistical sensitivity (power) of the comparison. For studies involving multiple readers, this method provides a measure of a component of the sampling variation that is otherwise difficult to obtain. (10 refs.)

87.60B Sonic and ultrasonic radiation

115883 Detectability of gas bubbles in blood by the ultrasonic method. L. Filipczynski (Inst. of Fundamental Technol. Res., Polish Acad. of Sci., Warsaw, Poland).

Arch. Acoust. (Poland), vol.8, no.1, p.11-29 (1983).
The reflection of a plane ultrasonic wave from a gas bubble in the blood was considered quantitatively in the range $ka \leq 1$ (a is the radius of the bubble, $k = 2\pi/\lambda$ and λ is the wavelength). Taking as an example the elbow vein (vena basilica), the losses in a signal caused by electroacoustical transducing, attenuation of the wave in tissues, reflection of the wave from the bubble and divergence of the reflected wave were evaluated using a typical ultrasonic Doppler device with a frequency of 8 MHz. The present calculation procedure permits the determination in a specific anatomic case of the level of signals scattered by blood, the level of electronic noise and also the determination of the detectability of gas bubbles in blood caused, for example, by the decompression of divers or by the caisson disease. In the case of the pulmonary artery, using a frequency of 5 MHz, radii of detectable gas bubbles greater than 70 μm were obtained. (20 refs.)

115884 Ultrasonic characterization of tissues in cardiology. L. Filipczynski (Inst. of Fundamental Technol. Res., Polish Acad. of Sci., Warsaw, Poland).

Arch. Acoust. (Poland), vol.8, no.1, p.83-94 (1983).

In order to analyse the possibility of the determination of the properties of soft tissues using ultrasonic (noninvasive) methods, a review was made of the basic physical properties characterizing acoustic wave propagation in these tissues (propagation velocity, attenuation, scattering). In a discussion of the results of 'in vitro' investigations, it was shown that investigations of backscattering can be very significant for cardiological applications; the heart muscle with scars caused by an infarct is characterized by an increased proportion of collagen-rich connective tissue which has the value of the backscattering coefficient greater by a factor of some dozens than that of normal muscle. This is related to the higher echographic visualizability of collagen than other soft tissues and suggests the practical possibility of noninvasive distinguishing of the regions of the muscle with scars caused by the infarct from normal muscle. This possibility was confirmed by 'in vivo' investigations performed on dogs by the method of grey level histograms obtained from ultrasonograms of dog's hearts. (17 refs.)

115885 Formalization of choice for parameters of an acoustic stimulus in a small automatic facility to examine and diagnose the functional status of an auditory analyzer. E.I.Podgornyi, E.A.Bakai (A.I. Kolomiichenko Kiev Sci. Res. Inst. of Otolaryngology, Kiev, Ukrainian SSR). *Biomed. Eng. (USA)*, vol.16, no.6, p.179-83 (Nov.-Dec. 1982). Translation of: *Med. Tekh. (USSR)*, vol.16, no.6, p.10-14 (Nov.-Dec. 1982). A method is presented for choosing the parameters of the stimulus produced by the acoustic channel of a small automatic facility for examining and diagnosing the functional status of the auditory system. By a concrete example of equipment design, the advantages of the method are demonstrated. (12 refs.)

115886 Bone-conduction receiver with an extended frequency range for measuring the threshold of audibility. B.M.Sagalovich, F.V.Bednin (Moscow Sci. Res. Inst. for Ear, Throat & Nose, Moscow, USSR). *Biomed. Eng. (USA)*, vol.16, no.6, p.183-6 (Nov.-Dec. 1982). Translation of: *Med. Tekh. (USSR)*, vol.16, no.6, p.14-18 (Nov.-Dec. 1982). A piezoelectric transducer type of bone-conduction receiver is described. By means of this receiver thresholds of audibility can be measured over a range from 250 Hz to 20 kHz. This receiver opens up new possibilities for the early diagnosis of hearing disorders for people having various forms of deafness. (14 refs.)

115887 The selection of modulation waveform for frequency modulated sound field stimuli. H.Dillon, G.Walker (Nat. Acoustic Labs., Sydney, NSW, Australia). *Aust. J. Audiol. (Australia)*, vol.4, no.2, p.56-61 (Nov. 1982). [received: Sept. 1983]

Frequency modulated (FM) tones are used in sound field audiometry in order to avoid problems caused by standing waves. To provide uniform sound fields and be sufficiently frequency specific, the FM stimulus should possess a uniform distribution of energy within the frequency limits set by its bandwidth, and a very rapid fall off of energy outside these limits. This paper compares several practical modulation waveforms with regard to how well they meet these constraints. The modulation waveform affects the spectral characteristics both within the signal band and outside it. Sinusoidal modulation provides very steep skirts at the band edges but somewhat non-uniform energy distribution within the band. Triangular and ramp modulation improves uniformity within the band at the expense of shallower skirt slopes. Square wave modulation provides neither uniform energy distribution within the band nor steep skirt slopes. The skirt slope is required to be steeper than the maximum audiogram slope likely to be encountered. Both sinusoidal and triangular modulation meet this requirement but triangular modulation is preferred because of its more uniform energy distribution within the band. Square wave and ramp modulation are not suitable for use in audiometric warble tone generators. (5 refs.)

115888 Acoustic notch filters for hearing aids. J.Macrae (Nat. Acoustic Labs., Sydney, NSW, Australia). *Aust. J. Audiol. (Australia)*, vol.4, no.2, p.71-6 (Nov. 1982). [received: Sept. 1983]

Hearing losses with normal hearing in a narrow band centred on one of the higher frequencies should be fitted with hearing aids which contain a notch filter centred on the region of good hearing. A closed branch tube or a Helmholtz resonator incorporated into the sound channel of the hearing aid will act as an acoustic notch filter. Equations are given for calculating appropriate dimensions and damping for a branch tube or Helmholtz resonator from the centre frequency, bandwidth and depth of the required notch in the hearing aid response. Measurements revealed that the actual effects of a closed branch tube or Helmholtz resonator differ slightly from the calculated effects, as a result of the acoustical interaction of the branch tube or resonator with other components of the sound channel, but allowance can be made for the discrepancies. The branch tube is preferable to the Helmholtz resonator for notches at the higher frequencies, while the Helmholtz resonator is the better to use for notches at the lower frequencies. (2 refs.)

115889 Standardized function test for audiometers in the audiological prophylaxis as part of occupational medicine in accordance with principle 20. B.H.Pfeiffer. *Audiol. Akust. (Germany)*, vol.22, no.5, p.150-8 (Sept.-Oct. 1983). In German, English.

The following topics in the title subject are considered: purpose and application; the minimum program for audiometer function tests; subjective audiometer checking by the user; additional tests of air-conduction equipment; checking the bone-conduction system. (12 refs.)

115890 Effect of half-wavelength membranes on the axial resolution of real-time ultrasonic scanners. J.Ophir, P.A.Narayana (Dept. of Radiology, Univ. of Texas Medical School, Houston, TX, USA).

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.687-90 (Sept. 1983). The effect of interposing a half-wavelength membrane between the transducer and the load in mechanically sectioned ultrasonic scanners was investigated. In particular, the effects of impedance mismatch and detuning on broadband spectra were theoretically and experimentally studied. These studies indicate that for certain common cases, a bandwidth reduction of 20%-30% can be anticipated, resulting in a proportional decrease in the axial resolution. (8 refs.)

115891 Electronic sector-scanning crosssectional echocardiograph, model SSH-40A. S.Sato, T.Ito (Toshiba Corp., Kawasaki, Japan).

Toshiba Rev. (Int. Ed.) (Japan), no.143, p.27-30 (Spring 1983). This equipment is a cardiac sector and linear electronic scanning ultrasound diagnostic system. It incorporates a newly developed high frequency phase array probe and a microcomputerized multifunctional digital scan processor (DSP). By virtue of the DSP, ultrasound echoes can be directly converted into TV signals, thus allowing tomographic images to be displayed on a TV monitor. In addition, a combination of a tomographic image and up to two channels of M-mode waveforms can be displayed simultaneously on the same screen. If a doppler unit is added into the configuration, a combination of tomographic image, M-mode and doppler information can be displayed. Basic ventricular function calculations are made possible by measuring diastolic and systolic parameters on the displayed cardiac image. Dual cardiac synchronization and slow-motion triggering on the tomographic image facilitate heart movement observations at any cardiac phase. (3 refs.)

115892 Three-dimensional imaging in ultrasound. J.F.Greenleaf (Dept. of Physiology & Biophys., Mayo Found., Rochester, MN, USA).

Proceedings of the Fifteenth Hawaii International Conference on System Sciences 1982, Honolulu, HI, USA, 6-8 Jan. 1982 (HI, USA: Hawaii Int. Conference Syst. Sci. 1982), p.425-34 vol.2

Ultrasonic three-dimensional images are accomplished by 'stacking' B-scan tomograms or ultrasonic CAT scans with a computer algorithm for subsequent perspective or sectional display. Perspective images of surfaces representing Doppler measurements of fluid velocity are illustrated in combination with iso-velocity contours for flows through a flexible tube in vitro. Iso-speed contours calculated from a dynamically moving epicardial surface

are mapped onto the heart surface illustrating the combination of quantitative parametric data with a qualitative surface display. The efficacy of three-dimensional displays for increasing the information density and comprehensibility of ultrasonic data sets is discussed. (13 refs.)

115893 Light sources for fluorescein fluorophotometry. J.W.McLaren, R.F.Brubaker (Ophthalmology Dept., Mayo Found., Rochester, MN, USA).

Appl. Opt. (USA), vol.22, no.18, p.2897-905 (15 Sept. 1983). Seven light sources were considered as excitation sources for ocular fluorescein fluorophotometry: tungsten, xenon flash, the continuous high pressure short arc lamps of xenon, xenon zinc iodide and mercury, and argon and He-Cd lasers. Each source was evaluated on the basis of its spectral match to the fluorescein absorption spectrum and dissimilarity to the ocular blue light hazard function. Light from the argon laser was found to be most suitable while light from the mercury arc and He-Cd laser was least. Each source was also evaluated on the basis of irradiance available at the cornea when used with a Zeiss slit lamp that had been converted to an ocular fluorophotometer. (19 refs.)

115894 Methods of proportioning the quantity and density of laser radiation for therapeutic action. V.I.Pronin, G.F.Fedotkin, V.F.Evmenov. *Med. Radiol. (USSR)*, vol.28, no.5, p.72-4 (May 1983). In Russian.

The use of medical laser installation 'Impulse-I' allows control of quantity and density of laser radiation for therapeutic treatment of neoplasms of the skin, with reduction of time to $2/3$ without damage to the quality of radiation. The method of proportioning quantity and density is simple, accurate and reliable, and makes the work of the doctor easier. (4 refs.) *D.E.P.*

115895 Medical NMR spectroscopy and introscopy: progress and prospects. A.F.Tsy', G.A.Zedgenidze, O.N.Denisenko, O.V.Nestaiko, V.I.Slesarev.

Med. Radiol. (USSR), vol.28, no.6, p.86-94 (June 1983). In Russian. Describes results from NMR spectroscopy on normal and on pathological tissue. Basic principles of NMR introscopy are given, followed by use in clinical practice. Results of X-ray computed tomography and NMR tomography on brain and infarcted liver are compared. (52 refs.) *D.E.P.*

115896 A microwave radiometer for medical applications. S.Osterrieder, G.Schaller (Inst. fur Hochfrequenztech., Univ. Erlangen-Nurnberg, Erlangen, Germany).

Frequenz (Germany), vol.37, no.1, p.7-12 (Jan. 1983). In German. [received: Aug. 1983]

A microwave radiometer for the determination of the temperatures of the human body is presented. Starting from known procedures, a method is described in which an output signal is obtained which is proportional to the temperature of the object being measured and independent of mismatches of the antenna. Simultaneously, as a measure of the match of the antenna, a second signal is obtained which is independent of temperature. After a short description of the apparatus some results are given; with the 4 GHz radiometer a resolution better than 0.1K for the temperature at a response time smaller than 0.5 s could be achieved. (4 refs.)

115897 The biomedical laser. Y.Sakurai.

Jpn. J. Med. Electron. & Biol. Eng. (Japan), vol.20, no.7, p.546-50 (Dec. 1982). In Japanese. [received: July 1983]

Applications of laser to medical instrumentation include lighting, spectrometry, laser interferometry, laser Doppler blood-flow measurements, stimulation threshold-value measurements, laser holography, laser flow microphotometry, cytofluorometry, and speckle patterning. For applications to therapy there are three methods: (1) stimulating the tissue of the body using continuous or pulsed milliwatt laser beams; (2) selectively destroying particular tissue using weak laser beams and special chemical substances; and (3) evaporating or excising tissue with high-energy laser beams. These are summarized in this review paper. (76 refs.) *K.B.*

115898 Ruby laser system with kaleidoscope for nevus treatment. T.Matozaki, M.Suzuki (Medical Equipment Div., Toshiba Corp., Tokyo, Japan), R.Tanino.

Jpn. J. Med. Electron. & Biol. Eng. (Japan), vol.21, no.2, p.114-20 (April 1983). In Japanese. [received: Sept. 1983]

Ruby laser radiation is effective in treating pigmented skin tumors, such as melanomas and nevus. The conventional ruby laser unit, however, is limited in practical use due to its uneven beam distribution over the target area. To overcome this problem the authors have developed a new ruby laser system utilizing a kaleidoscope as the application head. The spatial uniformity of the kaleidoscope output as well as its efficiency varies depending on the kaleidoscope length, reflection ratio, the incident beam spread angle, incident position, etc. Therefore, the kaleidoscope has excellent characteristics for the authors' purposes, when these parameters are set to proper values. The prototype model has an output energy of 20~40 J/cm² over a 10² mm irradiated area. The pulse interval is 1 msec. The spatial uniformity of the output intensity on the kaleidoscope output surface was found to be below 12%, which is close to simulated data. (8 refs.)

115899 Computer calculations of a one-dimensional model, useful in the application of hyperthermia. M.van-Sliedregt (Delft Univ. of Technol., Delft, Netherlands).

Microwave J. (USA), vol.26, no.6, p.113-26 (June 1983).

Discusses the development of a radiator suited for 27 MHz, consisting of a water-filled ridged waveguide, in which over a part of the cross-section (7x24 cm) the greatest power density is used. This has enabled the construction of an EM radiator for direct contact with the body. Using this 27 MHz radiator, a one-dimensional model has been developed for computing the temperature distribution as a function of place and time in the abdomen of a patient with a deep-seated tumor. The characteristics of this model are described. (7 refs.)

115900 Nuclear magnetic resonance: a gray scale model for head images. R.T.Droege, S.N.Wiener, M.S.Rzeszotarski, G.N.Holland, I.R.Young (Mount Sinai Medical Center, Cleveland, OH, USA).

Radiology (USA), vol.148, no.3, p.763-71 (Sept. 1983).

The gray scale of nuclear magnetic resonance (NMR) head images is explained in terms of tissue and machine parameters. Tissue parameters considered here include the spin-lattice relaxation time, the spin-spin relaxation time, and the proton density. Machine parameters include the pulse sequence (saturation recovery, inversion recovery, or spin echo), the repetition time, and the delay time. The ability of the operator to alter the NMR gray scale predictability is examined by computer simulation. The simulation computes NMR pixel values for a selected combination of tissue and machine parameters. The computed values are compared with those extracted from clinical NMR images. The agreement between simulation and clinical pixel values implies that the operator can use the machine parameters to alter the NMR gray scale, and thereby control contrast, appropriate to the diagnostic requirements. The extent to which the NMR gray scale can be predictably controlled is illustrated through graphs, simulated contrast displays, and representative NMR images. (8 refs.)

115901 NMR zeugmatographic imaging in medicine. P.C.Lauterbur (Dept. of Chem. & Radiology, State Univ. of New York, Stony Brook, NY, USA).

Proceedings of the Fifteenth Hawaii International Conference on System Sciences 1982, Honolulu, HI, USA, 6-8 Jan. 1982 (HI, USA: Hawaii Int. Conference Syst. Sci. 1982), p.435-9 vol.2

The history of the application of nuclear magnetic resonance techniques to biology and medicine is outlined, and the fundamental principles and certain techniques of nuclear magnetic resonance zeugmatographic imaging are described, with emphasis on true three-dimensional reconstruction methods. 115902 The prospects of instrumentation in medical radiology and problems of clinical dosimetry. E.A.Zherbin.

Med. Radiol. (USSR), vol.28, no.6, p.3-5 (June 1983). In Russian.

There is a rapid increase in technical provisions for medical diagnostics and treatment of illnesses. Medical radiology is at present the most engineered branch of practical public health. (3 refs.) D.E.P.

115903 Special purpose CT-system for quantitative bone evaluations in the appendicular skeleton. B.Stebler, P.Rueggsegger (Inst. für Biomedizinische Tech., Univ. Zurich, Zurich, Switzerland).

Biomed. Tech. (Germany), vol.28, no.9, p.196-205 (Sept. 1983). In German.

Presents a computed tomography system which has been specially developed to determine the bone density of human extremities. High precision and low radiation dose were the primary goals of the development. It is with respect to these aspects that the authors describe the system, including mechanical construction, X-ray generation and detection, data-acquisition and processing, and evaluation of the CT-images. The system is based on a second-generation translation/rotation scanner. It is controlled by a microcomputer, which on the one hand ensures interactivity between user and system, and on the other permits high flexibility in the adjustment of system parameters to the given measuring conditions. Fast slave processors permit on-line image reconstruction, and thus the immediate availability of the measurement. The computed CT-images are stored in a digital display memory and visualized on a commercial TV monitor. The quantitative evaluation of trabecular and cortical bone is done off-line after completing the investigation. (10 refs.)

115904 Analysis of a camera based SPECT system. J.W.Beck (Bell Labs., Whippany, NJ, USA).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.415-36 (1 Aug. 1983).

A Monte Carlo computer simulation has been developed to study the emission and transport of gamma radiation through tissue phantoms. The unique features of this research include the development of computed tomographic geometry particular to the SPECT simulation, application of variance reduction techniques, and development of an energy dependent weighting function that reduces the degrading effects of scatter and attenuation while decreasing the measurement time for a given diagnostic study. In addition, the computer simulation is used to illustrate and evaluate other methods of improving image quality. (41 refs.)

115905 The spectral shape and the components of the background in vivo neutron capture prompt gamma ray analysis [of human beings]. D.Vartsky, K.J.Ellis, L.Wielopolski, S.H.Cohn (Medical Res. Centre, Brookhaven Nat. Lab., Upton, NY, USA).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.213, no.2-3, p.437-46 (1 Aug. 1983).

The shape of the background spectrum and the different contributions to the background in vivo neutrons capture prompt gamma ray analysis have been studied using a ²²⁵Cf neutron source. Since the source of background and its contribution varies for different energy regions, the detector shielding and the facility construction materials may be different for each analysed element. Limits of detection for in vivo measurement of Hg, Ca and N were determined. (21 refs.)

115906 Quantitative microfocal radiography in medicine, biological research, and the quality control industry. J.C.Buckland-Wright (Dept. of Anatomy, Guy's Hospital Medical School, London, England).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.368, p.9-16 (1983). [received: Sept. 1983] (SPIE Proceedings on Microscopy Techniques and Capabilities, London, England, 21-22 Sept. 1982).

The microfocal X-ray units have an extremely small X-ray source (5-15 μ m diameter) achieved by focusing an electron beam onto the side of a solid target. High resolution magnification radiographs are obtained by placing the object close to the source and the recording surface at some distance away. The advantages of this type of X-ray are described as well as its applications in industry, biomedical research and medicine. The high resolution and magnification of the radiographs enable precise measurements to be carried out. (14 refs.)

115907 Automatic rib detection in chest radiographs. P.De Souza (IBM UK Sci. Centre, Winchester, England).

Comput. Vision, Graphics & Image Process. (USA), vol.23, no.2, p.129-61 (Aug. 1983).

A detailed algorithm is presented for automatic detection of posterior (dorsal) ribs in posterior/anterior chest radiographs. It is entirely automatic and includes algorithms for locating the lung fields and the lung boundary. Written in PL/I for an IBM 3031, it requires about 8 sec to process a 400×400 digitised full chest radiograph which is significantly faster than previously published results. The reason for the efficiency can be attributed to the fact that no two-dimensional image processing is performed; it works instead by locating the ribs on a small set of one-dimensional sections taken through the lung fields. Curves are then fitted through these locations to represent the rib edges. The detection of anterior (ventral) ribs is also discussed. (15 refs.)

115908 A new angiographic equipment with indirect 100-mm film exposure combined with digital subtraction unit (DSA): first clinical results. K.Feldt-Rasmussen, J.Praestholm, G.Niepel (Radiological Dept., Bispebjerg Hospital, Copenhagen, Denmark).

Electromedica (Germany), vol.51, no.3, p.86-92 (1983).

COMPATIX A, first as a prototype and then in operation as a serial product since February 1980, has, in the meantime, completed a substantial trial period. A total of 228 angiographies taken during the test period showed that this compact examination unit based on a 100-mm film indirect imaging technique with a SIRECON 33 N triplex was very versatile in angiography, for both general purpose and peripheral studies. The stepwise movable intensifier/X-ray tube combination obviously invited the mounting of the ANGIOTRON for the digital subtraction alternative. From June 1982, to January 1983 of a total of 922 patients examined with COMPATIX A 218 underwent digital subtraction either intravenously or intraarterially, supplementary to arteriography, with convincing results. (8 refs.)

115909 A universal angiographic set-up for any special investigation—practical experience and remarks. E.R.Briggs, A.G.Martin, G.Haufe (Haemodynamic Dept., Hospital Italiano, Mendoza, Argentina).

Electromedica (Germany), vol.51, no.3, p.92-6 (1983).

In 1980, the haemodynamic department of the Hospital Italiano in Mendoza, Argentina, a town of about one million inhabitants located 1100 kilometres to the west of Buenos Aires, was faced with a decision regarding the purchase of a new angiographic set-up. Since, on the one hand, the spatial and dimensional possibilities were limited while, on the other, the medical requirements were extremely high and wide-ranging, the authors needed a set-up that would cover all aspects of angiography without any restrictions. They made their choice in favour of a system concept which, on the basis of the selection and combination of the individual components permitted without restriction the performance of general haemodynamic examinations, cardangiography and coronary angiography, cerebral and visceral angiography and also the visualization of the peripheral blood vessels. (4 refs.)

115910 20 years of experience with the orthopantomograph. U.Hirschfelder (Polyclinic for Orthodontics, Univ. Hospital Erlangen-Nuremberg, Erlangen-Nuremberg, Germany).

Electromedica (Germany), vol.51, no.3, p.110-14 (1983).

The orthopantomograph provides an excellent radiological survey of the entire upper and lower jaws and dentition, including the ascending branch of the mandible and the temporo-mandibular joint on a single radiograph. As a result, it has become an indispensable aid for the establishment of findings and the planning of treatment in the field of orthodontics. After 20 years of experience with this radiographic procedure in the Polyclinic for Orthodontics of the University Hospital, Erlangen-Nuremberg, the indication of the orthopantomogram, in particular in this specialized field, is presented and discussed with respect to its economics. (25 refs.)

115911 Factors affecting radiation exposure and radiographic image contrast in urology. W.A.Wiatrowski (Audie L. Murphy Memorial Veterans Hospital, San Antonio, TX, USA), D.T.Kopp, D.W.Jordan, F.Barragan.

Health Phys. (GB), vol.45, no.3, p.599-605 (Sept. 1983).

An evaluation of certain radiographic factors affecting patient exposure during urography is made. Factors considered included selection of tube kilovoltage, total beam filtration and film-screen combination. The effect on image quality is considered. Experimental results suggest specific actions which would result in decreased patient exposure without compromising the quality of the examination. (8 refs.)

115912 Determination of left-ventricular volume from first-pass kinetics of labeled red cells. M.D.Harpen, R.L.Dubuisson, G.B.Head, III, L.F.Parmley, T.B.Jones, A.E.Robinson (Univ. of South Alabama Medical Center, Mobile, AL, USA).

J. Nucl. Med. (USA), vol.24, no.2, p.98-103 (Feb. 1983). [received: Sept. 1983]

A mathematical model is presented for the dynamics of a bolus of technetium-99m-labeled red blood cells through the left ventricle. It is used to correct for attenuation the count rate observed over the left ventricle during a conventional gated blood-pool study. The left-ventricular volumes are calculated from the corrected count rates and expressed as a percentage of total blood volume, or in absolute terms if a blood sample is obtained. The procedure was applied to a number of patients with nonvalvular cardiac disease. Cardiac volumes determined by the method were found to correlate well ($r=0.98$) with those determined by contrast left ventriculography. The method is simple, requires no special equipment, and can be applied with existing computer software. (18 refs.)

115913 Nuclear medicine. M.Iio.

Jpn. J. Med. Electron. & Biol. Eng. (Japan), vol.20, no.7, p.525-6 (Dec. 1982). In Japanese. [received: July 1983]

Continued resolution improvement has caused gamma-ray cameras to still dominate imaging applications in the field of nuclear medicine. In conjunction with these cameras, single-photon emission computed tomography (SPECT) enables one to obtain three-dimensional information from gamma rays. Future nuclear medicine may go towards the development of finer-pixel imaging, of drugs for use in SPECT, of selective radiotherapeutic treatment of tumours, and the utilization of polyclonal and monoclonal antibodies. (no refs.) K.B.

115914 Recent advances in medical imaging. T.A.Iinuma.

Jpn. J. Med. Electron. & Biol. Eng. (Japan), vol.20, no.7, p.527-31 (Dec. 1982). In Japanese. [received: July 1983]

According to the X-ray beam shape used, digital X-ray imaging can be classified as follows: (1) digital cone beam imaging, digital radiography and digital fluorography, which use cone beams; (2) digital fan beam scannography using fan beams; and (3) digital pencil beam scannography using pencil beams. The most developed imaging method is cone-beam imaging. Digital subtraction angiography (DSA) has achieved clinical importance in X-ray imaging practice. The technique is noninvasive because it involves only a venous injection, and thus allows angiography on an outpatient basis. DSA equipment can provide coronary images. Nuclear magnetic resonance diagnos-

tic imaging applications have reached the clinical evaluation stage. (9 refs.) K.B.

115915 Cancer and radiotherapy. VI. Present status of radiation therapy. H.Tsunemoto. *Jpn. J. Med. Electron. & Biol. Eng. (Japan)*, vol.21, no.1, p.36-47 (Feb. 1983). In Japanese.
For pt.V see ibid., vol.20, no.4, p.256, 1982. It has been known a long time that highly oxygenated cells can be easily destroyed by radiation. This is of particular importance for hypoxic tumor cells. This paper attempts to describe the present technology of radiotherapy and examines its future possibilities. The optical areas discussed include: (1) irradiation methods in radiotherapy; (2) clinical practice for laryngeal cancer, glioblastoma multiforme, esophagus cancer, digestive cancer, cervical cancer and radiation-resistant cancer; (3) the use of X-ray CT in planning for cancer treatment; and (4) some clinical trials for radiotherapy. (58 refs.) K.B.

115916 Three-dimensional reconstruction and display of coronary arteries obtained from coronary cineangiograms. M.Kaneko, M.Onoe (Inst. of Industrial Sci., Univ. of Tokyo, Tokyo, Japan), J.-I.Fujii, T.Aizawa, K.Kato. *Jpn. J. Med. Electron. & Biol. Eng. (Japan)*, vol.21, no.2, p.73-9 (April 1983). In Japanese. [received: Sept. 1983]
Digital image processing techniques are applied to the extraction of three-dimensional (3-D) information on coronary arteries from mutually orthogonal cineangiograms (e.g. RAO 30 degrees and LAO 60 degrees). Both cineangiograms are of the same scale factor and carefully registered in space. The registration in time is done by determining the end-diastole phase and the end-systole phase on the cineangiograms. The registration of left and right coronary arteries (LCA and RCA) is done by detecting a small intentional leak of contrast material so as to show both entrances of LCA and RCA. Corresponding points in RAO and LAO images are selected on a display and their 3-D coordinates are calculated. The 3-D structures of coronary arteries are approximated by lines which connect points thus obtained. Its view from any direction can be displayed. Branches are color coded to make the identification easy. A 16 mm film and a video tape are used to show the rotation of the 3-D structure around an arbitrary-axis. Stereoscopic pairs of arteries are also presented. These display techniques are quite effective in understanding the 3-D structure of coronary arteries. (5 refs.)

115917 Physical aspects of radiation therapy using fast electrons. W.Binder (Univ. Wien, Wien, Austria). *Roentgenpraxis (Germany)*, vol.36, no.6, p.210-17 (June 1983). In German.
There are at present three types of apparatus used in medicine for generating high energy electrons, i.e. the linear accelerator, the Betatron, and the Microtron. Depending on the original energy, an electron impinging on matter causes various effects, such as ionization, excitation, etc. These effects are schematically illustrated. Electrons of over 100 eV energy emitted as a result of ionization are delta particles, which according to the bicomponent theory by Wideroe, are responsible for biological changes in the tissue. The application of fast electrons in radiation treatment of tumors and the physical effects of such treatment are extensively discussed. The problem of suitable doses of energy applied and absorbed by the subject is dealt with and attention is drawn to problems which could arise as a result of inhomogeneities in the irradiated matter. (9 refs.) G.R.S.

115918 Computed radiography utilizing scanning laser stimulated luminescence. M.Sonoda, M.Takano, J.Miyahara, H.Kato. *Radiology (USA)*, vol.148, no.3, p.833-8 (Sept. 1983).
A new system of computed radiography that is based on new concepts and the latest computer technologies has been developed. This system eliminates the drawbacks of conventional screen-film radiography. The basis principle of the system is the conversion of the X-ray energy pattern into digital signals utilizing scanning laser stimulated luminescence. (7 refs.)

115919 Reconstruction algorithms for nonstandard CT scanner designs. G.T.Herman (Dept. of Radiology, Univ. of Pennsylvania, Philadelphia, PA, USA).
Proceedings of the Fifteenth Hawaii International Conference on System Sciences 1982, Honolulu, HI, USA, 6-8 Jan. 1982 (HI, USA: Hawaii Int. Conference Syst. Sci. 1982), p.410-19 vol.2
Data collected by a CT scanner provide estimates of line integrals of the X-ray attenuation distribution in a cross-section of the human body. The lines along which integrals are collected are determined by the positions of the source-detector pairs during the data collection. Since only the lines are important (and not the positions of the source and the detector on the line) essentially the same data may be collected by scanners of very different design. This article illustrates that in certain situations the problem of reconstruction from data collected by a CT scanner of a new (and nonstandard) design can be 'reduced' to the problem of reconstruction from data collected by a CT scanner for which the problem has already been solved. The 'reduction' involves identifying values of free parameters in the old design (such as the radius of the circle in which the source rotates) which would make the geometry of data collection essentially identical to that of the proposed new design. Since reconstruction algorithms for the old design already exist, they can be applied without any change to the data collected by the new scanner. In other words, the problem of finding a reconstruction algorithm for a non-standard mode of data collection can sometimes be solved by describing a (virtual) machine of standard design whose reconstruction algorithms are immediately applicable to the data collected by the nonstandard machine. The method is demonstrated on a recently proposed concept for transforming a radiotherapy simulator into a CT scanner. (10 refs.)

115920 Positron emission tomography (PET). M.M.Ter-Pogossian (Edward Mallinckrodt Inst. of Radiology, Washington Univ. School of Medicine, St. Louis, MO, USA).
Proceedings of the Fifteenth Hawaii International Conference on System Sciences 1982, Honolulu, HI, USA, 6-8 Jan. 1982 (HI, USA: Hawaii Int. Conference Syst. Sci. 1982), p.420-4 vol.2
Positron emission tomography, often referred to by its acronym 'PET', is an emerging radiologic modality which yields transverse tomographic images of functioning organs in the human body. The image forming variable in PET is the spatial distribution of a positron-emitting radionuclide which is systemically administered to the patient under study incorporated into a selected radioactively labelled compound. The premise which provides the foundation for the usefulness of PET is that any form of physiological activity results from, or is accompanied by, biochemical changes and that pathology is characterised by the divergence of such biochemical changes from the norm. The goal of PET is to study in vivo, regionally, and noninvasively biochemical processes essential to the normal function of human organs with the purpose of understanding better the relationship between their function and the biochemical processes upon which these functions depend and to extend this knowledge to the understanding and diagnosis of pathology. (7 refs.)

87.60M Radiation dosimetry

115921 Dosimetry of X-ray and gamma-ray beams for radiation therapy in the energy range 10 keV to 50 MeV. Recommendation of the National Council on Radiation Protection and Measurement. NRC Report No.69. Washington, USA. M.Sh.Vainberg. <i>Med. Radiol. (USSR)</i> , vol.28, no.5, p.66-70 (May 1983). In Russian. The content of Report 69 is as follows. A summary is given of the most important radiation quantities and dosimetric methods. Brief information is presented on national (or primary standards) of radiation units and measurement systems from the USA National Bureau of Standards. Secondary standards of radiation units and the work of regional calibrating laboratories are dealt with. Instruments used for routine measurements on radiation apparatus and sources of ionising radiation. Material which is very valuable for practical work in radiation therapy is presented. Errors in determining absorption doses are discussed. It is concluded that Report 69 may serve as a prototype for creation of similar instruction manuals for USSR standards in the field of radiation therapy. (4 refs.) D.E.P.	
115922 Experiment in the use of thermoluminescent dosimeter IKS-A in therapeutic practice. I.A.Karpova. <i>Med. Radiol. (USSR)</i> , vol.28, no.5, p.75-7 (May 1983). In Russian. The thermoluminescent dosimeter IKS-A allows determination, with accuracy of 10%, of skin doses during irradiation of patients. Dose fields can be determined at 3-8 mm distances from the axis of the source, permitting determination of the degree of unevenness of irradiation of tissues next to the source. One can determine the position of the source for intracavitary phantom irradiation, which leads to more accurate calculation of doses. IKS-A instruments should be used more widely in oncological clinics, and their repair and testing should be organised on a wider scale. (4 refs.) D.E.P.	
115923 Contribution of γ-radiation to the dose absorbed, and some radiation effects in a radiation field p(50 MeV)—Be. V.N.Bukanov, Yu.F.Kataevsky, V.M.Indyk, E.E.Chebotaev, N.A.Tkachenko (R.E. Kavetsky Inst. of Oncology Problems, Acad. of Sci., Kiev, Ukrainian SSR). <i>Radiobiologiya (USSR)</i> , vol.23, no.4, p.565-8 (1983). In Russian. The contribution of γ -radiation to the total dose absorbed in the radiation field formed during 50 MeV proton bombardment of a beryllium target has been determined. A study was made of the biological effectiveness of the action of mixed γ /neutron-radiation on albino mongrel and inbred (C57 black) female mice. (6 refs.)	
115924 Three-dimensional beam scanning for proton therapy. T.Kanai, K.Kawachi, H.Matsuzawa (Div. of Phys., Nat. Inst. of Radiological Sci., Chiba-shi, Japan), T.Inada. <i>Nucl. Instrum. & Methods Phys. Res. (Netherlands)</i> , vol.214, no.2-3, p.491-6 (1 Sept. 1983). An important goal of radiation therapy is to localize the dose in the target volume. The favorable properties of proton beams, such as a well-determined range and straight penetration through tissues, have been used to develop a three-dimensional beam scanning method. This system consists of a two-dimensional beam scanning system and an energy degrader of variable thickness which are both controlled by a beam monitor that is connected to a minicomputer. A typically conformed dose distribution with the three-dimensional beam scanning system was measured by a specially designed multiwire ionization chamber. The results have shown that the system works satisfactorily and considerably reduces the radiation dose outside the target volume. (9 refs.)	
115925 Tunneling afterglow and anomalous fading in dosimetry with $\text{CaSO}_4\text{:Dy}$. R.Visocekas, M.Ouchene (Lab. d'Optique de la Matière Condensée, Univ. Pierre et Marie Curie, Paris, France), B.Gallois. <i>Nucl. Instrum. & Methods Phys. Res. (Netherlands)</i> , vol.214, no.2-3, p.553-5 (1 Sept. 1983). In irradiated $\text{CaSO}_4\text{:Dy}$ a low temperature tunneling afterglow is observed. This causes some anomalous fading of the stored thermoluminescence, which is evaluated to be negligible in dosimetry. (13 refs.)	
115926 Methods of treatment planning for therapy with irregular fields—a comparison of two methods of dose computation. G.H.Hartmann, H.Scharfenberg, W.Schlegel, R.Thieme (German Cancer Res. Center Heidelberg, Heidelberg, Germany). <i>Electromedica (Germany)</i> , vol.51, no.3, p.107-10 (1983). The treatment planning system, SIDOS, incorporates a method, suggested by Wrede (1972), for calculating the dose in irregular fields. Later, a method described by Clarkson (1941), has also become available for use with this system. The results of dose computation using these methods are compared with direct measurements made at various points in a mantle field. The investigations showed that the computations carried out with the method described by Clarkson resulted in an improvement in the unblocked area. Here, deviations from the measured doses varied between -3% and +1%, while figures of between -3% and +6% were found with the method suggested by Wrede. (9 refs.)	
115927 Recent muon fluence measurements at Fermilab. J.D.Cossairt (Fermilab., Batavia, IL, USA). <i>Health Phys. (GB)</i> , vol.45, no.3, p.651-8 (Sept. 1983). Muon fields at Fermilab were measured during 1980-1 using a Mobile Environmental Radiation Laboratory (MERL). During the spring of 1980, measurements were made with the accelerator operating at 350 GeV; in the spring of 1981, measurements were made at 400 GeV. The measurements were used to obtain an understanding of muon dose-equivalent rates at various locations both on and off the Fermilab site. These were found to be less	

than 1 mrem/yr at any given location. The data indicate that more severe problems may be encountered during operations of the 1000 GeV accelerator presently being installed. (8 refs.)

115928 Dose-rate conversion factors for external exposure to photons and electrons. D.C.Kocher (Health & Safety Res. Div., Oak Ridge Nat. Lab., Oak Ridge, TN, USA).

Health Phys. (GB), vol.45, no.3, p.665-86 (Sept. 1983).

Dose-rate conversion factors for external exposure to photons and electrons have been calculated for approx. 500 radionuclides of potential importance in environmental radiological assessments. The three exposure modes considered are immersion in contaminated air, immersion in contaminated water, and irradiation at a height of 1 m above a contaminated ground surface. For each exposure mode, the source region is assumed to be effectively semi-infinite or infinite in extent with uniform radionuclide concentration. The dose-rate factors then give external dose-equivalent rates per unit radionuclide concentration in air, in water or on the ground surface. The results are tabulated in this paper in the form of effective dose-rate factors based on the definition of the effective dose equivalent given in ICRP Publication 26 (1977). The effective dose-rate factors are obtained from photon dose-rate factors for 23 separate body organs and electron dose-rate factors for skin calculated with the revised DOSFACTER computer code. In addition to presenting the dose-rate factor equations and the tabulated results, this paper emphasizes the assumptions underlying the calculations for each exposure mode, differences between the organ dose-rate factors for photons used here and those used previously with the original version of the DOSFACTER code Kocher, 1980, and limitations inherent in application of the idealized external dose-rate factors to realistic environmental radiological assessments. (41 refs.)

115929 Statistical procedures for assignments of upper bounds for radiation doses to an unbadged individual in a group for which some individuals are badged. R.C.Grimson, L.A.Kammerman (Dept. of Biostatistics, Univ. of North Carolina, Chapel Hill, NC, USA), J.Soukup.

Health Phys. (GB), vol.45, no.3, p.723-9 (Sept. 1983).

Consider a group of individuals exposed to radiation for an interval of time such as units of military personnel during nuclear weapons tests three and four decades ago. Often, dosimetry information is known for several, but not all, individuals of that group. A nonparametric procedure is described that gives probability-based, upper-bound estimates of doses for an unbadged individual (within the group) for whom dose information is required; such information is useful in litigation. The method is illustrated by an application to a Navy unit. (18 refs.)

115930 Radiation exposure of the respiratory tract and associated carcinogenic risk due to inhaled radon daughters. F.Steinhauser, W.Hofmann, E.Pohl, J.Pohl-Ruling (Div. of Biophys., Univ. of Salzburg, Salzburg, Austria).

Health Phys. (GB), vol.45, no.2, p.331-7 (Aug. 1983).

The atmospheric content of radon and its decay products contributes significantly to the radiation exposure of man even in the normal environment. The risk for lung cancer induction associated with normal exposure to natural radionuclides is assessed in Salzburg, Austria. Altogether more than a thousand rooms have been investigated by using combined radon grab-sampling methods together with continuous measurements of radon and daughters at different control stations. Dose calculations were carried out for 729 demographically selected test persons, considering individual differences in age, sex and life-style and atmospheric nuclide concentrations at different sites. Using a specially developed age-dependent lung model, the dose frequency distribution of the absorbed dose to the basal cells of the bronchial epithelium could be evaluated for the population of Salzburg. Dose modifications caused by anatomical and physiological variabilities as well as microdosimetric considerations of the stochastic events during energy deposition result in a significantly increased dispersion of the dose histogram. (15 refs.)

115931 Concentrations of radon and its progeny in the rooms of Polish spas. W.Chruscielowski, T.Domanski, W.Orzechowski (Inst. of Occupational Medicine, Lodz, Poland).

Health Phys. (GB), vol.45, no.2, p.421-4 (Aug. 1983).

Radon concentrations and radon-daughter exposures of workers have been determined in three Polish spas where radon is used as a therapeutic agent. A wide range of values for both parameters was observed during the late 1970s, with some exposures above the annual limit of 3.5 WLM, particularly among technical personnel at a spa using uranium ore as a source. A downward trend in these exposures in recent years reflects the effect of improved practices. (9 refs.)

(inc. radiation monitoring)

115932 RF radiation hazards—measurement and evaluation. A.Schwartz (Narda Microwave Corp., Hauppauge, NY, USA).

R.F. Des. (USA), vol.6, no.4, p.12-22 (July-Aug. 1983).

Discusses the standard (C95.1-1982) that recognizes the physical phenomena which impact exposure level by providing a frequency dependent Radio Frequency Protection Guide, and by explicitly requiring the separate determination of both electric and magnetic field strength in near field situations. A large number of emitters previously exempt have now been included. Below 300 MHz, separate electric and magnetic field measurements should be made. Above 300 MHz, electric field measurements alone are normally adequate. For multiple signal situations where the signals occupy frequency intervals with different RFPG levels there are sensors which automatically incorporate the frequency dependence of the RFPG into their readings. (no refs.)

115933 Optimum conditions for protecting the eyes from solar radiation in vision correction. Kh.M.Kaiyumov (Medoborudovanie Cooperative, Moscow, USSR).

Biomed. Eng. (USA), vol.16, no.6, p.206-9 (Nov.-Dec. 1982). Translation of: *Med. Tekh. (USSR)*, vol.16, no.6, p.39-42 (Nov.-Dec. 1982).

The performance of protective correcting lenses under laboratory conditions was estimated by means of a special instrument with interchangeable filters. A number of conclusions are drawn which should be useful to those designing and making protective spectacles. (1 ref.)

115934 Indoor radon measurements in New Jersey, New York and Pennsylvania. A.C.George (Environmental Measurements Lab., US DOE, New York, NY, USA), J.Eng.

Health Phys. (GB), vol.45, no.2, p.397-400 (Aug. 1983).

The distribution of ^{222}Rn concentrations in 33 buildings near Canonsburg, PA, Lewiston, NY and Middlesex, NJ was investigated over a 2-yr period. One or 2 week-long time-integrated measurements of radon concentration, repeated several times during the study period, were obtained in the living and working areas of the buildings. Average air concentrations of radon, measured over the study period, varied from 0.32 to 4.5 pCi/l. among the buildings, but in only one building did the annual radon concentration exceed the US Nuclear Regulatory Commission's limit of 3 pCi/l. for continuous exposure in uncontrolled areas. 115935 Levels of ^{234}U , ^{238}U and ^{230}Th in excreta of uranium mill crushermen. D.R.Fisher, P.O.Jackson, G.G.Brodaczynski, R.I.Scherpelz (Radiological Sci. Dept., Battelle Pacific Northwest Lab., Richland, WA, USA).

Health Phys. (GB), vol.45, no.3, p.617-29 (Sept. 1983).

Describes a research program to measure uranium and thorium levels in excreta of uranium mill crushermen who are routinely exposed to airborne uranium ore dust. The purpose of this work was to determine whether ^{230}Th was preferentially retained in the body over either ^{234}U or ^{238}U . Urine and fecal samples were obtained from 14 active crushermen with long histories of exposure to uranium ore dust, plus four retired crushermen and three control individuals for comparison. Radiochemical procedures were used to separate out the uranium and thorium fractions which were then electroplated on stainless steel discs and assayed by α spectrometry. Significantly greater activity levels of ^{234}U and ^{238}U were measured in both urine and fecal samples obtained from uranium mill crushermen, indicating that uranium in the inhaled ore dust was cleared from the body with a shorter biological half-time than the daughter product ^{230}Th . The measurements also indicated that uranium and thorium separate in vivo and have distinctly different metabolic pathways and transfer rates in the body. (6 refs.)

115936 ^{90}Sr and ^{137}Cs in soil and biota of fallout areas in southern Nevada and Utah. E.M.Romney, R.G.Lindberg, J.E.Kinnear, R.A.Wood (Lab. of Biomedical & Environmental Sci., Univ. of California, Los Angeles, CA, USA).

Health Phys. (GB), vol.45, no.3, p.643-50 (Sept. 1983).

Measurements of ^{90}Sr and ^{137}Cs in soil, vegetation and small mammals were made periodically at sites in southern Nevada and Utah that were contaminated by radioactive fallout from nuclear detonations at the Nevada Test Site as well as from global sources. Results from a survey in 1980 indicate that both of these fallout-derived radionuclides have remained primarily within the top 5-cm layer of undisturbed soil in these arid land areas. Trace amounts of ^{90}Sr and ^{137}Cs were measured in soil and biota samples. The ^{90}Sr concentrations in jackrabbit and rodent bone samples in 1980 varied within the range of 2-8 pCi/g ash (equivalent to 0.4-1.6 pCi/g wet bone or 5-20 pCi/g Ca). The ^{137}Cs concentrations in muscle-tissue samples were generally less than 1.5 pCi/g ash (less than 0.045 pCi/g wet muscle). Comparisons of data obtained periodically since the early 1950s show that measured concentrations of ^{90}Sr

in bone tissues have been highly variable in trace amounts, and that the concentration attenuation appears to be following radioactive decay of this radionuclide. (30 refs.)

115937 Biological elimination rates of radioisotopes by mallards contaminated at a liquid radioactive waste disposal area. D.K.Halford, O.D.Markham (Radiological & Environmental Sci. Lab., US Dept. of Energy, Idaho Falls, ID, USA), G.C.White.

Health Phys. (GB), vol.45, no.3, p.745-56 (Sept. 1983).
The biological elimination of nine γ -emitting radioisotopes was studied in mallards (*Anas platyrhynchos*) which were released onto liquid radioactive waste ponds in southeastern Idaho. After 68, 75 or 145 days, the ducks were removed from the contaminated environment and placed in metabolic cages. Whole-body and feces-urine counts were made for 51 days and then the ducks were sacrificed and dissected for tissue analyses. The biological elimination of radioisotopes were fitted to two compartment models using nonlinear least squares estimation. Fecal-urine data substantiated two-compartment elimination of all radionuclides. Biological half-lives in mallards were 10 days (^{131}I), 22 days (^{140}Ba), 86 days (^{51}Cr), 32 days (^{58}Co), 26 days (^{75}Se), 67 days (^{65}Zn), 10 days (^{134}Cs), 67 days (^{60}Co) and 11 days (^{137}Cs). Contaminated waterfowl would receive most of the internal dose in the first month after leaving the contaminated environment indicating that long-term doses would be inconsequential. (28 refs.)

115938 Indoor radiation exposures from ^{222}Rn and its daughters: a view of the issue. A.V.Nero (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

Health Phys. (GB), vol.45, no.2, p.277-88 (Aug. 1983).
Exposure to ^{222}Rn daughters indoors can result in significant risk to the general public, particularly those living in homes with much higher than average concentrations. The author reviews what is known about indoor concentrations, associated risks, and the effect of measures to save energy by reducing ventilation rates, using US housing as an example. The author concludes that, by employing appropriate control measures in homes having unacceptably high concentrations, the average exposure (and therefore risk) of the general public can remain at its present level, or even decrease, despite programs to save energy by tightening homes. (29 refs.)

115939 Background atmospheric ^{222}Rn concentrations outdoors and indoors: a review. T.F.Gesell (Univ. of Texas Health Sci. Center, Houston, TX, USA).

Health Phys. (GB), vol.45, no.2, p.289-302 (Aug. 1983).
The sources of outdoor and indoor atmospheric radon are examined. The variation of outdoor atmospheric radon with time of day, time of year, altitude and geographic location is quantitatively assessed. Average values of outdoor atmospheric radon concentrations are examined and it is estimated that the mean value for normal areas of the contiguous United States lies in the range of 100-400 pCi/m³ and is probably about 250 pCi/m³. Values for Alaska and Hawaii are an order of magnitude lower. Indoor atmospheric radon concentrations are found to vary with time of day, geographic location and story above ground. (54 refs.)

115940 Airborne radionuclides and radiation in buildings: a review. A.V.Nero (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

Health Phys. (GB), vol.45, no.2, p.303-22 (Aug. 1983).
Reviews the literature on sources and measurement of natural airborne radionuclides and radiation in buildings. The author briefly reviews control measures and suggests areas for further research. The major emphasis is given to ^{222}Rn and its daughters, since they typically cause the largest organ dose to the general population, most of which arises from indoor exposures. The indoor radiation field from radionuclides fixed in building materials and soil is also given substantial treatment. (85 refs.)

115941 Radon daughter exposures in the UK. K.D.Cliff, A.D.Wrixon, B.M.R.Green, J.C.H.Miles (Nat. Radiological Protection Board, Chilton, Didcot, England).

Health Phys. (GB), vol.45, no.2, p.323-30 (Aug. 1983).
Exposure due to the inhalation of the short-lived daughters of ^{222}Rn is the single largest contributor to the exposure of the UK population. A survey of dwellings situated largely in the centres of population indicates an annual exposure of 0.16 WLM, on the average. On the basis of current knowledge this is equivalent to an annual effective dose equivalent of 800 μSv . This compares with the overall average of the effective dose equivalent from natural radiation of almost 1900 μSv in a year. The distribution of exposures to the short-lived daughters of ^{222}Rn is markedly skew and indicates that some dwellings support concentrations of these daughters leading to exposures in excess of 1 WLM in a year. The areas of the UK in which exposures above this level are most likely to occur are regions with enhanced uranium mineralisation. These areas are sparsely populated and high exposures here do not significantly affect the overall average exposure in one predominantly igneous region is reported. (36 refs.)

115942 Environmental radon and cancer correlations in Maine. C.T.Hess, C.V.Weiffenbach, S.A.Norton (Univ. of Maine, Orono, ME, USA).

Health Phys. (GB), vol.45, no.2, p.339-48 (Aug. 1983).
The distribution of ^{222}Rn has been measured in the sixteen counties of Maine, USA by liquid scintillation counting of water samples from more than two thousand public and private wells. Three hundred and fifty of these wells have been characterized for geology and hydrology. Airborne radon has been measured in seventy houses with grab samples and in eighteen houses for 5-7 days each with continuously recording diffusion-electrostatic radon detectors. Concentrations of radon in water ranged from 20 to 180000 pCi/l. Granite areas yielded the highest average levels ($\bar{x}=22100$ pCi/l., $n=136$), with considerably intra-granite variation. Metasedimentary rocks yielded levels characteristic of the lithology for metamorphic grades ranging from chlorite to andalusite. Sillimanite and higher-grade rocks yielded higher ^{222}Rn levels, probably due to the intrusion of uranium-bearing pegmatites in these terranes. Airborne ^{222}Rn in homes ranged from 0.05 to 210 pCi/l. At the high end of this range, doses will exceed recommended industrial limits. In some homes only a small fraction of the airborne ^{222}Rn was due to the water supply. (23 refs.)

115943 Indoor radon progeny exposure in the Florida phosphate mining region: a review. C.E.Roessler, G.S.Roessler, W.E.Bolch (Coll. of Engng., Univ. of Florida, Gainesville, FL, USA).

Health Phys. (GB), vol.45, no.2, p.389-96 (Aug. 1983).
Reviews the data generated in studies of land radioactivity and indoor airborne radon progeny associated with mined and reclaimed phosphate lands in Florida. Highest indoor radon progeny levels are associated with the slab-on-grade type of construction. Concentrations exceeding 0.03 WL are associated with overburden soils, deposits and fill, while concentrations up to about 0.03 WL are associated with tailings. The lower limit for distinguishing increases above non-enhanced natural concentrations is on the order of 0.01-0.02 WL. Results of this study show that about 25% of the land produced by present methods of mining and reclamation practices would require restric-

tions on the type of construction or would require special construction methods. It is projected that with modification of mining and tailings disposal practices, virtually all of the land produced by mining and reclamation would be satisfactory for unrestricted construction use. (6 refs.)

115944 Radon concentrations and infiltration rates measured in conventional and energy-efficient houses. A.V.Nero, M.L.Boegel, C.D.Hollowell, J.G.Ingersoll, W.W.Nazaroff (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA).

Health Phys. (GB), vol.45, no.2, p.401-5 (Aug. 1983).
To elucidate any connection between high radon concentrations and low-infiltration houses, the authors have concurrently measured the ^{222}Rn concentration and the infiltration rate in US houses. Three housing surveys have been undertaken: one in 'energy-efficient' houses located throughout the US and two in 'conventional' houses in the San Francisco area and in Maryland. In each of the groups surveyed, no clear correlation was observed between ^{222}Rn concentrations and infiltration rate, although each parameter varied over a wide range. Infiltration rates for the entire sample, numbering 98 houses, ranged between 0.02 and 1.6 air changes per hr, and ^{222}Rn concentrations ranged from 0.1 to 27 pCi/l. It appears that the major cause of the observed differences in ^{222}Rn concentration is variation from one house to another in the rate at which ^{222}Rn enters houses from its sources. (10 refs.)

115945 Indoor radon levels in the northeastern US: effects of energy-efficiency in homes. R.L.Fleischer, A.Mogro-Campero, L.G.Turner (General Electric Res. & Dev. Center, Schenectady, NY, USA).

Health Phys. (GB), vol.45, no.2, p.407-12 (Aug. 1983).
The expectation of elevated ^{222}Rn levels in modern homes that have low air interchange rates with the out-of-doors causes the authors to survey both solar and conventional homes in northeastern New York State. The solar homes as a group have three times the ^{222}Rn levels of the conventional homes, and specific problems exist that are introduced or exaggerated by modern construction. For example the highest two levels of radon in the solar homes give radiation doses over 30 yr that are known to produce lung cancer in 1% of uranium miners. Summer readings in more than half of the cases are different from winter ones by a factor of two or more, so that year-round measurements are necessary for precise dosimetry. The track etching technique is ideally suited for such measurements. (9 refs.)

115946 Radon and radon daughter measurements in solar buildings. A.C.George, E.O.Knutson, H.Franklin (Environmental Measurements Lab., US DOE, New York, NY, USA).

Health Phys. (GB), vol.45, no.2, p.413-20 (Aug. 1983).
Measurements of radon and radon daughters in 11 buildings in five states, using active or passive solar heating, showed no significant excess in concentrations over the levels measured in buildings with conventional heating systems. Radon levels in two buildings using rock storage in their active solar systems exceeded the US Nuclear Regulatory Commission's limit of 3 pCi/l. for continuous exposure in uncontrolled areas. In the remainder of the buildings, radon concentrations were found to be at levels considered to be normal. It appears that the slightly elevated indoor radon concentrations result from the local geological formations and from the tightening of the buildings rather than as a result of the solar heating technology. (15 refs.)

115947 Results of indoor radon measurements using the Track Etch method. H.W.Alter, R.A.Oswald (Terradex Corp., Walnut Creek, CA, USA).

Health Phys. (GB), vol.45, no.2, p.425-8 (Aug. 1983).
Summarizes the (rather startling) results of numerous indoor radon measurements made in the US, Canada and Sweden over the past year by means of Track Etch monitors. (12 refs.)

115948 Integrated radon data from dwellings in Maine and Texas. H.M.Prichard, T.F.Gesell (Univ. of Texas School of Public Health, Houston, TX, USA), C.T.Hess, C.Weiffenbach, P.Nyberg.

Health Phys. (GB), vol.45, no.2, p.428-32 (Aug. 1983).
Presents a preliminary analysis of surveys of ^{222}Rn in dwellings made in the summer and fall of 1980 in Houston, TX, and in the late fall and winter of 1980-1 in several communities in central Maine. Approximately 100 dwellings were surveyed in each area during the season when houses are most likely to be closed for the purpose of temperature control. The primary objectives of the surveys were to develop baseline data on the distribution of indoor radon concentrations in the two areas, to determine the extent of spatial variations within dwellings, to add to the understanding of source mechanisms and to evaluate the utility and practicality of a number of air sampling strategies. (6 refs.)

115949 Study of radon daughter concentrations in Polk and Hillsborough counties. W.B.Johnson, P.G.Bailey (Radiological Health Services, Dept. of Health, Orlando, FL, USA).

Health Phys. (GB), vol.45, no.2, p.432-5 (Aug. 1983).
Because U decay series are present in Florida phosphate ore deposits, structures built on reclaimed phosphate land have high Rn daughter levels. Measurements were made of γ exposure rates and working levels inside homes built on undisturbed-nonmineralized, undisturbed-mineralized and reclaimed land in Polk and Hillsborough counties. Track-etch and thermoluminescent dosimeters were deployed in homes. It was found that the average excess dose equivalent resulting from reclaimed land was below the NCRP limit but that the annual average excess exposure from Rn daughter inhalation on reclaimed land was more than 5 times the national average dose and a significant number of individuals receive lung doses which exceed NCRP recommended limits. 115950 Effect of the radiation factor on operator activity. B.I.Davydov, V.V.Antipov, I.B.Ushakov.

Cosmic Res. (USA), vol.20, no.6, p.660-70 (Nov.-Dec. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.6, p.928-40 (Nov.-Dec. 1982). [received: Sept. 1983]

Reviews papers on radiation psychophysiology. An evaluation of the psychophysiological possibilities for an irradiated person is given based on clinical observational data. Special attention has been allotted to an analysis of the behavioral effects for irradiated monkeys according to such tests as: irradiation and the retention of discrimination skills, the transfer of skills into new situations, delayed reactions, attention, manipulations with objects, etc. The dose and time laws governing these effects have been evaluated for dependence on the conditions of irradiation. The authors arrive at the conclusion that damage to a cosmonaut's operator activity can occur only at very high irradiation doses, the probability for the occurrence of which is extremely small even for very prolonged flights. (47 refs.)

115951 Non-invasive recording of human His-bundle activity using a newly designed device aided by a microcomputer. Quan Wei Lun, Ou Yang Jing Zheng.

Biomed. Tech. (Germany), vol.28, no.9, p.188-91 (Sept. 1983). In German. Describes a newly designed device for recording His-Purkinje activity in humans from the surface of the body, using signal averaging. The principal components of the equipment are a microcomputer and a special trigger circuit controlling the data flow. The method has proved to be extremely effective, even in the case of a complete AV-block. (7 refs.)

115952 Method of investigating muscle tone. A.A.Uten'kin, N.N.Kalinina, G.V.D'yachkova (Khirkiz Sci. Res. Inst. of Experimental & Clinical Orthopedics & Traumatology, USSR).

Biomed. Eng. (USA), vol.16, no.6, p.199-201 (Nov.-Dec. 1982). Translation of: *Med. Tekh. (USSR)*, vol.16, no.6, p.31-3 (Nov.-Dec. 1982).

Muscle tone is one of the principal parameters of muscle function. Instruments for measuring tone (myotonometers) differ in design and principle of action. An indicator of pointer type, with limits of measurement 0-10 mm and with a scale division of 0.01 mm (State Standard 577-68) is often used as the measuring element of the tonometer. This paper describes an analysis of the method of using the pointer-type indicator for myotonometry and gives the experimental basis for a scale of units for the measurement of muscle tone. (2 refs.)

115953 Biomedical telemetry: the formative years. R.S.MacKay (Boston Univ., Boston, MA, USA).

IEEE Eng. Med. & Biol. Mag. (USA), vol.2, no.1, p.11-17 (March 1983). [received: Sept. 1983]

The descriptions and examples presented suggest that, although it is not absolutely clear when biomedical telemetry started, the formative years are still in progress and are limited only by the imagination of the investigators using new technologies as they evolve. (32 refs.)

115954 Overview of biomedical telemetry techniques. D.C.Jeutter (Marquette Univ., Milwaukee, WI, USA).

IEEE Eng. Med. & Biol. Mag. (USA), vol.2, no.1, p.17-24 (March 1983). [received: Sept. 1983]

Biomedical telemetry has been around for about 30 years and has become a useful tool for obtaining restraint-free physiological data from a broad spectrum of animal species and of monitoring setting. The techniques described for biotelemetry circuit design and construction are now well established and it seems likely that future development will be in the further miniaturization and integration of biotelemetry and transducers, improved power sources, and improved packaging. (7 refs.)

115955 Foil electret transducer for blood pressure monitoring. J.E.West, I.J.Busch-Vishniac (Acoustics Res. Dept., Bell Labs., Murray Hill, NJ, USA), G.A.Harshfield, T.G.Pickering.

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.680-6 (Sept. 1983).

A foil electret microphone for use under the cuff of an automatic blood pressure monitoring system is described. The transducer is designed to operate with relatively flat sensitivity over a static pressure range of 40 to 250 mm Hg (5.33×10^4 to 3.33×10^5 dyn/cm²). The new electret microphone differs from conventional microphones used for airborne sound reception in two ways: (1) the diaphragm thickness is 50 μ m rather than the typical 12.5 or 25 μ m, and (2) the backplate contains a set of annular ridges spaced at 4 mm rather than the typical 7-10 mm. This microphone offers three advantages over the piezoelectric microphone now in use: (1) greater tolerance in positioning the microphone over the brachial artery, (2) nearly 20-dB higher sensitivity and signal-to-noise ratio, and (3) the ability to obtain measurements with the microphone placed midway between the elbow and shoulder. Tests of the new foil electret microphone in conjunction with the automatic blood pressure monitoring system indicate that the automatic and conventional measurements of systolic and diastolic blood pressure agree to within 5 mm Hg at least 90% of the time. In addition, the electret microphone is able to obtain automatic measurements on subjects with a wider range of ages and sizes. (15 refs.)

115956 Transducers. T.Togawa.

Jpn. J. Med. Electron. & Biol. Eng. (Japan), vol.20, no.7, p.516-18 (Dec. 1982). In Japanese. [received: July 1983]

Many attempts to develop new versions of transducers for biomedical applications have been made according to the need for more safety, long term instrumentation, suitability for signal processing, manageability, and productivity. This paper reviews recent advances in transducers for measuring pressure inside living organisms; in electromagnetic flowmeters, ultrasonic Doppler flowmeters, laser Doppler flowmeters, thermal flowmeters and plethysmographs for blood flow or velocity measurement; in transducers for body-surface strain and stress instrumentation; and in biochemical instrumentation transducers. (39 refs.) K.B.

115957 Electrocardiography. M.Okajima.

Jpn. J. Med. Electron. & Biol. Eng. (Japan), vol.20, no.7, p.522-4 (Dec. 1982). In Japanese. [received: July 1983]

It has been known for many years that a measurable amount of electric current is associated with activity of the heart. Inferring cardiac electrophysiological details from potentials measured on the body surface has flourished remarkably today. Widespread utilization of computers has led to significant advances in electrocardiography. An image recognition algorithm for electrocardiogram waves is now being developed. Automated routine elec-

trocardiogram diagnoses are top in popularity. Today's electrocardiographs are progressing from analog recording to digital recording. (no refs.) K.B.

115958 The recent trend of biomedical signal processing research. S.Kikawa, Y.Saitoh.

Jpn. J. Med. Electron. & Biol. Eng. (Japan), vol.20, no.7, p.536-40 (Dec. 1982). In Japanese. [received: July 1983]

Considerable research has been done on bioelectric signal processing, and a number of review papers has been written concerning it. In this paper, a brief outline is given of the signal processing research. Processing of electrocardiographic data has well been developed and includes data reduction, rhythm spectrum analysis and digital filtering. The analysis of brain waves has been carried out using predictive filters, autoregressive models, etc. For analyzing neural pulse waves, the nearest neighbor method and template matching method have been proposed. One of the central themes in myoelectric signal processing has been the search for optimal estimation applied to electromyography. (81 refs.) K.B.

115959 Information structure analysis of body surface potential maps. H.Tanaka, K.Hirayanagi, K.Yajima (Inst. of Medical Electronics, School of Medicine, Univ. of Tokyo, Tokyo, Japan), T.Furukawa.

Jpn. J. Med. Electron. & Biol. Eng. (Japan), vol.21, no.2, p.106-13 (April 1983). In Japanese. [received: Sept. 1983]

The information structure of body surface potential distributions has been analyzed according to the concepts of the Karhunen-Loeve transform and of information entropy. As a result of the Karhunen-Loeve transform, 10 components were extracted as the effective information patterns and their accumulated contribution rate was found to be 96.0%. The first three components resembled dipolar patterns and the other seven components showed complicated patterns. From entropy analysis, the simple information amount at each lead reached the maximum at 3.41 bits on the left precordial field. The specific information amount at each lead, free from the effect of correlation with the other leads, showed positive values only in the limited region of the left precordial field. The information amounts of all the leads totaled 10.33 bits. Based on the results of the information amount distribution, the authors propose a 3-electrode system which reduces the redundancy of the 96-electrode system. The 30-electrode system could explain 97% of the 96-channel body surface potentials. (15 refs.)

115960 Development of a real-time monitoring system of spatial ST vector. A.Kuroiwa, T.Fukumoto (Dept. of Internal Medicine, Univ. of Occupational & Environmental Health, Kitakyushu, Japan), Y.Senda.

Jpn. J. Med. Electron. & Biol. Eng. (Japan), vol.21, no.2, p.121-4 (April 1983). In Japanese. [received: Sept. 1983]

A real-time continuous monitoring system for the ST-segment of the electrocardiogram has been developed at the authors' laboratory. This system calculates a spatial ST magnitude and two angles (azimuth and elevation) from three-channel Frank electrocardiograms using the following formulae with a microcomputer: spatial ST magnitude = $\sqrt{(ST(X)^2 + ST(Y)^2 + ST(Z)^2)}$, azimuth = $\tan^{-1} ST(Z)/ST(X)$, elevation = $\tan^{-1} ST(Y)/\sqrt{(ST(X)^2 + ST(Z)^2)}$. The data obtained are displayed on a CRT display system (4 channels) and a penwriting recorder (6 channels) simultaneously. This system could record changes of spatial ST magnitude on experimental coronary artery occlusion. It is concluded that this system will be useful for non-invasive monitoring of myocardial ischemia or injury in intensive care units. (9 refs.)

115961 Human factors approach to medical instrument design. J.Kreifeldt (Dept. of Engng. Design, Tufts Univ., Medford, MA, USA).

Electro/82 Conference Record, Boston, MA, USA, 25-27 May 1982 (El Segundo, CA, USA: Electron. Conventions 1982), p.3-3/1-4

The approach is given and illustrated from several different areas. Basically, designing medical instruments for direct use by operators is essentially the same as designing consumer products. The most important feature of the process is the early and intensive involvement of human factors in the design process since human factors engineering is an integral rather than supplementary part of the design process. The user-tool-task systems forms the framework for the human factors design of medical instruments. As with any other area of design or engineering, proficiency with the approach comes with practice. 115962 A method of estimating biosignal stability. A.A.Smerdov, V.K.Gorelik (REMA Organization, L'vov, Ukrainian SSR).

Biomed. Eng. (USA), vol.16, no.6, p.194-9 (Nov.-Dec. 1982). Translation of: *Med. Tekh. (USSR)*, vol.16, no.6, p.26-31 (Nov.-Dec. 1982).

One is frequently restricted to analyzing a unique (measurable) data-bearing signal in medical diagnosis in relation to state evaluation for a complicated and inaccessible object. A mathematical analysis of biosignal stability is given based on state diagnosis. This enables automated analysis of the signal to be made. The method proposed has a high noise immunity. (2 refs.)

115963 Comparative study of linear prediction parameters for quantification and monitoring of dysphonic voices. C.Hernandez, S.Fejoo, J.E.Arias, M.A.Bernal.

IEE Proc. A (GB), vol.130, no.6, p.336-9 (Sept. 1983).

Linear prediction parameters have been used to study the vocal changes accompanying a case of laryngitis, the aim being to quantify the vocal degeneration so as to monitor the progress of the laryngeal dysfunction. The effectiveness for this purpose of a number of parameters (predictor coefficients, autocorrelation function, area coefficients, long-area ratios, PARCOR coefficients and cepstrum) and metrics (the Euclidean and Itakura distances and the crosscorrelation function) are compared and discussed. Of the parameters used the most intrinsically sensitive (as measured by the Kullback divergence) are the PARCOR coefficients. However, when a metric is introduced to measure the deviation from normal vocal performance, the combina-

tions producing the best results seem to be the Itakura distance applied to the predictor and autocorrelation coefficients and the crosscorrelation of the cepstral coefficients, both of which appear capable of registering changes in the patient's vocal condition which might pass unnoticed in a conventional noninvasive examination. The way seems to be open towards effective quantification of voice deformation for the diagnosis and treatment of laryngeal disorders. (11 refs.)

115964 A computerized analysis system of masticatory electromyograph with silent period. T.Kiryu, Y.Saito (Dept. of Information Engng., Niigata Univ., Niigata, Japan), T.Yamaga, K.Ishioka. *Jpn. J. Med. Electron. & Biol. Eng. (Japan)*, vol.21, no.2, p.93-9 (April 1983). In Japanese. [received: Sept. 1983]

A computerized analysis system for the masticatory muscles has been developed. The silent period (SP), which observed in masticatory muscles shortly after tooth contact during tapping movements or after chin tap during clenching, has been determined because of its diagnostic value for TMJ dysfunction. This system has the following characteristics: (1) it is suitable for a dental clinic, (2) it enables automated objective measurements of the SP parameters, and (3) it enables the easy data processing for statistical analyses. In order to measure the SP parameters, the threshold level technique and the peak to peak technique are common. However, since these techniques have some disadvantages, a new technique, 'activity changing curve' technique, has been developed. The activity changing curve is independent of the amplitude of the EMG and shows a marked increase at the onset or the termination of the SP. Thus this technique indicates the SP parameters more clearly and more objectively than the other methods. (23 refs.)

115965 Conductimetric method of determining the hematocrit value of blood. P.S.Neelakantaswamy, K.F.Aspar, A.Rajaratnam (Dept. of Phys., Nat. Univ. of Singapore, Singapore), N.P.Das. *Rev. Sci. Instrum. (USA)*, vol.54, no.9, p.1186-90 (Sept. 1983).

A simple conductimetric method for measuring the hematocrit value of blood is described. Using a conventional electronic conductivity meter having a two-electrode cell, the conductivity between the electrodes dipped in a diluted sample of the blood is measured and related quantitatively to the strength of suspended erythrocytes (that is, to the hematocrit value) in the test suspension. The extent of diluting the sample prior to the measurement is optimally determined on the basis of theoretical considerations. The merits of this instrumentation in terms of simplicity, economy, and linearity are compared with those of conventional methods of hematocrit determination. Possibilities of improving the present method by using inductive-type conductivity meters and/or by using VHF (very high frequency) resonant circuit sensors are suggested. Relevant theoretical considerations and experimental results are presented. (17 refs.)

115966 Development of a microprocessor-based ECG signal processing method. J.K.Choudhury, S.N.Bhattacharyya, A.Rakshit (Electrical Engng. Dept., Jadavpur Univ., Calcutta, India), A.Chattopadhyay.

Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.417-27 vol.2

Describes two microprocessor based algorithms for ECG signal monitoring and spectrum analysis. The resulting system which is relatively limited in scope, is considered to be useful for the medicare of cardiac patients particularly in economically underdeveloped countries. (3 refs.)

115967 Aspects of standardisation and validation of automatic ECG interpreting systems. D.Neubert, U.Tepfner, R.Schliel (Phys.-Tech. Bundesanstalt, Inst. Berlin, Berlin, Germany).

Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.429-41 vol.2

Automatic ECG-interpretation by computers is on the verge of becoming a helpful tool in cardiological diagnostics. Aspects of standardization and validation of computerized ECG-interpreting systems are discussed. Especially, it is argued that standardization cannot be achieved purely by majority rule, but must be based on scientific reasoning. For the purpose of validation of interpreting systems a dedicated storage device containing a library of representative ECG-source signals is proposed as a materialized standard. The independent validation of the diagnostic meaning of the source signals is a necessary requirement. (21 refs.)

115968 A digital system for rheoencephalography. C.De Rooij, B.R.Cleine (Dept. of Electrical Engng., Twente Univ. of Technol., Enschede, Netherlands).

Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.443-52 vol.2

Presents an on-line biomedical measuring and processing system for the measurement of electrical impedance fluctuations of the human brains, which is considered to be a good indication of the blood velocity fluctuations. The method used is patient-friendly, noninvasive and requires neither adjustments nor balancing. To gain an overall accuracy of 10% the most important noise- and error sources are analysed. The digital processing of the signal and the determination of the most important parameters as well as the statistical calculations are described. (4 refs.)

115969 Transducer system for absolute intravascular angiometry. B.Szucs, J.Sandor, E.Monos (Dept. of Automation, Tech. Univ. of Budapest, Budapest, Hungary).

Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.473-7

Deals with a transducer system for in vivo measurement of intravascular diameter changes in the range of 2 and 20 mm. A resilient lens-shaped absolute angiometer loop is introduced via an angiographic catheter as a sensor into the target blood vessel. The electromotive force induced in the sensor loop is processed by a newly developed transducer system for measurement and recording the diameter changes in the frequency range between 0 and 30 Hz. The frequency and output power of the driving circuit are optimized according to sensitivity and physiological requirements. (4 refs.)

115970 The basics of cryosurgery. R.Rzasa.

ASTM Stand. News (USA), vol.11, no.7, p.28-9 (July 1983).

A cryosurgical medical instrument is a surgical tool that can be applied in the fields of dermatology, gynecology, proctology, ophthalmology, neurosurgery, orthopedics, and urology. Tissue destruction without bleeding or scarring, minimal use of anaesthesia, and reduced hospitalization are some of cryosurgery's highlights. The destruction of tissue by cryosurgery occurs when the tissue is adequately frozen below -20°C . Below this temperature protein denaturation and cellular death occur. Following the freeze procedure, swelling occurs and the body begins to reject the dead tissue. After a brief period of time, this dead tissue sloughs off leaving clean, healthy tissue with no stitch marks and minimal scattering. The development of standards for cryosurgical instruments is discussed. (no refs.)

115971 Computer graphics and an interactive stereotactic system for CT-aided neurosurgery. M.L.Rhodes, W.V.Glenn, Jr., Y.-M.Azzawi (Multi-Planar Diagnostic Imaging Inc., Torrance, CA, USA), R.S.Howland, D.L.Hibbard.

IEEE Comput. Graphics & Appl. (USA), vol.3, no.5, p.31-7 (Aug. 1983).

Using digital CT image data transformed to a patient-frame coordinate system, neurosurgeons can simulate, plan, and execute their procedures with submillimeter precision—all in the CT suite. (14 refs.)

115972 Evaluation of intra-aortic counterpulsation with an assisted circulation. V.E.Tolpekin, G.G.Amosov, S.I.Shchukin, G.L.Khodzhshvili (Res. Inst. of Transplantation & Artificial Organs, Min. of Health, Moscow, USSR).

Biomed. Eng. (USA), vol.16, no.6, p.201-4 (Nov.-Dec. 1982). Translation of: *Med. Tekh. (USSR)*, vol.16, no.6, p.33-6 (Nov.-Dec. 1982).

Dog experiments and a case history are described. It is concluded that the addition of an internal work index to the external work index in the criterion of efficacy enables the time course of changes in energy consumption of the heart during assisted circulation to be estimated objectively. Also, the addition of an equivalent of the coronary blood flow, calculated on the basis of hemodynamic parameters, into the criterion of efficacy of intraaortic counterpulsation enables the state of myocardial bioenergetics to be reflected more completely; the mean intra-aortic diastolic pressure can be used as such a parameter. (7 refs.)

115973 Development of a cryo-probe suitable for gynaecological applications. N.G.Shah, V.M.Mehta (Dept. Obstetrics & Gynaecology, Sheth K.M. School of Post-graduate Medicine & Res., Ahmedabad, India), G.H.Shah. *Indian J. Cryog.*, vol.8, no.1, p.57-63 (1983).

In India, cryo-surgery has never gained momentum because of the price of the instrument. Even though, two or three Indian manufacturers have now introduced different types of cryo-probes, their price is still in the range of few thousand rupees. This project to develop a cheap and dependable cryo-probe was undertaken so that the cryo-probe can become a useful tool in day-to-day practice of each and every gynaecologist. (8 refs.)

115974 Safety and reliability in medical equipment and systems. M.Saito. *Jpn. J. Med. Electron. & Biol. Eng. (Japan)*, vol.20, no.7, p.557-8 (Dec. 1982). In Japanese. [received: July 1983]

Medical treatment is evaluated in three aspects: safety, reliability and clinical availability. Safety and reliability are most important. Low-frequency current, electromagnetic waves, light, radiant ray, acoustic waves, ultrasonic waves, heat, etc. are used as the physical energy in medical treatment. The effects of these energies on living organisms should be managed quantitatively for safety. Faulty operation of medical treatment equipment and malfunction of diagnostic equipment can cause the patient to be endangered. Reliability is related directly to safety. National standards for the reliability and safety of medical equipment should be established. (no refs.) K.B.

115975 Hyperthermia, hypothermia. M.Kikuchi. *Jpn. J. Med. Electron. & Biol. Eng. (Japan)*, vol.20, no.7, p.600-1 (Dec. 1982). In Japanese. [received: July 1983]
Hyperthermia and hypothermia in medical treatment are briefly summarized. Hyperthermia devices may be increasingly used as part of cancer therapeutic treatment; they can damage tumor cells. Hypothermia may be applied as a new method for storing internal organs for transplantation. Hyperthermia and hypothermia techniques will play an important role in medical therapy. The topical areas discussed in this paper include: (1) cancer therapy by hyperthermia, (2) orthopedic operation using hypothermia, and (3) cryosurgery and after-freeze immunity. (17 refs.) *K.B.*

115976 Studies on the loadability of the bone/cement interface in joint replacement. D.Gebauer (Orthopädische Klinik, Univ. München, München, Germany), H.Hager, S.Breier.

Biomed. Tech. (Germany), vol.28, no.9, p.192-5 (Sept. 1983). In German.
Mechanical overloading of the bone/cement interface is often discussed as the cause of loosening cemented artificial joints. Experimental studies on the loadability of the interface were performed under various types of pressure and shear loading, and their combinations under static and dynamic, in particular impact, conditions. The results confirm the problem of impact loads for the long-term stability of endoprostheses. (2 refs.)

115977 Inductive dynamic transducer for an electrically driven extracorporeal blood circulator. V.A.Artamonov, V.M.Dement'ev, A.I.Skorospehkin (V.V. Kuibyshev Polytech. Inst., Kuibyshev, USSR).

Biomed. Eng. (USA), vol.16, no.6, p.204-6 (Nov.-Dec. 1982). Translation of: *Med. Tekh. (USSR)*, vol.16, no.6, p.37-9 (Nov.-Dec. 1982).

An inductive dynamic transducer has the advantages of small mass and size, high reliability, and long service life. An apparatus has been developed for extracorporeal blood circulation. It is an integrated design with an inductive dynamic transducer and a pump. The transducer, which is mounted in a housing, comprises an exciting winding enveloped within magnetic circuits (types 600NN and 2000MI ferrites) and a cylindrical moving element made of copper that is connected with the piston of the pump and a diaphragm spring in one subassembly. Located between the side walls of the housing and the piston is a flexible diaphragm made of a thin, nonstretching spindle-shaped film. The end surface of the piston is a cone with exponential elements. Such a design provides a smooth variation in the velocity for the input and output of the blood, i.e. an eddy-free flow with minimal hydraulic resistance, thereby reducing the traumatization of the blood's constituents. (3 refs.)

115978 Artificial organs. K.Atsumi.

Jpn. J. Med. Electron. & Biol. Eng. (Japan), vol.20, no.7, p.541-5 (Dec. 1982). In Japanese. [received: July 1983]

Reviews recent technological development in artificial organs. The topical areas include: (1) the classification of artificial organs; (2) the historical aspect of artificial organs; (3) activity of the artificial internal organ society in each country; (4) clinical evaluation of artificial organs; (6) operating costs; (7) typical applications; (8) new technologies; and (9) development processes. 115979 Development of sensors to be used in orthopaedic implants. T.Yamamuro.

Jpn. J. Med. Electron. & Biol. Eng. (Japan), vol.20, no.7, p.574-5 (Dec. 1982). In Japanese. [received: July 1983]

In orthopaedic implant treatment, a suitable sensor is required to detect and control stress applied to the artificial os or joint implanted into the patient. Although the orthopaedic implant material used has passed an in-vitro fatigue failure test under cyclic load, the in-vitro test condition differs from the in-vivo behaviour. This paper deals with the detection of displacement of the interface between a living organism and implanted material, the detection of stress in orthopaedic implant, and the control of implanted material. (no refs.) *K.B.*

115980 Sensory prosthesis. T.Ifikube.

Jpn. J. Med. Electron. & Biol. Eng. (Japan), vol.20, no.7, p.597-9 (Dec. 1982). In Japanese. [received: July 1983]

Most of the themes in the study of sensory prostheses are common to those in pattern recognition and robotics studies. For sensory prostheses there are three practicable methods: (1) aiding the disabled through cutaneous sensation to electrical signals into which characters, images or sounds are converted, such as optical-to-tactile image conversion; (2) aiding the blind through auditory sense or the deaf through visual sensation, e.g. ultrasound glasses and sound-response typewriters; and (3) aiding the disabled by means of electrical stimulation of the visual or auditory nerve, e.g. artificial internal ears. These methods are briefly outlined in this paper. (15 refs.) *K.B.*

115981 Measurement of spatial forces by the 'matrix'-method [prosthetics application]. G.Bergmann, J.Siraky, A.Rohlmann, R.Koelbel (Dept. of Orthopaedics, Free Univ. of Berlin, Berlin, Germany).

Technological and Methodological Advances in Measurement. Acta IMEKO 1982. Proceedings of the 9th IMEKO Congress of the International Measurement Confederation, Berlin, Germany, 24-28 May 1982 (Amsterdam, Netherlands: North-Holland 1983), p.463-72 vol.2

Transducers for the measurement of spatial forces are mostly constructed by using conventional strain gauge technique. They require at least the application of six strain gauges, arranged in three independent bridge circuits. The matrix-method, however, reduces the necessary expenditure to three single SG. It requires additional digital equipment but enables construction of extremely small transducers and is much more accurate than the usual method. The matrix-method was used for the construction of artificial hip joints in animal experiments. (5 refs.)

87.80 BIOPHYSICAL INSTRUMENTATION AND TECHNIQUES

115982 Soft X-ray imaging microscopy using zone plates and nonsynchrotron sources. R.J.Rosser (Blackett Lab., Imperial Coll. London, London, England).

Proc. SPIE Int. Soc. Opt. Eng. (USA), vol.368, p.17-20 (1983). [received: Sept. 1983] (SPIE Proceedings on Microscopy Techniques and Capabilities, London, England, 21-22 Sept. 1982).

The resolution of hydrated biological specimens by soft X-ray microscopy is considered. This is set by damage to the specimen caused by secondary electrons and free radicals. Using synchrotron radiation the limit would be about 10 nm. By using short lived (~1 ns) sources as produced by a laser generated plasma, the Rayleigh limit of 2.3 nm should be possible. (10 refs.)

115983 Wildlife biotelemetry. F.M.Long (Univ. of Wyoming, Laramie, WY, USA), R.W.Weeks.

IEEE Eng. Med. & Biol. Mag. (USA), vol.2, no.1, p.42-6 (March 1983). [received: Sept. 1983]

A brief review is given. Telemetry has become a valuable tool for studying wildlife in its native habitat. With telemetry, a biologist can monitor animals in the dark, in rough terrain, in water, underground, or in the air. He can monitor heart rate as a measure of stress or as an indication of metabolic rate. Movement can be correlated with feeding, stress, or other activity. The electronics and circuitry used in telemetry systems for wildlife studies have probably reached a mature state, with modifications mostly being the results of new technologies rather than bringing new fundamental ideas to the design. Thus, the improvement of telemetry systems will likely depend on improvements in sensors, in packaging, and in overall system reliability. (13 refs.)

115984 Bioelectrodes. T.Matsuo.

Jpn. J. Med. Electron. & Biol. Eng. (Japan), vol.20, no.7, p.513-15 (Dec. 1982). In Japanese. [received: July 1983]

Practical electrodes attached to living organisms to measure bioelectric phenomena or supply electrical energy to the body can be classified under four main divisions: (1) electrodes for inducing bioelectric phenomena; (2) stimulating electrodes; (3) electrodes for measuring bioimpedance; and electrodes as chemical sensors. This paper briefly describes surface-attached electrodes, microelectrodes, multielectrode arrays, and electrodes serving as chemical sensors. (14 refs.) *K.B.*

115985 Diode array versus photomultiplier for measuring the UV-excited resonance Raman spectra of enzyme-substrate transients. P.R.Carey, L.R.S.Cartier (Div. of Biological Sci., Nat. Res. Council of Canada, Ottawa, Ontario, Canada).

J. Raman Spectrosc. (GB), vol.14, no.4, p.271-5 (Aug. 1983).

The construction of a multiplex system for recording the resonance Raman (RR) spectra of enzyme-substrate complexes in the near-UV region is described. The instrument is based on commercially available components consisting of a 2 W UV krypton ion laser, a triple spectrograph (in which the first two monochromators act as a zero dispersion, variable bandpass filter) and an intensified diode array. The performance of this system is compared with that of a double monochromator with a photomultiplier as a detector. The enzyme-substrate systems chosen as examples for the comparison offer a difficult experimental challenge because they evolve rapidly and have poor optical homogeneity. In addition, a simple apparatus is described for recording the RR spectra of enzyme-substrate complexes in cryosolvents at temperatures as low as -50°C. (8 refs.)

115986 Epitaxial crystallization of alkane chain lipids for electron diffraction analysis. D.L.Dorset, W.A.Pangborn (Electron Diffraction Dept., Medical Foundation of Buffalo Inc., Buffalo, NY, USA), A.J.Hancock.

J. Biochem. & Biophys. Methods (Netherlands), vol.8, no.1, p.29-40 (Aug. 1983).

Thin microcrystals of a wide variety of polymethylene chain materials, including *n*-alkanes, linear waxes, glycerides, a detergent, phospholipids and phospholipid analogs based on cyclopentane-1,2,3-triol, were epitaxially grown on naphthalene to give an orientation with long chain axes parallel to the best developed crystal face. These crystals, which represent a different orientation than those grown from solution, facilitate ab initio quantitative crystal structure analysis from electron diffraction intensity data from the projection yielding the most crystallographic information. (40 refs.)

115987 A low-cost microcomputer-based data acquisition and analysis system for an electron spin resonance spectrometer: data handling of dilute spin labeled nucleic acids. J.C.Ireland, J.A.Willett, A.M.Bobst (Dept. of Chem., Univ. of Cincinnati, Cincinnati, OH, USA).

J. Biochem. & Biophys. Methods (Netherlands), vol.8, no.1, p.49-56 (Aug. 1983).

Describes the construction of an inexpensive and reliable data acquisition system for a Varian E-line Century Series ESR spectrometer utilizing an Apple II Plus microcomputer. All necessary hardware is readily available and used without modification. A BASIC program for routine collection, display, plotting and disk storage of experimental data has been written and subsequently compiled into machine code for high speed operation. The interface offers distinct advantages in spectral resolution as well as instrument control. An example of signal enhancement via computer controlled time averaging is presented for a spin labeled DNA experiment. The technique has recently been applied to studies of relative binding affinities of gene-32 protein for various spin-labeled polynucleotides. (16 refs.)

115988 A simplified method for the estimation of individual amino acid radioactivity in plasma samples. P.Roca, A.Palou (Dept. de Bioquímica, Univ. de la Ciutat de Mallorca, Mallorca, Spain), M.Alemay. *J. Biochem. & Biophys. Methods (Netherlands)*, vol.8, no.1, p.63-7 (Aug. 1983).
A method is presented for the quantitative estimation of the individual amino acid radioactivity in biological samples. The material is deproteinized with cold acetone, and, after acetone evaporation, is passed through a column containing 1 g of Amberlite XAD-2, then eluted with 10% ethanol. The samples are derivatized with Sanger's reagent (alkaline 1-fluoro-2,4-dinitrobenzene) and passed again through the Amberlite XAD-2 column; the 10% ethanol eluate is now discarded and the DNP-amino acids eluted with acetone. Aliquots are used for TLC chromatography on Silicagel plates; the spots are identified, cut away and their radioactivity estimated. The actual recovery of radioactivity in the spots is about 86-92% of the initial radioactivity. No contamination with radioactive glucose, lactate, pyruvate or glycerol has been observed. (10 refs.)

115989 An analog-digital feedback system for measuring photoreceptor properties with an equal response method. J.G.J.Smakman, B.A.Pijpker (Lab. voor Algemene Natuurkunde, Biophys. Dept., Univ. of Groningen, Groningen, Netherlands). *J. Neurosci. Methods (Netherlands)*, vol.8, no.4, p.365-73 (Aug. 1983).
Describes a feedback system in which a neutral density wedge automatically controls the light flux applied to a photoreceptor, so that an intracellular recorded response is held constant. The authors describe a 'differential sampler' that subtracts the photoreceptors dark response from the light response induced by a chopped light source. The resulting signal drives the feedback system. The response time of the feedback system can be adjusted with a 'digital integrator' to match a range of variable conditions that occur in different experiments. (7 refs.)

115990 The stereotrode: a new technique for simultaneous isolation of several single units in the central nervous system from multiple unit records. B.L.McNaughton (Dept. of Psychology, Univ. of Colorado, Boulder, CO, USA), J.O'Keefe, C.A.Barnes. *J. Neurosci. Methods (Netherlands)*, vol.8, no.4, p.391-7 (Aug. 1983).
A new method is described for the recording and discrimination of extracellular action potentials in CNS regions with high cellular packing density or where there is intrinsic variation in action potential amplitude during burst discharge. The method is based on the principle that cells with different ratios of distances from two electrode tips will have different spike-amplitude ratios when recorded on two channels. The two channel amplitude ratio will remain constant regardless of intrinsic variation in the absolute amplitude of the signals. The method has been applied to the rat hippocampal formation, from which up to 5 units have been simultaneously isolated. The construction of the electrodes is simple, relatively fast, and reliable, and their low tip impedances result in excellent signal to noise characteristics. (9 refs.)

115991 A comparison of the selectivities of microelectrodes incorporating the Orion and Corning liquid ion exchangers for potassium over sodium. P.J.Laming, M.B.A.Djamgoz (Dept. of Pure & Appl. Biology, Imperial Coll., London, England). *J. Neurosci. Methods (Netherlands)*, vol.8, no.4, p.399-402 (Aug. 1983).
The K^+ : Na^+ selectivities of double-barrelled microelectrodes employing either of two commercially available liquid ion exchangers for K^+ (Corning 477317 and Orion) have been measured using several calibration methods. Microelectrodes employing the Orion exchanger were found to be much less selective than those based on Corning 477317. (8 refs.)

115992 Schlieren optical imaging of weak objects. T.Von Zglinicki (Abteilung fur Elektronenmikroskopie am Pathologischen, Inst. der Charite, Berlin, Germany), S.Heymann. *Micron (GB)*, vol.14, no.2, p.109-18 (1983).
It is shown that with the aid of a schlieren optical mode in real electron microscopes, the amplitude contrast of weak objects can be enhanced up to twofold in comparison with the bright-field mode, if a part of the unscattered beam strikes the objective aperture. This remains true also in the case of thicker objects imaged (for example, unstained sections of biological matter). Furthermore, evidence is given for the existence of an optimum schlieren image in the transition range between strict schlieren optics and conventional bright-field microscopy. Such images are characterized by high amplitude contrast without significant distortion. Theory and experiment are shown to be in good agreement. As an application, unstained nucleosomes have been investigated schlieren-optically. Model calculations show that the 'hole' in their centre, which has been demonstrated from dark field images, is probably not due to a structural void (cavity), but is a consequence of the lower density of the protein core as compared with DNA. (26 refs.)

115994 Orbital rates of Earth satellites at resonances to test the accuracy of Earth gravity field models. J.Klokocnik (Astron. Inst., Czechoslovak Acad. of Sci., Ondrejov, Czechoslovakia). *Celestial Mech. (Netherlands)*, vol.30, no.4, p.407-22 (Aug. 1983).
Differences among the Earth gravity field models, which were (in Klokocnik and Pospisilova, 1981) expressed as dispersions of the relevant lumped geopotential coefficients, are transformed to the differences in variations of orbital quantities. Theoretical formulae, the Lagrange (planetary) equations, describing the orbital rates near resonances due to the geopotential, are derived in a simple and unified form. They are then applied to estimate the orbital uncertainty as a function of Earth models differences. The first set of the Earth models (set I) consists of 11 models from the decade 1970-80 of greatly varying quality; the set II contains several recent models; the author presents a test (for the 13th- to 15th-order) based on standard deviations of the lumped values of GEM 10B, which were estimated by means of independent resonant data (in Klokocnik, 1982). (25 refs.)

115995 Collocations and thirtieth order resonant harmonics. J.Kostecky (Res. Inst. of Geodesy, Topography & Cartography, Geodetical Obs., Pecny, Ondrejov, Czechoslovakia), J.Klokocnik. *Planet. & Space Sci. (GB)*, vol.31, no.8, p.829-41 (Aug. 1983).
The method of collocations (LSC) is compared with traditional least-squares adjustments, (LSA) for determining the values of the individual harmonic coefficients in the expansion for the Earth's gravitational potential from the lumped geopotential coefficients of order 30. The computations are based on data from King-Hele and Walker (1982), where the 30th-order harmonic coefficients were determined from the lumped values by means of the usual least-squares method. The authors take into account the correlation coefficients among the lumped coefficients; Four groups of runs performed: from LSA (similar to that in King-Hele and Walker, 1982) to as general an LSC as possible. The resulting harmonic coefficients are compared mutually, with the resonant solution by King-Hele and Walker (1982), with the older trials (Kostecky and Klokocnik, 1979) and with the comprehensive Earth models (GEM 10 B(C), 'Rapp 77' and GRIM 3). (13 refs.)

115996 Variations in the Earth's rotation. J.B.Merriam (Dept. of Earth Sci., Memorial Univ. of Newfoundland, St. John's, Newfoundland, Canada). *Sci. Prog. (GB)*, vol.68, no.271, p.387-401 (Autumn 1983).
The author discusses the variations in the Earth's rotation, and measurements of the phenomenon since the seventeenth century. (24 refs.)

115997 Equivalent solutions of the inverse three-dimensional gravimetry problem for a class of polynomial densities. P.I.Balk (Computational Center, Acad. of Sci., Irkutsk, USSR). *Sov. Geol. & Geophys. (USA)*, vol.23, no.5, p.88-96 (1982). Translation of: *Geol. & Geofiz. (USSR)*, vol.23, no.5, p.98-107 (1982).
It is shown that the inverse linear problem does not have a unique solution for a class of field sources with polynomial density and piecewise-analytic mass-carrier boundary consisting of planes and second-order algebraic surfaces. Sufficiently broad model families are identified in which the inverse problem has unique solutions, and examples of families of equivalent distributions are constructed. The study was carried out with the aid of a computerized analysis of theoretical problems in gravimetry. (10 refs.)

115998 A high resolution gravimetric geoid for Europe and bordering marine areas. W.Torge, G.Weber, H.-G.Wenzel. *Z. Vermessungswes. (Germany)*, vol.108, no.8, p.321-31 (Aug. 1983). In German.
A high resolution gravimetric geoid has been determined in the area $30^\circ < \phi < 73^\circ$ and $-30^\circ < \lambda < 46^\circ$ in a $12'$ by $20'$ grid covering Europe, the North Sea, Baltic Sea, Mediterranean Sea, and parts of the North Atlantic Ocean. The computation has been carried out by least squares spectral combination using closed integral formulas, combining 104000 mean $6'$ by $10'$ free air gravity anomalies 12000 mean 1° by 1° free air gravity anomalies and the spherical harmonic model GEM9 complete to degree and order 20. The precision of the computed geoid heights has been estimated at ± 1 m. (27 refs.)

115999 Movements of the fracture zone and the seismic activity under the fracture zone—based on the observations at Abuyama. Y.Umeda, J.Yamazaki (Faculty of Sci., Kyoto Univ., Kyoto, Japan). *Zisin. J. Seismol. Soc. Jpn. (Japan)*, vol.36, no.1, p.43-51 (March 1983). [received: Sept. 1983]
The movements of the fracture zone (strike $N20^\circ E$, dip angle $20^\circ W$ and thickness 1 m) in the observational vault at Abuyama Seismological Observatory have been monitored by two extensometers crossing this zone. The movements of this zone are analyzed with special reference to the temporal variation of activity of small earthquakes and microearthquakes occurring under the fracture zone. (5 refs.)

91.25 GEOMAGNETISM AND PALAEOMAGNETISM; GEOELECTRICITY

116000 The interpretation of magnetotelluric and electrical sounding's data by modified generalized inverse matrix. Chen Ming-Sheng, Chen Le-Shou (Beijing Graduate School, Wuhan Coll. of Geology, China), Wang Tian-Sheng, Bai Gai-Xian.

Acta Geophys. Sin. (China), vol.26, no.4, p.390-400 (July 1983). In Chinese. English translation in: *Acta Geophys. Sin. (USA)*

The essential theory of inversion with a generalized inverse matrix is systematically explained. Several practical problems in the inversion of MTS and electrical sounding (ES) curves using generalized inverse matrix have been studied and solved. Good results have been obtained and demonstrated. Moreover, some relationships are explored, so that interpretation can be improved. (5 refs.)

116001 Paleomagnetism of the Paleocene Ghost Rocks Formation, Prince William terrane, Alaska. P.W.Plumley (Earth Sci., Univ. of California, Santa Cruz, CA, USA), R.S.Coe, T.Byrne.

Tectonics (USA), vol.2, no.3, p.295-314 (June 1983). It is suggested that, despite the lack of evidence for a major Tertiary suture zone between the Prince William terrane and central Alaska, the Prince William and perhaps adjacent terranes may have lain substantially south of their present position in the Early Tertiary. (45 refs.)

116002 Rapid diffusion of the poloidal geomagnetic field through the weakly conducting mantle: a perturbation solution. E.R.Benton, K.A.Whaler (Dept. of Astro-Geophys., Univ. of Colorado, Boulder, CO, USA).

Geophys. J. R. Astron. Soc. (GB), vol.75, no.1, p.77-100 (Oct. 1983). A systematic regular perturbation procedure is developed to account for weak mantle conduction as unsteady electromagnetic fields are extrapolated downward from the Earth's surface to the core-mantle boundary. The mantle is treated as a radially symmetric conductor of highly variable conductivity. The unique poloidal-toroidal decomposition of a magnetic vector potential leads first to three-dimensional and then, after spherical harmonic analysis, to one-dimensional linear diffusion equations for the two defining scalar functions. Emphasis is placed on a regular perturbation solution to the inverse poloidal diffusion problem, for the case where diffusion through the mantle is rapid on the time-scale for changes in forcing at the core-mantle boundary. The perturbation theory is evaluated with reference to a range of proposed conductivity profiles and two geomagnetic field models. It is found that uncertainty in the conductivity is at present less important than errors in the field models, and that the first-order corrections to the main field and secular variation at the core surface are likely to be negligible and small, respectively. (31 refs.)

116003 Inversion of the electromagnetic induction problem using Parker's algorithms were both precise and practical data. R.J.Jady, G.A.Paterson (Dept. of Math., Univ. of Exeter, Exeter, England), K.A.Whaler.

Geophys. J. R. Astron. Soc. (GB), vol.75, no.1, p.125-42 (Oct. 1983). An important contribution to the theory of inversion of the electromagnetic induction problem has been made by Parker (1980, 1982). A numerical procedure for implementing the theory has been described by Parker & Whaler (1981). The physical interpretation of the resulting conductivity models is difficult because of the wide range of acceptable solutions generated by the method. This is a consequence of the inherent non-uniqueness associated with a finite dataset. Before applying the algorithms to practical data, the authors have examined their performance using analytic datasets derived from simple conductivity distributions. The results of using the methods on both precise and real Dst data are shown. The storm data suggest that the upper mantle has low conductivity overall to a depth between 650 and 700 km, followed by a rise to about 0.1 S m^{-1} and a further sharp increase at about 1000 km, which is close to the penetration depth for these data. (9 refs.)

116004 Palaeomagnetism of Palaeozoic rocks from the Cabo de Penas, Asturias, Spain. H.Perroud (Univ. de Rennes 1, Rennes, France).

Geophys. J. R. Astron. Soc. (GB), vol.75, no.1, p.201-15 (Oct. 1983). Ordovician volcanic samples of the Cabo de Penas area yielded a primary remanent magnetization ($D=202^\circ$, $I=78^\circ$, $\alpha_{95}=6^\circ$) which is partially or entirely overprinted by a Late Palaeozoic remagnetization. Late Devonian-Early Carboniferous sedimentary samples reveal a pre- or syntectonic Carboniferous remanent magnetization similar to the secondary one of the volcanic samples. A soft post-tectonic component appears also in few samples, for which a Late Carboniferous age is inferred. Comparison of the Carboniferous remanent magnetizations and structural parameters suggest that in a late stage of the deformation, the sites have undergone minor rotations around a vertical axis. A 'strike correction' is therefore proposed to take such an effect into account. The average of the corrected mean-site directions is considered to be a good approximation of the Early or Middle Carboniferous palaeomagnetic direction in Asturias. (28 refs.)

116005 Palaeomagnetism of NW Scotland syenites in relation to local and regional tectonics. H.B.Turnell, J.C.Briden (Dept. of Earth Sci., Univ. of Leeds, Leeds, England).

Geophys. J. R. Astron. Soc. (GB), vol.75, no.1, p.217-34 (Oct. 1983). A detailed thermal demagnetization study has been carried out on a number of syenitic intrusions from north of the Great Glen Fault in Scotland. Multi-component remanences of normal and reversed polarity have been recognized. These define a series of palaeomagnetic poles from which an Ordovician to Silurian apparent polar wander path for northern Scotland is deduced. Comparison of this apparent polar wander path with the established path for Britain throws new light on the sequence of thrusting and magmatic activity in the NW Highlands and precludes large-scale ($\geq 1500 \text{ km}$) movement along the Great Glen Fault later than the Ordovician. The data are consistent with the suggestion that Britain was among a set of intracratonic microplates which underwent complicated, distinct movements throughout the Caledonian orogeny. (28 refs.)

116006 Palaeomagnetism of late Precambrian-Cambrian volcanics and intrusives from the Armorican Massif, France. R.Perigo, van der Voo (Dept. of Geological Sci., Univ. of Michigan, Ann Arbor, MI, USA), B.Auvray, N.Bonhomme.

Geophys. J. R. Astron. Soc. (GB), vol.75, no.1, p.235-60 (Oct. 1983). Samples of the keratophyre tufts of Treguier ($640 \pm 12 \text{ Myr}$) of the Upper Brioverian series, and the microgranite dykes of Loguivy ($548 \pm 24 \text{ Myr}$) have been collected from the north coast of Brittany, France. The samples were progressively demagnetized with AF and, predominantly, thermal methods. Blocking temperatures, coercivities and acquisition of isothermal remanent magnetization (IRM) indicate that the keratophyre remanence, is variably carried in magnetite, hematite, or occasionally in both. After removal of a soft viscous component, two stable palaeomagnetic directions were found, one in magnetite, the other in hematite. The characteristic magnetite direction ($T_b=300-580^\circ\text{C}$) is a prefoling primary thermoremanent magnetization (TRM) which after structural correction has a mean declination/inclination of $217.9^\circ/-30.4^\circ$. The younger hematite component has a mean in situ direction of $320.4^\circ/+20.3^\circ$. The microgranite natural remanent magnetization intensity distribution is distinctly bimodal, forming high and low intensity groups. (70 refs.)

116007 Singular solutions to Maxwells equations and their significance for geomagnetic induction. D.Wolf (Dept. of Phys., Univ. of Toronto, Toronto, Ontario, Canada).

Geophys. J. R. Astron. Soc. (GB), vol.75, no.1, p.279-83 (Oct. 1983). In geomagnetism the interpretation of induction anomalies has frequently encountered difficulties. Sometimes the problems may be overcome if channelled currents are taken into account. This idea was introduced by Japanese workers to explain the characteristics of the Central Japan anomaly in a consistent manner (Rikitake 1959). But whereas their channelling models showed some resemblance to electrical circuits, later work has usually considered the three-dimensionality of the problem. Dyck and Garland (1969) correctly pointed out that current channelling would always be presented unless: (1) the source fields are local or (2) the conductivity of the host rocks is vanishing. For the real Earth neither condition applies rigorously. Any serious interpretation of induction anomalies must consider their frequency response. In this article the low-frequency limit of the response of several model conductors is discussed. The general conclusion is that for configurations adequate to the Earth the solutions are incompatible with excessively large anomalous fields at points sufficiently removed from conductivity contrasts. (12 refs.)

116008 Internal and external components of the 60-yr variations in the geomagnetic field. Yu.D.Kalinin, T.S.Rozanova (L.V. Kirenskii Inst. of Phys., Acad. of Sci., USSR).

Geomagn. & Aeron. (USA), vol.22, no.3, p.395-6 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983] The amplitude of the internal component of the 60-yr variations in the geomagnetic field is approximately five times the amplitude of the external component. Some possible consequences are discussed. (8 refs.)

116009 Palaeomagnetic evaluation of the orocline hypothesis in the Central and Southern Appalachians. A.Y.Schwartz, R.Van der Voo (Dept. of Geological Sci., Univ. of Michigan, Ann Arbor, MI, USA).

Geophys. Res. Lett. (USA), vol.10, no.7, p.505-8 (July 1983). The axial traces of the major Appalachian folds change azimuthal direction from a NE-SW orientation to a N-S orientation in the area of the Pennsylvania Salient and swing back to a NE-SW orientation in the vicinity of the Virginia Reentrant. All available palaeomagnetic data from the folded Appalachians have been examined to test the Appalachian orocline hypothesis. Pre-deformational site-mean directions from suitable studies were rotated by the amount required to bring the strike of the sampled beds into coincidence with an average trend of the Central and Southern Appalachians (N35E). A comparison of clustering of site-means before and after this correction, reveals that in all cases unbending of the arc causes site-mean directions to disperse. This dispersal demonstrates that the curvature of the Appalachian orogen is to a very large degree a primary feature rather than a feature which resulted from the bending of initially straight fold axes. (18 refs.)

116010 Reduction of the vertical magnetic anomalies to the magnetic pole and the estimation of the parameters used in the reduction, based on the Poisson's relation. K.Kis.

Magy. Geofiz. (Hungary), vol.24, no.3, p.81-96 (1983). In Hungarian. The maxima and minima of the magnetic anomalies are mainly influenced by the direction of the magnetic polarisation. In order to get rid of this influence the reduction to the magnetic pole can be derived without reference to the Poisson's relation. The derived transfer function is valid in the case of the homogeneous polarisation. The transfer function of the reduction to the magnetic pole has a finite discontinuity at the origin of the coordinate system. For the elimination of this finite discontinuity an appropriate truncating function is suggested. The unknown value of the parameters of the reduction are calculated by optimisation based on the Poisson's relation. The suggested procedure is illustrated by model calculations and a field example. (21 refs.)

116011 Non-recurrent geomagnetic disturbances from high-speed streams. M.S.Bobrov (Astron. Council, Acad. of Sci., Moscow, USSR).

Planet. & Space Sci. (GB), vol.31, no.8, p.865-70 (Aug. 1983). It is shown that at any phase of solar activity cycle the Earth is circumflown mainly by high-speed solar wind streams (M-streams). The attention is called to the fact that M-streams cause not only the well-known recurrent geomagnetic disturbances (at the declining phase of solar cycle) but also numerous non-recurrent disturbances (at all the other phases). The intensity and duration of a typical non-recurrent M-disturbance are less than those of a recurrent one. (9 refs.)

116012 Worldwide features of the strength of recurrent geomagnetic activity. G.K.Rangarajan, A.Bhattacharyya (Indian Inst. of Geomagnetism, Bombay, India).

Proc. Indian Acad. Sci. Earth & Planet. Sci., vol.92, no.1, p.5-13 (March 1983). [received: Sept. 1983]

Variation of the strength of recurrent geomagnetic activity, which occurs just before a sunspot minimum, with local time is studied for a network of observatories covering different latitude and longitude zones. For this purpose, hourly averages of horizontal intensity for each UT hour for 173 days, which are totally free of disturbances due to solar transients, have been subjected to spectral analysis. Well-defined spectral peaks associated with periodicities of 28, 14 and 9 days were present in almost all the spectra. (18 refs.)

116013 Analytical representation of spatial and temporal variations of the geomagnetic field in the Indian region. B.R.Arora, V.H.Badshah, B.P.Singh (Indian Inst. of Geomagnetism, Bombay, India), M.G.Arur, P.S.Bains, Jeevan Lal.

Proc. Indian Acad. Sci. Earth & Planet. Sci., vol.92, no.1, p.15-30 (March 1983). [received: Sept. 1983]

The magnetic measurements of declination (D), and horizontal (H) and vertical (Z) components of the Earth's magnetic field, collected from ground

surveys between 1962 and 1966, are used to develop an analytical model of geomagnetic field variations over India for the epoch 1965. In order to reflect spatial features with wavelengths of approximately 1000 km, a sixth degree polynomial as a function of differential latitude and longitude is calculated by the method of least squares. The values of the field at common repeat stations recorded between 1962 and 1974 are used to determine the secular variation and its spatial dependence. (20 refs.)

116014 An episode of steep geomagnetic inclination 120000 years ago. K.L.Verosub (Dept. of Geology, Univ. of California, Davis, CA, USA). *Science (USA)*, vol.221, no.4608, p.359-61 (22 July 1983). The mean inclinations of three sections of 120000-year-old fine-grained sediments from northern California range from 62° to 66°. These inclinations are significantly steeper than the inclination of the geocentric axial dipole at this site. Because these sediments have probably recorded an actual episode of steep inclination lasting several thousand years, they provide new insights into the significance of mean inclinations shallower than the geocentric axial dipole. Such inclinations are characteristic of fine-grained sediments younger than 35000 years. The results raise questions about the time-averaged geomagnetic field and about the determination of plate motions from paleomagnetic data. (15 refs.)

116015 A combined analysis of the gravitational and magnetic anomalies for the detection of magnetically active rock complexes in the basement of the West Siberian plate. T.L.Zakharova, L.A.Sharlovskaya (Inst. of Geology & Geophys., Acad. of Sci., Novosibirsk, USSR). *Sov. Geol. & Geophys. (USA)*, vol.23, no.5, p.59-66 (1982). Translation of: *Geol. & Geofiz. (USSR)*, vol.23, no.5, p.67-75 (1982). Presents the results of a geologic interpretation of the gravitational and magnetic anomalies in the Ob'-Irtys' region of the West Siberian plate. On the basis of a quantitative estimate of Poisson's areal coefficient and the anomalous magnetic field, transformed by the differentiated method at the level of the basement, the distribution of magnetically active rock complexes and the metallogeny associated with them is suggested. (18 refs.)

116016 A geological and paleomagnetic study of the Hyblean volcanic rocks, Sicily. M.Grasso, F.Lentini (Istituto di Scienze della Terra, Univ. of Catania, Catania, Italy), A.E.M.Nairn, L.Vigliotti. *Tectonophysics (Netherlands)*, vol.98, no.3-4, p.271-95 (1983). The geological and paleomagnetic study of the Hyblean volcanic rocks in southeastern Sicily permits the following conclusions: (1) The Upper Cretaceous volcanics are considerably more extensive than earlier studies indicated. Their magnetization is identical to that of the better known outcrops around Capo Passero. Of the two new age dates reported, one is younger than any so far reported. (2) The Upper Tortonian flows are normally magnetized, suggesting a correlation of the Carlentini Formation with magnetic interval 7. The flows at the top of the Tellaro Formation are also normally magnetized and are tentatively correlated with the Carlentini Formation flows. Shorter reversed intervals within interval 7 may be represented by two less well-dated flows. (3) The lowest Pliocene flows have an adequate stratigraphic control and their magnetization is consistent with the extrusion of the pillow lavas during the Mammoth event. (4) The geomagnetic pole positions are consistent with that of the African plate during the Cretaceous, and a European plate location during both Pliocene and Miocene time.

116017 Paleomagnetic investigations in the Thuringer Forest (GDR). H.J.Mauritsch, K.Rother (Dept. of Geophys., Mining Univ. Leoben, Leoben, Austria). *Tectonophysics (Netherlands)*, vol.99, no.1, p.63-72 (1983). In the Thuringer Forest, the whole 'Rotliegendes' is well exposed, and was chosen as the starting place for a Permian traverse via Czechoslovakia, Austria into Italy. Rock magnetic experiments established haematite as main carrier of the NRM, except a few localities, where magnetite was found to present. Sediments and volcanities show consistent ChRM directions. The comparison with KrS's (1978) compilation proves a good Permian pole position.

116018 Magnetic anomalies on and around the Bonin Rise. T.Matsumoto, Y.Tomoda (Ocean Res. Inst., Univ. of Tokyo, Tokyo, Japan). *Zisin. J. Seismol. Soc. Jpn. (Japan)*, vol.36, no.1, p.77-82 (March 1983). In Japanese. [received: Sept. 1983] Magnetic data obtained in and around the Bonin region are compiled. The magnetic anomaly of the Bonin Rise shows that the rise was produced at about 19°N in latitude. The distribution of the differential magnetic anomalies indicates extension of the subbottom structure of the Bonin Rise onto the landward region of the Bonon Trench at this area. (7 refs.)

91.30 SEISMOLOGY

116019 P-wave velocity structure of the upper mantle in northern China. Zhao Zhu (Seismological Bur. of Sichuan Province, China). *Acta Geophys. Sin. (China)*, vol.26, no.4, p.341-54 (July 1983). In Chinese. English translation in: *Acta Geophys. Sin. (USA)* The data of 140 earthquakes recorded at different azimuths from the Beijing network are used. By using both the smoothing method and $dT/d\Delta$ method, the slowness curves of P-waves are obtained. By incorporating the travel-time and slowness data, continuous travel-time curves can be obtained. A simple formula is derived and used to invert the initial velocity models. The average velocity model shows that a shallow low velocity zone begins near 60 km in

depth: two abrupt increases in velocity from 360 to 420 km and from 660 to 680 km are also obtained; a possible minor zone of high-velocity gradient near 500 km is detected. (12 refs.)

116020 Direct and indirect aftershocks. Lu Yuan-Zhong, Wu Pei-Zhi, Shen Jian-Wen (Seismological Bur. of Anhui Province, China). *Acta Geophys. Sin. (China)*, vol.26, no.4, p.355-65 (July 1983). In Chinese. English translation in: *Acta Geophys. Sin. (USA)* Aftershock sequences of 25 large earthquakes, $M \geq 6$, which occurred in China since the $M=7.2$ Xingtai earthquake of 1966, are analyzed. It is found that in these sequences a great number of aftershocks followed the mainshocks in two or three days. The frequencies of these aftershocks decreased rapidly and exhibited a time decay law different from that governing the later aftershocks. These early aftershocks governed the temporal variation of the later aftershocks and had already roughly sketched out the aftershock regions. Based on these characteristics, aftershocks are considered to be of two kinds; direct aftershocks and indirect aftershocks. (4 refs.)

116021 A splitting-up method for solution of higher-order migration equation by finite-difference scheme. Ma Zai-Tian. *Acta Geophys. Sin. (China)*, vol.26, no.4, p.377-89 (July 1983). In Chinese. English translation in: *Acta Geophys. Sin. (USA)* The lower-order migration equations, second-order and third-order migration equations (i.e. first and second approximations of wave equation), are used to seismic migration practice. They are not accurate enough to migrate the events with steep dips. In order to obtain more accurate migrated seismic data, the higher-order migration equation must be used. For this purpose the author has developed a splitting-up method which is a general algorithm for solving the higher-order migration equations (including third-order equation and over) by a finite-difference scheme. The theory of this method is described and some practical experiments are shown. (7 refs.)

116022 Microearthquake activity of Derbendikhan dam area. S.A.Alsinawi (Dept. of Geology, Coll. of Sci., Univ. of Baghdad, Baghdad, Iraq), B.S.Ayar. *Iraqi J. Sci.*, vol.22, no.4, p.570-88 (1981). [received: Aug. 1983] Microearthquake activity was monitored during the period from January 1978 to March 1978. 1900 hours were recorded continuously from which 1550 hours were analysed. The rate of microearthquake occurrence, spatial distribution, fluctuation of seismic activity with duration of recording, relation between the number of microearthquakes and their duration. Poisson's distribution, frequency distribution of the maximum trace amplitude, the relation between magnitude, energy and intensity of events, and the predominant frequency were determined from statistical and Fourier analysis. (12 refs.)

116023 Amplitude spectra for some earthquakes recorded in Iraq. S.A.Alsinawi (Dept. of Geology, Coll. of Sci., Univ. of Baghdad, Baghdad, Iraq), H.J.Al-Shukri. *Iraqi J. Sci.*, vol.22, no.4, p.589-612 (1981). [received: Aug. 1983] Amplitude spectra were studied for 38 earthquakes recorded at 10 different sites in Iraq. These spectra were obtained from 10 seconds of the recorded events starting just before the P-onset. These earthquakes were recorded by a 3-component short period seismograph. The spectral characteristics indicate that the predominant frequencies of the analysed earthquakes fall in the range of 0.23-3.5 Hz. The decrease in the energy of the seismic waves as the frequency increases reaches a value of about 35% of the relative amplitude at 3.5 Hz. (11 refs.)

116024 A lithospheric seismic refraction profile in the western North Atlantic Ocean. R.B.Whitmarsh (Inst. of Oceanographic Sci., Wormley, England), C.E.Keen, L.Steinmetz, J.Tomblin, R.B.Whitmarsh, M.Donegan, R.C.Lilwall, B.D.Loncarevic, B.Nichols, J.Shepherd, J.Shepherd. *Geophys. J. R. Astron. Soc. (GB)*, vol.75, no.1, p.23-69 (Oct. 1983). A study of the seismic velocity structure of the subcrustal oceanic lithosphere was conducted in the Western North Atlantic north of the Lesser Antilles, where the age of the lithosphere is 80-95 Ma. A 1000 km long north-south array of 18 ocean-bottom seismographs (OBS), spaced at 60 km intervals, recorded arrivals from explosions at ranges up to 800 km and arrivals from earthquakes in the northern Caribbean region at ranges up to 1400 km. Analysis of the travel-time and amplitude data from the explosions provided the velocity structure down to about 65 km below sea-level. (90 refs.)

116025 Long-term premonitory seismicity patterns in Italy. M.Caputo (Accademia Nazionale dei Lincei, Roma, Italy), R.Console, A.M.Gabrielov, V.I.Keilis-Borok, T.V.Sidorenko. *Geophys. J. R. Astron. Soc. (GB)*, vol.75, no.1, p.71-5 (Oct. 1983). The clustering of earthquakes as a premonition to a strong earthquake in the same region is defined as pattern BG, which is a generalization of patterns B ('burst of aftershocks') and S ('swarm'), described previously (Caputo et al.; Keilis-Borok et al.); five out of the seven strongest earthquakes in Italy ($M \geq 6.3$, 1900-1980) are preceded by pattern BG within 5 yr; and eight out of 11 patterns BG are followed by a strong earthquake within 5 yr; the last pattern BG (1979 November 11) was diagnosed in advance of the Irpinia earthquake of 1980 November 23 ($M=6.5$). The statistical significance of pattern BG cannot be tested with the data on Italy alone. (9 refs.)

116026 Calculation of complete theoretical seismograms in vertically varying media using collocation methods. P.Spudich (US Geological Survey, Menlo Park, CA, USA), U.Ascher. *Geophys. J. R. Astron. Soc. (GB)*, vol.75, no.1, p.101-24 (Oct. 1983). Presents a method for calculating complete theoretical seismograms in Earth models whose velocity, density and attenuation profiles are arbitrary piecewise-continuous functions of depth only. A form of attenuation valid for low loss situations is included by allowing the seismic velocities to be complex, and frequency is also allowed to be complex to avoid wrap-around problems in the time-domain seismograms. Solutions for the stress-displacement vectors in the medium are expanded in terms of orthogonal cylindrical functions. A seismic source is applied at the Earth's surface and a radiation condition is applied at depth. The resulting two-point boundary value problem for the expansion coefficients is solved by a collocation technique which works best for those cases that other methods, e.g. propagator matrices, work most poorly, i.e. highly evanescent solutions. Solutions for the expansion coefficients are obtained in the depth, frequency and horizontal wavenumber domain. Phase velocity filtering may be affected at this point by restricting the portion of the frequency-wavenumber plane in which solutions are sought. (20 refs.)

116027 A study of the 1980 summer seismic sequence in the Magnesia region of Central Greece. B.C.Papazachos, D.G.Panagiotopoulos, T.M.Tsapanos (Geophys. Lab., Univ. of Thessaloniki, Thessaloniki, Greece), D.M.Mountrakis, G.Ch.Dimopoulos. *Geophys. J. R. Astron. Soc. (GB)*, vol.75, no.1, p.155-68 (Oct. 1983). Properties of the seismic sequence (foreshocks and aftershocks) of the 1980 July 9, ($M=6.5$) earthquake in the Magnesia region of Central Greece are investigated. Fault plane solutions of the three major shocks of the sequence, distribution of epicentres, geological data and field observations show that the seismic fault is a normal trending ENE-WSW and dipping SSE. Evidence

that its dip angle decreases with depth is presented. The parameter b , in the frequency-magnitude relation, was found equal to 0.84 for the foreshocks and equal to 1.28 for the aftershocks, while the decay parameter p of the time distribution of the aftershock frequency was found equal to 0.72. The frequency of foreshocks, which started on July 4, increased till July 6 but after that decreased till the occurrence of the main shock, while their average magnitude decreased continuously between July 4 and 9. A striking similarity between the focal properties of shocks of this sequence and of shocks of two other sequences which occurred in 1978 and 1981 in the back-arc. Aegean area is attributed to tensional forces acting in this area since the middle Pleistocene. (19 refs.)

116028 Synthesis of complete *SH* seismograms. S.F.Ingate, G.Bock (Res. School of Earth Sci., Australian Nat. Univ., Canberra, Australia), R.Kind. *Geophys. J. R. Astron. Soc. (GB)*, vol.75, no.1, p.261-74 (Oct. 1983). A method for calculation of theoretical *SH*-waves in a laterally homogeneous layered medium is presented. The *SH* wave trains are complete, i.e. they include surface waves as well as body waves. The *SH* displacements are calculated for two point sources, a single horizontal force and a shear dislocation of arbitrary orientation, both buried in the layered half-space. Numerical problems are discussed. The correctness of the method is ascertained by its ability to reproduce complete synthetic *SH* seismograms published elsewhere in the literature. Several examples demonstrate that this method is well suited for crustal studies as well as for teleseismic studies of the upper and lower mantle. (28 refs.)

116029 An alternative method for fault-plane solutions from a single station. S.F.Ingate (Res. School of Earth Sci., Australian Nat. Univ., Canberra, Australia). *Geophys. Res. Lett. (USA)*, vol.10, no.7, p.497-9 (July 1983). An alternative to the method of Langston (1982) for determining fault-plane solutions from a single 3-component seismic station is proposed. The method calculates synthetic *P* and *SH* seismograms for three basic orientations of a shear dislocation embedded in a plane layered Earth model, and uses least-squares to minimise the error between the observed data and a linear sum of the synthetic seismograms. The result is five trigonometric functions of fault strike θ , fault dip δ , and rake of the slip vector λ . When applied to the Borrego Mountain event of 9 April 1968, the method provides a solution which is in close agreement with well-constrained studies of the main shock. (7 refs.)

116030 T-phases from an earthquake swarm on the Mid-Atlantic Ridge at 31.6°N. T.M.Brocher (Hawaii Inst. of Geophys., Univ. of Hawaii, Honolulu, HI, USA). *Mar. Geophys. Res. (Netherlands)*, vol.6, no.1, p.39-49 (1983). An ocean bottom seismometer array on the Nova Scotia shelf edge recorded T-phases from an earthquake swarm on the mid-Atlantic ridge at about 31.6°N in June 1975. The swarm occurred along a segment of the ridge that ruptured similarly 17 yr previously. From 1964 to mid-1979 the worldwide network recorded three other earthquake swarms along this segment of the Mid-Atlantic Ridge (MAR). A sparse network of sensors in the SOFAR channel, having a lower magnitude threshold, might provide a better means of monitoring the seismicity of both short-length transforms and ridge crests along the MAR than does the worldwide seismic network. (25 refs.)

116031 A standard format for storage and exchange of natural and explosive-source seismic data: the ROSE format. S.L.Latraille, L.M.Dorman (Hawaii Inst. of Geophys., Univ. of Hawaii, Honolulu, HI, USA). *Mar. Geophys. Res. (Netherlands)*, vol.6, no.1, p.99-105 (1983). The ROSE experiment (Ewing and Meyer, 1982) involved the participation of much of the US marine seismic community. Prior to that experiment, wide consultation was made and much effort was expended in the intercomparison of instruments and in the establishment of a uniform, yet flexible, data exchange format. Results of the instrument intercomparison were reported earlier (Sutton et al., 1981) and the data exchange format is described. The participating institutions have provided their data to a central exchange facility at the University of Hawaii where the data are catalogued and distributed. The authors hope that the use of this format for the exchange of data from other experiments will reduce the time spent on work of a housekeeping nature, time which is irretrievably lost to the pursuit of scientific goals. (3 refs.)

116032 Scattering of seismic waves by the broken edge of a flat boundary. A.M.Aizenberg (Inst. of Geology & Geophys., Acad. of Sci., USSR). *Sov. Geol. & Geophys. (USA)*, vol.23, no.5, p.74-82 (1982). Translation of: *Geol. & Geofiz. (USSR)*, vol.23, no.5, p.83-92 (1982). The scattering of seismic waves by the broken edge of a flat boundary is investigated on the basis of the Huygens-Fresnel principle (secondary sources). The scattered field is represented by the superposition of three types of waves: a geometrical wave (reflected or refracted), the diffracted wave, and the wave from a corner point on the broken edge. It is shown that the results obtained in this way are equivalent to the description of this phenomenon within the framework of the theory of edge waves (Young's principle). (15 refs.)

116033 The seismology of Greece. M.Bath (Seismological Section, Uppsala, Sweden). *Tectonophysics (Netherlands)*, vol.98, no.3-4, p.165-208 (1983). A review and a bibliography are given of the seismological literature for the area of Greece in the period from 1950 up to the present time. The aim is to incorporate all aspects of seismology, starting with instrumental installations, passing on to earthquake catalogues, statistics and effects, and ending up with structural properties and seismotectonics. The purpose is to provide a service to every geophysicist who has an interest in this tectonically complex area and particularly to the numerous researchers engaged in geophysical expeditions to Greece.

116034 The occurrence of large earthquakes in South Italy. M.Caputo (Inst. of Phys., Univ. of Rome, Rome, Italy). *Tectonophysics (Netherlands)*, vol.99, no.1, p.73-83 (1983). An analysis of the data in the catalogues of Italian earthquakes indicates that large earthquakes which occur in the area of radius of about 140 km centered in the Straits of Messina occur in sequences. Each sequence is generally formed by two events and covers an average time window of 10 years. The last four sequences occurred in the time windows 1783-1891, 1818-1823, 1865-1870, 1905-1908 and are separated by about 40 years indicating that in that area there is now a gap in the time domain. The analysis of the data in the catalogue for the region between the latitudes 39°N and 41°50'N indicates that in the region the large earthquakes occurred in 13 sequences. Each sequence is formed by 3 events in average and covers an average time window of 7 years. This indicates that, after the earthquake of Nov. 1980, which occurred after a gap of 67 years, other moderately large earthquakes may be expected.

116035 Long-term prediction of earthquakes in western Honshu, Japan. H.Miki (Faculty of Sci., Kyoto Univ., Kyoto, Japan). *Zisin. J. Seismol. Soc. Jpn. (Japan)*, vol.36, no.1, p.1-11 (March 1983). In Japanese. [received: Sept. 1983] Great earthquakes along the Nankai Trough did not occur at random but occur quasi-periodically. The time intervals of their recent occurrences are 90-150 years. As the most recent past earthquakes were the Tonankai earthquake in 1944 and the Nankai earthquake in 1946, about the first third of this time interval has lapsed. If the seismicity in the coming second term is the same as that in the past term, the possibility of the occurrence of an earthquake is 50%. (16 refs.)

116036 Scaling of rupture size. II. On time and space distributions and magnitude-frequency distribution of swarm. Y.Iio (Faculty of Sci., Kyoto Univ., Kyoto, Japan). *Zisin. J. Seismol. Soc. Jpn. (Japan)*, vol.36, no.1, p.13-21 (March 1983). In Japanese. [received: Sept. 1983] For pt. I see *ibid.*, vol.35, no.2, p.183-93 (1982). The time and space distributions and b -values of the micro-fractures in mines and acoustic emissions were investigated and compared with those of earthquake swarms. (33 refs.)

116037 Focal distribution of earthquakes in relation to major geological tectonic lines in Shikoku, Japan. K.Okano (Dept. of Phys., Kochi Univ., Kochi, Japan), S.Kimura, T.Konomi. *Zisin. J. Seismol. Soc. Jpn. (Japan)*, vol.36, no.1, p.23-9 (March 1983). In Japanese. [received: Sept. 1983] Shikoku Island is divided into four zones of different geological nature by three major faults called the Median-, the Mikabu-, and the Butsuzo-Tectonic Lines, respectively. It has become obvious from the precise examination of the focal distribution of earthquakes that the four zones are characterized not only by geological features but by seismological ones: there exist aseismic zones along the three tectonic lines and the deepest levels of seismically active regions in the crust are discontinuous across the tectonic lines. (10 refs.)

116038 Study of Iwasaki earthquake swarm in Aomori Prefecture. II. Seismic activity and crustal movement. T.Sato, S.Horiuchi, S.Hori, T.Satoh, K.Kusunose, E.Murakami, K.Tachibana, H.Ishii, A.Takagi (Faculty of Sci., Tohoku Univ., Ibaraki, Japan), T.Sato. *Zisin. J. Seismol. Soc. Jpn. (Japan)*, vol.36, no.1, p.63-75 (March 1983). In Japanese. [received: Sept. 1983] For pt. I see *ibid.*, vol.34, no.1, p.81-93 (1981). An earthquake swarm with the largest event of magnitude 4.3 occurred in and near Iwasaki, on the west coast of Aomori Prefecture, NE Honshu, Japan, between September 1978 and January 1979. The authors present the results of measurements of hypocentral locations, focal mechanisms, fault plane solutions and the total seismic energy liberated. Large anomalies in the total geomagnetic field were observed in the epicentral region. No abnormal variations were detected by a tiltmeter located about 9 km from the swarm region. The results of distance measurements and levelling surveys are discussed: the crustal movements observed could not be explained by a simple elastic deformation model. (21 refs.)

91.35 EARTH'S INTERIOR STRUCTURE AND PROPERTIES

116039 The characteristics of geophysical field and the distribution and formation of oil- and gas-bearing basin in eastern China. Teng Ji-Wen, Wang Qian-Shen, Liu Yuan-Long, Wei Si-Yu (Inst. of Geophys., Acad. Sinica, Beijing, China). *Acta Geophys. Sin. (China)*, vol.26, no.4, p.319-30 (July 1983). In Chinese. English translation in: *Acta Geophys. Sin. (USA)* Based on the crust and upper mantle structures on both sides of the Tangcheng-Lujiang fault system in the epicontinental region of Eastern China, as well as on the characteristics of the geophysical fields the authors discuss the relation between these characteristics and the distribution of a series of rift valley oil- and gas-bearing basins, as well as the sedimentation and evolution of these basins. The conclusions are that, all these basins are distributed in uplifted regions of the upper mantle and that there exist anomalies of geophysical fields as well as anomalous crust and upper mantle structures. In these basins, there are Meso-Cenozoic thick sediments, with favourable conditions for the formation and accumulation of petroleum. The formation of these basins is directly connected with the motion of the Pacific and Eurasian plates and is restricted by the movement of the material in the deep mantle. (12 refs.)

- 116040 Further thermochronometric unravelling of the age and palaeomagnetic record of the southwest Grenville Province.** M.Lopez-Martinez, D.York (Dept. of Phys., Univ. of Toronto, Toronto, Canada). *Can. J. Earth Sci. (Canada)*, vol.20, no.6, p.953-60 (1983). The Cordova gabbro in the Hastings Basin of the southwestern Grenville Province has been studied thermochronometrically to see if the anomalous C magnetic pole was actually acquired prior to 1200 Ma ago. Resetting of the plagioclase argon clock very strongly indicates that, in fact, the C pole was acquired during a mild Siluro-Ordovician event and does not record the existence of a pre-Grenville small ocean between a Grenville plate and Interior Laurentia. Such a hypothesised mild event is consistent with the magnetic, isotopic, and fluid inclusion record. (17 refs.)
- 116041 Marathon dikes: Rb-Sr and K-Ar geochronology of ultrabasic lamprophyres from the vicinity of McKellar Harbour, northwestern Ontario, Canada.** R.G.Platt, R.H.Mitchell (Dept. of Geology, Lakehead Univ., Thunder Bay, Canada), P.M.Holm. *Can. J. Earth Sci. (Canada)*, vol.20, no.6, p.961-7 (1983). Discusses the Rb/Sr and K/Ar geochronology of a set of ultramafic lamprophyres located in the vicinity of McKellar Harbour (48°48'N, 86°44'W) some 40 km west of Marathon. (24 refs.)
- 116042 Apatite fission-track dating of erosion in the eastern Andes, Bolivia.** S.T.Crough (Dept. of Geosci., Purdue Univ., West Lafayette, IN, USA). *Earth & Planet. Sci. Lett. (Netherlands)*, vol.64, no.3, p.396-7 (Sept. 1983). Three samples from a Triassic-age batholith in the eastern Andes northeast of La Paz, Bolivia, yield apatite fission-track ages of 11-13 Ma. Interpreting these young ages as due to uplift and erosion requires approximately 2.5-5.0 km of erosion in the past 12 Ma, an amount which is consistent with the known geology and which is typical of many active mountain ranges. (7 refs.)
- 116043 A marine seismic refraction study of the Santa Barbara Channel, California.** G.J.Crandall, B.P.Luyendyk, M.S.Reichle, W.A.Prothero (Dept. of Geological Sci., Univ. of California, Santa Barbara, CA, USA). *Mar. Geophys. Res. (Netherlands)*, vol.6, no.1, p.15-37 (1983). Seismic data from a 186 km-long refraction profile in the Santa Barbara Channel are interpreted using several velocity inversion techniques. Data were obtained during two cruises in 1978 and 1979. Seismic arrivals from fifty explosions of between 1 and 300 lb of TNT were recorded by two ocean bottom seismometers, four permanent ocean bottom stations (University of Southern California), and much of the United States Geological Survey/California Institute of Technology Southern California seismic network. Travel-time inversion is discussed. The velocity structure determined by these methods suggests that the channel has a sedimentary fill of from 4 to 7 km and a layer of mafic plus ultramafic rock 14 to 17 km thick. The greatest thicknesses of sediments are restricted to east of Point Conception. The velocity data also suggest that the Franciscan formation may not be present beneath the channel. Rather, the crust may represent a thickened portion of the Coast Range ophiolite. (43 refs.)
- 116044 Ion microprobe identification of 4100-4200 Myr-old terrestrial zircons.** D.O.Froude, T.R.Ireland, P.D.Kinny, I.S.Williams, W.Compton (Res. School of Earth Sci., Australian Nat. Univ., Canberra, Australia), I.R.Williams, J.S.Myers. *Nature (GB)*, vol.304, no.5927, p.616-18 (18 Aug. 1983). Reports the existence of detrital zircons from Western Australia which are far older than any known terrestrial rocks. They are from quartzites at Mt. Narryer, a locality which has created interest because of the nearby occurrence of 3630 ± 40 Myr orthogneisses. The older zircons were discovered during reconnaissance U-Pb age determinations of zircon concentrates from Archaean metasediments, using the ion microprobe SHRIMP at the Australian National University. These determinations are being made specifically to search for zircons having ages in the interval 3800-4500 Myr, a period unrepresented so far by reliable terrestrial age determinations. Grain-by-grain measurements of one particular concentrate revealed four zircons having near-concordant U-Pb ages between 4100 and 4200 Myr, in striking contrast to most grains whose ages are ~3750 and ~3500 Myr. These results show that pre-3800 Myr silica-saturated rocks were indeed present on the Earth's crust. (7 refs.)
- 116045 Some features of the evolution of the shelf zones of the globe during Mesozoic-Cenozoic time.** Ye.N.Nevesskiy (Shirshov Inst. of Oceanology, Acad. of Sci., Moscow, USSR). *Oceanology (USA)*, vol.22, no.1, p.40-9 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.1 (1982). [received: Aug. 1983] The theory of plate tectonics is used to analyze the possible influence of continental drift and other global factors on the evolution of the shelf zones of the Earth during Mesozoic-Cenozoic time. The author compares paleogeographic maps, with maps for the corresponding time, reflecting the movement of the continents. The evolution of the shelves under conditions of unstable tectonic, hydrodynamic, and climatic environments, which determined the main features of sedimentational process, and the structure and composition of the shelf sediments, is traced. Maps of the likely distribution of Mesozoic-Cenozoic sedimentary associations of different lithologies on the present shelves are presented. (29 refs.)
- 116046 On the relation between the deep subsurface structure of the Baikal and Red Sea rifts and the lateral movements of lithospheric plates.** Ye.G.Mirlin, N.Yu.Bocharova (Shirshov Inst. of Oceanology, Acad. of Sci., Moscow, USSR). *Oceanology (USA)*, vol.22, no.4, p.438-43 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.4 (1982). [received: Aug. 1983] The relationship between the height of ascent of mantle material and the total separation of continental plates in a rift zone is analyzed on the examples of the Baikal and the Red Sea rifts. All the available geologic and geophysical data is taken into account in preparing sections showing the structure of both rifts at depth. It is shown that the subsurface structure of the Red Sea rift differs from that of the Baikal rift in the greater height to which the mantle material rises and in the formation of a crust of the oceanic type. The differences are assumed to be due to the different stages of development of the two rifts. A comparative analysis is made of other rift zones with similar plate separations. (22 refs.)
- 116047 The dynamic Earth.** R.Siever. *Sci. Am. (USA)*, vol.249, no.3, p.30-9 (Sept. 1983). A general account is given of the Earth's history throughout geological time. The structure of the Earth's interior is described and plate tectonic processes are explained. The author discusses the other geologic processes that influence the shape and form of the Earth. These processes include the hydrologic cycle and volcanic activity. (no refs.)
- 116048 The Earth's core.** R.Jeanloz. *Sci. Am. (USA)*, vol.249, no.3, p.40-9 (Sept. 1983). A general account is given of the structure and properties of the Earth's core. The article describes how seismology is used to study the interior structure.

Dynamo models of the geomagnetic field are considered. These dynamo models require convection processes to occur in the core. The chemical composition of the core and its accretional history are described. (no refs.)

- 116049 The Earth's mantle.** D.P.McKenzie. *Sci. Am. (USA)*, vol.249, no.3, p.50-62 (Sept. 1983). A general account is given of the structure, chemical composition and tectonic convection processes occurring in the Earth's mantle. (no refs.)
- 116050 The oceanic crust.** J.Francheteau. *Sci. Am. (USA)*, vol.249, no.3, p.86-98 (Sept. 1983). Oceanic crust is created from mantle material at midocean ridges, it slowly spreads out to be consumed at subduction zones located at the junction with the continents or at island arcs. This article gives a general account of this plate tectonic process. The article also describes the detailed structure of the oceanic crust describing the transform faults, geology and gravity field. The results of seismic surveys and deep-sea sonar studies are also described. Details are given of sediment core studies and studies of ocean bottom rocks and submarine surveys. (no refs.)
- 116051 The continental crust.** B.C.Burchfiel. *Sci. Am. (USA)*, vol.249, no.3, p.86-98 (Sept. 1983). The article provides an overview of the continental crust describing its geology and the tectonic processes that have shaped it. Several examples are used to describe these processes. These areas are the Basin and Range Province in the USA, the Dead Sea rift system, the Pannonian Basin and the Australasia-Solomon Sea area. (no refs.)
- 116052 A model of thermal conduction in the Earth's crust in the Okhotomorskii region.** N.A.Volkova. *Sov. Geol. & Geophys. (USA)*, vol.23, no.5, p.83-7 (1982). Translation of: *Geol. & Geofiz. (USSR)*, vol.23, no.5, p.92-7 (1982). A thermal-conduction model is proposed for the Earth's crust in the Okhotomorskii region. It is based on the results of experimental and theoretical studies. It is concluded that the thermophysical properties of the Earth's crust are highly inhomogeneous in the horizontal direction in this region. (8 refs.)
- 116053 Cataclastic rocks of the San Gabriel fault—an expression of deformation at deeper crustal levels in the San Andreas fault zone.** J.L.Anderson, R.H.Osborne (Dept. of Geological Sci., Univ. of Southern California, Los Angeles, CA, USA), D.F.Palmer. *Tectonophysics (Netherlands)*, vol.98, no.3-4, p.209-51 (1983). The San Gabriel fault, a deeply eroded late Oligocene to middle Pliocene precursor to the San Andreas, was chosen for petrologic study to provide information regarding intrafault material representative of deeper crustal levels. Cataclastic rocks exposed along the present trace of the San Andreas in this area are exclusively a variety of fault gouge that is essentially a rock flour with a quartz, feldspar, biotite, chlorite, amphibole, epidote, and Fe-Ti oxide mineralogy representing the milled-down equivalent of the original rock. Likewise, fault gouge and associated breccia are common along the San Gabriel fault, but only where the zone of cataclasis is several tens of meters wide. At several localities, the zone is extremely narrow (several centimeters), and the cataclastic rock type is cataclasite, a dark, aphanitic, and highly comminuted and indurated rock. The San Gabriel cataclastic rocks also show more mineralogical changes.
- 116054 Geochronological and structural study of Tertiary and Quaternary dikes in southern France and Sardinia: an example of the utilization of dike swarms as paleostress indicators.** G.Feraud, R.Campredon (Lab. de Geologie et Geochemie, ERA, Nice, France). *Tectonophysics (Netherlands)*, vol.98, no.3-4, p.297-325 (1983). Ancient dikes swarms which are datable by geochronological methods can be used as paleostress indicators. This study defines criteria by which suitable dike swarms can be selected. This paper deals with Tertiary and Quaternary dike swarms of the French and Sardinian peri-Alpine platform. The results of geochronological and structural analysis show that the general trends of dikes (ranging from NW-SE to N-S) intruded during the last 8 Ma on the border of Massif Central and in Languedoc parallel the general trajectories of the present stress field (plane $\sigma_1\sigma_2$) as deduced from in situ measurements and from focal mechanism determination of earthquakes.

91.40 VOLCANOLOGY

- 116055** Relation of summit deformation to East Rift Zone eruptions on Kilauea volcano, Hawaii. D.Epp (Hawaii Inst. of Geophys., Univ. of Hawaii, Honolulu, HI, USA), R.W.Decker, A.T.Okamura. *Geophys. Res. Lett. (USA)*, vol.10, no.7, p.493-6 (July 1983). An inverse relationship exists between the summit deflation of Kilauea, as recorded by summit tilt, and the elevation of associated eruptive vents on the East Rift Zone. This relationship implies that East Rift eruptions drain the summit magma reservoir to pressure levels that are dependent on the elevation of the eruptive vents. (11 refs.)
- 116056** The Long Valley/Mono Basin volcanic complex in eastern California: status of present knowledge and future research needs. J.F.Hernance (Dept. of Geological Sci., Brown Univ., Providence, RI, USA). *Rev. Geophys. & Space Phys. (USA)*, vol.21, no.7, p.1545-65 (Aug. 1983). The Long Valley-Mono Basin volcanic complex in eastern California is a major silicic system which is considered to be still potentially active. The complex is associated with a well developed convective hydrothermal system and with hot spring activity at the surface. Recent earthquakes and tectonic deformation, and the reactivation of fumaroles, indicate that a potential volcanic hazard exists for the southwest segment of Long Valley caldera. The author recommends a programme of drilling to 2-3 km depth, coupled with surface field studies, to understand the nature of the inferred high-temperature hydrothermal reservoir and how it is linked to a possible magma body at depth. (69 refs.)
- 116057** ^{14}C age of volcanic ash flow at Danan Island Somma of Krakatau Volcano, Indonesia. T.Yokoyama (Dept. of Earth Sci., Doshisha Univ., Kyoto, Japan), O.Yamada, S.Nishimura. *Sci. & Eng. Rev. Doshisha Univ. (Japan)*, vol.24, no.1, p.78-82 (May 1983). In Japanese.
- The radiocarbon age of the wood sample, obtained from the outcrop of ash flow at Danan Island, Krakatau Volcano was measured. This volcano locates between Sumatra and Jawa Islands, Indonesia, and is very famous for the most disastrous eruption in 1983. Obtained ^{14}C age is 190 ± 25 B.P. This age indicates the Early Caldera Stage or the Second Stage. It was clarified that the actual activity of Krakatau Volcano is very young. (8 refs.)
- 116058** The Mesozoic magmatism of the Aldan shield as an indicator of its tectonic regime. E.P.Maksimov (Central Combined Specialized Thematic Expedition, Yakutsk, USSR). *Sov. Geol. & Geophys. (USA)*, vol.23, no.5, p.9-14 (1982). Translation of: *Geol. & Geofiz. (USSR)*, vol.23, no.5, p.11-18 (1982).
- The Mesozoic association of potassic-alkalic basites is extensively developed on the Aldan shield of the Siberian platform. The arched-block structure of the region and the antitropic direction of the magmatic process indicate a rift-forming regime of its tectonic development during the Mesozoic. Moreover the alkalic magmatism is linked through subalkalic monzonite-syenites within a single lateral series to calcic-alkalic granitoid magmatism. The lateral zonality, which also extends to the Stanovoi orogenic region, results from the formation of a Benioff zone during the Late Jurassic and Early Cretaceous. (16 refs.)

91.45 PHYSICS OF PLATE TECTONICS

- 116059** The underthrusting movement of the Western Pacific Plate and the deep focus earthquake zone or northeast China. Zhang Li-Min (Inst. of Geophys., Acad. Sinica, China), Tang Xiao-Ming. *Acta Geophys. Sin. (China)*, vol.26, no.4, p.331-40 (July 1983). In Chinese. English translation in: *Acta Geophys. Sin. (USA)*
- In the Huichuen region of northeast China, there is a deep focus earthquake zone, the depth of which reaches as deep as 600 km. As seen from the projection of the focal profile, it is the result of underthrusting of the Western Pacific Plate. The angle of the thrusting plate with the horizontal is about 26° . The authors set up a plate underthrusting model to calculate the temperature distribution within the thrusting plate at various depths, taking the thermal conduction between the mantle material and the lithospheric plate into account. The calculation shows that the plate reaches the Huichuen region, at the depth of 600 km the temperature at its center is about $1200^\circ C$, which is much lower than that of the mantle around it. So it is possible to form elastic fractures and thus generate deep earthquakes. The focal mechanism solutions of earthquakes in this region are discussed. (7 refs.)

116060 Isostatic adjustments in a full glacial sea. J.England (Dept. Geography, Univ. of Alberta, Edmonton, Canada). *Can. J. Earth Sci. (Canada)*, vol.20, no.6, p.895-917 (1983).

During the last glaciation an ice-free corridor existed between the northeast Ellesmere Island and northwest Greenland ice sheets. This corridor constituted a peripheral depression in which the marine limit marks the uppermost extent of a full glacial sea. Relative sea-level curves from the full glacial sea confirm previous morphostratigraphic and glaciostatic evidence for limited ice extent during the last glaciation. These curves also document the history of glacial unloading and the form of the relative sea-level curve that one would theoretically expect in the peripheral depression. These relative sea-level curves are discussed in relation to other paleoclimatic changes and the deglacial history of northwest Greenland. (64 refs.)

116061 The Snake Range decollement: an exhumed mid-Tertiary ductile-brittle transition. E.L.Miller, P.B.Gans, J.Garing (Dept. of Geology, Stanford Univ., Stanford, CA, USA). *Tectonics (USA)*, vol.2, no.3, p.239-63 (June 1983).

Focuses on the age, three-dimensional extent, and tectonic significance of the northern Snake Range decollement in east-central Nevada. (58 refs.)

116062 Paleogene evolution of the Kodiak Islands, Alaska: consequences of ridge-trench interaction in a more southerly latitude. J.C.Moore (Center for Coastal Marine Studies, Univ. of California, Santa Cruz, CA, USA), T.Byrne, P.W.Plumley, M.Reid, H.Gibbons, R.S.Coe. *Tectonics (USA)*, vol.2, no.3, p.265-93 (June 1983).

Outlines a geological and paleomagnetic case for the interaction of a spreading center with a subduction zone bordering one of the displaced terranes of southern Alaska. An accretionary complex bordering southern Alaska landward of the modern Aleutian Trench is investigated. The structural geology, petrology, geochemistry and paleomagnetism of igneous and sedimentary rocks formed prior, during and after the Paleocene igneous activity in the Kodiak Islands has been investigated. (111 refs.)

116063 Tectonic stresses in the lithosphere. L.Fleitout, C.Froidevaux (Lab. de Geophys. et Geodynamique Interne, Univ. Paris-Sud, Orsay, France). *Tectonics (USA)*, vol.2, no.3, p.315-24 (June 1983).

Analyzes the effect of both boundary and internal forces on the lithospheric stress pattern and shows that both contributions are of comparable magnitude. The presence of internal sources makes the problem three-dimensional. However, it can be reduced to a two-dimensional plane stress formulation, where the edge forces are expressed by the 'non-hydrostatic stresses' and the basal shear is increased by the addition of a term proportional to the gradient of the mean vertical stress. (32 refs.)

116064 Fault slip beyond a barrier on a transform plate boundary. M.Bonafede, E.Boschi, M.Dragoni (Dipartimento di Fisica, Univ. di Bologna, Bologna, Italy). *Geophys. J. R. Astron. Soc. (GB)*, vol.75, no.1, p.143-53 (Oct. 1983).

A strike-slip plate boundary is considered with nonuniform strength. Depth-dependent slip on the fault is assumed to occur aseismically in the lower fault section, in response to a basal shear stress, and seismically in the brittle upper section. The upper fault section acts as a friction decreases in the proximity of the Earth's surface, brittle fracture may occur beyond the barrier. It is found that, when friction in the uppermost fault section exceeds the applied shear stress, fault slip occurs there with a smaller amplitude than at larger depth. This may explain the discrepancies, which have been sometimes reported, between fault offsets observed at the Earth's surface and fault offsets inferred from seismograms by using simpler dislocation models. (44 refs.)

116065 Thermoelastic bending of the lithosphere: implications for basin subsidence. B.G.Bills (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA). *Geophys. J. R. Astron. Soc. (GB)*, vol.75, no.1, p.169-200 (Oct. 1983).

Thermoelastic stresses are capable of producing significant lithospheric deflection. A systematic approach to modelling this effect is presented, in which the lithosphere is presumed to behave as a thin, elastic (or viscoelastic) plate on a fluid substrate, and lateral variations in basal heat flow induce both vertical buoyant loads and thermoelastic bending moments. The amount of uplift or subsidence produced by a given heat source depends on a number of factors, including the strength, duration and lateral extent of the thermal anomaly, and the thickness, density, rigidity and viscosity of the plate. The mechanical response of the plate is characterized by two distinct length scales (one for shearing, the other for bending) and the deformation produced depends critically on the scaled width of the heat source. The plate acts as a low pass spatial filter in response to thermal loads, but has a narrow band pass filter response to applied moments. The temporal response to an abrupt change in basal temperature or heat flow also depends on the ratio of the thermal diffusion time for the plate versus the viscoelastic relaxation time of the material. (71 refs.)

116066 Tectonics of ridge-transform intersections at the Kane fracture zone. J.A.Karson, H.J.B.Dick (Dept. Geology & Geophys., Woods Hole Oceanographic Instn., Woods Hole, MA, USA). *Mar. Geophys. Res. (Netherlands)*, vol.6, no.1, p.51-98 (1983).

The Kane Transform offsets spreading-center segments of the Mid-Atlantic Ridge by about 150 km at $24^\circ N$ latitude. In terms of its first-order morphological, geological, and geophysical characteristics it appears to be typical of long-offset (>100 km), slow-slipping (2 cm yr^{-1}) ridge-ridge transform faults. High-resolution geological observations were made from deep-towed ANGUS photographs and the manned submersible ALVIN at the ridge-transform intersections and indicate similar relationships in these two regions. These data indicate that over a distance of about 20 km as the spreading axes approach the fracture zone, the two flanks of each ridge axis behave in very different ways. These are discussed. (78 refs.)

116067 Changing stress field in the middle segment of the Tan-Lu fault zone, eastern China. Lu Huaifu, Yu Hongnian, Ding Youwen, Zhang Qinglong (Dept. of Geology, Nanjing Univ., Nanjing, China). *Tectonophysics (Netherlands)*, vol.98, no.3-4, p.253-70 (1983).

The Tan-Lu active fault zone is an important tectonic boundary in east China. Minor structures associated with the fault show that the nature of displacement on the middle segment of the fault zone has changed in consecutive episodes since the Cretaceous: normal faulting during the Cretaceous, sinistral strike-slip and reverse faulting at the end of the Cretaceous or in the early Tertiary, and dextral strike-slip and reverse faulting from the late Tertiary to the present. The regional orientation of the maximum principal compressive stress, based upon the statistical study of minor shear fracture orientation, is 6° , $S52^\circ W$ in the late Tertiary to Quaternary. This stress field may be related to the collision between India and Tibet and the microspreading of the Japan Sea.

116068 Continental uplift, compensation and shunting during trench-spreading center collision. P.E.Damon (Dept. of Geosci., Univ. of Arizona, Tucson, AZ, USA).

Tectonophysics (Netherlands), vol.99, no.1, p.T1-8 (1983).

A model for continental uplift at a convergent margin (Damon, 1979) is further developed. The model assumes the necessity of isostatic compensation of the subducted lithospheric plate. It predicts a continental declivity that reaches its maximum uplift and extent at the time of trench-spreading center collision. As a result of the passage of the subducted plate eastward the region of maximum uplift increases and migrates eastward behind the eastward migrating declivity. The 'gang plank' from the Front Range to the Mississippi River is the most obvious modern expression of the continental declivity whereas the Great Basin is an expression of the area of maximum uplift lowered somewhat by extension and crustal thinning. Compensation takes place by transfer of asthenosphere to the base of continental lithosphere.

116069 The reliability of asymmetric c-axis fabrics of quartz to determine sense of vorticity. C.W.Passchier (Dept. of Geology, Univ. Coll. of Swansea, Swansea, Wales).

Tectonophysics (Netherlands), vol.99, no.1, p.T9-18 (1983).

Asymmetric c-axis fabrics of quartz are convergent margin (Damon, 1979) is further developed. The model assumes the necessity of isostatic compensation of the subducted lithospheric plate. It predicts a continental declivity that reaches its maximum uplift and extent at the time of trench-spreading center collision. As a result of the passage of the subducted plate eastward the region of maximum uplift increases and migrates eastward behind the eastward migrating declivity. The 'gang plank' from the Front Range to the Mississippi River is the most obvious modern expression of the continental declivity whereas the Great Basin is an expression of the area of maximum uplift lowered somewhat by extension and crustal thinning. Compensation takes place by transfer of asthenosphere to the base of continental lithosphere.

116070 Oceans, continents and orogens. J.H.Brunn (Univ. of Paris, Paris, France).

Tectonophysics (Netherlands), vol.99, no.1, p.1-29 (1983).

The processes related to subduction and mountain building are discussed, and some new models and notions are proposed. At all known epochs, the Earth's surface comprised essentially migrating plates and large belts where the lithosphere is mobilised, so that subductions and crustal resorption occur in complex structural patterns. Through time, these orogens start as island arcs and evolve into folded ranges. The formation and location of island-arc belts is shown to be related to the obliquity between rifts and continental margins. It is suggested that the energy output (heat flow) varies with the pressure exerted by the top (elastic) lithosphere upon the underlying mantle. A compression tends to be established between the inner flow and tectonic stress, as the latter brings about pressure variations through uplift-subsidence couples. These may therefore be related to the generation of paired metamorphic belts.

116071 Analogue models of folds above a wrench fault. F.Odonne, P.Vialon (Inst. de Recherches Interdisciplinaires de Geologie et de Mecanique, Domaine Univ. de Grenoble, France).

Tectonophysics (Netherlands), vol.99, no.1, p.31-46 (1983).

Describes the experimental deformation of models made with sheets of parafin wax simulating a bedded cover resting on a basement wrench fault. During the experiments, 'en echelon' folds appear in the cover. As a result of early fault motion, folds first appear at heterogeneities in the bedding and with axes at about 45° to the trace of the wrench fault. Further fault displacement causes a bulk rotation of fold axes towards parallelism with the basement wrench fault, and a resulting curvature of fold axes at larger fault displacement. Folding affects an area which tends to quickly stabilize in width, since folding weakens the sheared cover and subsequent deformation is concentrated in it. Axial surfaces of folds are initially upright, then tend to become inclined with an external vergence, forming a fan centered on the basement wrench fault. Deeper layer-deformation, close to the basement, involves fold reorientations that are greater than in the upper layers.

116072 Characteristics of distributions of thermal stress and stress due to phase change in the descending plate beneath Island Arc. K.Goto, H.Hamaguchi (Geophysical Inst., Tohoku Univ., Ibaraki, Japan).

Zisin. J. Seismol. Soc. Jpn. (Japan), vol.36, no.1, p.31-41 (March 1983). In Japanese. [received: Sept. 1983]

Studies on double-planed intermediate seismic zones beneath some island arcs reveal that the earthquakes have two different types of focal mechanism solutions: down-dip compression and down-dip extension. This feature is important for studies of the stress distribution in the descending plate, and several stress sources are proposed. The authors calculate the distributions of thermal stress and the stress due to the olivine-spinel phase change in the descending plate. (33 refs.)

116073 ²²⁶Ra and ²²²Rn contents of Galapagos Rift hydrothermal waters—the importance of low-temperature interactions with crustal rocks. J.Dymond, R.Cobler, L.Gordon (School of Oceanography, Oregon State Univ., Corvallis, OR, USA), P.Biscaye, G.Mathieu.

Earth & Planet. Sci. Lett. (Netherlands), vol.64, no.3, p.417-29 (Sept. 1983). Hydrothermal waters collected by 'Alvin' from the Galapagos Spreading Center are enriched in ²²²Rn by factors of 50-200 over bottom waters. The ²²⁶Ra in the same samples, however, is enriched by less than a factor of four over bottom waters. Enrichments of ²²²Rn result primarily from α-recoil from rock surfaces while ²²⁶Ra enrichments are dominantly produced by high-temperature alteration of cooling ridge volcanics. The data extrapolate to bottom water temperatures and compositions, demonstrating the importance of seawater mixing. The ²²²Rn/²²⁶Ra value appears to be a sensitive indicator of low-temperature crustal interaction. (19 refs.)

116074 Intense hydrothermal activity at the axis of the East Pacific Rise near 13°N: submersible witnesses the growth of sulfide chimney. R.Hekinian (Centre Océanologique de Bretagne, Brest, France), J.Francheteau, V.Renard, R.D.Ballard, P.Choukroune, J.L.Cheminee, F.Albarede, J.F.Minster, J.L.Charlou, J.C.Marty, J.Bouleuge.

Mar. Geophys. Res. (Netherlands), vol.6, no.1, p.1-14 (1983).

A submersible study of the East Pacific Rise near 12°5'N led to the discovery of intense hydrothermal activity. Twenty four sites with active vents and sixty inactive hydrothermal deposits were found within a narrow graben averaging about 300 m in width along a 20 km long segment of the ridge crest. From both deep towed camera stations and manned submersible observations, the average spacing between the ridge axis hydrothermal deposits is discussed. Detailed investigations of one active site enabled the authors to witness the growth of an active chimney. The hydrothermal deposits found on both the ridge axis and on the seamount are similar in composition. Chemical studies conducted on the venting fluids showed the concentration of the dissolved major metal ions (Fe, Mn, and Zn). (23 refs.)

116075 New data on the structure of Ampere Seamount. V.M.Litvin, V.V.Matveyenko, E.L.Onishchenko, M.V.Rudenko, A.M.Sagalevich (Shirshov Inst. of Oceanology, Acad. of Sci., Moscow, USSR).

Oceanology (USA), vol.22, no.1, p.62-4 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.1 (1982). [received: Aug. 1983]

The Ampere Seamount was studied with the aid of the Pisces manned submersible craft and the Zvuk-4m towed device. The seamount consists of volcanic rocks, including trachytes. The latter outcrop in the form of narrow, linear ridges. On the summit of the seamount, there are conglomerates dissected by deep scours, and cavernous limestones. (8 refs.)

116076 Geologic mapping of the summit of Afanasiy Nikitin Seamount from the Zvuk-4 towed submersible. N.A.Rimskiy-Korsakov, A.A.Shreyder (Shirshov Inst. of Oceanology, Acad. of Sci., Moscow, USSR).

Oceanology (USA), vol.22, no.4, p.489-92 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.4 (1982). [received: Aug. 1983]

The Zvuk-4 towed submersible, carrying a bilateral side-scanning sonar (SSS), a precision echo sounder, an acoustic profiler (AP), and a photographic system was used in a geologic and morphological survey of the summit of the Afanasiy Nikitin Seamount on the twenty-fifth cruise of the R/V Dmitriy Mendeleev in the Indian Ocean. The authors identify and map three types of seafloor. Layered sand, solid rock lightly covered with a sandy material, and solid rock devoid of sediment. The photographic survey, the visual examination of the bottom, and the taking of samples in the area under study using the Pisces manned submersible suggest that the solid rock is limestone covered with manganese crusts. (1 ref.)

116077 The benthic boundary layer and sediment transport. A.R.M.Nowell (School of Oceanography, Univ. of Washington, Seattle, WA, USA).

Rev. Geophys. & Space Phys. (USA), vol.21, no.5, p.1181-92 (June 1983). Recent research by US workers into the dynamics and sedimentation processes of the BBL are reviewed. The viscous sublayer and logarithmic layer are described. The similarity variables which are used to scale the flow are reviewed. The effects of internal waves and the structure of the mixed layer are covered in this review. Both laboratory experiments and sediment transport models are also described. (137 refs.)

116078 Ninigi and Godaigo seamounts: twins of the Emperor Chain by multi-beam sonar. N.C.Smoot (US Naval Oceanographic Office, NSTL Station, MS, USA).

Tectonophysics (Netherlands), vol.98, no.3-4, p.T1-5 (1983).

Bathymetry is shown for two heretofore unknown seamounts in the Emperor Chain: Ninigi and Godaigo seamounts. They were discovered by the US Naval Oceanographic Office and named by the author. Very accurate bathymetry and positioning allows a clarification of previous mid-chain bathymetric charts and an explanation of hot spot multiple conduit flow.

91.60 PHYSICAL PROPERTIES OF ROCKS AND MINERALS

116079 Stress corrosion and acoustic emission during tensile crack propagation in Whin Sill dolerite and other basic rocks. P.G.Meredith, B.K.Atkinson (Geology Dept., Imperial Coll. of Sci. & Technol., London, England).

Geophys. J. R. Astron. Soc. (GB), vol.75, no.1, p.1-21 (Oct. 1983).

Double torsion tests in ambient air and liquid water have been used to establish critical stress intensity factors (K_{Ic}) and stress intensity factor (K_I)-crack velocity (v) diagrams for propagation of single tensile cracks in Whin Sill

dolerite and Ralston Intrusive. K_{Ic} for Whin Sill dolerite was $3.28 \text{ MN m}^{-3/2}$ and for Ralston Intrusive was $2.58 \text{ MN m}^{-3/2}$. No stress corrosion limit was encountered. Acoustic response was monitored during experiments on Whin Sill dolerite which spanned a velocity range from 5×10^{-4} to $5 \times 10^{-9} \text{ m s}^{-1}$. The rate of acoustic emission was an indirect measure of crack velocity. The slopes of K_{Ic} diagrams and K_{Ic} -acoustic emission rate diagrams had similar slopes of c. 30 in double logarithmic coordinate frames. The activation enthalpy for dolerite between 20° and 75°C was determined. A discussion is given of these results in terms of their implications for earthquake mechanisms. (38 refs.)

116080 Dynamic compression of diopside and salite to 200 GPa. B.Svendsen, T.J.Ahrens (Seismological Lab., California Inst. of Technol., Pasadena, CA, USA).

Geophys. Res. Lett. (USA), vol.10, no.7, p.501-4 (July 1983). New Hugoniot data on single crystal diopside, $\text{CaMgSi}_2\text{O}_6$ (Di), suggest that transformation to a high-pressure thermomechanical state begins at ~50 GPa and is complete above 100 GPa, in agreement with other pyroxenes and silicates of geophysical interest. Comparison of the new high pressure phase (HPP) data for Di and salite, $\text{CaMg}_{0.82}\text{Fe}_{0.18}\text{Si}_2\text{O}_6$ (Sa) with appropriate mixed oxide and perovskite models implies compatibility between either model and the data. Conversely, least-squares fits to the HPP Di data favour lower ($3.6\text{--}3.9 \text{ Mg/m}^3$) values of zero-pressure, room-temperature density than the models ($4.0\text{--}4.1 \text{ Mg/m}^3$). This may represent the influence of multiple transition processes (e.g. polymorphism and Fe^{2+} high-low spin) as a function of Fe content across the Di-Hd series. The new HPP Sa data closely parallel ($\approx 0.1 \text{ Mg/m}^3$ less dense) the lower mantle density profile from ~90 GPa to 136 GPa. The results are consistent with the speculations of Jeanloz and Ahrens on the possibility of significant Ca in the lower mantle. (41 refs.)

116081 Evidence for correlation of ultrasonic attenuation and fluid permeability in very low porosity water-saturated rocks. J.G.Berryman, B.P.Bonner, R.C.Y.Chin (Lawrence Livermore Nat. Lab., Livermore, CA, USA).

Geophys. Res. Lett. (USA), vol.10, no.7, p.595-8 (July 1983). The measured amplitude A of ultrasonic pulses in intact and fractured samples of water-saturated gabbro and granite is observed to decrease as the permeability κ increases according to the proportionality $A \propto \kappa^{-1/2}$. This relation is predicted by Biot's theory of elastic waves in fluid-saturated porous media and, therefore, suggests that Biot's attenuation mechanism may play a significant role in low porosity materials at ultrasonic frequencies. The evidence is not conclusive. The limited data set studied is also consistent with correlations of the form $A \propto \kappa^{-\epsilon}$ where $0.2 < \epsilon < 0.6$. Nevertheless, the observed correlations may still provide a means for monitoring changes in permeability of low-porosity underground repositories of radioactive waste. (10 refs.)

116082 Influence of the type of thermodynamic approximation on the description of the dynamic compressibility of multicomponent media. S.V.Bobrovskii, V.M.Gogolev, V.P.Lozhkina.

J. Appl. Mech. & Tech. Phys. (USA), vol.23, no.6, p.811-16 (Nov.-Dec. 1982). Translation of: *Zh. Prikl. Mekh. & Tekh. Fiz. (USSR)*, vol.23, no.6, p.83-7 (Nov.-Dec. 1982). [received: Sept. 1983]

The authors consider the degree of disparity between the limiting approximations in shock compressions and isentropic stress relief and they investigate the conditions under which they yield either close or sharply different mechanical parameters of the state of the medium. The solution of these problems will provide a basis for considering the application of a particular thermodynamic approximation to various practical problems involving multicomponent soils. (7 refs.)

116083 Compression, nonstoichiometry and bulk viscosity of wüstite. R.Jeanloz (Dept. of Geology & Geophys., Univ. of California, Berkeley, CA, USA), R.M.Hazen.

Nature (GB), vol.304, no.5927, p.620-2 (18 Aug. 1983). Wüstite (Fe_{1-x}O) is a complex oxide that is invariably non-stoichiometric ($0.04 \leq x \leq 0.12$). Point defects associated with this nonstoichiometry are clustered and result in a modulated crystal structure that has been extensively studied, but is not well understood. Many of the properties of these compounds, such as chemical diffusivity, electrical conductivity and magnetic transitions seem to be significantly affected by the nonstoichiometry and resulting ordering of defects. The authors summarise new and existing data on the elasticity of wüstite; these data indicate virtually no correlation between the bulk modulus and stoichiometry. There appears, however, to be a systematic difference between static and dynamic measurements. This behaviour suggests the presence of a frequency dependence to the bulk modulus that can be ascribed formally to a finite bulk viscosity of Fe_{1-x}O . (30 refs.)

116084 Dynamic processes during slip of stick-slip as an earthquake fault model. M.Ohnaka (Earthquake Res. Inst., Univ. of Tokyo, Tokyo, Japan), K.Yamamoto, Y.Kuwahara, T.Hirasawa.

Zisin. J. Seismol. Soc. Jpn. (Japan), vol.36, no.1, p.53-62 (March 1983). In Japanese. [received: Sept. 1983]

Dynamic strain and displacement during stick-slip in Tsukuba granite have been measured at different locations in the neighborhood of a fault, and typical strain and displacement records are presented. A local stress concentration resulting in strain change is observed near the fault prior to the onset of foreship, and this premonitory strain change and the onset of foreship, often accompanied by foreshocks, propagate slowly along the fault. If this occurs along natural faults, it can be a promising premonitory effect for earthquake prediction. (15 refs.)

91.65 GEOPHYSICAL ASPECTS OF GEOLOGY, MINERALOGY AND PETROLOGY

116085 Nd-Sr systematics of the Setouchi volcanic rocks, southwest Japan: a clue to the origin of orogenic andesite. K.Ishizaka, R.W.Carlson (Dept. of Terrestrial Magnetism, Carnegie Instn. of Washington, Washington, DC, USA).

Earth & Planet. Sci. Lett. (Netherlands), vol.64, no.3, p.327-40 (Sept. 1983). Twenty-three volcanic rocks from the Setouchi volcanic belt, southwest Japan, were analyzed for Nd and Sr isotopic compositions for the purpose of examining the genetic relationships among the basalt, high-magnesium andesite and evolved porphyritic andesite. The andesites have higher $^{87}\text{Sr}/^{86}\text{Sr}$ and lower $^{143}\text{Nd}/^{144}\text{Nd}$ than the basalts. This result confirms earlier conclusions that the andesites cannot be fractionation products of basaltic magma but that the andesitic and basaltic magmas were generated independently. On the basis of melting experiments it is inferred that there is an isotopically stratified mantle beneath southwest Japan. (41 refs.)

116086 Rb-Sr, Sm-Nd, K-Ca, O, and H isotopic study of Cretaceous-Tertiary boundary sediments, Caravaca, Spain: evidence for an oceanic impact site. D.J.DePaolo, F.T.Kyte, B.D.Marshall (Dept. of Earth & Space Sci., Univ. of California, Los Angeles, CA, USA), J.R.O'Neil, J.Smit.

Earth & Planet. Sci. Lett. (Netherlands), vol.64, no.3, p.356-73 (Sept. 1983). Isotopic ratios and trace element abundances were measured on samples of Ir-enriched clay at the Cretaceous-Tertiary boundary, and in carbonate and marl from 5 cm below and 3 cm above the boundary. The data indicate that most of the clay material was derived from a terrestrial source with relatively low $^{87}\text{Sr}/^{86}\text{Sr}$ and high $^{143}\text{Nd}/^{144}\text{Nd}$ ratios. The isotopic evidence for foreign terrestrial detritus in the boundary clay, the low rare earth element concentrations and high Ni concentration support the hypothesis of a terminal Cretaceous asteroidal impact that produced a global layer of fallout. The data are most easily explained if the impact site was on oceanic crust, and if a substantial fraction of the fallout was derived from relatively deep within the lithosphere (>3 km). (60 refs.)

116087 Possible origin of K-rich volcanic rocks from Virunga, East Africa, by metasomatism of continental crustal material: Pb, Nd and Sr isotopic evidence. R.Vollmer, M.J.Norry (Dept. of Earth Sci., Leeds Univ., Leeds, England).

Earth & Planet. Sci. Lett. (Netherlands), vol.64, no.3, p.374-86 (Sept. 1983). The isotopic compositions of Sr, Nd and Pb together with the abundances of Rb, Sr, U and Pb have been determined for mafic and felsic potassic alkaline rocks from the young Virunga volcanic field in the western branch of the East African rift system. Excellent correlations of $^{87}\text{Sr}/^{86}\text{Sr}$ with Rb/Sr, 1/Sr and $^{207}\text{Pb}/^{206}\text{Pb}$ for Sabinyo rocks suggest these to be members of a hybrid magma series. However, the nearly uniform Pb compositions for this series points to radiogenic growth of ^{87}Sr in the magma source region following an event which homogenized the isotopic compositions but not Rb/Sr. The Rb-Sr age derived from the erupted Sabinyo isochron-mixing line is consistent with the ~500 Myr Pb-Pb age from Nyiragongo. (35 refs.)

116088 Origin of Espanola Island and the age of terrestrial life on the Galapagos Islands. M.L.Hall.

Science (USA), vol.221, no.4610, p.545-7 (5 Aug. 1983). Geological studies of Espanola (Hood) Island, Galapagos, Ecuador, indicate that the island had a subaerial rather than a submarine origin. Because the younger lava flows are dated at 3 million years. Espanola has apparently existed as an island for at least that long. Thus terrestrial life may have existed or arrived on the Galapagos Islands at least 3 million years ago, more than twice as long as had been assumed. (25 refs.)

91.90 OTHER TOPICS IN SOLID EARTH GEOPHYSICS

116089 The Vredefort dome in South Africa. Crater of a gigantic meteorite or a terrestrial gas explosion?. W.Schreyer (Inst. fur Mineralogie, Ruhr-Univ., Bochum, Germany).

Naturwissenschaften (Germany), vol.70, no.8, p.388-95 (Aug. 1983). In German.

A meteorite impact origin of the Vredefort structure is in conflict with the results of recent geological, petrological, and fluid-inclusion studies. They indicate that the shock event was preceded by domal uplift and static thermal metamorphism within the dome rising to temperatures above 900°C in the central region now exposed. Here heating has also continued after the shock and caused strong annealing recrystallization and nearly complete obliteration of the shock features in the former lower crustal granulites. High-density CO_2 fluid inclusions are still aligned along shock-induced planar elements in quartz despite complete post-shock recrystallization of this mineral. Fluid pressures of 2-4 kbar at the time of trapping, that is shortly after the shock catastrophe, are not compatible with a near-surface cause of the shock by meteorite impact but may point to a deep-seated gas explosion that occurred as one episodic event during the long-term tectonic and thermal evolution of the dome. However, difficulties still exist to explain the high intensity of the

shock and its pervasive character through internal terrestrial mechanisms. (45 refs.)

92.10 PHYSICS OF THE OCEANS

(see also 43.30 Underwater sound)

116090 Wind dependence of underwater ambient noise. B.R.Kerman (Boundary Layer Res. Div., Atmospheric Environment Service, Downsview, Ontario, Canada), D.L.Evans, D.R.Watts, D.Halpern. *Boundary-Layer Meteorol. (Netherlands)*, vol.26, no.2, p.105-13 (June 1983). Sound generated underwater by wind waves displays two sensitivities to wind speed depending on whether the waves are breaking. A historical review is presented of several experimental studies over the years, as well as new results obtained at a relatively quiet, deep equatorial Pacific site. The duration of the experiment, the multiple high frequency bands as well as the desirable acoustic attributes of the site are useful in establishing the wind sensitivity, and its variability. The results are compared to a recent theoretical model of sound generation by oscillating bubbles in breaking waves. (19 refs.)

116091 The role of sea surface temperature in large-scale air-sea interactions. S.J.S.Khalsa (Cooperative Inst. for Res. in Environmental Sci., Univ. of Colorado, Boulder, CO, USA). *Mon. Weather Rev. (USA)*, vol.11, no.5, p.954-66 (May 1983).

Data from the 1972-73 El Nino event are used to study relationships between sea surface temperature (SST), surface wind, surface heat fluxes and rainfall in the tropical Pacific east of the dateline. It is found that the maximum in SST anomaly is not correlated spatially or temporally in any consistent manner with the sum of latent and sensible heat fluxes ($Q_E + Q_S$) or rainfall as estimated from highly reflective cloud. Varying anomalies in wind speed and sea-air temperature and humidity differences all influence the $Q_E + Q_S$ anomaly in ways which may be unrelated to the SST anomaly. Implications to modeling efforts which equate SST anomalies with diabatic heating anomalies are discussed. (36 refs.)

116092 ^{224}Ra , ^{228}Ra , and ^{226}Ra in Winyah Bay and Delaware Bay. R.J.Elsinger, W.S.Moore (Geology Dept., Univ. of South Carolina, Columbia, SC, USA).

Earth & Planet. Sci. Lett. (Netherlands), vol.64, no.3, p.430-6 (Sept. 1983). The first ^{224}Ra ($t_{1/2}=3.64$ days) measurements from mixing zones of estuarine systems are presented for the Pee Dee River-Winyah Bay and Delaware Bay estuaries. High-resolution gamma-ray spectrometry was used to determine ^{224}Ra , ^{228}Ra ($t_{1/2}=5.7$ years), and ^{226}Ra ($t_{1/2}=1622$ years) activity ratios. In Delaware Bay ^{224}Ra concentrations were nearly constant over the 2.5% to 15% salinity range where two turbidity maximum zones are located. Samples collected on the ebb and flood tide from a salt marsh along Delaware Bay have a 5-fold increase in ^{224}Ra from flood to ebb and 3- and 2-fold increases for ^{228}Ra and ^{226}Ra respectively. (15 refs.)

116093 Reduction of thermohaline circulation during deglaciation: the effect on atmospheric radiocarbon and CO_2 . R.S.Keir (Scripps Instn. of Oceanography, Univ. of California, La Jolla, CA, USA).

Earth & Planet. Sci. Lett. (Netherlands), vol.64, no.3, p.445-56 (Sept. 1983). A two-box ocean reservoir model is employed to examine the combined effects of vertical ocean circulation, organic matter extraction and cosmic ray production on the $^{14}\text{C}/^{12}\text{C}$ in the atmosphere, ocean and sediment ratio. If the vertical ocean circulation decreased by 50% during the maximum rate of deglaciation, the atmospheric $^{14}\text{C}/^{12}\text{C}$ would have increased concurrently by 10% relative to the pre-bomb present. Further, if cosmic ray production of ^{14}C was 50% greater than at present at about 7800 years BP, a double maximum of 10% occurs. This result is similar to the variation of $^{14}\text{C}/^{12}\text{C}$ over the last 10000 years calculated from ^{14}C dates on the varved Lake of the Clouds. (37 refs.)

116094 An observation of the surface circulation in a Gulf Stream frontal perturbation. F.M.Vukovich, G.A.Maul (Research Triangle Inst., Res. Triangle Park, NC, USA).

Geophys. Res. Lett. (USA), vol.10, no.7, p.591-4 (July 1983). In the period of 3-16 June 1979, a satellite-tracked, free-drifting buoy passed through a Gulf Stream frontal perturbation and was entrained into a warm filament on the shoreward side of the perturbation. Significant speed convergence noted as the buoy passed through the perturbation and approached the counterclockwise turn into the warm filament, the buoy drifted to the southwest at speeds of about 0.1 to 0.3 m/sec. Eventually, the buoy drifted out of the filament and went westward in an apparent response to wind-induced surface drift. (17 refs.)

116095 Barotropic instability of weakly non-parallel zonal flows. L.-O.Merkine (Dept. of Math., Technion-Israel Inst. of Technol., Haifa, Israel), R.Balgovind.

Geophys. & Astrophys. Fluid Dyn. (GB), vol.25, no.3, p.157-90 (1983). The barotropic instability of weakly non-parallel zonal flows with localized intense shear regions is investigated numerically. The numerical integrations of the linear stability problem reveal the existence of unstable localized wave packets whose spatial structure and eigenfrequencies depend on two parameters which measure the degree of supercriticality and the zonal length-scale of the shear region. The structure of the instability is determined by conditions that ensure the decay of the wave packet at infinity and the transition from long to short waves across a turning point (critical layer) region which is controlled by non-parallel effects. (20 refs.)

116096 The incidence of internal waves onto a thin submerged barrier. L.F.Clovis, H.G.Pinsent (Math. Dept., Chelsea Coll., London Univ., London, England).

Geophys. & Astrophys. Fluid Dyn. (GB), vol.25, no.3, p.191-212 (1983). The problem of oblique incidence of internal ocean waves on a thin submerged ocean barrier is considered when the ocean has exponential density

stratification. A Wiener-Hopf approach is used combined with numerical evaluation of series. Results for the reflected energy are obtained and reveal a complex dependence on incidence and barrier height. Application of this model to waves incident on the Mid-Atlantic Ridge suggests that the ridge almost isolates first mode energy on one side of the ocean from the other side. In certain circumstances there is a surprising appearance of 'barrier' waves. These waves are closely confined to the barrier and propagate along it. (5 refs.)

116097 Contour dynamics method in the model problems on the ocean topographical cyclogenesis. V.F.Kozlov.

Izv. Akad. Nauk SSSR Fiz. Atmos. & Okeana, vol.19, no.8, p.845-54 (Aug. 1983). In Russian. English translation in: *Izv. Acad. Sci. USSR Atmos. & Oceanic Phys. (USA)*

The contour dynamics method presented by Zabusky et al. (1979) is extended to the problems on cyclogenesis in rapidly rotating homogeneous fluid flows above an uneven bottom. The calculation algorithm involves the spline approximation of the contour parametric equations and the systematic rearrangement of the markers for their uniform distribution. Examples are presented. (8 refs.)

116098 Stability of wind waves at weak wind. K.D.Ruvinskii, G.I.Freidman.

Izv. Akad. Nauk SSSR Fiz. Atmos. & Okeana, vol.19, no.8, p.855-9 (Aug. 1983). In Russian. English translation in: *Izv. Acad. Sci. USSR Atmos. & Oceanic Phys. (USA)*

The stability of stationary waves excited by a weak wind is considered assuming that their amplitude is restricted by capillary-gravity waves (ripples). It is shown that account of the dispersion of nonlinear damping can lead to the instability of stationary wind waves in that region of parameters where they are stable disregarding the decrement dispersion (threshold wave number is in this region). (7 refs.)

116099 Vertical structure of currents and hydrological elements in central region of the Red Sea. V.M.Kushnir, Yu.N.Koltakov, S.Yu.Zakharov.

Izv. Akad. Nauk SSSR Fiz. Atmos. & Okeana, vol.19, no.8, p.860-7 (Aug. 1983). In Russian. English translation in: *Izv. Acad. Sci. USSR Atmos. & Oceanic Phys. (USA)*

Studies results of experimental researches on the vertical structure of currents, sound velocity, temperature, salinity and density carried out with the help of current velocity profiler and CTD-probe. It is found that maxima in spectra of vertical wave numbers with wavelengths equal to 20-25 m are conditioned by gravitation-inertial waves with the frequency differing by 6-7% from inertial one. It is shown that speed drops in gravitation-inertial waves can be a cause of local hydrodynamic instability. (15 refs.)

116100 The space-time structure of internal inertia-gravity and topographical waves in the sea with frequency close to the inertial one. A.S.Blatov, V.A.Ivanov.

Izv. Akad. Nauk SSSR Fiz. Atmos. & Okeana, vol.19, no.8, p.868-77 (Aug. 1983). In Russian. English translation in: *Izv. Acad. Sci. USSR Atmos. & Oceanic Phys. (USA)*

Spectral space-time analysis of current and hydrological data shows the existence in the inertial frequency band of different wave motions at the same density stratification: inertial-gravity and topographic waves. These waves are distinguished in space structure and origin. Wave parameters obtained are in good agreement to theory. (20 refs.)

116101 Experimental studies of low-frequency waterborne and sediment-borne acoustic wave propagation on a continental shelf. T.M.Brocher, B.T.Iwatake, D.A.Lindwall (Hawaii Inst. of Geophys., Univ. of Hawaii, Honolulu, HI, USA).

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.960-72 (Sept. 1983).

The loss rates for propagation of 5- to 40-Hz acoustic normal modes recorded on a shallow, sandy bottom off Nova Scotia were found to be strongly dependent on the azimuth and range of propagation. Beyond a certain range the propagation loss rates for signals just below the nominal cutoff frequency (calculated assuming a range-independent acoustic medium) differed only insignificantly from those just above the nominal cutoff, suggesting that propagation of signals at long ranges below cutoff may not be less efficient than those slightly above cutoff. Although it is commonly thought that scattering, conversion to shear waves, and surface wave generation are important causes of acoustic wave attenuation at low frequencies, our data indicate that nearly all loss arises from sediment attenuation. These results are of general interest because the near seafloor geology of many continental shelves is similar. The authors are less certain of the reasons for the lack of success in modeling the observed propagation loss using the parabolic approximation for frequencies well above the cutoff frequency. They do know that the spatial variation of the sound velocity, density, and thickness of the water column was not measured in sufficient detail during the experiment. More reasonable fits to the observed propagation loss at lower frequencies suggest that the parabolic approximation was not the major source of modeling error. (34 refs.)

116102 Investigation of chemical sound absorption in seawater. IV. R.H.Mellen, D.G.Browning (Naval Underwater Systems Center, New London, CT, USA), V.P.Simmons.

J. Acoust. Soc. Am. (USA), vol.74, no.3, p.987-93 (Sept. 1983).

For pt.III see *ibid.*, vol.70, p.143 (1981). The low-frequency boric acid relaxation mechanism in seawater has been identified as an acid-base exchange between the $\text{B}(\text{OH})_3/\text{B}(\text{OH})_4^-$ and $\text{HCO}_3^-/\text{CO}_3^{2-}$ equilibria. Ion pairing with Ca^{2+} is also involved and a coupled-system model is proposed. Supporting experimental data for the CO_2 exchange mechanism are presented. Similar exchanges with ammonia and silicic acid are also investigated. (9 refs.)

116103 On equatorial dynamics, mixed layer physics and sea surface temperature. P.S.Schopf (Goddard Lab. for Atmospheric Sci., NASA/Goddard Space Flight Center, Greenbelt, MD, USA), M.A.Cane.

J. Phys. Oceanogr. (USA), vol.13, no.6, p.917-35 (June 1983).

Describes a new numerical model designed to study the interactions between hydrodynamics and thermodynamics in the upper ocean. The model incorporates both primitive equation dynamics and a parameterization of mixed layer physics. There is a consistent treatment of mixed layer structure for all physical processes. In order to study interplay between dynamics and mixed layer physics in the equatorial ocean, the authors carry out a series of numerical experiments with simple patterns of wind stress and surface heating. In some cases stratification and/or mixed layer physics are suppressed. (30 refs.)

116104 On equatorial waves and El Nino. I. Influence of initial states on wave-induced currents and warming. P.S.Schopf (Goddard Lab. for Atmospheric Sci., NASA/Goddard Space Flight Center, Greenbelt, MD, USA), D.E.Harrison.

J. Phys. Oceanogr. (USA), vol.13, no.6, p.936-48 (June 1983).

Presents results from three numerical model experiments designed to study the thermal and hydrodynamical changes associated with downwelling Kelvin wave passage and east coastal reflection along and near the equator. The

model employs primitive equation dynamics in two active layers and a full thermodynamics equation, so that sea surface temperature, thermocline displacement and sea level are each independently predicted. Wind and thermal forcing are used. The surface layer is a slab mixed layer using Kraus and Turner-style bulk physics. Kelvin waves are excited by introducing a westerly wind anomaly in the western part of the basin, and the temperature and current changes caused by the waves are studied as the wave fronts propagate through the circulation forced by three different mean wind fields: no mean winds, southerly mean winds and easterly mean winds. (16 refs.)

116105 Internal wave wake of a moving storm. I. Scales, energy budget and observations. J.F.Price (Woods Hole Oceanographic Inst., Woods Hole, MA, USA).

J. Phys. Oceanogr. (USA), vol.13, no.6, p.949-65 (June 1983).

The ocean's baroclinic response to a steadily moving storm is analyzed using a numerical model for an inviscid, multi-layered fluid. The author gives detailed account of the response to a rapidly moving hurricane. A central theme is the coupling between wind-forcing, the surface mixed layer, and the thermocline. The baroclinic response is made up of a geostrophic component and a three-dimensional wake of inertial-internal waves which is emphasized. These waves initially have large horizontal spatial scales set directly by the storm. An important qualitative result is that the vertical penetration scale is large compared to the thermocline thickness. Measurements made by buoy EB-10 in the wake of Hurricane-Eloise provide a semi-quantitative check on the model results. (38 refs.)

116106 A statistical model of vertical shear from Moored current meters. D.Rubenstein, F.Newman (Sci. Applications Inc., McLean, VA, USA), W.Grabowski.

J. Phys. Oceanogr. (USA), vol.13, no.6, p.966-71 (June 1983).

Derives a statistical model of shear to predict how measurements of mean-square shear vary with stratification and with vertical separation Δz between moored current meters. The model is based on a simplified version of the vertical wavenumber-shear spectrum proposed by Garrett et al. (1981). The authors compare the model predictions with shear derived from current meter measurements in the seasonal thermocline, from the MILE-1 mooring. The comparison is favorable and provides one with a framework for evaluating the vertical length scales of shear from current meter time series. (9 refs.)

116107 Radiating barotropic instability. L.D.Talley (School of Oceanography, Oregon State Univ., Corvallis, OR, USA).

J. Phys. Oceanogr. (USA), vol.13, no.6, p.972-87 (June 1983).

The linear stability of zonal, parallel shear flow on a beta-plane is discussed. While the localized shear region supports unstable waves, the far-field can support Rossby waves because of the ambient potential-vorticity gradient. An infinite zonal flow with a continuous cross-stream velocity gradient is approximated with segments of uniform flow, joined together by segments of uniform potential vorticity. This simplification allows an exact dispersion relation to be found. There are two classes of linearly unstable solutions. One type is trapped to the source of energy and has large growth rates. The second type is weaker instabilities which excite Rossby waves in the far-field: the influence of these weaker instabilities extends far beyond that of the most unstable waves. (19 refs.)

116108 A multi-limit mixed-layer entrainment formulation. J.W.Deardorff (Dept. of Atmospheric Sci., Oregon State Univ., Corvallis, OR, USA).

J. Phys. Oceanogr. (USA), vol.13, no.6, p.988-1002 (June 1983).

The second-moment equations for buoyancy flux and density-fluctuation variance in the entrainment zone of a mixed layer are combined to yield an entrainment rate (w_e) dependence having the nature of Turner's relation (1973). That is, $w_e q^{-1}$ is seen as a function solely of an interfacial Richardson number (Ri_i) involving q , where q^2 is twice the interfacial turbulence kinetic energy (TKE). The TKE equation in the entrainment layer is then utilized to evaluate Ri_i so that w_e can be obtained. This procedure allows the TKE equation to be solved past the point at which the interfacial-shear bulk Richardson number, Ri_b , becomes critical, and into the more unstable regime beyond where the experiment of Ellison and Turner (1959) can give guidance. The present entrainment results are shown as a function of the various Richardson numbers: Ri_i , Ri_b based on the friction velocity, and Ri_s based on the convective velocity scale, for values of each ranging from near zero to 1000. Comparison is made with previous results. (73 refs.)

116109 The generation and propagation of sea level variability along the Pacific coast of Mexico. D.B.Enfield, J.S.Allen (School of Oceanography, Oregon State Univ., Corvallis, OR, USA).

J. Phys. Oceanogr. (USA), vol.13, no.6, p.1012-33 (June 1983).

Case history analysis, cross spectra and multiple regression analysis are used in a study of low-pass filtered sea level records from the Pacific mainland coast of Mexico in 1971 and 1973-5. The authors focus on several aspects of the variability of Mexico that are complementary to the study of Christensen et al. (1983): (1) examination of individual, large amplitude events; (2) documentation of how the propagating variability is generated; (3) frequency domain analysis of the sea level fluctuations; and (4) consideration of the seasonality of the propagating variability and its forcing. Following a summary of the data used, the occurrence of tropical storms and their relation to individual sea level events are discussed and the statistical evidence for forcing is presented. The observed characteristics of alongshore propagation are then examined through spectral analytical techniques and compared with those expected from history. (35 refs.)

116110 The mean and seasonal circulation off southwest Nova Scotia. P.C.Smith (Atlantic Oceanographic Lab., Bedford Inst. of Oceanography, Dartmouth, Nova Scotia, Canada).

J. Phys. Oceanogr. (USA), vol.13, no.6, p.1034-54 (June 1983).

Long-term measurements off southwest Nova Scotia and the mean circulation are discussed. The gyre circulation appears permanent but the coastal current and upwelling exhibit annual variations of the same order as the means. Strong seasonal cycles are found in the salinity and density fields at Cape Sable which appear to be controlled both by buoyancy input from the coastal current and local mixing effects. A linear diagnostic model indicates that the primary dynamical balance for the circulation is between a longshore pressure gradient and longshore mean density and stratification gradients which have summer maxima. The 'centrifugal upwelling' hypothesis fails and the main driving force for Cape Sable upwelling appears to be the longshore density variations maintained by tidal mixing. (31 refs.)

116111 Blocking of steady circulation by coastal geometry. U.Unluata, T.Oguz, E.Ozsoy (Inst. of Marine Sci., Middle East Tech. Univ., Icel, Turkey).

J. Phys. Oceanogr. (USA), vol.13, no.6, p.1055-62 (June 1983).

Along the southern Turkish continental shelf the intensity of the observed mean flow has a considerable degree of variability. The relatively strong currents along the straight portion of the coast is reduced significantly in the nearshore region upon encountering irregularities in the form of bays and headlands. As a possible explanation of such blockage by coastal irregularities, a linear, homogeneous, wind-stress free model is presented incorporating

the constraints of topographic steering and linear bottom friction. Solutions are given for an idealized case of an abrupt indentation on a straight coast adjoining a linearly deepening shelf. The directional preference of blocking and the applicability of boundary layer approximations are discussed. Numerical solutions are obtained for the realistic bathymetry and coastal configuration along the southern Turkish continental shelf. The concepts developed are applied to the observed blocking features. (15 refs.)

116112 Formation of eddies and transverse currents in a two-layer channel of variable bottom with application to the lower St. Lawrence estuary. Heung-Jae Lie (Korea Advanced Inst. of Sci. & Technol., Seoul, Korea), M.El-Sabbh.

J. Phys. Oceanogr. (USA), vol.13, no.6, p.1063-75 (June 1983).

Baroclinic shelf waves and Kelvin waves in a two-layer channel of variable bottom are discussed using a simple numerical model. Two different propagation directions are shown to be possible, analogous to the existence of shelf waves and trench waves in an ocean bounded by a coast with a trench, described by Mysak et al. (1979). The eigenfunctions of baroclinic shelf wave modes are quite different from the barotropic eigenfunctions: that is, each of the baroclinic modes shows a pattern similar to the first mode with the exception of small scale structures near the coast. The model also shows the formation of a series of eddies with alternating rotation senses accompanied by transverse currents between two successive eddies. (27 refs.)

116113 Low-pass filters to suppress inertial and tidal frequencies. R.O.R.Y.Thompson (Div. of Oceanography, CSIRO Marine Labs., Hobart, Australia).

J. Phys. Oceanogr. (USA), vol.13, no.6, p.1077-83 (June 1983).

A systematic way is given to design digital filters which allow clear separation of signals with periods of a few days from noise of higher frequency, particularly tidal and inertial. Several examples are given which pass little high-frequency power and none at the principal tidal frequencies. The Lanczos-cosine filter passes too much energy near diurnal frequencies, the Godin filter is better but not optimal. A longer filter is recommended, with flat low-frequency response, a sharp cut-off and very low noise. For current meter records containing inertial motions, it appears desirable to design a filter which specifically suppresses the local inertial frequency. (6 refs.)

116114 Water waves, nonlinear Schrodinger equations and their solutions. D.H.Peregrine (School of Maths., Univ. of Bristol, Bristol, England).

J. Aust. Math. Soc. Ser. B (Australia), vol.25, pt.1, p.16-43 (July 1983).

Equations governing modulations of weakly nonlinear water waves are described. The modulations are coupled with wave-induced mean flows except in the case of water deeper than the modulation length scale. Equations suitable for water depths of the order the modulation length scale are deduced from those derived by Davey and Stewartson (1974) and Dysthe (1979). A number of cases in which these equations reduce to a one-dimensional nonlinear Schrodinger (NLS) equation are enumerated. Several analytical solutions of NLS equations are presented, with discussion of some of their implications for describing the propagation of water waves. Some of the solutions have not been presented in detail, or in convenient form before. One is new, a 'rational' solution describing an 'amplitude peak' which is isolated in spacetime. (24 refs.)

116115 Scattering analysis and synthesis of wave trains. R.J.Sobey (Dept. of Civil & Systems Engng., James Cook Univ., Townsville, Queensland, Australia), E.J.Colman.

J. Aust. Math. Soc. Ser. B (Australia), vol.25, pt.1, p.44-63 (July 1983).

The Zakharov-Shabat scattering transform is an exact solution technique for the nonlinear Schrodinger equation, which describes the time evolution of weakly nonlinear wave trains. Envelope soliton and uniform wave train solutions of the nonlinear Schrodinger equation are separable in scattering transform space. The scattering transform is a potential analysis and synthesis technique for natural wave trains. Discrete versions of the direct and inverse scattering transform are presented, together with proven algorithms for their numerical computation from typical ocean wave records. The consequences of discrete resolution are considered. (19 refs.)

116116 The generation of surface waves by an intense cyclone. F.Viera, V.T.Buchwald (School of Maths., Univ. of New South Wales, Kensington, NSW, Australia).

J. Aust. Math. Soc. Ser. B (Australia), vol.25, pt.1, p.64-83 (July 1983).

Assuming a travelling oscillating pressure source model, this paper sets out to investigate the observation of surface gravity waves generated by a cyclone moving with constant speed v . It is shown that when the source frequency is near the critical resonant value $g/4v$, large amplitude waves may be generated. There is some agreement with observations of waves from cyclone Pam of February, 1974. (7 refs.)

116117 Surface-wave interaction with a deeply submerged circular duct. J.W.Miles (Univ. of California, La Jolla, CA, USA).

J. Aust. Math. Soc. Ser. B (Australia), vol.25, pt.1, p.84-93 (July 1983).

The interaction of a surface wave of angular frequency ω with a deeply submerged, vertical, open-mouthed, circular duct of radius a is considered. The resulting boundary-value problem is solved by the Wiener-Hopf technique. The pressure-amplification factor (the ratio of the complex amplitude of the pressure in the depths of the duct to that of the incident wave in the plane of the mouth) is determined in closed form as a function of the dimensionless wave number $K = \omega a/g$. (6 refs.)

116118 Interaction of internal waves in a continuous thermocline model. N.T.Hung, S.A.Maslowe (Dept. of Maths., McGill Univ., Montreal, Quebec, Canada).

J. Aust. Math. Soc. Ser. B (Australia), vol.25, pt.1, p.94-109 (July 1983).

Weak nonlinear interactions are studied for systems of internal waves when the Brunt-Vaisala frequency is proportional to $\text{sech}^2 z$, where $z=0$ is the centre of the thermocline. Explicit results expressed in terms of gamma functions have been obtained for the interaction coefficients appearing in the amplitude evolution equations. The cases considered include resonant triads as well as second and third harmonic resonance. In the non-resonant situation, the Stokes frequency correction due to finite-amplitude effects have been computed and the extension to wave packets is outlined. Finally, the effect of a mean shear on resonant interactions is discussed. (17 refs.)

116119 The anti-cyclonic shear wave: a new geophysical wave. R.L.Hughes (Australian Numerical Meteorology Res. Center, Melbourne, Victoria, Australia).

J. Aust. Math. Soc. Ser. B (Australia), vol.25, pt.1, p.110-26 (July 1983).

A new type of first baroclinic mode wave which propagates on an anti-cyclonic vorticity field is identified. It is of the vorticity class of waves which contains Rossby waves amongst others. This anti-cyclonic shear wave is produced by pressure variations distorting the vertical stratification in such a manner that the associated vortex stretching generates the velocity variation required for Bernoulli compatibility with the initial pressure variation. The wave travels at a speed characteristic of particles within the undisturbed shear flow and is a low frequency and low wavenumber wave. In the present study

this wave is considered in the presence of a weak anti-cyclonic shear. (6 refs.)

116120 The baroclinic instability of the large-scale ocean circulation. A.V.Frolov (Hydrometeorological Center, Moscow, USSR). *Oceanology (USA)*, vol.22, no.1, p.1-5 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.1 (1982). [received: Aug. 1983]
The problem of the baroclinic instability of large-scale currents in the main ocean thermocline is considered. The necessary conditions for the amplification of small synoptic perturbations are presented. The stability of the subtropical anticyclonic gyres (beyond the western boundary layer), described in terms of particular solutions of the nonlinear equations for the 'advective' thermocline, is examined in detail. (7 refs.)

116121 Theory of the equatorial undercurrent. D.D.Mallik (Univ. of Calcutta, Calcutta, India). *Oceanology (USA)*, vol.22, no.1, p.6-10 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.1 (1982). [received: Aug. 1983]
An analytic model of the equatorial undercurrent is presented. The calculated maximum velocity was $127 \text{ cm} \cdot \text{sec}^{-1}$ at a depth of 86 meters. These values, and also features of the temperature field such as the eastward rise of the isotherms and the depression of the thermocline at the equator, are in good agreement with observations. (5 refs.)

116122 Evolution of synoptic disturbances deduced from measurements in the north-central Atlantic. V.I.Byshev, Yu.A.Ivanov, V.G.Kort (Shirshov Inst. of Oceanology, Acad. of Sci., Moscow, USSR). *Oceanology (USA)*, vol.22, no.1, p.11-14 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.1 (1982). [received: Aug. 1983]
The evolution of synoptic disturbances in the ocean is examined on the basis of measurements made southwest of the Azores. The synoptic disturbances observed are shown to propagate toward the west-southwest and to dissipate quite rapidly. The hydrodynamic instability of topographic eddies may be the reason for the high energy of the synoptic disturbances. (3 refs.)

116123 The seasonal variability of the Lomonosov Current. V.A.Bubnov (Shirshov Inst. of Oceanology, Acad. of Sci., Kaliningrad, USSR). *Oceanology (USA)*, vol.22, no.1, p.15-18 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.1 (1982). [received: Aug. 1983]
The response of the ocean to the seasonally varying winds is analyzed on the basis of data gathered in an equatorial study area during FGGE in 1979. It is shown that the strengthening of the southeasterly trade wind from spring to summer in the northern hemisphere induces a significant increase of the zonal pressure gradient along the equator, which in turn intensifies the flow in the Lomonosov current. This suggests that on a seasonal time scale, the ocean in the equatorial region is in dynamic quasi-equilibrium with the controlling trade winds. (7 refs.)

116124 Estimation of the small-scale turbulence level from its empirical dependence on the Richardson number. V.D.Pozdynin (Shirshov Inst. of Oceanology, Acad. of Sci., Moscow, USSR). *Oceanology (USA)*, vol.22, no.1, p.19-22 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.1 (1982). [received: Aug. 1983]
Analyzes the empirical dependence of the r.m.s. turbulence level on the Richardson number, derived from simultaneous measurements of small-scale fluctuations of current velocity, its vertical gradients and the vertical water density gradients. An algorithm for computing the distribution of the r.m.s. turbulence level-Richardson number relation in the equatorial current system of the Central Pacific is suggested. (11 refs.)

116125 Isotropy of inertial and semi-diurnal tidal motions in the ocean. N.N.Golenko (Shirshov Inst. of Oceanology, Acad. of Sci., Kaliningrad, USSR). *Oceanology (USA)*, vol.22, no.1, p.23-8 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.1 (1982). [received: Aug. 1983]
The spatial structure of the horizontal components of the velocity of the semi-diurnal tidal and inertial oscillations is investigated by analysis of their mean statistical hodographs. The semi-diurnal tidal oscillations in the POLY-GON-70 and TROPX-74 areas are anisotropic, with a prevailing south-to-north propagation. The anisotropy of the semi-diurnal tidal oscillations in the POLYMODE area is less pronounced, but exhibits two or more probable directions. The inertial oscillations turned out to be isotropic in all regions examined. (8 refs.)

116126 An investigation of low-frequency short-wave motions in the ocean. V.M.Kamenkovich, T.B.Tsybaveva (Shirshov Inst. of Oceanology, Acad. of Sci., Moscow, USSR). *Oceanology (USA)*, vol.22, no.4, p.391-5 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.4 (1982). [received: Aug. 1983]
Presents an analysis of the eigenmotions of a stratified fluid layer of constant depth on a rotating sphere, assuming a complete rather than an approximate equation for the Coriolis force. A general asymptotic method is proposed for surface short-wave motions. Local dispersion relations are constructed for surface gravity and internal waves. The applicability of the Ω -plane approximation for description of these waves is demonstrated. The effect of the horizontal component of the Earth's angular rotation rate is investigated. (4 refs.)

116127 Statistical estimates of the Antarctic circumpolar current in the Pacific Ocean. A.M.Gritsenko (Shirshov Inst. of Oceanology, Acad. of Sci., Moscow, USSR). *Oceanology (USA)*, vol.22, no.4, p.409-12 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.4 (1982). [received: Aug. 1983]
A two-dimensional empirical probability function was used in a statistical study of the mean multiyear circulation of the Antarctic circumpolar current. In order to study the variability of this current with depth, the circulation at standard depths is correlated with that of the surface. It is concluded that there is no continuous westward flow at depth. (5 refs.)

116128 Mediterranean water in the central Atlantic. Ye.A.Plakhin, V.G.Smirnov (Shirshov Inst. of Oceanology, Acad. of Sci., Moscow, USSR). *Oceanology (USA)*, vol.22, no.4, p.417-19 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.4 (1982). [received: Aug. 1983]
Thermohalinity probe measurements of the Mediterranean water along its path of propagation to the central Atlantic area analyzed, and its stability parameters are calculated. The authors find practically untransformed Mediterranean water in the central Atlantic, a finding which has been confirmed by more recent measurements. (6 refs.)

116129 The near-surface dynamics of coastal upwelling. K.H.Brink (Woods Hole Oceanographic Inst., Woods Hole, MA, USA). *Prog. Oceanogr. (GB)*, vol.12, no.3, p.223-57 (1983).
An attempt is made to examine some observational and theoretical aspects of upper ocean dynamics in regions of strong coastal upwelling. 'Upper ocean' is roughly defined as about the upper 10-30 m of water column for most systems. First, the basic surface Ekman and mixed layers are discussed, including some of the modifications due to upwelling. Next, coastal upwelling fronts and their associated circulation are treated. Finally, areas of strongly

three-dimensional upwelling are classified and discussed. Horizontal advection of heat and momentum appear to be generally important for the near-surface dynamics of coastal upwelling, and these phenomena make realistic theoretical treatments especially difficult. (66 refs.)

116130 Coastal upwelling in the California Current system. A.Huyer (School of Oceanography, Oregon State Univ., Corvallis, OR, USA). *Prog. Oceanogr. (GB)*, vol.12, no.3, p.259-84 (1983).
Coastal upwelling in the California Current system has been the subject of large scale studies off California and Baja California, and of small scale studies off Oregon. Recent studies of the winds along the entire coast from 25°N to 50°N indicate that there are significant alongshore variations in the strength of coastal upwelling, which are reflected in the observed temperature distribution. Active upwelling appears to be restricted to a narrow coastal band (about 10-25 km wide) along the entire coast, but the region influenced by coastal upwelling may be much wider. Intensive observations of the upwelling zone during summer off Oregon show the presence of a southward coastal jet at the surface, a mean vertical shear, a poleward undercurrent along the bottom, and persistently sloping isopycnals over the continental shelf; most of the upwelling there occurs during relatively short periods (several days long) of upwelling-favorable winds. (79 refs.)

116131 The physical environment of the Peruvian upwelling system. K.H.Brink (Woods Hole Oceanographic Inst., Woods Hole, MA, USA), D.Halpern, A.Huyer, R.L.Smith. *Prog. Oceanogr. (GB)*, vol.12, no.3, p.285-305 (1983).
Four important phenomena are discussed: wind-driven upwelling, the poleward undercurrent, surface mixed layer deepening, and low-frequency coastal-trapped waves. The coastal winds were invariably favorable for coastal upwelling, even during the 1976 El Nino. The agreement between the offshore transport in the relatively shallow (30 m) surface layer and the Ekman transport, deduced from the local wind, was good for both the mean and variable state. The agreement with the deeper onshore transport was less good, consistent with the marked three-dimensionality and spatial variability of the upwelling. (35 refs.)

116132 The upwelling area off Northwest Africa—a description of phenomena related to coastal upwelling. E.Mittelstaedt (Deutsches Hydrographisches Inst., Hamburg, Germany). *Prog. Oceanogr. (GB)*, vol.12, no.3, p.307-31 (1983).
Presents a brief review of the oceanography along the upwelling coast of Northwest Africa. The description contains information on: seasonal variations of large-scale winds, ocean circulation and some gross features of the hydrography, characteristic meso-scale patterns of currents during the upwelling season between 16°N and 26°N , air- and water-temperature differences during upwelling season, diurnal and semi-diurnal variations of temperature, atmospheric pressure, wind and current, regional peculiarities: canyons and the Banc d'Arguin. (65 refs.)

116133 The Benguela upwelling area. G.Nelson, L.Hutchings (Sea Fisheries Res. Inst., Cape Town, S Africa). *Prog. Oceanogr. (GB)*, vol.12, no.3, p.333-56 (1983).
The authors provide a description of the coastal upwelling occurring in the South Atlantic off the South African coast. In particular the authors describe the macroscale features of the Benguela system, the meteorology of the area and finally they provide a review of mesoscale upwelling processes. (58 refs.)

116134 Monsoon response of the Somali Current and associated upwelling. F.Schott (Rosenstiel School of Marine & Atmospheric Sci., Univ. of Miami, Miami, FL, USA). *Prog. Oceanogr. (GB)*, vol.12, no.3, p.357-81 (1983).
The Somali Current typically develops in different phases in response to the onset of the summer monsoon. Each of these phases exists quasistationary for some time ranging from weeks to months. There periods of rather constant circulation patterns are separated by periods of rapid transition. The authors provide a detailed description of these development phases. (39 refs.)

116135 An overview of the physical oceanography report. A.Leetmaa (Atlantic Oceanographic & Meteorological Labs., NOAA, Miami, FL, USA). *Rev. Geophys. & Space Phys. (USA)*, vol.21, no.5, p.1105-7 (June 1983).
To a great extent, this US physical oceanographic report to IUGG (1978-1982) focuses on advances made in large-scale oceanography. Reviews are presented for the areas of equatorial oceanography, subtropical gyre studies, polar oceanography, mid-latitude variability and oceanic heat flux. The last topic is a common thread that runs through all of the reviews since there is the realization that the ocean is an essential element in determining the climate of the Earth. (no refs.)

116136 Mid-latitude mesoscale variability. W.J.Schmitz, Jr. (Woods Hole Oceanographic Inst., Woods Hole, MA, USA), W.R.Holland, J.F.Price. *Rev. Geophys. & Space Phys. (USA)*, vol.21, no.5, p.1109-19 (June 1983).
Mesoscale ocean circulation phenomena are reviewed. Over the last few years, a promising zero-order description and rationalisation of the mesoscale field has become available. That is, eddy energy is largest near strong flows (intensification not only in western boundary currents, but along their mid-latitude open-ocean extension), roughly as indicated by gyre-scale numerical models where eddies develop as a result of instability processes in the mid-latitude jet and recirculation regimes, and then propagate into the ocean interior. The authors' point of view is that mesoscale eddies drive recirculations but do not play a crucial role in the dynamics of the mean flow in the ocean interior. In addition, the fluctuating response to forcing by variable winds may now be widely perceived as forming the horizontally homogeneous background signal in subtropical gyres. The time-dependent field associated with thermohaline flows at abyssal depths also has a special character. (134 refs.)

116137 Subsurface subtropical gyre of the North Atlantic and Pacific oceans. H.Stommel (Dept. of Phys. Oceanography, Woods Hole Oceanographic Inst., Woods Hole, MA, USA). *Rev. Geophys. & Space Phys. (USA)*, vol.21, no.5, p.1119-23 (June 1983).
In this review attention is restricted to studies of the structure of subtropical gyres (i) in the North Atlantic and Pacific, (ii) between the bottom of the mixed layer and about 1500 metres depth, (iii) between 15°N and 35°N , (iv) in the open ocean eastward of the Gulf Stream and Kuroshio Current and high-energy eddy regions. Work published since 1978 or later by American workers is reviewed. (69 refs.)

116138 Polar oceanography. A.L.Gordon (Lamont-Doherty Geological Obs., Columbia Univ., Palisades, NY, USA). *Rev. Geophys. & Space Phys. (USA)*, vol.21, no.5, p.1124-31 (June 1983).
Oceanographic progress pertaining to polar waters for the 1979-82 period is briefly presented within three research areas: Southern Ocean; Arctic; and ocean-ice interaction, after a discussion of general review articles and atlases. A conclusion is added which presents the author's view of future research direction in a general sense. Emphasis is placed on published US work, though key non US publications are included. The bibliography contains articles not cited in the text. This article is not meant to be a complete synthesis of research, but rather to provide a list of publications with an

associated narrative of the recent US polar oceanographic research. (122 refs.)

116139 Poleward heat transport by the ocean. K.Bryan (Geophys. Fluid Dynamics Lab., NOAA, Princeton, NJ, USA). *Rev. Geophys. & Space Phys. (USA)*, vol.21, no.5, p.1131-7 (June 1983). Reviews poleward heat transport and its relation to the thermohaline circulation of the World Ocean. A perceived need for a better understanding of the Earth's climate have given an impetus to studies of the ocean's role in the global heat balance. Oceanographers have a new appreciation of the existing hydrographic and geochemical data base, and ambitious plans are being made to measure new sections in all the major oceans. It is best to consider ocean heat transport in the context of fresh water, oxygen, silica and other geochemical transports. From the standpoint of climate, however, heat transport is of primary interest. To keep the scope of this review within manageable limits, attention will be restricted to this one aspect of a broader ocean transport problem. Research over the last four years has brought about some important changes in outlook. (40 refs.)

116140 Equatorial oceanography. M.A.Cane (Dept. of Meteorology & Phys. Oceanography, MIT, Cambridge, MA, USA), E.S.Sarachik. *Rev. Geophys. & Space Phys. (USA)*, vol.21, no.5, p.1137-48 (June 1983). Interest and activity in the equatorial oceans (defined arbitrarily as that part of the ocean within ten degrees of the equator) have undergone a remarkable expansion in the last four years. The previous IUGG report (O'Brien, 1979) listed about one hundred references—the present one lists over two hundred and fifty. Among the many reasons for this growth, a primary one is the realisation of the rapid nature of equatorial responses. The vanishing of the Coriolis parameter in the presence of density stratification means that the ocean can respond strongly to basinwide winds on the climatically important, and observationally accessible, annual and interannual time scales. This realisation has taken hold as the result of an interplay among theory, modelling and observation. (243 refs.)

116141 Physical oceanography of continental shelves. J.S.Allen (School of Oceanography, Oregon State Univ., Corvallis, OR, USA), R.C.Beardsley, J.O.Blanton, W.C.Boicourt, B.Butman, L.K.Coachman, A.Huyer, T.H.Kinder, T.C.Royer, J.D.Schumacher, R.L.Smith, W.Sturges, C.D.Winant. *Rev. Geophys. & Space Phys. (USA)*, vol.21, no.5, p.1149-81 (June 1983). Knowledge of the physical oceanography of continental shelves has increased tremendously in recent years, primarily as a result of new current and hydrographic measurements made in locations where no comparable measurements existed previously. Recent work in this field is reviewed in this article. In general, observations from geographically distinct continental shelves have shown that the nature of the flow may vary considerably from region to region. Although some characteristics, such as the response of currents to wind forcing, are common to many shelves, the relative importance of various physical processes in influencing the shelf flow field frequently is different. In the last several years, the scientific literature on shelf studies has expanded rapidly, with that for separate regions, to some extent, developing independently because of the variable role played by different physical effects. (526 refs.)

116142 Small-scale physics of the ocean. D.R.Caldwell (School of Oceanography, Oregon State Univ., Corvallis, OR, USA). *Rev. Geophys. & Space Phys. (USA)*, vol.21, no.5, p.1192-205 (June 1983). Recent progress in the study of fine structure and microstructure phenomena in the oceans is reviewed. Turbulence, internal wave and salt-finger phenomena are discussed. Surface mixing layers are also reviewed. Instrumentation and measurement techniques are described and a bibliography of recent work is provided. (211 refs.)

116143 Internal waves in the ocean: a review. M.D.Levine (School of Oceanography, Oregon State Univ., Corvallis, OR, USA). *Rev. Geophys. & Space Phys. (USA)*, vol.21, no.5, p.1206-16 (June 1983). This review documents the advances in knowledge of the oceanic internal wave field during the past four years. Emphasis is placed on studies that deal most directly with the measurement and modelling of internal waves as they exist in the ocean. Progress has come by realising that specific physical processes might behave differently when embedded in the complex, omnipresent sea of internal waves. To understand fully the dynamics of the internal wave field requires knowledge of the simultaneous interactions of the internal waves with other oceanic phenomena as well as with themselves. This report is not meant to be a comprehensive overview of internal waves. The focus is on topics that have been discussed most actively in the literature; subjects that may be important, but have not received recent attention, are omitted. The reference list is intended to be a comprehensive compilation of papers published since 1979. (232 refs.)

116144 Advances in satellite oceanography. O.B.Brown (Rosenstiel School of Marine & Atmospheric Sci., Univ. of Miami, Miami, FL, USA), R.E.Cheney. *Rev. Geophys. & Space Phys. (USA)*, vol.21, no.5, p.1216-30 (June 1983). Progress has been made in the past four years by US scientists in the development and application of active and passive satellite remote sensing techniques to the study of oceanic processes. This report summarises technical advances and recent applications. Major advances have been made in developing and applying quantitative measurements from active and passive satellite based sensor systems launched in the late 1970s and that proven methodologies now exist to observe sea surface temperature, ocean elevation, ocean colour, surface wind stress and waves, and to locate free drifting buoy data collection platforms. Many of the advances in technique and application have occurred using sensors which were experimental, i.e. not part of an operational satellite observing system. Consequently future geophysical application and development of advanced techniques to enhance understanding of the ocean will probably be limited in the next five years by data availability rather than knowledge of how to apply given satellite observations. (503 refs.)

116145 Paleooceanography: global ocean evolution. J.P.Kennett (Graduate School of Oceanography, Univ. of Rhode Island, Kingston, RI, USA). *Rev. Geophys. & Space Phys. (USA)*, vol.21, no.5, p.1258-74 (June 1983). Paleooceanography is concerned with the development of oceanic circulation through geologic time. This is a multifaceted and integrated endeavour since none of the subdisciplines is easily separated from the others. The field includes the history and effects of bottom, intermediate and surface circulation patterns, planktonic and benthonic biogeographic development and rates of organic evolution, the history of biogenic productivity and dissolution and their effect on sediment distribution and the consequences of sea level change. Paleooceanography was largely born of the Deep Sea Drilling Project (DSDP) and continues to be nourished by it. Because problems are of global scope, the appetite for new sediment core material is large, and is being supplied by numerous expeditions of DSDP. This article is a brief overview of a number of advances that have occurred in paleooceanography and related fields during the period from 1979 to 1982. (426 refs.)

116146 Models of the oceanic internal wave field. D.J.Olbers (Max-Planck-Inst. fur Meteorologie, Hamburg, Germany). *Rev. Geophys. & Space Phys. (USA)*, vol.21, no.7, p.1567-606 (Aug. 1983). This review presents kinematical models of the wave field in terms of vertically progressive waves (WKB waves) as well as standing modes. Some importance is attributed to critical layer effects. Spectral models have been successfully developed for the wave field in the main thermocline. Several methods of separating the internal wave contribution from turbulence and other contaminations in observations have been proposed. This problem is of particular relevance in the transition region between waves and small-scale turbulence at small vertical wavelengths. The search for dynamical relations between the wave field and environmental conditions is described. (170 refs.)

92.20 INTERDISCIPLINARY ASPECTS OF OCEANOGRAPHY

116147 Marine chemistry and paleoceanography in the United States—1978-82—an overview. D.R.Schink (Dept. of Oceanography, Texas A&M Univ., College Station, TX, USA).

Rev. Geophys. & Space Phys. (USA), vol.21, no.5, p.1231-2 (June 1983). A brief review is given of recent oceanographic research performed by American workers during the last four years. The various research programs studying chemical oceanography and paleoceanography are described. These programs include: Transient Tracers in the Ocean (TTO), Sea/Air Exchange (SEAREX), Manganese Nodule Program (MANOP), Coastal Upwelling Ecosystems Analysis (CUEA), Particle Flux Intercalibration (PARFLUX), Sub-seabed Disposal, Warm Core Rings, Spectral Mapping (SPECMAP), and Cenozoic Paleooceanography (CENOP). The author describes various trends in oceanographic research. Theoretical modelling work as well as experimental work is reviewed. (no refs.)

116148 Advances in marine chemistry 1979-82. W.J.Jenkins (Woods Hole Oceanographic Inst., Woods Hole, MA, USA), J.M.Edmond.

Rev. Geophys. & Space Phys. (USA), vol.21, no.5, p.1233-45 (June 1983). These four years saw advances in many areas. Further developments in sampling and analytical techniques have opened new avenues of exploration for trace elements and particulate matter. The impact of the GEOSECS expedition was further felt in the field of marine chemistry as the results were still being published. A major field effort occurred as a follow-on to the GEOSECS work (TTO), and intensive sampling was performed in the newly discovered submarine hydrothermal vent fields. An important and unresolved controversy has arisen regarding the ability to measure 'preformed' CO₂ in the seawater system. In many respects the field of marine chemistry appears to be gaining a momentum spurred by both improvements in analytic techniques and an increasing social and economic relevance. (386 refs.)

116149 Review of marine organic geochemistry. R.B.Gagosian (Dept. of Chem., Woods Hole Oceanographic Inst., Woods Hole, MA, USA).

Rev. Geophys. & Space Phys. (USA), vol.21, no.5, p.1245-58 (June 1983). Over the past four years the field of marine organic geochemistry has expanded in many directions. In order to cover the major areas of this expansion in a review of the type presented, several major topic areas have been selected focusing on the processes responsible for the transport and transformation of organic material. They include: (1) the atmosphere over the oceans and the air/sea interface; (2) dissolved material in seawater; (3) particulate material as it is transported vertically through the water column; (4) recent marine sediments, as well as (5) transformation reactions; (6) metal-organic interactions including adsorption/desorption processes in the ocean, and (7) selected subjects in new areas of research. (591 refs.)

116150 The ocean. W.S.Broecker.

Sci. Am. (USA), vol.249, no.3, p.100-12 (Sept. 1983). The author provides a comprehensive account of all the processes that influence the chemical composition of seawater. These processes include the marine biological processes and the carbon cycle, the input of volcanic and erosion products to the oceans and the loss of chemicals to marine sediments. Emphasis is placed on the supply, reactions and loss of dissolved oxygen, calcium, phosphate, CO₂, carbonate ion and bicarbonate ion. (no refs.)

92.40 HYDROLOGY AND GLACIOLOGY

116151 A Fortran (IV) program for the evaluation of hydraulic geometry parameters of river channels. N.A.Al-Ansari (Dept. of Geology, Coll. of Sci., Univ. of Baghdad, Baghdad, Iraq), M.H.Al-Jabbari, J.McManus, D.McDonald.

Iraqi J. Sci., vol.22, no.4, p.613-22 (1981). [received: Aug. 1983]

A computer program was developed to facilitate calculation of bed load budget in natural rivers by providing essential data for selected indirect methods. The program evaluates the cross sectional area, hydraulic radius, wetted perimeter and mean depth for given depth increments. In addition the above variables are plotting against elevation in a selected reach with the equations used for the plottings. (1 ref.)

116152 Hydrologic flood routing. R.J.Heggen (Dept. of Civil Engng., Univ. of New Mexico, Albuquerque, NM, USA). *CoED (USA)*, vol.2, no.4, p.8-11 (July-Aug. 1983).

Whereas students in introductory engineering hydrology should be exposed to computerized analyses, HEC-1 and other large models are generally too slow for interactive demonstration and unduly complex for student practice. Hydrologic routing through a multiple channel and/or reservoir system having known or predicted inflow hydrographs at upstream locations can be solved with a computer program much smaller, quicker, and easier to run than HEC-1. This paper documents a short classroom-oriented BASIC program which routes stream flow through a system of channels and reservoirs. Reach hydrographs are computed by the Muskingum method and reservoir hydrographs are calculated by the Puls procedure. Program data requirements consist of input hydrographs for the top reaches, Muskingum time constant and weighting values for channels, stage-discharge-storage coordinates for reservoirs, and a sequential listing of reach confluences. The program is suited for analyses of open channel conveyance systems, flood detention reservoirs, and combinations of the two. Having mastered this program, students are better prepared for the sophisticated practice-oriented packages they may later encounter. (no refs.)

116153 A model study of the short-term climatic and hydrologic effects of sudden snow-cover removal. T.-C.Yeh, R.T.Wetherald, S.Manabe (Geophys. Fluid Dynamics Lab./NOAA, Princeton Univ., Princeton, NJ, USA). *Mon. Weather Rev. (USA)*, vol.11, no.5, p.1013-24 (May 1983).

Describes the results from a set of numerical experiments which stimulate the effect of a large scale removal of snow cover in middle and high latitudes during the early spring season. This is done through use of a simplified general circulation model with a limited computational domain and idealized geography. It is found that removal of snow cover reduces the water available to the soil through snowmelt and decreases soil moisture in this region during the following seasons. Furthermore, it also reduces surface albedo in this region and increases absorption of insolation by the ground surface. This, in turn, heats the ground surface and allows more evaporation to occur. The removal of snow cover also affects the thermal and dynamical structure of the atmosphere. (13 refs.)

116154 Slope hydrology as influenced by thawing of the active layer. Resolute, N.W.T.. Ming-ko Woo, P.Steer (Dept. of Geography, McMaster Univ., Hamilton, Canada).

Can. J. Earth Sci. (Canada), vol.20, no.6, p.978-86 (1983).

Discusses the role played by the thawing of the active layer on the hydrology of slopes in permafrost terrains. Results from this study will have applications in streamflow forecasting and in construction projects that require a knowledge of slope drainage. (11 refs.)

116155 Operational flood routing for hydroelectric plants. M.Mimikou (Civil Engng. Dept., Tech. Univ. of Athens, Athens, Greece).

Int. Water Power & Dam Constr. (GB), vol.35, no.9, p.24-7 (Sept. 1983).

Hydraulic flood routing models need geomorphological, hydrologic and hydraulic field information from the stream-watershed system where they are applied. The spatial and temporal variability and the limited variability of this field information for most of natural streams are the main reasons for application difficulties and inaccuracies of the hydraulic flood routing models. The stochastic model presented for transferring flood streamflows with lateral inflows overcomes all these difficulties and has been used successfully in the design and the operation of hydroelectric plants. (8 refs.)

116156 The behaviour of silt-laden current. II. W.H.Graf (Lab. d'hydraulique, Ecole Polytech. Federale, Lausanne, Switzerland).

Int. Water Power & Dam Constr. (GB), vol.35, no.9, p.33-8 (Sept. 1983).

For pt.1, see *ibid.*, vol.35, no.4, p.45 (1983). Continuing his examination of the mechanics of reservoir sedimentation, the author examines the characteristics of those currents which carry sediment into existing bodies of water. A better understanding of their behaviour, it is argued, would improve the techniques of reservoir control. (32 refs.)

116157 Indonesia's Asahan hydro project. II. I.Miyachi, K.Miyake.

Int. Water Power & Dam Constr. (GB), vol.35, no.9, p.46-53 (Sept. 1983).

For pt.1 see *ibid.*, vol.35, no.8, p.59 (1983). Gives details of the area's hydrology, topography and geology and explains how these factors, among others, determined the form of the scheme. Also describes the execution of the project, and how the various problems during construction were overcome. (no refs.)

116158 Verification and correction of BKF-precipitation forecasts for the use in a runoff model. R.Dreissigacker, H.Fleer (Univ. Hannover, Hannover, Germany).

Meteorol. Rundsch. (Germany), vol.36, no.4, p.169-80 (Aug. 1983). In German.

The Germany Weather Service computes quantitative precipitation forecasts and publishes them in the form of charts with plotted isohyets. In the view of an application to flood forecasting in the Leine-river basin the forecast data are compared with two area-averaged observation data sets: one for an orographically undisturbed region in Schleswig-Holstein, and the other one for the Leine-river basin which is influenced by mountainous regions. The influence of orography in the Leine-river basin is investigated by analysing the correlations separately for various wind direction forecasts. (13 refs.)

116159 Oxygen isotope ratios in German groundwater. H.Forstel, H.Hutzen (Inst. of Radioagronomy, KFA Julich, Julich, Germany).

Nature (GB), vol.304, no.5927, p.614-16 (18 Aug. 1983).

The natural variation in the $^{18}\text{O}/^{16}\text{O}$ ratio in precipitation has a characteristic global pattern corresponding to the worldwide distribution of the local mean annual temperature. This global pattern is not, however, sensitive enough to predict the local $^{18}\text{O}/^{16}\text{O}$ ratio in precipitation. A survey of groundwater throughout the FRG was obtained from about 900 samples of the municipal water supply. Using a multicorrelation study the authors demonstrate that both distance from the coast and height above sea level determine the local $^{18}\text{O}/^{16}\text{O}$ ratio, and that this ratio generally decreases from the northern coast towards the southern mountainous region. The geographical variation in the

$^{18}\text{O}/^{16}\text{O}$ ratio may serve as a basis for palaeoclimatological, plant-physiological and food analytical applications. (10 refs.)

116160 A model for predicting currents in stratified basins. M.A.Akopyan, Yu.L.Demin (Shirshov Inst. of Oceanography, Acad. of Sci., Moscow, USSR).

Oceanology (USA), vol.22, no.4, p.404-8 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.4 (1982). [received: Aug. 1983]

Describes a prognostic model for currents in stratified basins, based on simple equations of motion and the equation for the surface of the basin. Using this model the authors calculate currents and water temperatures for Lake Sevan using a computational grid with spacings of 1 km. The results are compared to observational data. (12 refs.)

116161 Extraction of the synoptic component from hydrology survey data. O.P.Nikitin (Shirshov Inst. of Oceanology, Acad. of Sci., Moscow, USSR).

Oceanology (USA), vol.22, no.4, p.413-16 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.4 (1982). [received: Aug. 1983]

A procedure for extracting the synoptic component of the field of any scalar hydrophysical quantity from the corresponding data of a unified hydrological survey is described. The procedure consists of a series of successive least-square approximations for the field of the desired components by surfaces derived from polynomials orthonormalized over the given set of points of the hydrological survey. Conditions which must be satisfied by the extracting surface are derived. (5 refs.)

116162 Quantitative estimation of groundwater potentiality and rainfall infiltration in a typical crystalline environment. B.H.Briz-Kishore (Centre of Exploration Geophys., Osmania Univ., Hyderabad, India).

Proc. Indian Acad. Sci. Earth & Planet. Sci., vol.92, no.1, p.63-71 (March 1983). [received: Sept. 1983]

A sophisticated method of measuring water levels is adopted to determine the groundwater potentialities in a typical weathered and fractured environment. The frequency of the rainfall is shown to have a direct bearing on recharging the groundwater system. The Thiessen polygon method is used to determine the weighted average of the rainfall over the basin area to estimate the groundwater infiltration rates. The long term average infiltration is established as 15% of the total rainfall. (8 refs.)

116163 Regionalization of water quality in the Upper Fraser River basin, British Columbia. P.H.Whitfield (Water Quality Branch, Inland Waters Directorate, Environment Canada, Vancouver, BC, Canada).

Water Res. (GB), vol.17, no.9, p.1153-66 (1983).

Uniformity of water quality in the Upper Fraser River basin is examined using cluster analysis. Substantial variations in water quality exist within the basin. These differences are largely related to the geology of the watersheds. Differences in water quality are more pronounced among the tributaries than along the mainstream of the Fraser River. The mainstem of the river could be considered to have three distinct reaches where water quality properties were relatively constant. Cluster analysis was a useful technique for establishing similarities and differences for both the tributaries and the mainstem stations. Some limitations of water quality data and the methods used are discussed. (19 refs.)

116164 Parameter identification of compartmental models—case of hydrologic rainfall-runoff models. S.Sorooshian (Dept. of Systems Engng. & Civil Engng., Case Western Reserve Univ., Cleveland, OH, USA).

Identification and System Parameter Estimation 1982. Proceedings of the Sixth IFAC Symposium, Washington, DC, USA, 7-11 June 1982 (Oxford, England: Pergamon 1983), p.1565-70 vol.2

Addresses some of the difficulties associated with the parameter identification of hydrologic rainfall-runoff models ('compartmental' type) which simulate the dynamic response of watersheds. The presence of threshold (jump) parameters results in a nonexplicit structural equation for the model and consequently estimation techniques that do not require gradient evaluations are commonly employed. In this case the choice of the estimation criterion becomes a critical factor. It is shown that by using maximum likelihood estimators which take into account some of the stochastic properties of the rainfall-runoff process, better parameters and more reliable forecasts can be obtained. Some of the problems needing further research are also presented. (12 refs.)

116165 Optimal estimation of the average areal rainfall over a basin and optimal selection of rain-gauge locations. B.Lorent, G.Bastin, C.Duque, M.Gevers (Louvain Univ., Louvain-la-Neuve, Belgium).

Identification and System Parameter Estimation 1982. Proceedings of the Sixth IFAC Symposium, Washington, DC, USA, 7-11 June 1982 (Oxford, England: Pergamon 1983), p.1571-6 vol.2

Using a linear minimum variance unbiased estimation procedure for the estimation of spatially distributed random variables (called 'Kriging' by geostatisticians) the authors solve the following problems: estimate the average areal rainfall over a catchment area from measurements in a few rain-gauges; and find the measurement locations that will give the most accurate estimate of this areal rainfall. Furthermore they show that the estimated areal rainfall depends only on the location of the rain-gauges, and that one can find the measurement locations leading to the smallest estimation error variance. (6 refs.)

116166 Contemporary stochastic approach to water resources systems: the ARMP and feature prediction models. O.Ibidapo-Obe (Faculty of Engng., Univ. of Lagos, Lagos, Nigeria).

Identification and System Parameter Estimation 1982. Proceedings of the Sixth IFAC Symposium, Washington, DC, USA, 7-11 June 1982 (Oxford, England: Pergamon 1983), p.1583-7

An autoregressive model with Markovian parameters (ARMP) and a feature prediction scheme (FPM) are developed. The ARMP is physically based and adaptive in its implementation thus taking into consideration the inherent periodicities in hydrological time series. The FPM is motivated by the current inability to provide a suitable and sufficiently comprehensive yet simplified mathematical hydrological model. It is based on pattern analysis and is such that a system dynamic feature is identified using a priori data which can subsequently be used to simulate the missing data and forecast future hydrological parameter. The ARMP and FPM provide efficient alternatives to some other existing models which are not, in general, applicable to all classes of hydrological problems (perennial droughts and storm surges). It also affords an added advantage as a result of the ability of the schemes to forecast in real-time. A comparative analysis of the two techniques are undertaken using the discharge record data from the River Nile at Aswan Dam from 1870-1945. It is further proposed that in order to enhance the over-all performance of the prediction scheme, the FPM may be used as an input (training data) to the ARMP. (9 refs.)

- 116167 A model for rain attenuation prediction in single and site diversity Earth-satellite links.** C.Capsoni, E.Matriciani (Dipartimento di Elettronica, Politecnico di Milano, Milano, Italy). *Alta Freq. (Italy)*, vol.52, no.3, p.215-17 (May-June 1983). (4th Italian National Meeting on Applied Electromagnetics, Florence, Italy, 4-6 Oct. 1982).
- Site diversity systems are foreseen for Earth-to-satellite links operating at frequencies above 10 GHz in localities with high rain-induced attenuation. An analytical model for the rainrate statistical process is developed using radar derived information on the rain structure collected at Spino d'Adda in the framework of the SIRIO experiment. The procedure for estimating rain attenuation in both single and site diversity systems is outlined in a general formulation which makes it applicable to different situations. The model gives results very similar to experimental ones. (6 refs.)
- 116168 Clear air scintillation in electromagnetic line-of-sight propagation at 35 GHz.** P.Basili, P.Ciotti, G.D'Auria (Dipartimento di Elettronica, Univ. di Roma, Roma, Italy), D.Solimini. *Alta Freq. (Italy)*, vol.52, no.3, p.221-3 (May-June 1983). (4th Italian National Meeting on Applied Electromagnetics, Florence, Italy, 4-6 Oct. 1982).
- Scintillation of millimetre waves propagating in the atmosphere is considered from the theoretical point of view and practical formulas and diagrams are given. An experiment has been carried out at 34.8 GHz and some results are reported. The general properties of amplitude spectra with respect to the statistical fluctuations of refractivity are presented and their relationships with the covariance functions and with the relevant meteorological parameters are illustrated. (11 refs.)
- 116169 Investigation of the spectral composition of solar radiation under conditions prevailing at Tashkent.** B.Z.Mavashev, Yu.Z.Mavashev (S.V. Starodubtsev Physicotech. Inst., Acad. of Sci., Uzbek SSR). *Appl. Sol. Energy (USA)*, vol.18, no.4, p.68-70 (1982). Translation of: *Geliotekhnika (USSR)*, vol.18, no.4, p.57-9 (1982). [received: Aug. 1983]
- The authors describe the variability of the distribution of solar radiation over certain portions of the spectrum, in relation of the time of day, season, meteorological conditions, and pollution of the ground layer of the atmosphere. (4 refs.)
- 116170 Plume dispersion in a nocturnal drainage wind.** S.Barr, T.G.Kyle, W.E.Clements, W.Sedlacek (Los Alamos Nat. Lab., Los Alamos, NM, USA). *Atmos. Environ. (GB)*, vol.17, no.8, p.1423-9 (1983).
- A series of tracer experiments were conducted under nocturnal drainage wind conditions in a complex terrain setting in the Piceance Basin of western Colorado. Concurrent meteorological information including profiles of wind and temperature as well as gross turbulence fluctuations from fixed 2-m stations provided the basis to test plume growth and dilution prescriptions for this moderately complex site. Plume parameters exhibited slightly greater diffusion than would be indicated by simple stability-based prediction methods or the gross turbulence indicators. Two terrain-related mechanisms appear to contribute to the development of the plume: these two mechanisms are described. (13 refs.)
- 116171 Measurements of sulfur in gases and particles during sixteen months in the Ohio River Valley.** R.W.Shaw, Jr., R.J.Paur (Office of Res. & Dev., US Environmental Protection Agency, Research Triangle Park, NC, USA). *Atmos. Environ. (GB)*, vol.17, no.8, p.1431-8 (1983).
- During the period May 1980-August 1981, air quality measurements were made at three rural sites in the Ohio River Valley. Monthly averages of O_3 , NO_2 and gaseous and particulate sulfur were quite uniform from site to site and showed a strong annual pattern: NO_2 and gas phase sulfur were highest in winter; while O_3 and particulate sulfur were highest in summer. The ratio of particulate sulfur to gaseous sulfur varied from less than 0.1 in winter to nearly 1 in summer. (22 refs.)
- 116172 Mesoscale air pollution dispersion modelling.** H.Van Dop, B.J.De Haan (Royal Netherlands Meteorological Inst., De Bilt, Netherlands). *Atmos. Environ. (GB)*, vol.17, no.8, p.1449-56 (1983).
- An air pollution model is developed which describes the transport of pollutants on a scale of $500 \times 500 \text{ km}^2$. This corresponds with episodes of a few days. In the model a detailed description is given of the vertical diffusion processes under different stability conditions. Also much effort is put into the determination of the horizontal mean wind field, which is strongly non-homogeneous and non-stationary on the above space- and timescales. The transport equation is numerically solved. For the advective part a pseudo-spectral scheme was applied. The vertical diffusion is treated with a Crank-Nicolson scheme. Dry deposition is included in the model in a way which accounts for the chemical properties of pollutant and soil. Wet deposition and chemical transport are included by simple linear decay terms. The model is tested in a complex source area (Netherlands and surrounding countries), during a fair weather episode on 29 and 30 May 1978. (18 refs.)
- 116173 Modelling of long-range transport of sulphur over Europe: a two-year model run and some model experiments.** A.Eliassen, J.Saltbones (Norwegian Meteorological Inst., Oslo, Norway). *Atmos. Environ. (GB)*, vol.17, no.8, p.1457-73 (1983).
- The long-range transport of sulphur over Europe is quantified using a simple trajectory model with constant mixing height. Results from a model run covering a two-year period shows that average concentrations of sulphur dioxide and particulate sulphate are predicted reasonably well. The calculations

confirm that, in most countries in Europe, the deposition of sulphur due to foreign sources represents an important contribution to the total deposition. Seasonal concentration variations are not well predicted with this simple model. The model experiments show that improvements are gained in this respect when a variable mixing height is introduced. (17 refs.)

- 116174 Anatomy of an episode of high sulfate concentration at Whiteface Mountain, New York.** V.A.Dutkiewicz, J.A.Halstead, P.P.Parekh, A.Khan, L.Husain (Center for Labs. & Res., New York State Dept. of Health, Albany, NY, USA). *Atmos. Environ. (GB)*, vol.17, no.8, p.1475-82 (1983).
- Concentrations of seven metals and sulfate in aerosols collected at Whiteface Mountain, New York, were measured continuously in 6-h intervals for 2 weeks in June 1979. Thirteen consecutive samples showed high episodic concentrations of sulfate, Fe, Al and, to a lesser extent, Zn, Pb, K, Mg and Ca. The trajectories for the period of elevated $[\text{SO}_4^{2-}]$ passed through the mid-western United States and entered New York State from the southwest. The trajectories for the time periods of low $[\text{SO}_4^{2-}]$ before and after the episode entered New York from the north. This relationship between high concentrations and the surface-air trajectories suggests that in this particular episode SO_4^{2-} and metals may have been transported from the Midwest. (20 refs.)

- 116175 The relationship of sulfur emissions to sulfate in precipitation. II. Gas phase processes.** M.Oppenheimer (Environmental Defense Fund Inc., New York, NY, USA). *Atmos. Environ. (GB)*, vol.17, no.8, p.1489-95 (1983).
- For pt.1 see *ibid.*, vol.17, p.451-60 (1982). A climatological box model is applied to wet deposition of sulfur in eastern North America using the extreme assumption that all wet-deposited sulfates originate in sulfate aerosol. The measured sulfate in precipitation during 1977-1979 constrains the probability that an SO_2 molecule emitted in the eastern United States is oxidized before deposition or outflow from the region to values greater than 0.5 and more likely near 1.0. This result implies that uniform SO_2 emission reductions will produce nearly proportional reductions in wet sulfates originating in those emissions and deposited on land. The amount of wet sulfate deposition is demonstrated to constrain the mean scale of transport along air parcel trajectories for the precursor of wet sulfur, whether SO_2 or sulfate aerosol, to values greater than 900 km. (30 refs.)

- 116176 The pH and ionic composition of stratiform cloud water.** R.A.Castillo, J.E.Justo (Atmospheric Sci. Res. Center, State Univ. of New York, Albany, NY, USA), E.McLaren. *Atmos. Environ. (GB)*, vol.17, no.8, p.1497-505 (1983).
- Over 50 cloud water samples were collected during five comprehensive case studies of the water chemistry of stratiform clouds at Whiteface Mountain, New York. The water samples were analyzed for pH, conductivity and ions of sodium, potassium, magnesium, calcium, ammonium, sulfate, chloride and nitrate. Trajectory analyses and cloud condensation nucleus concentrations at 0.5% confirmed that the air masses in all five of these cases represented continental air that was relatively clean (low aerosol concentration) for the northeastern United States. The major ions related to cloud water pH were found to be sulfate, nitrate, potassium, ammonium and calcium. The results revealed a mean pH=3.6 for all collected cloud samples. The low pH values are related to a normal background of nitrate ions found in the rural continental air masses plus sulfate ions largely from the industrial emissions of the midwestern United States. (21 refs.)

- 116177 Aerosol composition at Chacaltaya, Bolivia, as determined by size-fractionated sampling.** F.Adams, P.Van Espen (Dept. of Chem., Univ. of Antwerp, Wilrijk, Belgium), W.Maenhaut. *Atmos. Environ. (GB)*, vol.17, no.8, p.1521-36 (1983).
- Thirty four cascade impactor samples were collected between September 1977 and November 1978 at Chacaltaya, Bolivia. The concentrations of 25 elements were measured for the six impaction stages of each sample by means of energy-dispersive X-ray fluorescence and proton-induced X-ray emission analysis. The results indicated that most elements are predominantly associated with a unimodal coarse particle soil dust dispersion component. Also chlorine and the alkali and alkaline earth elements belong to this group. The anomalously enriched elements (S, Br and the heavy metals Cu, Zn, Ga, As, Se, Pb and Bi) showed a bimodal size distribution. Correlation coefficient calculations and principal component analysis indicated the presence in the submicrometer aerosol mode of an important component, containing S, K, Zn, As and Br, which may originate from biomass burning. (43 refs.)

- 116178 Electron microscopy of acidic aerosols collected over the northeastern United States.** R.J.Ferek (Dept. of Oceanography, Florida State Univ., Tallahassee, FL, USA), A.L.Lazrus, J.W.Winchester. *Atmos. Environ. (GB)*, vol.17, no.8, p.1545-61 (1983).
- As part of the acid precipitation experiment (APEX) conducted in the northeastern US, aerosols were collected from an aircraft in different seasons, locations and meteorological conditions. Particles were impacted on electron microscope grids for morphological analysis and thin-film chemical tests for sulfate and nitrate. Under most conditions the accumulation mode aerosols ($c. 0.1\text{-}1.0 \mu\text{m}$ diameter) collected in the boundary layer were composed of sulfate particles of uniform composition (i.e. an internally mixed aerosol), indicating that individual particle composition could be inferred from bulk measurements. Externally mixed aerosols (i.e. assemblages of different kinds of particles) were found to exist near certain sources (e.g. power plants), in urban plumes, and near fair weather cumulus clouds. Direct evidence of rapid oxidation of SO_2 to H_2SO_4 in cloud droplets was obtained in samples collected near clouds in northern New York and central Illinois, and this represents a potentially major pathway for SO_2 oxidation in the lower troposphere. (22 refs.)

- 116179 World-wide ambient measurements of peroxyacetyl nitrate (PAN) and implications for plant injury.** P.J.Temple, O.C.Taylor (Dept. of Botany & Plant Sci., Univ. of California, Riverside, CA, USA). *Atmos. Environ. (GB)*, vol.17, no.8, p.1583-7 (1983).
- Peroxyacetyl nitrate (PAN) is a major phytotoxic component of the photochemical oxidant complex in southern California. Based on ambient air sampling at Riverside, California, in 1980, and published reports of PAN concentrations from other parts of the world, PAN concentrations in southern California appear to be five or ten times higher than those reported from eastern North America, western Europe, or Japan. Potentially phytotoxic episodes, defined herein as $\text{PAN} > 15 \text{ ppb}$ for 4 h during the a.m. period or $> 25 \text{ ppb}$ for 4 h in the p.m. period occurred 27 times in Riverside, California, in 1980. PAN normally averages 1 ppb or less outside of southern California, and because of this low concentration, PAN by itself does not appear to be a major cause of photochemical oxidant injury to vegetation in those regions. (38 refs.)

116180 Estimating the zero-plane displacement for tall vegetation using a mass conservation method. L.C.B.Molion, C.J.Moore (Inst. of Hydrology, Wallingford, England).

Boundary-Layer Meteorol. (Netherlands), vol.26, no.2, p.115-25 (June 1983). This note describes estimation of the zero-plane displacement derived from experimental windspeed measurements above an 18 m pine forest and an 8-9 m savannah using a 'mass conservation technique' mentioned by Tajchman (1981). The results obtained using this analysis exhibit a lack of sensitivity to experimental errors which is in marked contrast to those commonly obtained over tall vegetation using more conventional least-square analyses. The consistency in the results allows an investigation of the windspeed dependence of the aerodynamic properties of the mean horizontal airflow over tall vegetation, and permits consideration of the effect of experimental errors on such dependence. (17 refs.)

116181 Tracer experiments with turbulently dispersed air ions. P.B.Storebo, T.Bjorvatten, K.Honnashagen, A.Lillegraven (Norwegian Defence Res. Establ., Kjeller, Norway), C.D.Jones, C.J.P.van Buijtenen. *Boundary-Layer Meteorol. (Netherlands)*, vol.26, no.2, p.127-39 (June 1983). Unipolar air ions released into the wind constitute a tracer which can be measured with high resolution. An ion source produces a cloud with homogeneous charge density, insensitive to source strength, dependent on time since formation only. It is well suited for tracing concentration changes due to turbulence, less suited for cloud size tracing. A tight array of 8 sensors has been used to examine turbulently dispersed ions. High-resolution records are presented and discussed. The highest concentrations measured could be undiluted source material. The frequency distribution within a plume did not differ from that in a multitude of puffs. The distribution seems to be log-normal with a geometric standard deviation of about 2.45. The time resolution used corresponds to volume resolutions of 40, 225, and 650 cm³. Sample size had no apparent effect. (7 refs.)

116182 Wave and turbulence structure in a disturbed nocturnal inversion. Lu Nai-Ping (Inst. of Atmospheric Phys., Acad. Sinica, Beijing, China), W.D.Neff, J.C.Kaimal.

Boundary-Layer Meteorol. (Netherlands), vol.26, no.2, p.141-55 (June 1983). Acoustic sounder and tower data obtained at the Boulder Atmospheric Observatory are used to examine several features of the wave and turbulence structure associated with a disturbed nocturnal inversion. General features, including mean fields and Richardson number, for the case selected for this study are presented. Spectral analysis of the tower data reveals a separation of energy into wavelike and turbulent fluctuations. Analysis of the heat flux, however, shows upward counter-gradient fluxes in the vicinity of a low-level jet and near the top of the inversion. The major contribution to the upward heat flux occurs at frequencies that would normally be considered characteristic of waves. In some cases, the upward flux is associated with a phase shift between vertical velocity w and fluctuating temperature θ different from the quadrature relation that would be expected of internal waves. (18 refs.)

116183 A study of multiple stable layers in the nocturnal lower atmosphere. Li Xing-Sheng (Inst. of Atmospheric Phys., Acad. Sinica, Beijing, China), J.E.Gaynor, J.C.Kaimal.

Boundary-Layer Meteorol. (Netherlands), vol.26, no.2, p.157-68 (June 1983). The structure of nocturnal inversions in the first 300 m of the atmosphere is analyzed using observational data from the Boulder Atmospheric Observatory from March through June 1981. The temperature profiles show more than one inversion layer 41 of the time during the observational period. The vertical distributions of wind speed and moisture also show evidence of stratification during these multiple-layer events. The relation between the radiative cooling rate in time and height, including moisture, and the vertical structure of the multiple layers is calculated. The vertical distribution of eddy kinetic energy and the turbulent vertical fluxes of heat and momentum are also calculated. Turbulent structure in the elevated inversion layers is more complicated than that in the single-layer, stable nocturnal boundary layer. The total heat budget for a multiple-layer case is calculated, and turbulent cooling is found to be negligible relative to radiative cooling and to horizontal advection and/or horizontal divergence of heat flux. (21 refs.)

116184 A simple model of neutrally stratified boundary-layer flow over real terrain incorporating wavenumber-dependent scaling. P.A.Taylor, J.L.Walmsley (Boundary Layer Res. Div., Atmospheric Environment Service, Downsview, Ontario, Canada), J.R.Salmon.

Boundary-Layer Meteorol. (Netherlands), vol.26, no.2, p.169-89 (June 1983). The authors' experience in applying earlier versions of a model of boundary-layer flow over low hills to real terrain (see Walmsley et al., 1982) has led to the development of a new version which is designated MS3DJH/3. The main improvements are the use of terrain-dependent length and velocity scales and the blending of inner and outer layer results into a single 'universally valid' solution for the velocity perturbation field. MS3DJH/3 was carefully calibrated against alternative computations of flow over idealized two-dimensional terrain features using more detailed models prior to its application to real, three-dimensional terrain. It still provides high spatial resolution with low computing cost and is applicable to flow over terrain features with horizontal scales from 10 m to 10 km. (8 refs.)

116185 A suggested refinement for O'Brien's convective boundary layer eddy exchange coefficient formulation. R.A.Pielke (Dept. of Atmospheric Sci., Colorado State Univ., Fort Collins, CO, USA), H.A.Panofsky, M.Segal. *Boundary-Layer Meteorol. (Netherlands)*, vol.26, no.2, p.191-5 (June 1983). With observational data collected and interpreted by Crane et al. (1977), the adequacy of the O'Brien polynomial to represent the exchange profile of heat and pollution in a convective boundary layer is examined and a refinement suggested. Also, it is shown that the height of the surface layer, $h=0.04 z_i$, developed by Blackadar and Tennekes (1968) for a neutrally stratified boundary layer (with $z_i=0.25 u_*^2/f$) appears to be equally valid for the convective boundary layer where z_i , defined as the top of the mixed layer, is used. (13 refs.)

116186 Seasonal variation of wind direction fluctuations vs. Pasquill stabilities in complex terrain. Y.Sadurham, K.P.R.Vittal Murthy (Nat. Inst. of Oceanography, Dona Paula, Goa, India).

Boundary-Layer Meteorol. (Netherlands), vol.26, no.2, p.197-202 (June 1983). The authors have studied the seasonal variation of σ_θ (the standard deviation of wind direction fluctuations) vs. Pasquill stabilities over complex terrain. It is found that the values of σ_θ are quite high in the month of April in contrast with other months. Values are also high when compared with those estimated over flat terrain and at a coastal site. (13 refs.)

116187 Global temperature variations in the troposphere and stratosphere, 1958-1982. J.K.Angell, J.Korshover (Air Resources Labs., NOAA, Rockville, MD, USA).

Mon. Weather Rev. (USA), vol.11, no.5, p.901-21 (May 1983). A network of 63 well-distributed radiosonde stations is used to estimate mean-annual temperature variations at the surface and for 85-30 kPa (850-300 mb), 30-10 kPa, 10-5 kPa, 10-3 kPa, and surface-10 kPa layers for five climate zones both hemispheres, and the world for the interval 1958-81. There

is evidence for an 0.3°C decrease in Northern Hemisphere surface temperature following the Agung eruption in 1963, as well as at least a 1.0°C temperature increase in the low stratosphere of the tropics, but no convincing evidence that the eruptions of Fuego in 1974 or St.Helens in 1980 affected either tropospheric or stratospheric temperatures. Between 1958 and 1981, the correlation between sea-surface temperature in the equatorial eastern Pacific and global temperature for the surface-10 kPa layer, is discussed. (39 refs.)

116188 The large-scale circulation and heat sources over the Tibetan Plateau and surrounding areas during the early summer of 1979. I. Precipitation and kinematic analyses. Huibang Luo, Michio Yanai (Dept. of Atmospheric Sci., Univ. of California, Los Angeles, CA, USA).

Mon. Weather Rev. (USA), vol.11, no.5, p.922-44 (May 1983). The time evolution of the large-scale precipitation, low-level (850 mb) wind, moisture and vertical motion fields over the Tibetan Plateau and surrounding areas during a 40-day period from late May to early July 1979 is studied based on the objectively analyzed FGGE Level II-b data set. During this period the general circulation over East Asia undergoes a distinct change characterizing the onset of the summer monsoon circulation. The Tibetan Plateau exerts profound orographic and thermal influences upon the low-level wind field. Detailed examinations of daily values of the areal mean vertical p -velocity, mixing ratio and rainfall are made for four heat source regions (the western Plateau and adjacent areas, the eastern Plateau, the Yangzi River, the Assam-Bengal region) as a preliminary to the discussion of heating mechanisms operating in these regions. (49 refs.)

116189 On the relative motion of binary tropical cyclones. K.Dong (Central Meteorological Bur., Acad. of Meteorological Sci., Beijing, China), C.J.Neumann.

Mon. Weather Rev. (USA), vol.11, no.5, p.945-53 (May 1983). The interaction between spatially proximate (binary) tropical cyclones is such that relative rotation in the counterclockwise sense and decreasing separation distance between the two storm centers can be expected. This is referred to as the Fujiwhara effect. The author analyzes this effect for 43 binary tropical cyclone systems which occurred over the western North Pacific, 1949-78. It is shown that most demonstrated mutual interaction according to Fujiwhara expectations. However, there were notable apparent exceptions. Further analysis of these exceptional cases shows that environmental currents in which the storms were embedded has a significant effect on relative motion and masked the Fujiwhara effect. Additionally, it was found that storms exhibiting behavior most in accordance with Fujiwhara expectations were located in or near the Intertropical Convergence Zone. (13 refs.)

116190 Variability of the Indian summer monsoon and tropical circulation features. D.A.Mooley, B.Parthasarathy (Indian Inst. of Tropical Meteorology, Pune, India).

Mon. Weather Rev. (USA), vol.11, no.5, p.967-78 (May 1983). The Indian economy is very closely linked with the variable performance of the summer monsoon. The incidence of dry and wet conditions over the country is examined for the period 1871-1978 by examining the normal monsoon rainfall and its variability over the region by means of the Index of Dryness over India (IDI) and the Index of Wetness over India (IWI). These are respectively defined as the country's percentage area characterized by dry and wet conditions. These series are found to be homogeneous, random, highly variable and positively skewed. The year in which IDI (IWI) exceeds the mean by more than two times the mean deviation from the mean is taken as a year of large-scale drought (flood). The IDI and IWI show consistently significant correlation with the Southern Oscillation Index and with sea surface temperature anomalies of the equatorial eastern Pacific for the concurrent and succeeding seasons. (55 refs.)

116191 Monitoring tropical-cyclone intensity using environmental wind fields derived from short-interval satellite images. E.Rodgers (Goddard Space Flight Center, NASA, Greenbelt, MD, USA), R.C.Gentry.

Mon. Weather Rev. (USA), vol.11, no.5, p.979-96 (May 1983). Rapid-scan visible images from the Visible Infrared Spin Scan Radiometer (VISSR) sensor on board SMS-2 and GOES-1 are used to derive high-resolution upper and lower tropospheric environmental wind fields around three western Atlantic tropical cyclones (Caroline, August 1975; Anita, August and September 1977; and Ella, September 1978). These wind fields are used to derive the local change of the net relative angular momentum (RAM) upper and lower tropospheric areal mean relative vorticity and their difference, and the storm's transverse circulation. The local change of the storm's net RAM is investigated for the purpose of predicting future storm intensification while the areal mean relative vorticity and transverse circulation are investigated to better understand how the storm's environmental circulation affects its intensification. (38 refs.)

116192 A convergence analysis of a numerical method for solving the balance equation. S.J.Bijlsma, R.J.Hoogendoorn (Royal Netherlands Meteorological Inst., De Bilt, Netherlands).

Mon. Weather Rev. (USA), vol.11, no.5, p.997-1001 (May 1983). The convergence of an iterative method for solving the nonlinear balance equation is analyzed. It is shown that this iterative method, originally proposed by Miyakoda (1958) and Shuman (1957) is convergent if a sufficiently accurate initial approximation is used and if the successive iterates satisfy the ellipticity condition. Otherwise the method may be divergent. Experimental results are presented. (6 refs.)

116193 Limitations of some common lateral boundary schemes used in regional NWP models. H.C.Davies (Lab. Atmospheric Phys., ETH, Zurich, Switzerland).

Mon. Weather Rev. (USA), vol.11, no.5, p.1002-12 (May 1983). A brief critical assessment is presented of several lateral boundary schemes currently employed in regional weather prediction models. Simple flow models are used to determine the nature and cause of the primary shortcomings of each of the considered schemes. An awareness of these deficiencies can prove helpful in the implementation and further refinement of these schemes, and also in the interpretation of the resulting prediction errors. (40 refs.)

116194 A cyclone/anticyclone couplet over North America: an example of anticyclone evolution. J.S.Boyle, L.F.Boisart (Dept. of Atmospheric Sci., State Univ. of New York, Albany, NY, USA).

Mon. Weather Rev. (USA), vol.11, no.5, p.1025-45 (May 1983). A detailed case study is made of a cyclone/anticyclone couplet over North America during early winter, 11-18 November 1969. The anticyclone was the dominant member of the couplet in this case. Objective analyses of the wind and mass fields are carried out in both the isobaric and isentropic coordinate systems. Calculated quantities which are discussed include quasi-geostrophic vertical velocity and height tendency, potential vorticity, and quasi-Lagrangian kinetic energy budgets. The movement of the cold, polar anticyclone out of its source region in Alaska southeastward to the Gulf of Mexico is seen to be thermally steered. The mechanism by which the cold air dome associated with the anticyclone moves southward intact is explained from two complementary perspectives. One viewpoint is that of asymmetries in the jet stream about the long wave trough with a jet streak to the west of the cold dome. The other is

that a maximum in potential vorticity located above the coldest air will prevent the dome from subsiding. (37 refs.)

116195 Duration of convective events related to visible cloud, convergence, radar and rain gage parameters in south Florida. R.L.Holle, A.I.Watson (Environmental Res. Labs., NOAA, Boulder, CO, USA). *Mon. Weather Rev. (USA)*, vol.11, no.5, p.1046-51 (May 1983). The time interval between initiation of surface convergence and the subsequent response of visible cloud growth to this convergence is examined for nine cases of convection that occurred over the FACE 1973 and 1975 mesonetworks in south Florida. Clouds ranged in size from small echoes with a few towers to merged lines or large clusters of towers, but they met a series of observational criteria that specified them as belonging to a similar set of clouds, and were not representative of the entire range of clouds in the area. Visible clouds first formed 10 to 55 min after the associated surface convergence began, and grew rapidly upward 20 to 100 min after convergence started. This highly variable response can be understood better by taking into account the duration of the cloud, which is defined as the time from first surface convergence to complete dissipation. The same nine cases are examined as were chosen initially for the visible cloud study. (9 refs.)

116196 Analysis of nighttime drainage winds in Boulder, Colorado during 1980. B.W.Hootman, W.Blumen (Dept. of Astro-Geophys., Univ. of Colorado, Boulder, CO, USA). *Mon. Weather Rev. (USA)*, vol.11, no.5, p.1052-61 (May 1983). Characteristics of nighttime drainage winds that occurred along the eastern slope of the Rocky Mountains around Boulder, Colorado during the calendar year 1980 are examined. The data used for this study were acquired from the Boulder Wind Network (BWN) and from the Boulder Atmospheric Observatory (BAO). Data were available almost continuously from BWN and less frequently from BAO. BAO is a 300 m tower, instrumented at eight levels, but only surface wind observations are obtained from BWN. However, the combination of BWN and BAO observations represents a relatively unique set of wind data for the examination of drainage flows. Criteria for the identification of drainage winds are used to isolate events that are relatively free from external influences. Eighteen drainage wind events are identified, and some climatological features of the wind regime are established. In addition, the vertical structure of the flow associated with one event that reached the tower is examined in detail. Descriptions of the features of this flow and physical interpretations are presented. (10 refs.)

116197 The orographic modulation of pre-warm-front precipitation in southern New England. R.E.Passarelli, Jr., H.Boehm (Dept. of Meteorology & Phys. Oceanography, MIT, Cambridge, MA, USA). *Mon. Weather Rev. (USA)*, vol.11, no.5, p.1062-70 (May 1983). Topographic forcing over the hills and small mountains of southern New England plays an important role in determining the distribution of pre-warm-front precipitation from winter cyclones. Upslope regions receive 20-60% more precipitation than do nearby downslope or coastal regions. Both the intensity and duration of precipitation contribute to the positive upslope anomalies. The magnitude of the upslope anomalies, the details of the precipitation intensity distributions at proximal upslope and downslope gauges, and the results of simple models indicate that precipitation scavenging in orographic clouds can explain the orographic enhancement. Also, the existence of a positive precipitation anomaly over the coastal plain suggests that frictional convergence may be generating weak, but persistent vertical motions. (12 refs.)

116198 Atlantic hurricane season of 1982. G.B.Clark (Nat. Hurricane Center, NOAA, Miami, FL, USA). *Mon. Weather Rev. (USA)*, vol.11, no.5, p.1071-9 (May 1983). Five named tropical cyclones and one subtropical cyclone were tracked during 1982 in the Atlantic-Caribbean-Gulf of Mexico region. There were no land-falling hurricanes. (3 refs.)

116199 Eastern North Pacific tropical cyclones of 1982. E.B.Gunther, R.L.Cross, R.A.Wagoner (Eastern Pacific Hurricane Center, NOAA, Redwood City, CA, USA). *Mon. Weather Rev. (USA)*, vol.11, no.5, p.1080-101 (May 1983). Discusses the important features of the 1982 seasons. These include positions, velocities and maximum wind speeds. (1 ref.)

116200 Swedish Meteorological and Hydrological Institute (SMHI) invests in new technology: better weather forecasts using radar and microwaves. R.Carlsson. *Elek. Aktuell Elektron. (Sweden)*, vol.26, no.13, p.6-9 (Sept. 1983). In Swedish. Describes a new project proposed by SMHI for improving forecasts by using meteorological radar, laser technology and measurement of atmospheric microwave radiation. The article covers microwave measurement of humidity and temperature, obsolescence of weather balloons, microwave measurements, data comparison and meteorological radar. (no refs.) H.J.P.

116201 On the photodecomposition of CIONO₂ in the middle ultraviolet. H.-D.Knauth, R.N.Schindler (Inst. fur Phys. Chem., Univ. Kiel, Kiel, Germany). *Z. Naturforsch. Teil A (Germany)*, vol.38A, no.8, p.893-5 (Aug. 1983). Photodecomposition of gaseous CIONO₂ was investigated in a static system at wavelengths 265 nm and 313 nm. From the quantitative determination of the products O₂, N₂O₅, and ClO¹⁵NO₂ formed, and from Φ(-CIONO₂) it is concluded that the predominant primary step is CIONO₂ + hν → Cl + NO₃(3). (11 refs.)

116202 The mechanism of sulfate aerosol formation: chemical and sulfur isotopic evidence. E.S.Saltzman (Div. of Marine Geology & Geophys., Univ. of Miami, Miami, FL, USA), G.W.Brass, D.A.Price. *Geophys. Res. Lett. (USA)*, vol.10, no.7, p.513-16 (July 1983). In order to study the mechanism of aerosol sulfate formation, weekly samples of SO₂ and aerosol SO₄²⁻ were collected at Hubbard Brook Experimental Forest, West Thornton, New Hampshire from July to December, 1980. Samples were analysed for concentration and sulfur isotopes (δ³⁴S). Late summer-early fall samples are characterised by high, variable SO₄²⁻ levels and low SO₂ levels, while late fall-early winter samples exhibit low SO₄²⁻ and high SO₂ levels. These trends suggest that the oxidation rate varies seasonally, with faster oxidation during warmer months. The sulfur isotopic fractionation between aerosol SO₄²⁻ and SO₂ is intermediate between that expected from homogeneous and heterogeneous reactions, indicating that both processes can be important. The isotopic data suggest that homogeneous oxidation reactions are more important than solution reactions, particularly during warm months. (14 refs.)

116203 Tropospheric oxalate. R.B.Norton, J.M.Roberts (Aeronomy Lab./NOAA/ERL, Boulder, CO, USA), B.J.Huebert. *Geophys. Res. Lett. (USA)*, vol.10, no.7, p.517-20 (July 1983). The existence of oxalate (COO)₂²⁻ in tropospheric aerosols and in precipitation has been demonstrated using ion chromatography. Mixing ratios have been observed up to 50 pptv in air samples and 0.3 ppm in precipitation.

Correlation of airborne oxalate with airborne nitrate suggests a pollution source. (13 refs.)

116204 Simultaneous detection of FC-11, FC-12 and FC-22, through 8 to 13 micrometers IR solar observations from the ground. R.Zander (Inst. of Astrophys., Univ. of Liege, Liege-Ougree, Belgium), G.M.Stokes, J.W.Brault. *Geophys. Res. Lett. (USA)*, vol.10, no.7, p.521-4 (July 1983). High-resolution solar observations covering the 8 to 13 μm atmospheric window are now being carried out routinely at the Kitt Peak National Observatory (KPNO), Tucson, Arizona, using a 1 meter-path difference Fourier transform spectrometer. Such observations allow the simultaneous measurement of a large number of trace gases. Preliminary results for the three most important fluorocarbons, FC-11, FC-12 and FC-22 are reported. These results, in the form of average mixing ratios, show the potential and illustrate the performance of the Kitt Peak interferometer for this application. (25 refs.)

116205 Centimeter wave propagation experiments using the beacon signals of CS and BSE satellites. H.Fukuchi, T.Kozu, K.Nakamura, J.Awaka, H.Inomata (Kashima Branch, Radio Res. Labs., Ibaraki, Japan), Y.Otsu. *IEEE Trans. Antennas & Propag. (USA)*, vol.AP-31, no.4, p.603-13 (July 1983).

The wave propagation experiments using Japanese geostationary satellites CS (20/30 GHz) and BSE (12/14 GHz) satellites have been performed at the Kashima earth station of the Radio Research Laboratories (RRL). Cumulative rain attenuation and cross-polarization discrimination (XPD) statistics are given for the period of three years at 11.7 GHz (vertical polarization) and for the period of four years at 19.5 GHz (circular polarization) and for the period of four years at 19.5 GHz (circular polarization). It is shown that the yearly rainfall rate and attenuation distributions are well approximated by log-normal distributions, and the XPD distribution is well approximated by a normal distribution. Monthly and time-of-day variation of the attenuation and XPD distributions are presented. Duration statistics of attenuation and XPD are presented and characterized. Other characteristics in the wave propagation, such as effective path length, frequency dependence of attenuation, and joint statistics of attenuation and XPD are derived and discussed. Rainfall events are classified into three rainfall types, 'stratus', 'cumulus', and 'others' using measurements of the radar reflectivity factor along the satellite-to-earth path, and the dependence of XPD characteristics on the rainfall type is also presented and discussed. Some prediction methods of calculating attenuation and XPD statistics are applied to the data obtained in these experiments and the predicted results are compared with the measured ones. It is found that some corrections are needed when the XPD statistics are predicted from the attenuation statistics using the theoretical relation between XPD and attenuation. (24 refs.)

116206 A comparative study of scintillation analysis over two line-of-sight paths at 6.7 GHz and 7.6 GHz. N.Sengupta, M.K.Das Gupta (Inst. of Radio Phys. & Electronics, Univ. of Calcutta, Calcutta, India), B.M.Reddy, H.N.Dutta, S.K.Sarkar. *IEEE Trans. Antennas & Propag. (USA)*, vol.AP-31, no.4, p.620-4 (July 1983).

A comparison of the signal intensity fluctuations or scintillation of signal level, observed over two line-of-sight links is presented. These links are situated over Calcutta, DumDum-Andul (6.7 GHz) and Delhi, Delhi-Sonepat (7.6 GHz). The study reveals departures, in the occurrence and variation of the scintillation over the Calcutta path as compared with the path over Delhi. This deviation has been attributed to the large variation in humidity which exists in the coastal region, and also which plays a major role in microwave propagation in the troposphere. (11 refs.)

116207 Radio propagation beyond the horizon observed at 1 and 3 GHz compared with predicted reflections from random rough layers. L.Hoglund (Nat. Defence Res. Inst., Linköping, Sweden). *IEEE Trans. Antennas & Propag. (USA)*, vol.AP-31, no.4, p.631-5 (July 1983).

Measurements from the scaled tropospheric scatter links at 1 and 3 GHz Stockholm-Mora have given unexpected results. As a rule, the variation in received signal level in decibels of the half-hour median is three times higher at the lower frequency than at the higher frequency for comparatively low signal levels, whereas for high signal levels it is almost only the signal level at the higher frequency that shows variations. The measurements are compared with the theory of reflections from random rough layers with a linear refractive index step Δn and a length L, which is shorter than the Fresnel zone and shorter than the glistening surface. The theory is in very good agreement with the measurements. (6 refs.)

116208 Spectral density of millimeter wave amplitude scintillations in an absorption region. F.C.Medeiros Eilho (Dept. of Electronic & Electrical Engng., Univ. Coll. London, London, England), D.A.R.Jayasuriya, R.S.Cole, C.G.Helmis. *IEEE Trans. Antennas & Propag. (USA)*, vol.AP-31, no.4, p.672-6 (July 1983).

A detailed theory including the effect of water vapor fluctuations for the spectral density of the log amplitude scintillations of a radio wave propagating in an absorption medium is presented. The scintillation spectra obtained from links at 55.5 and 36.1 GHz on a common 4.1 km path are given together with the relevant meteorological data. Results show that the lower corner frequency predicted by Ott and Thompson, for the enhancement of the scintillations in an absorption region, is a good approximation. (13 refs.)

116209 On parameters determining the frequency of tropical cyclone genesis. V.N.Ivanov, A.P.Khain. *Izv. Akad. Nauk SSSR Fiz. Atmos. & Okeana*, vol.19, no.8, p.787-95 (Aug. 1983). In Russian. English translation in: *Izv. Acad. Sci. USSR Atmos. & Oceanic Phys. (USA)*

Climatological tropical cyclone genesis parameters by Gray (1968, 1975, 1981) are critically analyzed. New parameters and a criterion function of seasonal genesis frequency are proposed. A satisfactory agreement between predicted and observed seasonal cyclone frequency is obtained. (13 refs.)

116210 The nonlinear wave-train evolution in the background of weakly unstable stratified shear flow. N.N.Romonova, V.Yu.Tseitlin. *Izv. Akad. Nauk SSSR Fiz. Atmos. & Okeana*, vol.19, no.8, p.796-807 (Aug. 1983). In Russian. English translation in: *Izv. Acad. Sci. USSR Atmos. & Oceanic Phys. (USA)*

Weakly nonlinear phenomena which occur when the shear flow of an ideal incompressible fluid loses its stability are considered. The nonlinear evolution equation for the amplitude of the wave-train formed by nearly neutral modes is obtained and it is shown that the nonlinear term in this equation is purely imaginary so the nonlinearity results only in a frequency shift. (15 refs.)

- 116211 Variations of the nearground aerosol particle size distribution.** D.M.Metreveli, G.I.Gorchakov, S.O.Lomadze, G.V.Rosenberg. *Izv. Akad. Nauk SSSR Fiz. Atmos. & Okeana*, vol.19, no.8, p.807-12 (Aug. 1983). In Russian. English translation in: *Izv. Acad. Sci. USSR Atmos. & Oceanic Phys. (USA)*.
The submicron fractions of atmospheric aerosol particle size distributions are measured for Tajikistan and Moscow, urban and rural regions. The variations due to different meteorological and geographical conditions are discussed. The histograms of particle concentration in size ranges 0.2-0.3 and 0.8-0.9 microns are presented. (11 refs.)
- 116212 Large-scale energy transformations in the high latitudes of the Northern Hemisphere.** E.C.Kung, S.E.Masters (Dept. of Atmospheric Sci., Univ. of Missouri, Columbia, MO, USA), J.A.M.Corte-Real. *J. Atmos. Sci. (USA)*, vol.40, no.5, p.1061-72 (May 1983).
The kinetic energy balance and kinetic energy sources are studied for high latitudes north of 55°N with twice daily upper air observations during a seven-year period from 1973 to 1979. Energy variables are presented for 5° latitudinal zones from 55 to 75°N and for the polar cap north of 75°N. Spatial distributions of important energy variables are also presented. The flux convergence of potential energy from the source in lower latitudes is identified as the single major source of kinetic energy in higher latitudes. The contribution of the baroclinic conversion is minor. (19 refs.)
- 116213 On the theory of the long-term variability of the atmosphere.** J.Egger, H.-D.Schilling (Meteorologisches Inst., Univ. Munchen, Munchen, Germany). *J. Atmos. Sci. (USA)*, vol.40, no.5, p.1073-85 (May 1983).
Much of the atmosphere's long-term variability is contained in the planetary modes with zonal wavenumber $m \leq 5$. It is proposed that a considerable fraction of this variability is induced by the nonlinear interaction of synoptic-scale modes ($m > 5$) with the planetary-scale modes. To test this hypothesis, the synoptic-scale forcing of the planetary-scale 500 mb streamfunction is determined from data. The response of the planetary motions to this forcing is calculated within the framework of the linear barotropic vorticity equation on the sphere and for β -plane flow. The power spectra and the low-frequency variance of the induced planetary-scale motions are presented. (13 refs.)
- 116214 Space-time spectral analyses of Northern Hemisphere geopotential heights.** P.Speth, R.A.Madden (Nat. Center for Atmospheric Res., Boulder, CO, USA). *J. Atmos. Sci. (USA)*, vol.40, no.5, p.1086-100 (May 1983).
A space-time spectral analysis of a long time series of observed geopotential heights for each season at several levels and latitudes of the Northern Hemisphere is performed as part of a continuing investigation of large-scale traveling waves. The data set that is analyzed consists of the first six zonal wavenumbers. A discussion emphasizes westward traveling wave 1 with periods near 16 and 5 days which the authors argue are consistent with external Rossby waves. An additional outstanding feature is an eastward propagating wave 6 which may result from baroclinic instability. (53 refs.)
- 116215 A diagnostic study of the forcing of the Ferrel cell by eddies, with latent heat effects included.** G.Salustri, P.H.Stone (Dept. of Meteorology & Phys. Oceanography, MIT, Cambridge, MA, USA). *J. Atmos. Sci. (USA)*, vol.40, no.5, p.1101-9 (May 1983).
A diagnostic study of the forcing of the Ferrel cell by eddy fluxes in the Northern Hemisphere is carried out. The quasi-geostrophic omega equation, and Oort and Rasmusson's (1971) data set are used. The effects of condensation associated with the large-scale motions are introduced to the omega equation by using the quasi-geostrophic moisture conservation equation. Thus the dry static stability is replaced by a moist static stability and the forcing of the Ferrel cell by eddy latent heat fluxes as well as sensible heat and momentum fluxes is included. Both effects tend to enhance the forcing of the Ferrel cell. The numerical analysis indicates that the effects are small in January, but in July the maximum vertical velocities are enhanced by ~30%. (12 refs.)
- 116216 The effect of the interference of traveling and stationary waves on time variations of the large-scale circulation.** R.A.Madden (Nat. Center for Atmospheric Res., Boulder, CO, USA). *J. Atmos. Sci. (USA)*, vol.40, no.5, p.1110-25 (May 1983).
It is hypothesized that the interference of stationary and traveling waves of the same longitudinal scale can cause some of the observed time variations in the large-scale circulation. To explore this hypothesis the eight-winter average structure of a regularly occurring, westward propagating disturbance which was earlier (Madden, 1978) called the '16-day wave' is further documented. Energy quantities are calculated as this 16-day wave moves in and out of phase with the stationary or time-mean wave. Eddy heat and momentum transports associated with energy conversions have phase relationships between pressure levels that can be approximately predicted by a simple linear superposition of the observed stationary waves and traveling external Rossby waves. In further support of the hypothesis, cross-spectral results determined from independent data show a reasonable agreement with these predictions. (47 refs.)
- 116217 Interactions between orographically and thermally forced planetary waves.** K.E.Trenberth (Dept. of Atmospheric Sci., Univ. of Illinois, Urbana, IL, USA). *J. Atmos. Sci. (USA)*, vol.40, no.5, p.1126-53 (May 1983).
A comprehensive analysis is made of the atmospheric planetary wave response to orographic and thermal forcing in midlatitudes using a simple model. Vertical heating profiles with maxima at the surface and in the mid-troposphere are considered. The model is quasi-geostrophic on a beta-plane, and has a constant zonal mean basic-state wind. With these simplifications it is possible to obtain complete analytic solutions, not only for the wave response with and without Ekman pumping, but also for the secondary effects of the waves on the zonal mean flow. The presence of diabatic heating in the waves results in significant non-zero Eliassen-Palm fluxes and violates conditions for non-acceleration of the zonal mean flow, both for propagating and trapped waves. The potential vorticity transport or, alternatively, the Eliassen-Palm flux divergence is shown to be directly related to the vertical heating profile. It is the interaction between orographic and thermally forced waves that is mainly responsible for changes in the zonal mean flow, and the results therefore strongly depend upon the relative phase of the thermal and orographic forcing. (57 refs.)
- 116218 A moist baroclinic model for monsoonal mid-tropospheric cyclogenesis.** M.Mak (Dept. of Atmospheric Sci., Univ. of Illinois, Urbana, IL, USA). *J. Atmos. Sci. (USA)*, vol.40, no.5, p.1154-62 (May 1983).
Investigates the effects of condensational heating on the formation of a monsoonal mid-tropospheric cyclone (MTC) by applying the heating parameterization of Mak (1982) to the dynamic model of Brode and Mak (1978) except that the beta-effect is also included. It is found that the observed basic baroclinic flow with turning provides a dynamic framework conducive for a MTC-like disturbance to interact with the embedded moist

convection. The joint processes give rise to an unstable disturbance that has a large but finite growth rate and an intermediate length scale. The key structural features of the observed MTC are reproduced in the most unstable model disturbance. The main influence of the beta-effect is on the phase speed of the model disturbance. In the presence of condensational heating, the beta-effect only has a secondary influence on the growth rate. To understand whether or not the instability results might be strongly controlled by the low-level basic shears, the results computed with or without the latter are compared. (10 refs.)

- 116219 The behavior of stationary waves and the summer monsoon.** B.-D.Lin (Dept. of Atmospheric Sci., Univ. of Washington, Seattle, WA, USA). *J. Atmos. Sci. (USA)*, vol.40, no.5, p.1163-77 (May 1983).
A linear primitive equation model has been used to simulate the behavior of summer stationary waves in the Northern Hemisphere. The role of different forcing mechanisms for the summer stationary waves is compared. It is found that latent heating plays the dominant role for the formation and maintenance of the summer monsoon circulation in the subtropics, but in high latitudes, where advective processes become more important topography and sensible heat flux from the surface produce more realistic surface wave patterns than does the latent heating. The performance of the model for different latitude domains is discussed in some detail. The effects of the mean wind structure on the behavior of stationary waves, especially on horizontal propagation, are examined. (30 refs.)
- 116220 Absolute barotropic instability and monsoon depressions.** R.S.Lindzen, B.Farrell (Center for Earth & Planetary Phys., Harvard Univ., Cambridge, MA, USA), A.J.Rosenthal. *J. Atmos. Sci. (USA)*, vol.40, no.5, p.1178-84 (May 1983).
Approaches the barotropic instability of mean zonal flows over the Bay of Bengal for the months of June, July and August from the perspective of pulse asymptotics rather than most rapidly growing normal modes. (24 refs.)
- 116221 The mesoscale and microscale structure and organization of clouds and precipitation in midlatitude cyclones. VIII. A model for the 'seeder-feeder' process in warm-frontal rainbands.** S.A.Rutledge, P.V.Hobbs (Dept. of Atmospheric Sci., Univ. of Washington, Seattle, WA, USA). *J. Atmos. Sci. (USA)*, vol.40, no.5, p.1185-206 (May 1983).
For pt.VII see *ibid.*, vol.40, no.3, p.559-79 (1983). Previous field studies have indicated that warm-frontal rainbands form when ice particles from a 'seeder' cloud grow as they fall through a lower-level 'feeder' cloud. The authors present results from a parameterized numerical model of the growth processes that can lead to the enhancement of precipitation in a 'seeder-feeder' type situation. The model is applied to two types of warm-frontal rainbands. In the first (Type 1 situation) the vertical air motions are typical of those associated with slow, widespread lifting in the vicinity of warm fronts. In the second (Type 2 situation) the vertical air motions are stronger, and more characteristic of the mesoscale. (41 refs.)
- 116222 Bounds on the growth of perturbations to non-parallel steady flow on the barotropic beta plane.** R.T.Pierrehumbert (Dept. of Meteorology & Phys. Oceanography, MIT, Cambridge, MA, USA). *J. Atmos. Sci. (USA)*, vol.40, no.5, p.1207-17 (May 1983).
Based on considerations of the perturbation enstrophy and energy equations, the author derives a general family of bounds on the growth rates of perturbations to non-parallel (vortex-like or wave-like) flow on the barotropic beta-plane, allowing for the effects of forcing, Ekman friction, and topography. The family of bounds generalizes Arnold's stability criterion. A number of specific applications of the family of bounds are explored. In particular, the formulas are used to demonstrate that the growth rate of the perturbations must vanish if the perturbation length-scale approaches zero or infinity. The distinction between transient and sustained growth of perturbation energy is discussed in light of the results. It is suggested that the bounds are most useful for estimating transient growth rates. (11 refs.)
- 116223 The kinematics of orographic airflow during Sierra storms.** J.D.Marwitz (Dept. of Atmospheric Sci., Univ. of Wyoming, Laramie, WY, USA). *J. Atmos. Sci. (USA)*, vol.40, no.5, p.1218-27 (May 1983).
Two case studies of the kinematics of the airflow over the Sierra barrier are presented. The observations consisted of rawinsondes and single Doppler RHI and velocity azimuth display (VAD) analysis of PPI scans. The RHI scans were made orthogonal to the nearly two-dimensional Sierra barrier. The cloud in the first case study contained a strong stable layer at 0°C while the second storm was highly unstable. The radar bright band and soundings near the radar indicated that an ~250 m thick 0°C isothermal layer was present in response to the diabatic process of melting. When the bright band was impinging upon the barrier, the associated 0°C isothermal layer was inferred to expand until it finally reached the ground. At that point it was ~1 km in depth. Direct thermodynamic soundings are presented for a similar situation which agrees with the modified soundings inferred for this study. The resulting effects on the airflow and precipitation are discussed. (17 refs.)
- 116224 A laboratory experiment on the dynamics of the land and sea breeze.** S.Mitsumoto, H.Ueda (Nat. Inst. for Environmental Studies, Ibaraki, Japan), H.Ozoe. *J. Atmos. Sci. (USA)*, vol.40, no.5, p.1228-40 (May 1983).
The land and sea breeze (LSB) circulation was simulated in a laboratory using a temperature controlled water tank. Flow visualization by tellurium and phenolphthalein and velocity measurement by laser-Doppler velocimeter were carried out in addition to temperature measurements. From similarity considerations, the simulated flow pattern is shown to have good correspondence with that in the atmosphere. It is shown that the overall features of the LSB flow pattern consist of a closed circulating motion caused by the periodically changing horizontal temperature difference between the land and the sea, and several kinds of small scale motions induced by the periodic variation of the land surface temperature itself. (27 refs.)
- 116225 Theoretical experiments on cumulus dynamics.** L.R.Koenig, F.W.Murray (Rand Corp., Santa Monica, CA, USA). *J. Atmos. Sci. (USA)*, vol.40, no.5, p.1241-56 (May 1983).
The sensitivity of a two-dimensional cloud model to changes in microphysical characteristics is examined using two soundings. The dynamical evolution of clouds having relatively warm bases is controlled more by rapidity of the production of liquid-phase precipitation than by the differences in the concentration of ice particles. There is little change in the dynamical properties of the relatively cold-base clouds with changes in either liquid or ice phases. A study of the components of the forces causing evolution of the clouds indicated that the net force acting at a given location was often quite small compared to several individual components of the force. Anything causing these individual forces to move relative to one another will make changes in the net force and alter the dynamical properties of the cloud. (17 refs.)

116226 A numerical simulation of winter cumulus electrification. I. Shallow cloud. T.Takahashi (Dept. of Meteorology, Univ. of Hawaii, Hilo, HI, USA).

J. Atmos. Sci. (USA), vol.40, no.5, p.1257-80 (May 1983).

The development of electricity in a shallow wintertime cumulus is studied using an axisymmetric cloud model containing both microphysical and electrical charge separation processes during graupel formation. The charge separation mechanisms considered included ion induction, ion diffusion, polarization and riming electrification. An unexpected result was that polarization did not intensify cloud electrification. Instead, riming electrification appears to be the principal charge separation process acting to intensify cloud electricity. (60 refs.)

116227 Effects of growth temperatures and surface roughness on crystal orientation of ice accreted in a dry regime. L.Levi, F.Prodi (Istituto FIS-BAT-CNR, Bologna, Italy).

J. Atmos. Sci. (USA), vol.40, no.5, p.1281-99 (May 1983).

The dependence of crystal orientation on air and deposit temperatures in ice accreted in the dry growth regime is re-examined by producing accretions over a wide range of these temperatures and critically examining the structural aspects of the deposits, such as surface roughness. It is shown that the variation in the preferred c -axis orientation with the air and deposit temperatures during growth is an intrinsic effect of the freezing mode of ice, rather than an effect of surface roughness. The $F(\phi)$ distributions of the angle ϕ between the accretion radius and the crystal c -axis, and those of its component angles $F(\eta)$ and $F(\theta)$, are obtained. (19 refs.)

116228 Observations of liquid water in orographic clouds over Elk Mountain. M.K.Politovich, G.Vali (Dept. of Atmospheric Sci., Univ. of Wyoming, Laramie, WY, USA).

J. Atmos. Sci. (USA), vol.40, no.5, p.1300-12 (May 1983).

The relatively simple orographic clouds forming in winter over Elk Mountain, Wyoming, provided useful opportunities for field studies of cloud formation and of ice crystal development. The observations of cloud droplet populations, spanning a range of five consecutive years, are summarized. Data are presented which describe the climatology of the cloud droplet spectra. Selected cases are described in detail to illuminate the processes at work and to allow comparisons with theoretical predictions. Droplet concentrations are mostly around 300 cm^{-3} in accordance with the weak updrafts of the clouds and with the mid-continental, unpolluted cloud condensation nucleus concentrations prevailing in the region. (19 refs.)

116229 On the aerosol particle size distribution spectrum in Alaskan air mass systems: Arctic haze and non-haze episodes. G.E.Shaw (Geophys. Inst., Univ. of Alaska, Fairbanks, AK, USA).

J. Atmos. Sci. (USA), vol.40, no.5, p.1313-20 (May 1983).

Aerosols in central Alaskan winter air mass systems are classified according to size by diffusive separation and light-scattering spectrometry. Particles entering central Alaska from the Pacific Marine environment had number concentrations ranging from 300 to 2000 cm^{-3} and unimodal size spectra, with maximum in number concentration near $1 \times 10^{-6}\text{ cm}$ radius. Air masses entering Alaska from the Eurasian Arctic possessed a factor of two smaller aerosol number concentrations than Pacific Marine systems but contained a factor of two greater particle volume loading within the fine particle radius range $\sim 5 \times 10^{-7} < r < 1 \times 10^{-5}\text{ cm}$. The particles in Eurasian Arctic air masses were bimodally distributed, with maxima in the particle size spectra near $r = 3 \times 10^{-7}$ and $5 \times 10^{-6}\text{ cm}$. Sulfur was the predominant element in all cases studied. A particle depleted region was present in the size spectra obtained for Eurasian Arctic air masses. The deficiency of particles in the 10^{-6} cm radius range is interpreted. (24 refs.)

116230 Troposphere-stratosphere (surface-55 km) monthly winter general circulation statistics for the Northern Hemisphere—four year averages. M.A.Geller (NASA/Goddard Space Flight Center, Greenbelt, MD, USA), M.-F.Wu, M.E.Gelman.

J. Atmos. Sci. (USA), vol.40, no.5, p.1334-52 (May 1983).

Monthly mean Northern Hemisphere general circulation statistics are presented for the four-year average December, January and February months of the winters 1978-9 through 1981-2. These calculations start with daily maps for eighteen pressure levels between 1000 and 0.4 mb of Northern Hemisphere temperature at 1200 GMT that are supplied by NOAA/NMC. Geopotential height and geostrophic wind are constructed using the hydrostatic and geostrophic relationships, respectively. Fields presented are zonally averaged temperature, mean zonal wind, and amplitude and phase of planetary waves with zonal wavenumbers 1-3. Diagnostic quantities, such as the northward fluxes of heat and eastward momentum by standing and transient eddies along with their wavenumber decomposition and Eliassen-Palm flux propagation vectors and divergences by the standing and transient eddies along with their wavenumber decomposition, are also given. The results are compared with those of several other works. (27 refs.)

116231 Asymmetries of the upper stratospheric ozone distribution between two hemispheres. K.Maeda, D.F.Heath (NASA/Goddard Space Flight Center, Greenbelt, MD, USA).

J. Atmos. Sci. (USA), vol.40, no.5, p.1353-9 (May 1983).

Based on the Nimbus-7 solar backscattered UV-radiation data which are free from the instrumental background noise (dark-current) produced by magnetospheric particles, it is found that the southern winter hemispheric ozone densities in the upper stratosphere are nearly 20% higher than their counterparts in the Northern Hemisphere. This is in significant contrast to the well-known hemispheric asymmetry of the total ozone content which is higher in the northern hemispheric winter than in the southern hemispheric winter. Comparisons of those findings with the previously obtained similar results from the Nimbus-4 backscattered UV radiation (BUV) experiment manifest that the dark-current effect on the latter was negligible. Therefore, using the stratospheric temperature which was observed by means of the selective chopper radiometer simultaneously with the BUV experiments on the Nimbus-4 for 1970 and 1972, the cause of these asymmetries due to the temperature dependent photochemistry is examined. (21 refs.)

116232 Hurricane Allen and island obstacles. H.F.Hawkins (Cooperative Inst. for Marine & Atmospheric Studies, Univ. of Miami, Coral Gables, FL, USA).

J. Atmos. Sci. (USA), vol.40, no.5, p.1360-1 (May 1983).

The first significant filling of Hurricane Allen coincided with its encroachment on Haiti, Jamaica and eastern Cuba. It is suggested that the filling was due to the interruption offered to its circulation by the mountainous terrain. The accompanying secondary wind maximum may have contributed to, or have been coincidental with, the weakening observed. (2 refs.)

116233 Occurrence probability of solar-geomagnetic-weather relations. B.R.Arora (Indian Inst. of Geomagnetism, Bombay, India).

J. Atmos. & Terr. Phys. (GB), vol.45, no.8-9, p.569-72 (Aug.-Sept. 1983).

Relationships of the vorticity area index (VAI) and the geomagnetic activity (Ap) to solar magnetic sector boundary passage (SBP) are examined in terms of the probability of occurrence of these associations with individual SBP.

The results reveal that the probability of occurrence of the characteristic variation in the VAI in relation to the SBP is comparable to the well-established association between Ap and SBP. It is further shown that the sector related effects on VAI are completely independent of the nature of transient changes in the geomagnetic activity accompanying the SBP. (12 refs.)

116234 A theoretical study of the height distribution of sodium in the mesosphere. L.Thomas (Dept. of Phys., Univ. Coll. of Wales, Aberystwyth, Wales), M.C.Isherwood, M.R.Bowman.

J. Atmos. & Terr. Phys. (GB), vol.45, no.8-9, p.587-94 (Aug.-Sept. 1983).

Time-dependent solutions of the diffusion and continuity equations for oxygen-hydrogen and sodium constituents are used to examine the characteristics of the height distribution of sodium atoms. Account is taken of recent experimental data on relevant chemical and photochemical processes. Particular attention is paid to the processes which determine the peak altitude of the layer, the slope of the height distribution above the peak, and the diurnal variation of the layer, as revealed by measurements using various techniques. (44 refs.)

116235 Intensity fluctuations due to a deeply modulated phase screen. I. Theory. B.J.Uscinski, C.Macaskill (Dept. of Appl. Math. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).

J. Atmos. & Terr. Phys. (GB), vol.45, no.8-9, p.595-605 (Aug.-Sept. 1983).

Analytical expressions are found for the intensity fluctuation spectrum due to a deeply modulated phase screen that are valid over the whole range of spatial frequencies including previously neglected transition regions. A screen with a Gaussian phase spectrum is considered, as well as screens with two different types of power-law spectra. The results illustrate the basic differences that exist in the intensity fluctuations for the different types of screen. It is shown that the low frequency part of the intensity fluctuation spectrum must be included to obtain the correct form of the limiting spectrum and scintillation index. (12 refs.)

116236 Intensity fluctuations due to a deeply modulated phase screen. II. Results. C.Macaskill, B.J.Uscinski (Dept. of Appl. Math. & Theoretical Phys., Univ. of Cambridge, Cambridge, England).

J. Atmos. & Terr. Phys. (GB), vol.45, no.8-9, p.607-15 (Aug.-Sept. 1983).

For pt.I see *ibid.*, vol.45, no.8/9, p.595-605 (1983). Detailed numerical results are presented for the spatial frequency spectra of intensity fluctuations for three representative types of one dimensional phase screen. Only deeply modulated screens are considered and comparison is made with analytical approximations. The role of the inner scale is discussed and shown to be significant in the case of a screen with an exponential correlation function. The effect of allowing the outer scale to become very large is also considered. (12 refs.)

116237 Determination of excessive absorption by atmospheric water vapour at 22.235 GHz. C.K.Bhattacharya, G.S.Uppal, M.K.Raina, V.Dubey (Radio Sci. Div., Nat. Phys. Lab., New Delhi, India).

J. Atmos. & Terr. Phys. (GB), vol.45, no.8-9, p.617-20 (Aug.-Sept. 1983).

A theoretical estimation of zenith attenuation at 22.235 GHz using radio-sonde data is presented. It is computed by dividing the atmosphere into thirteen layers and summing the contribution of attenuation from each layer. The attenuation of each layer has been computed by using line-by-line summation. The zenith attenuation is compared with that observed by a radiometer operating at 22.235 GHz. The radiometer observations are found to be 7-18% higher than the values computed by the radio-sonde data. This excessive absorption by water vapour is suggested to be due to clusters present in the water vapour phase in the Earth's atmosphere. (16 refs.)

116238 Estimation of low-frequency wind stress fluctuations over the open ocean. K.R.Thompson, R.F.Marsden (Dept. of Oceanography, Dalhousie Univ., Halifax, Nova Scotia, Canada), D.G.Wright.

J. Phys. Oceanogr. (USA), vol.13, no.6, p.1003-11 (June 1983).

A simple, approximate formula for mean wind stress is given in terms of the mean and variance of the wind fluctuations over the averaging period. The formula is tested using 3 h wind observations from eight North Atlantic Ocean Weather Ships. Mean wind stress is calculated (1) by vector averaging the 3 h wind stresses, and (2) by applying the approximate formula. For an averaging period of 4 months the two methods agree to within $\pm 0.025\text{ Pa}$, 95% of the time. A straightforward method is described for the estimation of vector mean wind and variance fields, and thus mean stress fields, over the open ocean. To check the method, the long-term stress field of the North Atlantic, and the seasonal Sverdrup transport across 31°N , are computed and compared with the values given by Willebrand (1978), and Bunker and Leetma (1978). The zonally integrated Sverdrup transport across 45°N is also calculated. (15 refs.)

116239 A comparison of different sea level pressure analysis fields in the east Greenland Sea. W.B.Tucker,III. (US Army Cold Regions Res. & Engng. Lab., Hanover, NH, USA).

J. Phys. Oceanogr. (USA), vol.13, no.6, p.1084-8 (June 1983).

Geostrophic wind fields, used to drive a numerical sea ice model, are calculated from three sources of sea-level pressure. The pressures obtained from the National Weather Service's operational analysis system, which are also included as part of the level III-A FGGE data set, yield erroneously high winds concentrated in a narrow band adjacent to the Greenland coast and, consequently, lead to unrealistic model results. Other pressure fields obtained from (1) an independent optimal analysis that merged pressure data from Arctic FGGE buoys with high latitude land stations and from (2) manual digitization of the NWS hand-analyzed Northern Hemisphere surface charts agree well and do not exhibit these high winds. The extreme pressure gradient parallel to Greenland results partially from the pressure reduction procedure used to obtain the sea level pressures from the terrain-following sigma coordinate system. An associated problem may be that the NWS data filtering procedure sees the rapid elevation change of eastern Greenland as a discontinuity. (7 refs.)

116240 Stationary waves forced by topography in a vertically sheared, stratified, rotating fluid. C.B.Fandry, R.L.Hughes, L.M.Leslie (Australian Numerical Meteorology Res. Centre, Melbourne, Victoria, Australia).

J. Aust. Math. Soc. Ser. B (Australia), vol.25, pt.1, p.127-44 (July 1983).

The effect of an isolated topographic bump in a two-layer fluid on a β -plane is investigated. An analytical solution is derived in terms of the appropriate Green's function for arbitrary topography of finite horizontal extent. It is found that the disturbances generated by the bump are composed of two fundamental modes which may be wavelike or evanescent. The wavelike modes are topographically induced Rossby waves which occur only when there is eastward flow in at least one of the layers. These waves are always confined to the downstream (eastward) side of the bump. Whereas previous studies of this type have concentrated on eastward flow over topography, the theory has been extended here to include a wide range of vertically sheared flows. Particularly important is the case of low level westward flow combined with upper level eastward flow, as it has direct application, for example, to

the summertime atmospheric circulation over the subtropical regions of the continental land masses. (15 refs.)

116241 Possible improvements in meteorology for aircraft navigation. M.Bisiaux, M.E.Cox, D.A.Forrester, J.T.Storey. *J. Navig. (GB)*, vol.36, no.1, p.54-63 (Jan. 1983). The studies described indicate the feasibility of improving the quality of meteorological forecast data, both for airborne flight management systems (FMS) and ATC purposes, based on the use of aircraft measurements of wind and temperature. Two-way communications could most effectively be supported by SSR Mode-S, the implementation of which should commence in Europe in the early 1990s. This timescale should enable all data source validation, system refinement, planning and implementation to take place in an efficient manner. The improvements envisaged should yield many benefits to ATC, aircraft operators and the meteorological services and thus facilitate an 'overall-system' approach to the more efficient operation and control of air traffic. (9 refs.)

116242 A synoptic case-study using a numerical model. E.McCallum, Jr., J.R.Grant (Meteorological Office Coll., Shinfield Park, England), B.W.Golding.

Meteorol. Mag. (GB), vol.112, no.1334, p.275-88 (Sept. 1983). Conventional analysis is supplemented by results from a numerical model to give increased understanding of the airflow through a system causing an area of extensive frontal rain over England on 22 June 1982. (9 refs.)

116243 An analysis of noctilucent cloud over western Europe during the period 1966 to 1982. D.A.R.Simmons, D.H.McIntosh.

Meteorol. Mag. (GB), vol.112, no.1334, p.289-98 (Sept. 1983). A statistical analysis of noctilucent cloud observations received at the Edinburgh Data Centre from 1966 to 1982 shows a somewhat higher elevation for the upper border of the clouds than has been previously suggested. The range in solar depression over which the clouds were visible and their distribution in latitudes are more restricted than in earlier surveys. The median date for peak frequency of occurrence of the clouds is found to be 4 July. An inverse relationship between annual sunspot number and corresponding frequency of noctilucent cloud occurrence is suggested but not definitely confirmed. (6 refs.)

116244 Spectra of nascent wind waves. G.E.Kononkova, K.V.Pokazeev (Dept. of Phys. of Sea & Inland Water Bodies, Moscow Univ., Moscow, USSR).

Moscow Univ. Phys. Bull. (USA), vol.38, no.1, p.16-20 (1983). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.38, no.1, p.16-19 (1983).

The spectra of wind undulation with startup distances of less than 4 m and dynamic velocities of 35 to 90 cm/sec are considered. The difference in the dependence of the spectra on the dynamic velocity and frequency under these conditions in comparison with the spectra of wave disturbance at large distances is explained by the action of drift flow. (7 refs.)

116245 Some periodicities of atmospheric circulation. A.Kh.Khrgian, E.D.Astakhova (Dept. of Atmospheric Phys., Moscow Univ., Moscow, USSR).

Moscow Univ. Phys. Bull. (USA), vol.38, no.1, p.66-71 (1983). Translation of: *Vestn. Mosk. Univ. Ser. 3 (USSR)*, vol.38, no.1, p.57-62 (1983).

On the basis of generalization of much statistical material, the periodicity of atmospheric circulation is studied in various regions of the terrestrial globe at three basic isobaric surfaces (10, 30, and 500 mbar). Zonal circulation varies with a period of 27 days at the 10- and 30-mbar levels and with a period of 25 days at all the levels investigated. An attempt is made to explain a series of the results obtained on the basis of the hypothesis of solar action on the atmospheric circulation and also taking account of the superposition of oscillations. (18 refs.)

116246 Remarks on the numerical forecast of the blizzard situation in Mid-Europe at the turn of the year 1978/79—a case study. P.Emmrich.

Meteorol. Rundsch. (Germany), vol.36, no.4, p.180-9 (Aug. 1983). In German.

The remarkable large-scale development of the atmospheric circulation in Mid-Europe at the turn of the year 1978-9 leading to a blizzard situation with a snow disaster in northern Germany is briefly described. Some important aspects concerning the judgement of numerical field forecasts are discussed from the forecaster's point of view. (6 refs.)

116247 Interpretation of NOAA 7 information for the Mediterranean on 7.10.1981 between 1220 and 1225 GMT. G.Beratung.

Meteorol. Rundsch. (Germany), vol.36, no.4, p.189-95 (Aug. 1983). In German.

The interception facility of AVHRR-data of weather-satellites of the NOAA-series at the German Military Geophysical Office at Traben-Trarbach has been used for a mesoscale-case study based on pictures of NOAA 7 in channels 2, 3 and 4 on 7.10.1981, between 1220-1225 GMT. Channel 2 gives the cloudiness, channel 4 with regard to the black-body-temperature gives the height of the clouds. The signal of channel 3 is made up of two components: the black-body-temperature and the reflected energy of the Sun. It helps to fix the geographic location of the cloudlayers. One problem is the distortion of the radiance caused by thin layers over thick clouds or the ocean surface. In this case study it appears as if a thin hazelayer (seen in channel 2 and partly 3) over the Aegean, Ionian, and Tyrrhenian Sea obstructs the calculation of exact sea surface temperatures. (1 ref.)

116248 3K cosmic microwave background radiation and the rotational levels of the atmospheric H₂O molecule. S.Chakravarty, H.L.Duorah (Dept. of Phys., Gauhati Univ., Gauhati, India).

Proc. Natl. Acad. Sci. India Sect. A, vol.52, pt.2, p.232-44 (1982). [received: Aug. 1983]

The effect of 3K cosmic microwave background radiation on the molecular constituent, H₂O, of the Earth's atmosphere is studied. The transitions among the rotational levels of H₂O, which take part in the absorption of this radiation, are obtained. Earth's motion through the microwave background results in the Doppler-shift of the spectral lines. The absorption coefficient for these lines are then calculated to study the radiation transfer of the 3K background both in emission and absorption. It is found that both emission and absorption are equally important, though absorption is found to exceed the emission slightly, for all the lines under consideration. It is suggested that the atmospheric emission lines need to be subtracted from observed radiation to determine microwave background emission. (10 refs.)

116249 Stratospheric negative ions—detailed height profiles. A.A.Vigiano, H.Schlager, F.Arnold (Max-Planck-Inst. für Kernphys., Heidelberg, Germany).

Planet. & Space Sci. (GB), vol.31, no.8, p.813-20 (Aug. 1983).

Balloon-borne mass spectrometers with extended mass range have been flown during controlled descents. This gives detailed height profiles of stratospheric negative ions between 15 and 34 km. The main ion families are HSO₄⁻ (H₂SO₄)_n (HNO₃)_n and NO₃⁻ (HNO₃)_n. Information concerning trace gases is obtained as well as an assessment of the problems of ion fragmenta-

tion and contamination. The data are used to derive information concerning the rate of H₂SO₄ clustering. (24 refs.)

116250 Solar cycle and equatorial stratopause temperature. K.Mohanakumar, S.Devanarayanan (Dept. of Phys., Univ. of Kerala, Trivandrum, India).

Proc. Indian Acad. Sci. Earth & Planet. Sci., vol.92, no.1, p.31-6 (March 1983). [received: Sept. 1983]

Variations in solar activity and their effect on the temperature of the stratopause are studied. Monthly mean stratopause temperatures during 1969-1976 and departures from the monthly mean determined for four equatorial rocket launching stations, viz. Ascension Island, Kwajalein, Fort Sherman, and Thumba, are statistically compared with sunspot numbers. (9 refs.)

116251 A method for estimating rain attenuation and site diversity effect on earth-satellite links for global use. K.Morita (Electrical Communication Labs., NTT, Tokyo, Japan).

Rev. Electr. Commun. Lab. (Japan), vol.30, no.4, p.676-85 (July 1982). [received: Aug. 1983]

Proposes a simple method for estimating rain attenuation and site diversity effects on earth-satellite links, respectively, from correction factor K_p for the uniform rain rate of each of two slant propagation paths and the simultaneous probability of rain attenuation occurrences over these two paths. Two parameters for the estimation—0°C layer height and the lognormal rain rate distribution—are presented for various parts of the world. Numerical investigations show that satisfactory estimates can be obtained by the method. (13 refs.)

116252 Progress in cloud physics 1979-1982. J.Hallett (Atmospheric Sci. Centre, Desert Res. Inst., Reno, NV, USA).

Rev. Geophys. & Space Phys. (USA), vol.21, no.5, p.965-84 (June 1983).

This review looks at many subjects and techniques. Topics are described beginning with the small and going to the large and then examining the implication of the large-scale phenomena on the small scale. Progress in Cloud Physics is made through laboratory studies, through numerical simulation, and through field observation, aided by new instruments and computers for data handling and reduction. Most important, however, is the birth and development of ideas, occurring on a somewhat random basis, arguably unrelated to the apparent magnitude of effort, but often depending on fortuitous circumstances of discovery and technology development. In particular this review considers atmospheric aerosol, nucleation, droplet growth, convective cloud mixing, ice crystal growth, hail, precipitation, optical and radar properties, electrification, cloud modelling, weather systems and instrumentation and techniques. (454 refs.)

116253 Cloud electrification. R.Lhermitte (Rosenstiel School of Marine & Atmospheric Sci., Univ. of Miami, Miami, FL, USA), E.Williams.

Rev. Geophys. & Space Phys. (USA), vol.21, no.5, p.984-92 (June 1983).

This article describes theories of cloud electrification, radar reflectivity and motion fields of storms, thunderstorm electric fields, lightning; VHF emissions; corona current and electrical processes in the atmospheres of other planets. (112 refs.)

116254 Lightning. M.A.Uman (Dept. of Electrical Engng., Univ. of Florida, Gainesville, FL, USA).

Rev. Geophys. & Space Phys. (USA), vol.21, no.5, p.992-7 (June 1983).

The research on lightning performed in the USA in the period 1976 to 1982 is reviewed. Much of the work reviewed was performed as part of the Thunderstorm Research International Program (TRIP). All aspects of lightning research are discussed. These areas are: (1) phenomenology of lightning; (2) locations of charges associated with various lightning processes; (3) characteristics of lightning electric and magnetic fields; (4) lightning theory and modelling; (5) lightning location by RF techniques; (6) optical measurements; (7) thunder, and (8) unusual lightning. (138 refs.)

116255 The dynamics of large scale atmospheric motions. J.R.Holton (Dept. of Atmospheric Sci., Univ. of Washington, Seattle, WA, USA).

Rev. Geophys. & Space Phys. (USA), vol.21, no.5, p.1021-7 (June 1983).

Dynamic meteorology is the study of atmospheric motions associated with weather and climate. During the past four years there have been a number of exciting developments in the dynamics of synoptic and planetary scale motions. Many of these are related to various aspects of short term atmospheric variability both internally and externally generated. A number of studies have gone beyond the traditional perturbation approach in which disturbances are imposed on a zonally symmetric basic state. Significant progress has been made in understanding the dynamics of the quasistationary zonally asymmetric flow and its control of the transient circulations. This review focuses on the progress made in the understanding of synoptic and planetary scale motions in the troposphere. (117 refs.)

116256 Mesoscale meteorology. K.Emanuel, F.Sanders (Dept. of Meteorology & Phys. Oceanography, MIT, Cambridge, MA, USA).

Rev. Geophys. & Space Phys. (USA), vol.21, no.5, p.1027-42 (June 1983).

Recent research in mesoscale meteorology is reviewed. The authors define what they mean by the mesoscale and go on to review a selected number of topics. These topics include organised convective systems, severe thunderstorms, mesoscale structures within extratropical cyclones, small-scale cyclones, mesoscale wave generation and propagation, thermally forced circulations, orographic circulations, mesoscale turbulence and finally regional scale numerical modelling. (291 refs.)

116257 Atmospheric boundary layers. L.Mahrt (Dept. of Atmospheric Sci., Oregon State Univ., Corvallis, OR, USA).

Rev. Geophys. & Space Phys. (USA), vol.21, no.5, p.1042-8 (June 1983).

This review addresses only fundamental aspects of the physics of the boundary layer and excludes research related to instrumentation, specific applied areas of boundary layer research, and interactions with larger-scale circulations. Some aspects of the boundary layer will be treated very briefly or included only in the reference lists while other topics, which have been omitted in past reviews, will be covered in more depth. Topics described include mixed-layer growth, surface momentum and heat fluxes, surface moisture flux, stability stratified boundary layers, cold air drainage and transitional periods. (217 refs.)

116258 Polar meteorology and climatology 1979-1982. E.Robinson (Coll. of Engng., Washington State Univ., Pullman, WA, USA).

Rev. Geophys. & Space Phys. (USA), vol.21, no.5, p.1048-64 (June 1983).

Recent progress in the study of polar region atmospheric processes is reviewed. The review is divided into four sections on instrumentation, climatology, synoptic studies and precipitation and atmospheric chemistry. (291 refs.)

116259 Progress in weather modification research: 1979-1982. R.A.Dirks (Atmospheric Sci. Div., NSF, Washington, DC, USA).

Rev. Geophys. & Space Phys. (USA), vol.21, no.5, p.1065-76 (June 1983).

This review considers only research which has direct bearing on weather modification. The review of inadvertent weather modification is limited to short term effects due to man which occur only in limited meteorological

conditions and occur over local and regional geographic scales. These somewhat arbitrary bounds distinguish it from climate modification. This review examines a wide range of topics and techniques. Topics are chosen along traditional lines of research beginning with advances in understanding weather modification concepts related to specific cloud and precipitation types, followed by a review of advances in modification and observational technology, design and evaluation techniques, societal impacts of weather modification and, finally, a discussion of the future directions for weather modification research. (181 refs.)

116260 Advances in short term climate prediction. T.P.Barnett, R.C.J.Somerville (Scripps Inst. of Oceanography, Univ. of California, La Jolla, CA, USA).

Rev. Geophys. & Space Phys. (USA), vol.21, no.5, p.1096-102 (June 1983). Dynamical and several empirical and statistical approaches to short term climate prediction are surveyed. General circulation models have displayed considerable potential for this application. Physical/synoptic and purely statistical methods have been intensively developed and tested in recent years. Important problems have been recognised in areas such as predictability, forecast verification and evaluation, and combining supplementary approaches to prediction. (84 refs.)

116261 The atmospheric aerosol system: an overview. J.M.Prospiero (Div. of Marine & Atmospheric Chem., Univ. of Miami, Miami, FL, USA), R.J.Charlson, V.Mohnen, R.Jaenicke, A.C.Delany, J.Moyers, W.Zoller, K.Rahn.

Rev. Geophys. & Space Phys. (USA), vol.21, no.7, p.1607-29 (Aug. 1983). The authors discuss work on atmospheric aerosols that illustrates the complex nature of the aerosol chemical and physical system, and suggest strategies for future research. A major conclusion is that man has had a great impact on the global budgets of certain species, especially sulfur and nitrogen, that play a dominant role in the atmospheric aerosol system. However, at present there is no evidence linking anthropogenic activities with a persistent increase in aerosol concentrations on a global scale. (242 refs.)

116262 Propagation experiment at 140 GHz through simulated rainfall.

T.Manabe, T.Ihara, K.Kitamura, Y.Imai, K.Tohma, Y.Furuhama. *Rev. Radio Res. Lab. (Japan)*, vol.28, no.147, p.541-51 (Sept. 1982). In Japanese. [received: Sept. 1983]

Measurements of rainfall attenuation of a millimeter wave at 140 GHz were conducted through simulated rain using a large scale rainfall installation. Using this installation, rainfalls with different drop-size distributions were realized without varying the rainfall rate. It was experimentally verified that the rainfall attenuation at the millimeter wave band is strongly affected by the raindrop size measurements of the attenuation and the rainfall rate was proposed. This method was applied to the experimental results. The inferred drop-size distribution showed fairly good agreement with those measured directly. The polarization dependence of attenuation and the depolarization were also measured. The effects of raindrop distortion from spherical shapes were found to be too small to be detected by the experimental system. (20 refs.)

116263 The atmosphere. A.P.Ingersoll.

Sci. Am. (USA), vol.249, no.3, p.114-30 (Sept. 1983).

A summary is given of the present state of knowledge about the Earth's atmosphere. The heat balance and optical properties of the atmosphere are described. A large part of the article describes the large scale circulation of the atmosphere and the attempts by meteorologists to make computer models of this circulation. Climate modelling and weather forecasting are also considered. (no refs.)

116264 Improved atmospheric path-length correction by a dual-frequency microwave radiometer. T.Ojima (Radio Res. Labs., Koganei, Japan). *Trans. Inst. Electron. & Commun. Eng. Jpn. Sect. E (Japan)*, vol.E66, no.7, p.427-34 (July 1983).

Water vapor excess path-length (WVEP) in atmosphere, in spite of its much smaller average value than a dry air component which is stable, makes larger seasonal and diurnal variations. An estimation algorithm for WVEP is improved for less errors even in large opacity of the atmosphere and the multi-algorithm program (MAP), together with the Wu-algorithm of JPL in CalTech, is applied to make the least estimation error. A limitation of the MAP is also discussed. The differential emission measurement (DEM) is also applied to WVEP estimation in order to reduce additional errors due to measurement errors of antenna temperature, which can make them a half through one tenth of those by other algorithms. The experimental results gave proof of the effectiveness of the DEM. (19 refs.)

116265 Diurnal variation of rainfall at Nandi Airport, Fiji. S.K.Sharma (Fiji Meteorological Service, Nandi Airport, Fiji). *Weather (GB)*, vol.38, no.8, p.231-9 (Aug. 1983).

Studies the diurnal variation of tropical rainfall on a coastal station based on data from Nandi Airport (17°45'S, 177°27'E, 16 metres), situated on the western, leeward side of Viti Levu. Viti Levu has an area of 10 384 km² and is the largest island in Fiji, from a group of over 300 islands. The extent of orographic effect is noteworthy on this island, since about one-third of Viti Levu lies above 300 metres. (11 refs.)

116266 On the temporal variance of stratospheric trace gas concentrations. D.H.Ehhalt, E.P.Roth, U.Schmidt. *Report JUL-1836*, Kernforschungsanlage, Julich, Germany (March 1983), 44 pp.

The relative variances in stratospheric observations of long-lived trace gases, CH₄, N₂O, CF₃Cl₂, CFC1₃, show large differences. These differences are greatly reduced when the local mean standard deviation is normalized to the local vertical gradient. This ratio, called 'equivalent displacement height' exhibits a characteristic vertical profile which is very similar for all the long-lived trace gases as well as for O₃. With the help of this ratio it is demonstrated that the variances are essentially due to natural causes, i.e. transport. Using the mixing length hypothesis a theoretical expression for the equivalent displacement height is derived. (16 refs.)

116267 Application of nonlinear identification to long range weather prediction. P.M.Toldalgi, R.K.Mehra (Sci. Systems, Inc., Cambridge, MA, USA).

Identification and System Parameter Estimation 1982. Proceedings of the Sixth IFAC Symposium, Washington, DC, USA, 7-11 June 1982 (Oxford, England: Pergamon 1983), p.515-20 vol.1

Discusses the problem of long range weather prediction using the Group Method of Data Handling, in which nonlinear time series models are constructed and trained on the weather data. The research reported involves the reduction and preliminary analysis of hemispheric 700-maps. (21 refs.)

116268 Evaluation of the climatic zonality of the Indian Ocean during Pliocene time from deep-sea drilling data. Ye.V.Ivanova, M.S.Barash (Shirshov Inst. of Oceanology, Acad. of Sci., Moscow, USSR).

Oceanology (USA), vol.22, no.1, p.50-6 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.1 (1982). [received: Aug. 1983]

Semi-quantitative data on the distribution of planktic forams in early, middle, and late Pliocene sediments of the Indian Ocean, published in reports on deep-sea drilling, are reduced to a single point scale and to percentages. On this basis, the authors determine the types and subtypes of thanatocoenoses of the planktic forams and reconstruct the position of the corresponding climatic zones. The authors find that during Pliocene time there was a gradual drop of the temperature of the surface layer of water in the Indian Ocean. (33 refs.)

116269 Apportioning light extinction coefficients to chemical species in atmospheric aerosol. H.Hasan, T.G.Dzubay (Environmental Sci. Res. Lab., US Environmental Protection Agency, Research Triangle Park, NC, USA). *Atmos. Environ. (GB)*, vol.17, no.8, p.1573-81 (1983).

A 1978 Denver aerosol data set has been analyzed by a variety of methods for determining light scattering and extinction coefficients per unit mass concentration for specific chemical species in fine particles (<2.5 µm diameter). Multiple regression of light scattering coefficient versus chemical species concentrations was used to determine scattering to mass concentration ratios and their related uncertainties for specific chemical species, and the results are compared with those reported by previous investigators. Differences in the scattering to mass concentration ratios for all the major species in the aerosol except ammonium sulfate were found to be statistically insignificant. Light scattering and absorption coefficients were apportioned by chemical species for an external mixture using a published equation and for an internal mixture using equations that the authors derived. (32 refs.)

116270 Surface illuminance and albedo of a planetary atmosphere with nearly conservative scattering. Zh.M.Dlugach, E.G.Yanovitskii.

Izv. Akad. Nauk SSSR Fiz. Atmos. & Okeana, vol.19, no.8, p.813-23 (Aug. 1983). In Russian. English translation in: *Izv. Acad. Sci. USSR Atmos. & Oceanic Phys. (USA)*

A plane homogeneous atmosphere of an arbitrary thickness with anisotropic scattering is considered. It is shown that in a nearly conservative case the plane albedo and illuminance of the surface are expressed by two functions at the conservative case. For calculation of complete amount of radiant energy absorbed by column of atmosphere of the unit section an additional function is needed. The tables of these functions for the Rayleigh and the Henyey-Greenstein phase functions are given for wide region of the values of the optical thickness. (7 refs.)

116271 Statistical method for calculation of molecular absorption. Yu.S.Makushkin, A.A.Mitsel', K.M.Firsov.
Izv. Akad. Nauk SSSR Fiz. Atmos. & Okeana, vol.19, no.8, p.824-30 (Aug. 1983). In Russian. English translation in: *Izv. Acad. Sci. USSR Atmos. & Oceanic Phys. (USA)*
Statistical forecast of molecular absorption characteristics according to the known value of the absorption coefficient near the Earth's surface is suggested. The correlation matrix of the optical thickness using the statistical information on humidity and temperature is calculated for the wavelength $\lambda=10.6\text{ }\mu\text{m}$. In conclusion the diagrams are given which allow to estimate effectively the optical thickness and transparency. (12 refs.)

116272 Spatial and temporal variability of the tropospheric aerosol absorption coefficient in the spectral region 0.4-2.2 microns. L.I.Chapurskii.
Izv. Akad. Nauk SSSR Fiz. Atmos. & Okeana, vol.19, no.8, p.831-8 (Aug. 1983). In Russian. English translation in: *Izv. Acad. Sci. USSR Atmos. & Oceanic Phys. (USA)*
Data are obtained on radiation fluxes in different atmospheric layers and various climatic zones, air masses and seasons. Data on spectral behaviour of mean values of the aerosol absorption coefficients are presented for altitude layers from 0.3-0.6 to 6.1-9 km. The data agree with published results of aircraft, aerostat and ground-based measurements of aerosol attenuation and absorption. Attention is paid to the spectral behaviour of these values which have a repeating maximum of absorption near 1.25 microns. The maximum may be connected with various particles of natural and anothropogenic origin. (22 refs.)

116273 Investigations of atmospheric spectroscopy. V.E.Zuev.
J. Appl. Spectrosc. (USA), vol.37, no.6, p.1362-78 (Dec. 1982). Translation of: *Zh. Prikl. Spektrosk. (USSR)*, vol.37, no.6, p.923-41 (Dec. 1982). [received: Sept. 1983]
Investigations of atmospheric spectroscopy are of interest from the standpoint of the study of the fundamental laws of intermolecular and intramolecular interactions and in connection with the enormous practical needs to have data on the parameters of lines and the absorption coefficients and functions of atmospheric gases. The latter are especially important for a quantitative estimate of the energy losses of laser radiation in the atmosphere due to its absorption by gaseous components as well as due to the widespread development of a research front in spectroscopic methods of laser sounding of the atmosphere. The article is devoted to an exposition of the principal results of investigations with special emphasis on results obtained recently. (25 refs.)

116274 Finite exposure time, astronomical speckle transfer function. R.Barakat (Div. of Appl. Sci., Harvard Univ., Cambridge, MA, USA), P.Nisenson.
Opt. Acta (GB), vol.30, no.10, p.1405-16 (Oct. 1983).
The effects of finite exposure time (used to record astronomical speckle data) on the speckle transfer function are shown to be highly dependent on the details of the atmospheric turbulence in the optical path as well as on the deterministic wavefront aberrations of the optical system. Both Taylor turbulence, where a frozen layer or layers are convected across the aperture, and Mintzer turbulence, where the turbulence is boiling and stationary, are taken into account. Computations have been made for some typical cases of the time integrated speckle transfer function for various combinations of Taylor and Mintzer turbulence with focused and defocused optical systems. (18 refs.)

116275 Amplification of the mean intensity of backscattering in a turbulent atmosphere. S.S.Kashkarov (Inst. of Atmospheric Phys., Acad. of Sci., USSR).
Radiophys. & Quantum Electron. (USA), vol.26, no.1, p.36-40 (Jan. 1983). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.26, no.1, p.44-8 (Jan. 1983). [received: Sept. 1983]
Describes an experimental study of the backscattering of optical radiation from a 'rough' scatterer over paths near the ground having lengths of 650 and 1300 m. The author investigates the dependence of backscatter amplification of the size of fluctuations in the radiation incident on the scatterer and on the direction of scattering. The ratios between the backscatter amplification and characteristics of the intensity fluctuations of the radiation at the scatterer are in agreement with theoretical predictions. (12 refs.)

116276 Propagation of thermal radiation in the presence of random refraction of rays in a medium with a fluctuating dielectric constant. A.N.Reznik.
Radio Eng. & Electron. Phys. (USA), vol.27, no.11, p.81-6 (Nov. 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.11, p.2156-62 (Nov. 1982). [received: Sept. 1983]
Transfer of thermal radiation in a randomly inhomogeneous medium is examined with a consideration of random refraction of rays. Expressions are derived for the average value and the variance of the brightness temperature of the characteristic radiation of a planar layer. It is shown that in terms of external radiation an inhomogeneous layer is a filter of low spatial frequencies and the transfer function of the layer is derived. The derived effects are estimated for conditions existing in the atmosphere and in the ionosphere of the Earth. (9 refs.)

116277 Atmospheric radiation: 1975-1983. W.Wiscombe (Dept. of Appl. Sci., New York Univ., New York, NY, USA).
Rev. Geophys. & Space Phys. (USA), vol.21, no.5, p.997-1021 (June 1983).
Recent progress in the field of atmospheric radiation is reviewed. Topics discussed include the greenhouse effect due to trace gases, molecular spectra, cloud radiation, Earth radiation budget, aerosol radiation, single and multiple scattering, surface reflectivity and measurement techniques. (1407 refs.)

116278 Krakatoa sunsets. J.Austin (Sci. Museum, London, England).
Weather (GB), vol.38, no.8, p.226-31 (Aug. 1983).
The major eruption of Krakatoa took place on 27 August 1883 and huge quantities of dust and water vapour were ejected into the stratosphere. The quantities involved, especially for water vapour, are not accurately known. A succession of optical phenomena then followed: coloured Suns, twilight glows, Bishop's Ring and noctilucent clouds in that approximate order. It seems that all of these, with the possible exception of noctilucent clouds, were attributable to optically active particles of size $0.5\text{ }\mu\text{m}$, situated in the stratosphere. The feature which changed with time was the amount of background haze due to larger optically neutral particles. Thus the coloured Suns were only seen in extremely murky conditions, while the Bishop's Ring was best seen on clear days or from the top of a mountain. There is no record of both being seen at exactly the same time. (9 refs.)

93.55 INTERNATIONAL ORGANIZATIONS, NATIONAL AND INTERNATIONAL PROGRAMS

- 116279 The Global Atmospheric Research Program: 1979-82.** J.S.Fein, P.L.Stephens (Atmospheric Sci. Div., NSF, Washington, DC, USA), K.S.Loughran. *Rev. Geophys. & Space Phys. (USA)*, vol.21, no.5, p.1076-96 (June 1983). Discusses the activities of the Global Atmospheric Research Program (GARP) during 1979-82. The period 1979-82 was one of extraordinary activity. Several major field programs were completed: the Global Weather Experiment (also known as FCGE, the First GARP Global Experiment) with its regional subprograms, the Monsoon Experiment (MONEX) and the West African Monsoon Experiment (WAMEX), and the last of the GARP field programs, the Alpine Experiment (ALPEX). These experiments are described and some of the preliminary results are reported, the GATE research results for the last four years are also summarised. (791 refs.)

93.85 INSTRUMENTATION AND TECHNIQUES FOR GEOPHYSICAL RESEARCH

- 116280 Image resolution in microwave radiometry.** G.D'Auria, D.Solimini (Dipartimento di Elettronica, Univ. di Roma, Roma, Italy). *Alta Freq. (Italy)*, vol.52, no.3, p.227-9 (May-June 1983). (4th Italian National Meeting on Applied Electromagnetics, Florence, Italy, 4-6 Oct. 1982). The effects of atmospheric opacity and antenna characteristics on the resolving capability of microwave radiometers are examined. Limits of resolution for temperature, emissivity and spatial extent are found. Under simplifying assumptions it is found that the transmittance of the atmosphere is the relevant parameter for determining the resolving capability of the radiometer. Therefore this parameter has been calculated on the basis of climatological data obtained from the Italian Air Force at Fiumicino Airport and the results for the limits of resolution are reported for the bands of frequency at 35 and 90 GHz. (6 refs.)
- 116281 Microwave radiometric features of vegetated surfaces.** F.Benincasa, G.Fasano, S.Paloscia, P.Pampaloni, G.Zipoli (IATA, CNR, Firenze, Italy). *Alta Freq. (Italy)*, vol.52, no.3, p.230-2 (May-June 1983). (4th Italian National Meeting on Applied Electromagnetics, Florence, Italy, 4-6 Oct. 1982). Microwave emission of soil and vegetation depends on the physical conditions of the medium. Due to the high value of the water dielectric constant with respect to that of dry soil and vegetation, detected microwave radiation may be used to evaluate soil moisture and plant water content. Radiometer data at 9.8 and 36.6 GHz of corn have been correlated with 'in situ' measured physical parameters of soil and vegetation. A strong correlation between the brightness and physical temperature of crop has been found, moreover daily emissivity variations are small, but clearly correlated with the humidity of air at the top of vegetation. (13 refs.)
- 116282 Lidar remote-sensing: fluorescence and differential reflectance experiments.** P.Burlamacchi, G.Cecchi, P.Mazzinghi (IEQ-CNR, Firenze, Italy), L.Pantani, I.Pippi. *Alta Freq. (Italy)*, vol.52, no.3, p.233-5 (May-June 1983). (4th Italian National Meeting on Applied Electromagnetics, Florence, Italy, 4-6 Oct. 1982). Experiments were carried on Lidar applications to the remote sensing of land and sea. A laboratory experiment was done on Lidar fluorosensing of oil films on sea water. Four different wavelengths were tested and films of thickness as low as 0.01 μm were detected. The ability of a two wavelength Lidar in the signature of topographical targets by means of their reflectance spectra was also investigated. (5 refs.)

- 116283 OH Pepsios.** C.R.Burnett, E.B.Burnett (Florida Atlantic Univ., Boca Raton, FL, USA). *Appl. Opt. (USA)*, vol.22, no.18, p.2887-92 (15 Sept. 1983). An ultraviolet spectrometer of Pepsios design has been constructed and used for measurements of the vertical column abundance of atmospheric hydroxyl. Ground-based observations are made of the spectroscopic absorption of sunlight by OH at 3081.7 Å. The measurements are of relevance to the problem of stratospheric ozone. The spectrometer is a series arrangement of four pressure-scanned Fabry-Perot etalons with vernier spacer ratios. The spectral resolution of 0.06 cm^{-1} permits the identification and measurements of the sharp absorption feature from cool terrestrial OH against the solar background. The observations from Fritz Peak Observatory, Colorado, are presently contributing to a new data base on this atmospheric trace constitu-

ent which should be of importance in the understanding of middle atmospheric photochemical processes. (25 refs.)

- 116284 Water channel simulation of the atmospheric boundary layer.** S.C.Cheah, J.W.Cleaver, A.Millward (Dept. of Mech. Engng., Univ. of Liverpool, Liverpool, England). *Atmos. Environ. (GB)*, vol.17, no.8, p.1439-48 (1983). As part of a programme of work designed to assess the feasibility of modelling the dispersion of heavy plumes in a water channel it has been necessary to develop artificially structured shear layers which attempt to simulate atmospheric conditions. For a variety of reasons the choice of simulation is similar to that developed by Counihan (1969) and consists of a rough surface preceded by a castellated barrier and a number of profiled vorticity generators. Mean velocity and turbulence distributions, together with turbulent spectra and integral length scales, compared favourably with boundary layers modelled in wind tunnels and with full scale experiments in rural surroundings. (22 refs.)

- 116285 Methodology for the analysis of peroxyacetyl nitrate (PAN) in the unpolluted atmosphere.** H.B.Singh, L.J.Salas (Atmospheric Sci. Center, SRI Internat., Menlo Park, CA, USA). *Atmos. Environ. (GB)*, vol.17, no.8, p.1507-16 (1983). A light weight electron capture gas chromatograph has been laboratory- and field-tested to conduct surface and airborne PAN measurements in the unpolluted troposphere. A dynamic calibration system based on $\text{CH}_3\text{CHO}/\text{NO}_2/\text{Cl}_2$ photolysis studies by Gay et al. (1976) was constructed and successfully tested. PAN was cryogenically preconcentrated prior to analysis. A sensitivity of 5 parts per trillion (ppt) and an overall accuracy of $\pm 20\%$ is estimated. PAN measurements at a marine Pacific site, and aboard an aircraft, show that PAN is always present at a concentration range of 10-100 ppt, although concentrations as high as 400 ppt were measured at an altitude of 4.6 km over the Pacific Ocean. (32 refs.)

- 116286 The type 81 system for direction finding of whistler observations in Beijing.** *Acta Geophys. Sin. (China)*, vol.26, no.4, p.309-18 (July 1983). In Chinese. English translation in: *Acta Geophys. Sin. (USA)* The principle of whistler observation, its instrumentation, and some observations in Beijing are described. Preliminary analyses of the data obtained on March 11, 1982 in Beijing show that the mean angle of incidence of the whistlers is 13° , its azimuth is 32° , and the mean field strength is 270 $\mu\text{V}/\text{m}$. (8 refs.)

- 116287 The long period seismograph type 763.** Qin Chao-Zhi, Wang Ming, Yang Ye-Yu, Zhang Wei-Qing, Duan Ming-Chu (Inst. of Geophys., State Seismological Bur., China). *Acta Geophys. Sin. (China)*, vol.26, no.4, p.366-76 (July 1983). In Chinese. English translation in: *Acta Geophys. Sin. (USA)* A matched three-component long period seismograph with galvanometer recording is described. The response of such a system is designed in accordance with that of the long period seismography at WWSSN. Many data had been obtained with this type of instruments operating in BJI, MDJ, WMQ, SSE, TIA stations. The records indicate that type 763 LP seismography have contributed to seismological research and internal structure of the Earth by providing increased sensitivity in period range longer than 50 sec. No other seismographs cover this period range in China. (11 refs.)

- 116288 An approach to ICP analysis of geological samples.** B.Casetta (Perkin-Elmer Italiana SpA, Padua, Italy), A.Giaretta, G.Rampazzo. *At. Spectrosc. (USA)*, vol.4, no.4, p.152-4 (July-Aug. 1983). The authors evaluate the Inductively Coupled Plasma (ICP) technique in geological analysis for precision and accuracy, real time for setup of analytical protocol, and real time for routine running of samples. In a pool of six rock samples, including the international standard BCR1, the determination of six elements (Ba, Er, Eu, La, Y, Zr) was chosen as a basis for evaluation of the ICP technique. (6 refs.)

- 116289 Silica standardization: a discriminant technique applied to a volcanic arc system.** P.C.Ragland, M.J.Defant (Dept. of Geology, Florida State Univ., Tallahassee, FL, USA). *Earth & Planet. Sci. Lett. (Netherlands)*, vol.64, no.3, p.387-95 (Sept. 1983). A classic tholeiitic, calc-alkaline, and shoshonitic island-arc sequence has developed in western Luzon, the Philippines as a result of subduction defined by an eastward-dipping Benioff zone. A simple technique of standardizing the data allows chemical concentrations to be recast to 'andesite equivalent' compositions. Based on the excellent linear correlations that exist between SiO_2 and other elements, individual analyses were standardized to 55% SiO_2 by projecting parallel to least-squares regression lines. Results of the analysis of valiance indicate that at the 99% confidence level 20 to 27 chemical variates discriminate between at least two of the three geographically distinct magma series. (24 refs.)

- 116290 Remote reconnaissance: methods of observation, picture analysis, examples. II.** R.Fiedler, H.Helbig, G.Kritikos, D.Kubler, H.van der Piepen. *Elektronik (Germany)*, vol.32, no.13, p.69-73 (1 July 1983). In German. For pt.I see *ibid.*, no.12, p.85 (1983). Discusses geometric distortion of surface pictures from aircraft or satellites, and correction methods based on system parameters and comparison with reference pictures. Mapping, overlay, and computer aided mosaicing techniques for composite picture generation are described and illustrated. Principles of spectral signature application in classification algorithms for surface features are explained. The greatest application of picture processing has been in remote Earth reconnaissance including resource and environment monitoring. The methods however apply in other fields such as medicine, buildings, engineering and automation. (no refs.) H.V.H.

- 116291 Structure of the perturbed zone near a large charged photoemitting object.** A.M.Moskalenko (Inst. of Terrestrial Magnetism, Ionosphere & Radio Wave Propagation, Acad. of Sci., USSR). *Geomagn. & Aeron. (USA)*, vol.22, no.3, p.314-18 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983] The electric field and the plasma structure near a charged spherical object are studied. It is assumed that electrons are photoemitted from the sunlit part of the object's surface. The radius of the object is assumed small in comparison with the mean free path of the particles but large in comparison with the plasma Debye length. The photocurrent is treated as a perturbation. Analytic expressions are derived for the distributions of the electric field and of the densities of ions, electrons, and photoelectrons. A detailed study is made of the case in which the electric field has only a slight effect on the photoelectron density distribution. (7 refs.)

- 116292 Determining the components of the magnetic field of a vehicle.** V.A.Blednov (Inst. of Terrestrial Magnetism, Ionosphere & Radio Wave Propagation, Acad. of Sci., USSR). *Geomagn. & Aeron. (USA)*, vol.22, no.3, p.397-9 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983]
A procedure is described for determining the components of the magnetic field of a vehicle from on-board vector measurements. The components are grouped as certain vector quantities. The accuracy with which they are determined does not depend on the accuracy with which the direction of the geomagnetic meridian is found. (3 refs.)
- 116293 On the dynamic range of resonance spectrophone.** Yu.G.Toporkov. *Izv. Akad. Nauk SSSR Fiz. Atmos. & Okeana*, vol.19, no.8, p.839-44 (Aug. 1983). In Russian. English translation in: *Izv. Acad. Sci. USSR Atmos. & Oceanic Phys. (USA)*
The problem of estimating a resonance spectrophone dynamic range in an integral form as a function of particle size spectra of the investigated aerosol medium is considered. A minimum possible (the far-infrared region) dynamic range is analytically determined for Junge size distribution. The numerical calculation of real ranges for the visible region ($\lambda=0.51 \mu\text{m}$) is performed. (8 refs.)
- 116294 HF Doppler measurements of mesospheric gravity wave momentum fluxes.** R.A.Vincent, I.M.Reid (Dept. of Phys., Univ. of Adelaide, Adelaide, Australia). *J. Atmos. Sci. (USA)*, vol.40, no.5, p.1321-33 (May 1983).
Recent theoretical studies have emphasized the probable importance of internal gravity waves in balancing the momentum budget of the mesosphere. The authors propose a method by which the vertical flux of horizontal momentum can be measured by ground based radars. The method uses two or more radar beams each offset from the vertical to measure the atmospheric motions by the Doppler technique. Provided there is horizontal homogeneity, the momentum flux is proportional to the difference of the variances of the Doppler velocities measured in each beam. The flux convergence and, hence, the associated body force acting on the atmosphere can be inferred by measuring the flux as a function of height. It is shown that mean wind components can also be measured by this method and, under certain circumstances, so can the horizontal wavelengths and phase velocities of the internal waves. Observations of the vertical flux of zonal momentum made with this technique using an HF radar located near Adelaide, Australia (35°S, 138°E) in May 1981 are discussed. (27 refs.)
- 116295 A VHF radar antenna for the measurement of incoherent scattered radiation from the ionosphere.** G.Schroer, T.Hagfors, P.-S.Kildal. *Mikrowellen Mag. (Germany)*, vol.8, no.5, p.545-6, 548-51 (Oct. 1982). [received: Aug. 1983]
A parabolic cylinder antenna with a $120 \times 40 \text{ m}$ aperture has been developed for observing scattered radiation from the ionosphere plasma at a frequency of 224 MHz. By an arrangement whereby the primary radiator lies outside the radiation field of the antenna (offset feed system) and other measures a gain of 43.6 dB was achieved corresponding to an efficiency of 64%. The antenna radiates northwards and can be swung up to 90° in the meridian plane. It is made of four 30 m sections which can either be moved together or independently. The primary feed comprises 128 crossed dipoles. By changing their relative phases electrical beam swinging of $\pm 21.3^\circ$ about the meridian plane can be achieved. The HF divide network for feeding the crossed dipoles is designed for a transmitted power of 375 kW continuous and 3 MV peak power for each orthogonal polarisation. (8 refs.) *J.R.B.*
- 116296 Calculation of well log apparent resistivities by discrete convolution.** D.Drahoš. *Magy. Geofiz. (Hungary)*, vol.24, no.3, p.97-110 (1983). In Hungarian.
Deals with the numerical solution of the electrical direct problem of well logging by applying the discrete convolution method. The discrete convolution method is effective in the numerical solution of linear integral transforms. The method is described briefly and its accuracy is illustrated by calculating such an integral transform the output function of which is known analytically. Formulae are derived to calculate the apparent resistivities of normal, lateral and laterolog arrangements. The results calculated by discrete convolution show good agreement with those calculated earlier by L.M. Alpin. (10 refs.)
- 116297 Quantitative determination of Al_2O_3 content in bauxite drill holes by neutron activation log.** I.Balogh, J.Horvath. *Magy. Geofiz. (Hungary)*, vol.24, no.3, p.111-18 (1983). In Hungarian.
Presents a complex solution for basic equation of the neutron activation logging. This solution considers the effects of the hole diameter, the nuclear parameters of the measuring environment, and the technical parameters of the continuous logging, simultaneously. The theoretical calculations have been controlled by experimental measurements. As a result of theoretical and experimental works the authors have elaborated a quantitative aluminium content interpretation system. In its practical use it was found that the average deviation from the laboratory data was 3.5 $\text{Al}_2\text{O}_3\%$ referring to a 1 metre interval. (6 refs.)
- 116298 Two-wavelength lidars. Target identification through a differential reflectance technique.** L.Pantani, I.Pippi (Istituto di Ricerca sulle Onde Elettromagnetiche, CNR, Florence, Italy). *Opt. Acta (GB)*, vol.30, no.10, p.1473-81 (Oct. 1983).
The ability of a two-wavelength lidar in the identification of natural and artificial targets is discussed. The analysis is carried out on the basis of target spectral reflectance and taking into account the atmospheric extinction at the two laser wavelengths. Preliminary results performed with a two-wavelength (0.532 and $1.064 \mu\text{m}$) Nd-YAG lidar are reported. (10 refs.)
- 116299 An EM field modelling unit for geophysical prospecting problems.** V.I.Gordienko, N.D.Pechenyak, V.P.Ubogii, E.V.Yaroshevskii. *Otbor & Peredacha Inf. (USSR)*, no.67, p.47-51 (1983). In Russian.
Presents details of design and evaluation of a unit for the modelling of EM field, for application to problems of geophysical prospecting by harmonic fields. The features of the unit are high accuracy, repeatability of measured results, suitability for automatic processing of amplitude/phase and impedance/admittance data and suitability for application to a wide range of problems of geophysical prospecting on land and sea, using dipole profiling and long cable methods. (11 refs.) *Z.F.V.*
- 116300 Influence of the dimensions of a sensor on estimates of the turbulent energy dissipation rate in the ocean.** V.M.Zhurbas, V.N.Nabatov (Shirshov Inst. of Oceanology, Acad. of Sci., Moscow, USSR). *Oceanology (USA)*, vol.22, no.1, p.111-14 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.1 (1982). [received: Aug. 1983]
Field measurement data are used to analyze the influence of the dimensions of the sensitive element of a conductive magnetohydrodynamic anemometer (CMA) on estimates of the turbulent energy dissipation rate ϵ in the ocean. It is found that for CMA variants used in oceanologic studies ϵ is underestimated by a factor of 2-3 due to the finiteness of the sensor dimensions. An empirical estimate of the CMA spectral characteristics obtained from the field measurement data is presented. (8 refs.)
- 116301 A method for calculating dispersion relations and eigenfunctions for internal waves in the ocean from field data.** V.A.Gritsenko, V.P.Krasitskiy (Shirshov Inst. of Oceanology, Acad. of Sci., Moscow, USSR). *Oceanology (USA)*, vol.22, no.4, p.400-3 (1982). Translation of: *Okeanologiya (USSR)*, vol.22, no.4 (1982). [received: Aug. 1983]
A finite-difference method is suggested for solving the boundary-value problem for the amplitudes of the vertical modes of internal waves. This method uses actual field measurements of the density profile. The method is based on a direct solution of the characteristic equation for the matrix of the corresponding finite-difference equations. An example of the calculation is given. (9 refs.)
- 116302 Computers in geophysical well-logging units.** R.M.Babaev. *Prib. & Sist. Upr. (USSR)*, no.7, p.15-17 (1983). In Russian. English translation in: *Sov. J. Instrum. & Control (GB)*
Special measuring devices used for geophysical well-logging and their adaptability for computer control are examined. Special microprocessors are used to process the information from the digging level which may be distorted by dispersive cable characteristics. Special modulation/demodulation schemes are suggested which should facilitate faithful reproduction of data after the A/D conversion. Block diagrams of several proposed systems are illustrated and discussed. (5 refs.) *J.K.S.*
- 116303 Calibration of long-period seismic channels.** J.Rasson, F.De Meyer. *Publ. Inst. R. Meteorol. Belg. Ser. A (Belgium)*, no.110, p.7-50 (1983).
Earthquake signals, as they are recorded on the seismogram, are deformed by the various systems they pass through after having been issued at the focus. Two main such systems can purposely be distinguished: the Earth and the seismometer. If one is to gain knowledge of the Earth deforming system or the signal generating focus or both, it is best that they be the only unknowns: since the seismometer is easily accessible for measurement (contrary to the Earth), it is worth designing an experiment giving as complete as possible a description of the instrument signal deforming action. Such an experiment, called a calibration, is discussed. (17 refs.)
- 116304 Radio transillumination of the atmosphere by artificial and natural sources.** M.A.Kolosov, A.G.Pavel'yev. *Radio Eng. & Electron. Phys. (USA)*, vol.27, no.12, p.30-7 (Dec. 1982). Translation of: *Radiotekh. & Elektron. (USSR)*, vol.27, no.12, p.2310-17 (Dec. 1982). [received: Sept. 1983]
A new procedure for transillumination of the atmosphere of the Earth by artificial and natural sources is examined. It is shown that measurements of amplitude and frequency characteristics of signals radiated by sources observed at low elevation angles enable one to calculate the angle of refraction and its derivative as functions of the impact parameter. When the accuracy of measurement is sufficiently high, one can reconstruct the profile of the refractive index and of its gradient as functions of altitude with the help of an analytic solution of the inverse problem, which also possesses a regularizing property. (10 refs.)
- 116305 Advances in remote sensing of the atmosphere.** K.S.Gage, B.B.Balsley (Aeronomy Lab., NOAA, Boulder, CO, USA). *Rev. Geophys. & Space Phys. (USA)*, vol.21, no.5, p.955-65 (June 1983).
The present review emphasises US contributions in the AD 1979 to 1983 period to techniques of atmospheric remote sensing. Both ground-based and satellite methods are described. Passive radiometric methods and active (lidar and radar methods) are included in this survey. Specific atmospheric variables for which techniques are described include humidity, precipitated water, cloud cover, rainfall, wind and chemical composition. Weather radar and clear air radar methods are also described. (312 refs.)
- 116306 Radar-acoustic probing of randomly oriented air flows.** I.V.Korytsev. *Radiotekhnika, Kharkov (USSR)*, no.61, p.57-9 (1982). In Russian. [received: Aug. 1983]
A multi-positional radar-acoustic probing method designed for determining the three velocity components of an air flow and the temperature of the atmosphere with a high space-time resolution is considered. An analysis is made of the measurement errors with three sloping and one vertical path for probing the same spatial region. (1 ref.) *L.M.H.*
- 116307 Equipment, procedure and some results relating to measurements of luminance temperature of water in liquid and solid phase in millimeter wave band.** A.S.Levda, I.Kh.Vakser, Yu.I.Malyshenko. *Radiotekhnika, Kharkov (USSR)*, no.61, p.77-81 (1982). In Russian. [received: Aug. 1983]
A study is made of the units and components of the radiometers which have been developed with sensitivities of 1 and 0.5K (with a time constant of 1 sec) at wavelengths of 3 and 8 mm and of the device for measuring the emissive properties of specimens of the Earth's mantle given differing angles of incidence. The results of measurements of the luminance temperature of water, snow and ice at these wavelengths are presented and shown to be of interest for the development of the remote radio-physical method. (4 refs.) *L.M.H.*
- 116308 Highly accurate inversion methods for three-dimensional stratified media.** M.Lahlou, J.K.Cohen, N.Bleistein (Dept. of Math., Univ. of Denver, Denver, CO, USA). *SIAM J. Appl. Math. (USA)*, vol.43, no.4, p.726-58 (Aug. 1983).
Describes two highly accurate velocity inversion methods for three-dimensional isovelocity stratified media. The first one is a Born-type perturbation method based on an asymptotic, implicit Green's function, while the second one is based on the Kirchhoff representation of the reflected field. It is shown that, given a band-limited reflected signal resulting from one backscatter experiment, both methods can be used in a recursive manner to accurately reconstruct the unknown velocity profile. They are tested on both synthetic and real data sets. The tests on synthetic data demonstrate higher accuracy than has been the case for previous methods in the literature. In the most extreme test, synthetics with 10 layers and velocity variation on the order of 200% were used and extremely accurate inversion was achieved. (51 refs.)
- 116309 Fast seismic ray tracing.** H.B.Keller (Appl. Math., California Inst. of Technol., Pasadena, CA, USA), D.J.Perozzi. *SIAM J. Appl. Math. (USA)*, vol.43, no.4, p.981-91 (Aug. 1983).
New methods for the fast, accurate and efficient calculation of large classes of seismic rays joining two points x_s and x_r in very general two-dimensional configurations are presented. The medium is piecewise homogenous with arbitrary interfaces separating regions of different elastic properties (i.e. differing wave speeds c_p and c_s). In general there are 2^{N+1} rays joining x_s to x_r while making contact with N interfaces. The authors methods find essentially all such rays for a given N by using continuation or homotopy methods on the wave speeds to solve the ray equations determined by Snell's law. In addition travel times, ray amplitudes and caustic locations are obtained.

When several receiver positions $X_R^{(i)}$ are to be included, as in a gather, the authors' techniques easily yield all the rays for the entire gather by employing continuation in the receiver location. (5 refs.)

116310 Classification capability and resolving power of the method of transients in searches for kimberlites. L.A.Tabarovskii, G.B.Itskovich (Inst. of Geology & Geophys., Acad. of Sci., Novosibirsk, USSR). *Sov. Geol. & Geophys. (USA)*, vol.23, no.5, p.50-8 (1982). Translation of: *Geol. & Geofiz. (USSR)*, vol.23, no.5, p.56-66 (1982). The solution of the direct problem of the field due to a vertical magnetic dipole above a half-space containing a cylindrical inhomogeneity is used to investigate the classification capability of different components of a nonstationary field in the case of a geoelectric section characterizing the presence of a kimberlite pipe. The resolving power of different systems relying on the method of transients is estimated in relation to determinations of the size and conductivity of the pipe. A method is proposed for determining a generalized electromagnetic parameter. (6 refs.)

116311 Combined interpretation of magnetic and gravitational fields based on calculations of the pseudogravitational field. I.D.Savinskii, G.I.Rossmann, V.V.Grushina, V.L.Briskin, E.I.Kulikova, Yu.A.Filipchenko. *Sov. Geol. & Geophys. (USA)*, vol.23, no.5, p.67-73 (1982). Translation of: *Geol. & Geofiz. (USSR)*, vol.23, no.5, p.75-83 (1982). The transformation of three-dimensional magnetic fields into the pseudogravitational field is discussed as a possible technique for geophysical exploration. Maps of such fields are reproduced for a region containing a volcano-tectonic depression. When the pseudogravitational and gravitational fields are analyzed together, this provides a new basis for the combined interpretation of magnetic and gravity data because the perturbing effects of anomalies vary in the same way for the two fields. Compilation of the correlation coefficients between the values of these fields in a 'sliding window' shows that there is good correspondence between regions of weak correlation and ore mineralization zones. (10 refs.)

116312 From qualitative to quantitative magnetic anisotropy analysis: the prospect of finite strain calibration. B.Henry, L.Daly (Lab. de Tectonophys., Paris, France). *Tectonophysics (Netherlands)*, vol.98, no.3-4, p.327-36 (1983). A method of separating low field, susceptibility anisotropies due to ferrimagnetics and the matrix, proposed hitherto in cases where the principal axis of these two components are merged, is generalized in cases where the axes are distinct. The method consists of analysing, in specimens close in the same sample, anisotropies, the differences of which are due to the variation of respective percentages of the two components, although the strain rate remains constant. One thus uses the cause which itself renders global anisotropy unusable. A first application is presented, where a control using the anisotropy of isothermal remanent magnetization allows the validity of the method to be tested. A discussion of the choice of the best ellipsoid, relative either to the matrix or to the ferrimagnetics, to give the best indication of relative finite strain rate, is opened.

116313 A computer-controlled tachymetric surveying system for the supervision of kinematic events without observers. H.Kahmen, H.Suhre. *Z. Vermessungswes. (Germany)*, vol.108, no.8, p.345-51 (Aug. 1983). In German. The development of an automatic computer-controlled tachometer system is described. The system provides automatic monitoring of an array of slowly moving control points for deformation measurements, manages the recording of the data and computes the displacements. Only the initial pointing of a reference point requires an operator. (1 ref.)

116314 Experimentation d'un système de sondage en source contrôlée, en prospection minière (Experiments with an EM sounding system with a controlled source in mineral prospecting). J.Mosnier. *Report EUR 8258 FR*, Comm. European Communities, Luxembourg (1983), iv+46 pp. In French. Contract 082-79-4/MPPF. Discusses a new type of electromagnetic receiver. The device was constructed for prospecting for conductive ores. It has a very high sensitivity and it is protected against interference noise by means of a double frequency change, amplification at a fixed frequency (30 Hz) and phase detection. In order to get a reference signal for the detector, the author uses either a radiotelemetric link, or two synchronous independent clocks. The device has been used for the detection of an ore of copper sulphide near 'La Porte aux Moines' in French Brittany. The author has also measured the electric and magnetic fields, produced by an artificial source at a variable frequency in the band 100 Hz-6000 Hz.

116315 A solid-state compass with microprocessor controlled data acquisition. K.Williams (Univ. of Santa Clara, Santa Clara, CA, USA). *Wescon/82 Conference Record*, Anaheim, CA, USA, 14-16 Sept. 1982 (El Segundo, CA, USA: Electron. Conventions 1982), p.SS-3/1-5. Describes the design and fabrication of a solid-state compass. The compass uses two high-sensitivity Hall-effect sensors oriented at right angles to each other to determine direction by sensing the Earth's magnetic field. The analog signals from the Hall-effect devices are digitized and stored under microprocessor control. Finally, the data are transmitted using ASCII code to an appropriate computer for processing and display. A small, single-board computer was used. (5 refs.)

116316 Inverse problems for reflection seismograms. E.A.Robinson (Dept. of Theoretical & Appl. Mech., Cornell Univ., Ithaca, NY, USA). Identification and System Parameter Estimation 1982. Proceedings of the Sixth IFAC Symposium, Washington, DC, USA, 7-11 June 1982 (Oxford, England: Pergamon 1983), p.939-44 vol.2. The purpose of seismic migration is to find the coordinate of inaccessible subsurface points by use of seismic reflection measurements taken on the Earth's surface. The three most popular conventional migration methods are the finite difference method, the Kirchhoff method, and the frequency wavenumber method. They are each based on a stratified model, that is a two-dimensional model in which all the interfaces encountered by propagating waves must be horizontal. Such a model is called a 1 1/2 dimensional (1.5D) model, because a true two-dimensional model would allow dipping interfaces. As a justification for the use of 1.5D wave equation migration on seismic data, in the paper the author proposes the random reflector-dip hypothesis. This statistical justification is the only reason the conventional migration methods give satisfactory results on actual seismic data. (11 refs.)

116317 Extraction of seismic profiles for one-dimensional nonhomogeneous media using the impulse response model. W.J.Vetter (Faculty of Engng. & Appl. Sci., Memorial Univ. of Newfoundland, St. John's, Newfoundland, Canada). Identification and System Parameter Estimation 1982. Proceedings of the Sixth IFAC Symposium, Washington, DC, USA, 7-11 June 1982 (Oxford, England: Pergamon 1983), p.945-50 vol.2. The time domain response for a horizontally stratified lossless acoustic medium, for normal incidence plane wave pulse type excitation, is detailed as

a response summation by order of reflection. Specialized to mathematical stratification in terms of layerwise homogeneous medium components having equal propagation delays, and considered in the limit of layer shrinkage to the continuum, the response becomes the solution of the wave equation for a vertically nonhomogeneous medium having independent segmentwise continuous profile functions of density and elastic constant, or equivalently of propagation velocity and characteristic acoustic impedance. A recursive procedure for efficient numerical generation of the response multiples is detailed. This analytical time response solution complements and extends the insight on the wave propagation phenomenon. The details in the solution structure point to the salient features in the reflectance profile or characteristic acoustic impedance profile estimation problem. (23 refs.)

116318 Review of some exact methods for the solution of the one-dimensional inverse problems. F.Santosa (Dept. of Theoretical & Appl. Mech., Cornell Univ., Ithaca, NY, USA). Identification and System Parameter Estimation 1982. Proceedings of the Sixth IFAC Symposium, Washington, DC, USA, 7-11 June 1982 (Oxford, England: Pergamon 1983), p.951-6 vol.2. The inverse problem in geophysics is the determination of the inhomogeneous structure of an elastic medium from experimental observations. The author reviews the Gelfand-Levitán and the Marchenko methods for the solution of the related quantum inverse problem. In these approaches, as well as in the methods for the geophysical problem, the author discusses how the desired information is recovered from the solution of certain integral equations. Next, the construction of a computational scheme for the inversion of geophysical data based on one of the methods is considered. Further it is shown that the resulting algorithm is stable under small perturbations to the data. Finally the inversion scheme is demonstrated by inverting noiseless and noise-corrupted synthetic seismograms. (11 refs.)

116319 Difference methods for solving one-dimensional inverse problems. K.P.Bube, R.Burridge (Dept. of Math., Univ. of California, Los Angeles, CA, USA). Identification and System Parameter Estimation 1982. Proceedings of the Sixth IFAC Symposium, Washington, DC, USA, 7-11 June 1982 (Oxford, England: Pergamon 1983), p.957-61 vol.2. Considers the one-dimensional inverse problem of reflection seismology. An impulsive plane wave in pressure is applied to a horizontally homogeneous elastic half space and the ensuing particle velocity is measured at the surface. The characteristic impedance is recovered as a function of travel time. Several methods of solution of this inverse problem require the construction of an auxiliary solution of the differential equations with a wave front, and the impedance is recovered using the theory of propagation of singularities. The use of difference schemes to construct this auxiliary solution leads to fast algorithms to solve this inverse problem. Fast recursive algorithms for solving discrete integral equations, which are Toeplitz linear systems, can be identified with difference schemes. A downward continuation algorithm developed by the authors which uses difference schemes is also presented. (9 refs.)

116320 Maximum-likelihood as applied to seismic inversion problems. J.M.Mendel (Dept. of Electrical Engng., Univ. of Southern California, Los Angeles, CA, USA). Identification and System Parameter Estimation 1982. Proceedings of the Sixth IFAC Symposium, Washington, DC, USA, 7-11 June 1982 (Oxford, England: Pergamon 1983), p.963-6 vol.2. Surveys work on maximum-likelihood as applied to seismic inversion problems performed by the USC Geo-Signal Processing Program. The author describes work on maximum-likelihood deconvolution, maximum-likelihood wavelet estimation and deconvolution, maximum-likelihood normal incidence inversion, and normal-incidence geo-optimal deconvolution. (14 refs.)

116321 Some results on the three-dimensional geophysical inverse problem. M.T.Silvia (Dept. of Electrical Engng., Univ. of Tulsa, Tulsa, OK, USA). Identification and System Parameter Estimation 1982. Proceedings of the Sixth IFAC Symposium, Washington, DC, USA, 7-11 June 1982 (Oxford, England: Pergamon 1983), p.967-73 vol.2. In geophysical signal processing, the basic problem is to identify the spatially-variant parameters of the wave equation which governs the propagation of seismic waves. In one dimension (1-D), this problem has several analytic solutions, which are accompanied by the 1-D concepts of deconvolution and wavelet processing. In the paper, the author discusses the identification of the three-dimensional (3-D) acoustic wave equation and explains how the ideas of deconvolution and wavelet processing can be extended to three dimensions. 94.00 AERONOMY AND SPACE PHYSICS

94.10 PHYSICS OF THE NEUTRAL ATMOSPHERE

(for planets, see 96.30)

- 116322** Distribution of meteor heights and sunrise. V.Purubcan (Astron. Inst., Slovak Acad. of Sci., Bratislava, Czechoslovakia), G.Cevolani. *Bull. Astron. Inst. Czech. (Czechoslovakia)*, vol.34, no.4, p.213-19 (July 1983).

The echo heights of 6921 sporadic meteors, determined by an interferometric height-finding system of the Budrio (44.5°N, 11.65°E) meteor radar in April-September 1978 during a 15-hour interval around sunrise, are analysed. No correlation in the variation of the mean height with the geomagnetic K_p index is found; mean sporadic heights exhibit a clear correlation with the elevation angle of the Earth's apex. The observed mean height seasonal variation at three times of the day (0^h, 6^h, 12^h) can almost entirely be accounted for by the position of the apex. Mean height with respect to local sunrise at 90 km shows a variation in a range of 92.4 km, with a minimum just after sunrise and a maximum about 4-5 hours after sunrise. (20 refs.)

- 116323** A possible mechanism for the excitation of mid-latitude internal gravity waves in the upper ionosphere. O.N.Savina (Gor'kii State Univ., Gor'kii, USSR).

Geomagn. & Aeron. (USA), vol.22, no.3, p.329-31 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3, p.361-4 (1982). [received: Sept. 1983]

The possible excitation of internal gravity waves by turbulent velocity fluctuations near the turbopause is analyzed. The conditions under which the waves will reach the upper ionosphere are studied. An expression is derived for the vertical component of the energy flux. With strong wind shear in the turbopause vicinity, the existence of semitransparent sporadic E layers may be accompanied by the excitation of intermediate-scale moving perturbations. (11 refs.)

- 116324** Temperature inversion in the thermosphere. A.G.Kolesnik, S.S.Kololev, S.G.Pasynikov (Siberian Physicotech. Inst., USSR).

Geomagn. & Aeron. (USA), vol.22, no.3, p.361-4 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983]

The previously proposed mechanism for cooling of the lower thermosphere, which produces regions with opposite formed dependence of T_n on $F_{10.7}$, is analyzed based on a one-dimensional model combining the effects of the composition and temperature at altitudes of 80 to 300 km. It is shown that the mechanism for vertical transport of mass and heat by turbulence and macroscopic motions can generate regions with a temperature inversion of up to 30% and a composition inversion of up to 20%. (10 refs.)

- 116325** Latitude dependence of disturbances of thermospheric winds. A.A.Namgaladze, L.P.Zakharov, V.M.Smertin (Inst. of Terrestrial Magnetism, Ionosphere & Radio Wave Propagation, Acad. of Sci., USSR).

Geomagn. & Aeron. (USA), vol.22, no.3, p.365-7 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983]

It is shown that in the latitude band of 45 to 65° disturbances of the meridional velocity of thermospheric winds induced by geomagnetic activity constitute 25 to 250 m/sec at $K_p=6$ when calculated from the Jacchia-1977 neutral atmosphere model, and 150-350 m/sec in a self-consistent calculation of disturbances in the temperature, density, and winds in the thermosphere. Such winds cause positive ionosphere disturbances, compensating or exceeding the negative effects of changes in the neutral composition at $k_p \geq 6$, suggesting that the latter could not produce negative ionospheric storms. (8 refs.)

- 116326** Geocoronal imaging with Dynamics Explorer: a first look. R.L.Rairden, L.A.Frank, J.D.Craven (Dept. of Phys. & Astron., Univ. of Iowa, Iowa City, IA, USA).

Geophys. Res. Lett. (USA), vol.10, no.7, p.533-6 (July 1983).

The ultraviolet photometer of the University of Iowa spin-scan auroral imaging instrumentation on board Dynamics Explorer 1 has returned numerous hydrogen Lyman alpha images of the geocorona from altitudes of 570 km to 23300 km. Attempts were made to fit these observations with a spherically symmetric isothermal Chamberlain model of the exosphere using numerical solutions to the radiative transfer equation. The removal of a substantial portion of the satellite component at higher altitudes was necessary to obtain the required functional dependence of hydrogen density with radial distance. The optimum fit utilizes a Chamberlain model of temperature 1050°K, with exobase r_c at 1.094 R_E (600 km altitude), exobase density of 40000 cm⁻³, and a satellite critical level r_{cs} equal to 3.5 r_c . (14 refs.)

- 116327** On the extraction of tidal information from measurements covering a fraction of a day. D.J.Crary, J.M.Forbes (Dept. of Phys., Boston Coll., Chestnut Hill, MA, USA).

Geophys. Res. Lett. (USA), vol.10, no.7, p.580-2 (July 1983).

The errors incurred by extracting tidal information from data covering only a fraction of a day are investigated quantitatively as a function of fit span and tidal period. Assuming a noise component in the observational data with standard deviation σ , errors in the diurnal and semidiurnal Fourier components equal to σ occur at fit spans of 15.5 and 13.5 hours, respectively, for hourly data points. Errors increase at an exponential rate for shorter fit spans. Assuming nominal values of tidal amplitudes and standard deviations applicable to 12 hours of daytime mesopause region winds that might be obtained from MST radar measurements, it is shown that data is required at approximately 5-minute intervals to determine with acceptable accuracy tidal Fourier components from a single day's measurements. Alternatively, one to three weeks of daytime data at 30-minute intervals would enable determination of diurnal and semidiurnal components to roughly the same accuracy. (5 refs.)

- 116328** Simultaneous observations of the quasi 2-day wave in the northern and southern hemispheres. R.L.Craig, R.A.Vincent (Dept. of Phys., Univ. of Adelaide, Adelaide, Australia), S.P.Kingsley, H.G.Muller.

J. Atmos. & Terr. Phys. (GB), vol.45, no.8-9, p.539-41 (Aug.-Sept. 1983).

Observations of winds in the mesosphere and lower thermosphere made in July and August 1980 at Sheffield (53°N, 2°W), Townsville (19°S, 147°E) and Adelaide (35°S, 138°E) are compared. A quasi 2-day oscillation is evident in both the Sheffield and Townsville data, which suggests a significant cross-equatorial leakage of the wave from the summer to the winter hemisphere. A mean period of near 50 h and a vertical wavelength of about 50 km are found. (11 refs.)

- 116329** Upper atmosphere wind observations of waves and tides with the UNH Meteor Radar System at Durham 43°N (1977, 1978 and 1979). R.R.Clark (Electrical and Computer Engng. Dept., Univ. of New Hampshire, Durham, NH, USA).

J. Atmos. & Terr. Phys. (GB), vol.45, no.8-9, p.621-7 (Aug.-Sept. 1983).

Meteor wind data obtained during the years 1977-1979 have been processed to obtain prevailing 12 h, 24 h, and pseudo 2 day components. Monthly wind values at various heights show regularity for the semidiurnal tide in both amplitudes and phase. The average properties of the semidiurnal tide agree well with classical tidal theory. There is considerable energy present in the diurnal and pseudo 2 day components; their amplitudes and phases are quite irregular. During the summer, the meridional component is equatorward at all levels (4-12 m s⁻¹) and the zonal component is eastward at all levels (15-30 m s⁻¹). (19 refs.)

- 116330** Laboratory measurements of the association rate coefficients of NO⁺, O₂⁺, N⁺, and N₂⁺ ions with N₂ and CO₂ at temperatures between 100K and 400K. S.Dheandhanoo, R.Johnsen (Dept. of Phys. & Astron., Univ. of Pittsburgh, Pittsburgh, PA, USA).

Planet. & Space Sci. (GB), vol.31, no.8, p.933-8 (Aug. 1983).

Rate coefficients for the association reactions of NO⁺ ions with N₂ and CO₂, O₂⁺ with N₂, and N⁺ and N₂⁺ with N₂ have been determined as a function of gas temperature in a laboratory experiment employing a variable-temperature drift-tube apparatus. The measured rate coefficients are fitted to power laws of the form $k=C(T/300)^x$ where the exponents x range from 2.2 to 4.3. The strong temperature dependence observed in the case of the reaction of NO⁺ with N₂ ($x=4.3$) supports the thesis by Arnold et al. (1979) that the temperature variability of D-region ion densities is a result of this reaction step in the ion clustering sequence. (15 refs.)

- 116331** Intensity of variations of the source of internal gravity waves and the ionospheric response during the substorm of September 18, 1974. T.V.Gaivoronskaya, G.F.Deminova, L.A.Yudovich (Inst. of Terrestrial Magnetism, Ionosphere & Radio-Wave Propagation, Acad. of Sci., USSR).

Radiophys. & Quantum Electron. (USA), vol.26, no.1, p.4-8 (Jan. 1983). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.26, no.1, p.7-11 (Jan. 1983). [received: Sept. 1983]

The location of the auroral electrojets is determined and the geomagnetic field variations with quasiperiods of 20-25 and 40-45 min along a chain of stations in the auroral region during the substorm are isolated by the methods of spectral analysis. The intensity distribution of the variations along the auroral oval allows one to identify the source of internal gravity waves (IGW) with the entire western electrojet. The spectral analysis of geomagnetic and ionospheric data makes it possible to connect the variations of electrojets with the properties of IGW generated by them. (6 refs.)

- 116332** A thermal mechanism for the escape of neutral hydrogen from the Earth's atmosphere. M.I.Pudovkin, I.V.Golovchanskaya (Leningrad State Univ., Leningrad, USSR).

Sol. Syst. Res. (USA), vol.17, no.1, p.36-42 (Jan.-March 1983). Translation of: *Astron. Vestn. (USSR)*, vol.17, no.1, p.49-55 (Jan.-March 1983). [received: Sept. 1983]

The thermal escape rate has been calculated for neutral hydrogen atoms from the present atmosphere of the Earth. It is shown that at $T_{\infty}=1000K$ the disappearing flux of hydrogen atoms amounts of 3.4×10^8 atoms/cm².sec and is found to be in good agreement with data on the rates of the appearance of atomic hydrogen in the Earth's atmosphere. - 116333** Investigation of the relation between perturbations of the altitude of the E_s layer and the intensity of nighttime luminescence at [OI] 557.7 nm. T.A.Gorbunova, N.Yu.Kuznetsova, G.M.Shved (Univ. of Leningrad, Leningrad, USSR).

Geomagn. & Aeron. (USA), vol.22, no.3, p.357-60 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983]

Measurements of the altitude of the E_s layer and the intensity of luminescence at [OI] 557.7 nm, obtained in Ashkhabad, are compared by two methods: comparison of temporal spectra and comparison of departures from the average values. The velocities of propagation of dynamic disturbances in the lower thermosphere are: upward 1-6 km.h⁻¹ and downward 2-5 km.h⁻¹. (13 refs.)

116334 Nature of wave variations in nighttime hydroxyl-ion emission in the upper atmosphere. I.M.Gavrilov, V.A.Yudin (Leningrad Univ., Leningrad, USSR). *Geomagn. & Aeron. (USA)*, vol.22, no.3, p.368-71 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983]
Equations for estimates of amplitudes and phases of wave variations in the intensity of the nighttime emission of OH⁺ are obtained. These are derived within the linear theory of IGW assuming the oxygen-hydrogen model for formation of vibrationally excited hydroxyl ion OH⁺ at altitudes of 70-100 km. Theoretical and experimental estimates of the ratio of the amplitudes η and phase differences Δt of oscillations in the emission intensity and temperature, generated upon the passage of the wave, coincide in order of magnitude. (16 refs.)

116335 Measurement of the OH rotational temperature at Mawson, East Antarctica. L.C.Stubbs, J.S.Boyd, F.R.Bond (Antarctic Div., Dept. of Sci. & Technol., Kingston, Tasmania, Australia). *Planet. & Space Sci. (GB)*, vol.31, no.8, p.923-32 (Aug. 1983).
Measurements of the hydroxyl rotational temperature for the (8,3) Meinel band are reported for observations made at Mawson, East Antarctica (67°36'S, 62°53'E) over the austral winter of 1979. Mean values of the rotational temperature are given for 54 nights. The average value lies in the range 160-170K. The measured temperatures appear lower than those that have been reported at similar latitudes in the Northern Hemisphere. A gradual decrease in the value of the temperature throughout the course of the evening is the only diurnal trend observed. There is little evidence for any impulsive heating associated with auroral activity. (36 refs.)

94.10S Aurora

116336 Ground-based observations of subauroral energetic-electron arcs. R.Vondrak, S.Harris, S.Mende (Space Sci. Lab., Lockheed Palo Alto Res. Lab., Palo Alto, CA, USA). *Geophys. Res. Lett. (USA)*, vol.10, no.7, p.557-60 (July 1983).
On March 1, 1981 the spatial distributions of ionisation and luminosity were monitored at Chatanika, Alaska, with the incoherent-scatter radar, an all-sky television system, and meridian scanning photometers. The radar detected discrete regions of enhanced E-region ionisation at subauroral latitudes, more than 3° equatorward of the diffuse aurora. The high-resolution all-sky television measurements at 427.8 nm showed that the luminosity pattern resembles multiple auroral arcs; they are narrow in latitudinal width and they extend from horizon to horizon in an east-west direction. These observations indicate the existence of a subauroral source of electron precipitation that is both narrow in latitude and extended in longitude. (15 refs.)

116337 Ionospheric characteristics of a detached arc in the evening-sector trough. R.R.Vondrak (Space Sci. Lab., Lockheed Palo Alto Res. Lab., Palo Alto, CA, USA), J.S.Murphree, C.D.Anger, D.D.Wallis. *Geophys. Res. Lett. (USA)*, vol.10, no.7, p.561-4 (July 1983).
Simultaneous measurements by the ISIS-2 satellite and the Chatanika incoherent-scatter radar have been used to identify the ionospheric characteristics of a detached arc in the evening-sector trough region. On 26 February 1977 at 0737 UT, the ISIS-2 Auroral Scanning Photometer detected a detached arc at 65° north geomagnetic latitude that extended from approximately 1900 MLT to 2100 MLT. The arc was about 2° wide in latitude and was separated by about 3° from the equatorward edge of the diffuse aurora. The ratio of observed emission intensity at 557.7 nm to that at 391.4 nm was low, indicating a fairly hard electron distribution. The ISIS-2 Energetic Particle Detector observed energetic electron precipitation (E>40 keV) in the detached arc. The Chatanika radar found that the detached arc consisted of several narrow ionisation enhancements, with peak E-region electron densities of about $1 \times 10^5 \text{ cm}^{-3}$ at 95 km altitude. The persistent spatial pattern suggests the presence of an energetic electron precipitation mechanism that is periodic in latitude and extended in longitude. (12 refs.)

116338 Apparent electrostatic ion cyclotron waves in the diffuse aurora. E.A.Bering (Phys. Dept., Univ. of Houston, Houston, TX, USA). *Geophys. Res. Lett. (USA)*, vol.10, no.8, p.647-50 (1983). (American Geophysical Union Chapman Conference on Waves in Magnetospheric Plasma, Kona Coast, HI, USA, 7-11 Feb. 1983).
Emissions that have properties consistent with electrostatic ion cyclotron (EIC) waves have been observed at low altitude in the diffuse aurora by a sounding rocket payload. Peaks were observed in the power spectrum of the electric field near the hydrogen and oxygen ion cyclotron frequencies. Doppler shift and polarization analyses have been performed using EIC wave parameters derived from linear theory. (12 refs.)

94.20 PHYSICS OF THE IONOSPHERE
(for planets, see 96.30)

116339 Ionospheric investigations using Sirio VHF beacon. P.Spalla, E.Capannini, L.Ciraola, R.Ragionieri (Istituto di Ricerca Sulle Onde Elettromagnetiche, CNR, Firenze, Italy). *Alta Freq. (Italy)*, vol.52, no.3, p.218-20 (May-June 1983). (4th Italian National Meeting on Applied Electromagnetics, Florence, Italy, 4-6 Oct. 1982).
Some results are reported concerning ionospheric measurements carried out at Istituto di Ricerca sulle Onde Elettromagnetiche (IROE), Firenze, Italy, using the VHF beacon of the SIRIO satellite. Total electron content (TEC) determinations were obtained by measuring Faraday rotation with a circular component polarimeter. Details are presented concerning the method used to solve the π ambiguity, relating the TEC to other independent ionospheric data from a nearby ionosonde. A simple method to determine the polarization at the satellite is presented. TEC profiles of over 1200 days and their monthly median values were obtained. This allowed inference of some preliminary results concerning the statistics of TEC behaviour during the 21st solar cycle. (8 refs.)

116340 Horizontal gradients and correlation coefficients in total electron content of the ionosphere. Huang Tian-Xi (Wuhan Inst. of Phys., Acad. Sinica, China). *Acta Geophys. Sin. (China)*, vol.26, no.4, p.301-8 (July 1983). In Chinese. English translation in: *Acta Geophys. Sin. (USA)*
The horizontal distribution and space correlation of TEC observed in Western Europe under quiet solar conditions during phase II of synchronous beacon

satellite ATS-6 when it was repositioned at 35°E over Eastern Africa are analysed. The latitudinal and longitudinal gradients, their diurnal variations and seasonal characteristics are dealt with. (13 refs.)

116341 The ionosphere at low and equatorial latitudes at a height of 500 km during magnetospheric-ionospheric disturbances in 1977 (September to December): data from Kosmos-900 satellite. G.L.Gdalevich, I.S.Vsekhsvyatskaya, V.D.Ozerov, T.N.Soboleva. *Cosmic Res. (USA)*, vol.20, no.6, p.616-24 (Nov.-Dec. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.6, p.872-80 (Nov.-Dec. 1982). [received: Sept. 1983]
Kosmos-900 data on changes in charged particle densities at different phases of development of geomagnetic storms are used to analyze how magnetoionospheric disturbances affect the ionosphere at low and equatorial latitudes. (25 refs.)

116342 Ion kinetics, minor neutrals, and excited constituents in the D-region with an excess of ionization. I. Statement of the problem and a general schematic of the processes involved. S.I.Kozlov, V.A.Vlaskov, N.V.Smirnova. *Cosmic Res. (USA)*, vol.20, no.6, p.624-33 (Nov.-Dec. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.6, p.881-91 (Nov.-Dec. 1982). [received: Sept. 1983]
On the basis of a critical analysis of published data, the authors have selected a general schematic of the processes involved, with appropriate values for the reaction rate constants. The authors consider in detail the difficulties which arise in connection with solving the large system of differential equations of chemical kinetics. A one-dimensional approach is suggested. (37 refs.)

116343 Determination of the electron content of the plasmasphere using coherent signals from the ATS-6 satellite recorded in the city of Neustrelitz. N.Yakovski, Kh.-G.Kugland. *Cosmic Res. (USA)*, vol.20, no.6, p.633-9 (Nov.-Dec. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.6, p.892-9 (Nov.-Dec. 1982). [received: Sept. 1983]
Discusses the problems and methods of determining the integrated electron density in the plasmasphere by receiving radio waves from ATS-6. (19 refs.)

116344 Natural waves excited in the ionospheric plasma by an intense radio wave. V.V.Vas'kov, A.V.Gurevich (Inst. of Terrestrial Magnetism, Ionosphere & Radio Wave Propagation, Acad. of Sci., USSR). *Geomagn. & Aeron. (USA)*, vol.22, no.3, p.309-13 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983]
A study is made of the behavior of trapped natural waves in a magnetized plasma (the z mode) which are excited in the ionosphere when an ordinary radio wave is scattered by small-scale, approximately steady-state inhomogeneities which are stretched out along the magnetic field. The propagation of the z mode from the excitation point to the region of the plasma resonance, the absorption of this mode, and its scattering by ionospheric inhomogeneities are studied. The z-mode energy flux in the region of the plasma resonance is determined. (6 refs.)

116345 Nature of the geophysical invariance in the lower part of the ionospheric F region. G.S.Ivanov-Kholdnyy, Yu.K.Kalinin (Inst. of Appl. Geophys., State Committee on Hydrometeorology, USSR). *Geomagn. & Aeron. (USA)*, vol.22, no.3, p.319-22 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983]
The geophysical-invariance properties established previously for the lower part of the ionospheric F region, which are manifested in a determinate variability of the parameters of the exponential electron density profiles approximating the experimental data, are explained as a consequence of aeronic processes which give rise to steeply and gently sloping density profiles. A superposition of such profiles in the height interval 15-300 km can explain the basic features of the experimental profiles of the electron density which have been obtained for the quiet and moderately disturbed ionosphere. (2 refs.)

116346 Calculation of the spatial and temporal distribution of the ionization maximum in the polar F₂ layer. A.S.Besprozvannaya, T.M.Krupitskaya, L.N.Makarova, V.M.Uvarov, K.E.Chernin, A.V.Shirochkov (Arctic & Antarctic Inst., State Committee on Hydrometeorology, USSR). *Geomagn. & Aeron. (USA)*, vol.22, no.3, p.323-8 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983]
A new model is offered for the spatial and temporal distribution of the ionization in the high-latitude F layer. This model was developed through a solution of the time-varying, one-dimensional continuity equation along a convection path. The structure of the convection paths is determined from a numerical model of the large-scale electric-field distribution which agrees with direct measurements. The calculated results are compared with experimental data. (13 refs.)

116347 Mathematical model for ionosphere-plasmasphere interactions. V.M.Polyakov, M.A.Koyen, L.D.Ryazanova, I.M.Sidorov, G.V.Khazanov (Inst. of Appl. Phys., Irkutsk State Univ., Irkutsk, USSR). *Geomagn. & Aeron. (USA)*, vol.22, no.3, p.332-6 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983]
An attempt is made to construct a self-consistent model for the ionosphere which does not depend on the choice of upper boundary conditions and which incorporates the interaction of the charged component of the ionospheric plasma with the neutral component. An effort is made to correctly take into account the heating sources which produce superthermal electrons from thermal electrons and the contribution of small neutral components to the energy balance in the ionosphere. (20 refs.)

116348 Frequency dependence of statistical properties of a decameter-band signal. I.S.Vsekhsvyatskaya, E.Z.Gorshkova (Inst. of Terrestrial Magnetism, Ionosphere & Radio Wave Propagation, Acad. of Sci., USSR). *Geomagn. & Aeron. (USA)*, vol.22, no.3, p.340-2 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983]
The frequency dependences of the statistical properties of a decameter-band signal, obtained by multifrequency oblique sounding along a radio path with length D=3000 km, are discussed. The frequency dependences of the energy scattering parameter β in the case of inhomogeneities with different scales and skewness and kurtosis coefficients on the depth of penetration of the wave into the ionosphere layer are derived. (6 refs.)

116349 Variations of the Doppler shift in frequency, angles of arrival and lateral deflections of short-wave signals at sunrise. M.F.Bayuklina, A.V.Dokuchayeva (Acad. of Sci., Kazakh SSR). *Geomagn. & Aeron. (USA)*, vol.22, no.3, p.343-6 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983]
A model experiment for purposes of study of the variations in the Doppler frequency shift f_d , the angles of arrival ϕ , and the lateral deflections β of a shortwave signal on single-hop mid-latitude paths in a three dimensionally inhomogeneous two-layer ionosphere at sunrise was performed. The time dependences of f_d , ϕ , and β were devised for paths with different orientation. The azimuthal asymmetry in these dependences is discussed. (7 refs.)

116350 Long-range propagation of radio waves from an emitter located in the ionosphere. S.M.Yefimuk, B.E.Lyanoy, V.A.Pakhotin (Univ. of Kaliningrad, Kaliningrad, USSR).

Geomagn. & Aeron. (USA), vol.22, no.3, p.347-9 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983]
Results of experimental investigations of long-range propagation of radio waves with the emitter situated in the ionosphere wave channel are presented. The possibility of selecting the direction of the probable reception of long range signals from the values of the gradients of the critical frequencies at the point of reception is demonstrated. The inapplicability of a selection criterion for optimum directions with the emitter situated in the ionospheric wave channel is demonstrated. (4 refs.)

116351 Investigation of the requirements on three-dimensional laminar models of the ionosphere in problems of propagation of shortwave radio waves. Yu.I.Nadezhnikov, M.A.Nikitin, V.G.Tokar' (State Univ. Kaliningrad, Kaliningrad, USSR).

Geomagn. & Aeron. (USA), vol.22, no.3, p.350-3 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983]
The general requirements imposed on the three-dimensional laminar models of the ionosphere in problems of propagation of shortwave radio waves are determined. The requirements are supported by specific calculations of paths for different conditions. (2 refs.)

116352 Heating of the cold geomagnetospheric plasma. I.V.Kovalevskiy (Inst. of Terrestrial Magnetism, Ionosphere & Radio Wave Propagation, Acad. of Sci., USSR).

Geomagn. & Aeron. (USA), vol.22, no.3, p.376-9 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983]
The energy characteristics of the plasma with energies from a few electron volts to hundreds of electron volts which have been observed in the outer plasmasphere and in the plasma trough can be explained in terms of a heating of the cold plasmaspheric plasma by an induced scattering of longitudinal ion cyclotron waves by cold ions and a Landau damping of oblique waves by thermal electrons. (10 refs.)

116353 Reconstruction of the three-dimensional current system from variations in the ground-level magnetic field for sloping lines of force. N.I.Gershenzon, A.L.Krylov (Inst. of Earth Phys., Acad. of Sci., USSR).

Geomagn. & Aeron. (USA), vol.22, no.3, p.384-7 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983]
Analytical solutions are derived for determining the variations in the magnetic field produced by the three-dimensional current system and for the inverse problem of reconstructing the electric field from the variations in the ground-level magnetic field. The calculations are carried out for the case of sloping lines of force and for a uniform ionospheric conductivity. For structures which are stretched out in the latitudinal direction the effect of the inclination angle I is minimized and take the form of a change proportional to $1/\sin I$ in the integral conductivity. In general, the inclination can have an arbitrarily large effect, even for small deviations of the magnetic field from the vertical. For this reason, the conventional approach of ignoring the sloping lines of force at high latitudes is not always justified. (9 refs.)

116354 Electric field behavior in various substorm phases according to balloon measurements. T.V.Kozelova, M.I.Pudovkin, I.A.Zhulin, L.L.Lazutin (Polar Geophys. Inst., Acad. of Sci., USSR).

Geomagn. & Aeron. (USA), vol.22, no.3, p.388-91 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983]
Electric field distributions in the ionosphere are constructed for various phases of a substorm from measurements of the field E on high-altitude balloons in the SAMBO-79 experiment. (16 refs.)

116355 Equatorial disturbance dynamo electric fields. B.G.Fejer, M.F.Larsen, D.T.Farley (School of Electrical Engng., Cornell Univ., Ithaca, NY, USA).

Geophys. Res. Lett. (USA), vol.10, no.7, p.537-40 (July 1983).
F-region vertical drift data from Jicamarca, Peru, show that equatorial east-west electric fields are sometimes perturbed 16-24 hours after the onset of geomagnetic storms. These disturbance dynamo electric fields, which must be caused primarily by the action of neutral winds at low and middle latitudes, decrease and sometimes even reverse the quiet time electric field pattern during both daytime and nighttime. The long delay excludes the possibility that gravity waves are responsible and suggests that the thermospheric circulation is disturbed. The data also show that after some storms there are no such delayed disturbances, a fact which may be due to the longitudinal structure of the disturbances at high latitudes and/or that only very strong storms can produce major thermospheric perturbations that extend to middle and low latitudes. (14 refs.)

116356 Ionospheric conditions affecting the evolution of equatorial plasma depletions. D.N.Anderson, M.Mendillo (Dept. of Astron., Boston Univ., Boston, MA, USA).

Geophys. Res. Lett. (USA), vol.10, no.7, p.541-4 (July 1983).
Model studies have been carried out to specify the ionospheric conditions and electrodynamical processes required to describe the geometry of westward tilting and bifurcating equatorial plasma depletions inferred from airglow imaging measurements taken on Ascension Island in early 1981. The results indicate that if the westward tilts are to be associated with eastward plasma drifts that decrease with altitude above the F peak, this shear must be set up by a zonal wind pattern of decreasing speed at increasing distances from the equator. Below the peak, calculations of flux tube integrated Pedersen conductivity, including both E and F region contributions, are in agreement with the simulations of Zalesak et al. (1982) that show bifurcated depletions to be associated with a mild gradient in the bottomside conductivity profile. (20 refs.)

116357 Characteristics of two types of beam plasma discharge in a laboratory experiment. R.W.Boswell, P.J.Kellogg (Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia).

Geophys. Res. Lett. (USA), vol.10, no.7, p.565-8 (July 1983).
Experiments on the Beam Plasma Discharge (BPD) using an electron beam traveling along a magnetic field have been carried out in a large volume laboratory vacuum chamber. Two different types of BPD have been observed, and scaling laws for varying neutral gas pressure, axial magnetic field, interaction length and electron flux, deduced. The second type of BPD occurs when the beam current is increased well above the threshold for the first type. The transition from the first type to the second, like the ignition of the first, is distinguished by abrupt changes of luminosity, discharge diameter, and wave emission signature. (9 refs.)

116358 Photometric evidence of electron precipitation induced by first hop whistlers. J.H.Doolittle, D.L.Carpenter (STAR Lab., Stanford Univ., Stanford, CA, USA).

Geophys. Res. Lett. (USA), vol.10, no.8, p.611-14 (1983). (American Geophysical Union Chapman Conference on Waves in Magnetospheric Plasma, Kona Coast, HI, USA, 7-11 Feb. 1983).
Electron precipitation events induced by discrete VLF whistler mode waves have previously been detected by photometers at Siple Station, Antarctica. This paper presents the first observations of ionospheric optical emissions correlated with VLF waves at the conjugate location, near Roberval, Quebec. (11 refs.)

116359 The modulated precipitation of radiation belt electrons by controlled signals from VLF transmitters. W.L.Imhof, J.B.Reagen, H.D.Voss, E.E.Gaines, D.W.Datlowe, J.Mobilia (Lockheed Palo Alto Res. Lab., Palo Alto, CA, USA), J.A.Helliwell, U.S.Inan, J.Katsufurakis, R.G.Joier.

Geophys. Res. Lett. (USA), vol.10, no.8, p.615-18 (1983). (American Geophysical Union Chapman Conference on Waves in Magnetospheric Plasma, Kona Coast, HI, USA, 7-11 Feb. 1983).
Reports the detection of the precipitation of radiation belt electrons by the controlled injection of signals from the US Navy VLF transmitters at Cutler, Maine (NAA) or at Annapolis, Maryland (NSS) modulated in a 3s ON/2s OFF format. During each of these events the fluxes of precipitating electrons were observed repeatedly to display a characteristic time behavior with respect to the transmitter modulation: a relatively slow rate of increase after start of the ON period leading to a maximum about 2 seconds later. Details of this consistent pattern and the statistics of occurrence of modulation events are presented along with comparisons of the absolute fluxes of precipitating electrons observed during normal transmitter operation with those recorded when one of the transmitters was modulated. (11 refs.)

116360 The mass dependence of wave particle interactions as observed with the ISEE-1 energetic ion mass spectrometer. R.D.Sharp, W.Lennartsson, W.K.Peterson, E.Ungstrup (Lockheed Palo Alto Res. Lab., Palo Alto, CA, USA).

Geophys. Res. Lett. (USA), vol.10, no.8, p.651-4 (1983). (American Geophysical Union Chapman Conference on Waves in Magnetospheric Plasma, Kona Coast, HI, USA, 7-11 Feb. 1983).
Simultaneous measurements of the O^+ and H^+ distributions from two transverse acceleration events in the high altitude auroral ionosphere are presented. The data were acquired from the energetic ion mass spectrometer on the ISEE-1 satellite, in the dusk sector, on auroral field lines ($L \approx 8.9$), at geocentric radial distances of $\sim 3 R_E$. Temporal and/or spatial fluctuations during the measurement cycle resulted in some scatter of the data points, but the transverse velocity distributions are reasonably well represented by Maxwellians at energies in the few hundred eV range. The transverse temperatures were about 60 eV in both cases and no O^+ significant differences were observed between the temperatures of the O^+ and H^+ . The flux intensities of the two ion species were also generally comparable. (28 refs.)

116361 Reflection of MHD-waves in the Pc 4-5 period range at ionospheres with non-uniform conductivity distributions. K.H.Glassmeier (Inst. fur Geophys., Univ. Munster, Munster, Germany).

Geophys. Res. Lett. (USA), vol.10, no.8, p.678-81 (1983). (American Geophysical Union Chapman Conference on Waves in Magnetospheric Plasma, Kona Coast, HI, USA, 7-11 Feb. 1983).
A theoretical model is proposed which describes the influence of non-uniform ionospheric conductivity distributions on ULF-pulsations. The assumption is made that the field-aligned currents carried out by the wave-field are closed by polarisation currents in the magnetosphere and by the irrotational part of the ionospheric currents. Current continuity at the magnetosphere-ionosphere boundary provides for a differential equation for the reflected electric field for arbitrary non-uniform conductivity distributions. A solution of the equation for two simple but realistic conductivity and electric field distributions shows that anomalies in the reflected electric field can occur which are confined to the conductivity gradient region. Under certain conditions also double peak electric field disturbances have been obtained. (9 refs.)

116362 Simultaneous geomagnetic and radio auroral observations. C.Haldoupis (Inst. of Phys., Univ. of Oslo, Oslo, Norway), E.Nielsen.

J. Atmos. & Terr. Phys. (GB), vol.45, no.8-9, p.543-56 (Aug.-Sept. 1983).
A correlative study was carried out using ground magnetometer data and STARE radar auroral data from an ionospheric region above the magnetometer station. The observations are from a reasonably disturbed period which covers the evening, midnight and morning sectors. A close relationships was found to exist between the long period geomagnetic and backscatter amplitude variations which are mainly controlled by conductivity modifications in the E-region. The irregular P_1 pulsation activity is positively related to enhancements in backscatter intensity. It is suggested that the major source of irregular P_1 -noise is the auroral Hall current perturbed by electron density fluctuations. (21 refs.)

116363 Annual and semiannual periodicities in NmF_2 in the African sector. M.C.Isherwood, L.B.Kolawole (Dept. of Phys., Univ. of Ife, Ile-Ife, Nigeria).

J. Atmos. & Terr. Phys. (GB), vol.45, no.8-9, p.557-62 (Aug.-Sept. 1983).
The annual and semiannual periodicities in amplitude and phase of NmF_2 have been computed for eleven stations in the African sector. The computations are for the sunspot maximum years of 1958 and 1968 and the solar minimum of 1964. Four patterns of diurnal behaviour in NmF_2 are discerned for different dip latitudes. The annual amplitude component is small in all sectors at low dip latitudes; however, at higher latitudes it is much larger in the northern hemisphere than the southern hemisphere at sunspot maximum. The annual phase occurs generally in December/January whilst the semiannual phase is in October/April. (11 refs.)

116364 Experimental results on satellite scintillations due to field-aligned irregularities at mid-latitudes. K.Sinno, H.Minakoshi (Radio Res. Labs., Tokyo, Japan).

J. Atmos. & Terr. Phys. (GB), vol.45, no.8-9, p.563-7 (Aug.-Sept. 1983).
Experiments using multi-station networks receiving signals from the VHF beacon of a geostationary satellite have been carried out in order to clarify the geometrical factor involved in ionospheric intensity scintillations due to field-aligned irregularities. The characteristics of scintillation observed in the daytime agree with the theoretical value expected for weak diffractive scattering by ionospheric irregularities with an elongation of 10 along the geomagnetic field. However, those in the night-time show much marked enhancement along the field-line due to strong refractive scattering by irregularities having the same elongation. (17 refs.)

116365 Determination of the latitude of Sq focus and its relation to the electrojet variations. M.Rajaram (Indian Inst. of Geomagnetism, Bombay, India).

J. Atmos. & Terr. Phys. (GB), vol.45, no.8-9, p.573-8 (Aug.-Sept. 1983).
The latitude of the Sq focus is determined analytically using the method of natural orthogonal components Geomagnetic data along the 75°E meridian

have been used. The day-to-day variations of the latitude of the Sq focus thus determined are very highly correlated with the electrojet enhancements. The strength of the normal Sq field and the electrojet field are not correlated. It appears that as the Sq focus moves towards the equator the entire current pattern bodily moves equatorwards with an increased current concentration in the electrojet region. (21 refs.)

116366 The accuracy of simple methods for determining the height of the maximum electron concentration of the F2-layer from scaled ionospheric characteristics. J.R.Dudeney (British Antarctic Survey, NERC, Cambridge, England).

J. Atmos. & Terr. Phys. (GB), vol.45, no.8-9, p.629-40 (Aug.-Sept. 1983). Techniques for estimating hmF_2 for $M(3000)F_2$ are reviewed with particular stress put upon those in which the effects of underlying ionization are accounted for by a correction (ΔM) to $M(3000)F_2$, formulated in terms of the ratio foF_2/foE . The factors considered are the dependence upon ymF_2 , the importance of the underlying layer shape (in particular the significance of the F_1 -ledge), and the influence of the geomagnetic field. It is demonstrated that the correction technique relies upon ymF_2 being a direct polynomial function of hmF_2 . (14 refs.)

116367 A scattering theory of VHF transequatorial propagation. J.A.Ferguson (Naval Ocean Systems Center, San Diego, CA, USA), H.G.Booker.

J. Atmos. & Terr. Phys. (GB), vol.45, no.8-9, p.641-57 (Aug.-Sept. 1983). Transequatorial propagation in the VHF band can occur when the ionosphere does not support such propagation by refraction. The phenomenon is closely associated with the scattering phenomenon known as spread-F. A model of scattering from long curve irregularities, aligned along the Earth's magnetic field, is developed. The theory leads to the conclusion that single partial reflections from field-aligned irregularities are all that are required to explain observations of VHF transequatorial propagation, and that multiple total reflections in a field-aligned duct are not needed. (27 refs.)

116368 Dynamics of artificial plasma clouds in 'Spolokh' experiments: movement pattern. N.I.Dzubenko (Phys. Dept., Kiev State Univ., Kiev, USSR), A.P.Zhilinsky, I.A.Zhulin, I.S.Ivchenko, A.A.Molotai, V.A.Rozhinsky, Yu.Ya.Ruzhin, V.S.Skomarovskiy, L.D.Tsandin.

Planet. & Space Sci. (GB), vol.31, no.8, p.849-58 (Aug. 1983). The data on space location and movement of the high-density ($n_e \gg n_b$) barium clouds injected at midlatitudes during the 'Spolokh-1' and 'Spolokh-2' shaped-charge experiments in the ionosphere are presented. At the initial stage, the neutral and ionized components move together at a speed of the neutral wind. An outflow of ions in the form of a stratified tail was also observed. Its movement is interpreted. (17 refs.)

116369 Auroral beam/plasma interaction observed directly. M.P.Gough (School of Math. & Phys. Sci., Univ. of Sussex, Brighton, England), A.Urban.

Planet. & Space Sci. (GB), vol.31, no.8, p.875-83 (Aug. 1983). On 9 December 1981 rocket borne energetic electron spectrometers measured energy spectra over a stable auroral arc. An associated microprocessor accurately timed the electron detection pulses to calculate auto-correlation functions for each of 16 energy levels between 300 eV and 19 keV. The observation provides the most direct measurement of the auroral beam/ionospheric plasma interaction to date. It provides hard experimental evidence to support the theories which have previously predicted that a major wave-particle interaction responsible for the evolution of the auroral distribution function occurs at heights where the upper hybrid frequency equals twice the local electron gyrofrequency. (23 refs.)

116370 Electron precipitation equatorward of the auroral oval and the mantle aurora in the midday sector. C.-I.Meng (Appl. Phys. Lab., Johns Hopkins Univ., Laurel, MD, USA), S.-I.Akasofu.

Planet. & Space Sci. (GB), vol.31, no.8, p.889-99 (Aug. 1983). In the midday sector, the hard electron precipitation and the associated patchy aurora at geomagnetic latitude $\sim 65^\circ$ are the only auroral features (≤ 20 keV) located equatorward of the dayside auroral oval during intense and moderately disturbed geomagnetic conditions. The authors identify the patchy luminosity in the midday and late morning sectors as the active mantle aurora. The precipitating electrons reside mostly at energies greater than several keV with an energy flux of ≥ 0.1 erg $\text{cm}^{-2} \text{s}^{-1} \text{sr}^{-1}$ during geomagnetic active periods. This hard precipitation occurs in a region which is asymmetric in LT with respect to the noon meridian. The region extends from the morning sector to only early afternoon (13-14 MLT) along the geomagnetic latitude circle of about $65-70^\circ$. (27 refs.)

116371 Intense night-time equatorial radio scintillations by sporadic E layers. R.G.Rastogi (Indian Inst. of Geomagnetism, Bombay, India).

Proc. Indian Acad. Sci. Earth & Planet. Sci., vol.92, no.1, p.37-43 (March 1983). [received: Sept. 1983] Almost saturated scintillations of radio beacons from geostationary satellites received at an equatorial station during the night have been shown to occur even during complete absence of spread F on the vertical incidence ionograms at the same location. These scintillation events were observed when the ionograms showed the blanketing type of sporadic E layers simultaneously at different heights. It is suggested that strong equatorial radio wave scintillations during the night-time are caused by multiple scattering between different levels of large plasma density gradients in the F or sometimes in the E regions of the ionosphere. (21 refs.)

116372 Indices of equatorial electrojet and counter-electrojet in the Indian region: evolution of the indices and their authenticity. B.N.Bhargava, B.R.Arora, N.S.Sastri (Indian Inst. of Geomagnetism, Bombay, India).

Proc. Indian Acad. Sci. Earth & Planet. Sci., vol.92, no.1, p.45-55 (March 1983). [received: Sept. 1983] Indices based on the difference in the horizontal field strength between a station under the electrojet axis (Trivandrum) and a station outside the jet influence (Alibag) can be used to characterize each day of the year. The distribution of monthly, seasonal and annual electrojet and counter-electrojet frequencies at Trivandrum during the 20-year period 1959-78 is examined. (27 refs.)

116373 Attenuation of high-frequency radio waves in the low-ionosphere at high latitudes when the ionosphere is artificially perturbed by powerful radio emission. S.I.Martynenko, V.A.Misyura, L.A.Piven', V.G.Simov, L.F.Chernogor, A.S.Shemet.

Radiophys. & Quantum Electron. (USA), vol.26, no.1, p.1-4 (Jan. 1983). Translation of: *Izv. VUZ Radiofiz. (USSR)*, vol.26, no.1, p.3-6 (Jan. 1983). [received: Sept. 1983]

The authors have discovered a significant (up to 60% and more) attenuation of the intensity of high frequency probe signals received from the low night-time ionosphere at high altitudes. The reason for the attenuation is that the ionosphere is being influenced by powerful shortwave radio emission. The experiment was performed in the region of the city of Monchegorsk during February-March, 1978. (4 refs.)

116374 Notes on the auroral electrojet indices. Y.Kamide (NOAA Space Environment Lab., Boulder, CO, USA).

Rev. Geophys. & Space Phys. (USA), vol.21, no.7, p.1647-56 (Aug. 1983). The authors examined the limitations of the auroral electrojet indices as an accurate quantitative measure of the auroral electrojets and of magnetospheric substorms. Such limitations should be kept in mind in studying individual substorms, the correlation with solar wind parameters, etc., particularly because the accuracy of the AE index decreases for $AE < \sim 250$ nT. A few suggestions are made to improve the present indices, which can be implemented efficiently when digital outputs become available from all the observatories contributing to the electrojet indices. (48 refs.)

116375 A study of global structures of the ionosphere using modelling methods. T.Tanaka.

Rev. Radio Res. Lab. (Japan), vol.28, no.147, p.521-40 (Sept. 1982). In Japanese. [received: Sept. 1983]

Diurnal variations of the thermosphere and the ionosphere are calculated by solving simultaneous time-dependent continuity equations for O^+ , H^+ , O_2^+ and NO^+ ions, equations of motion for ions and neutrals, the heat conduction equations for electrons and ions, and photoelectron transport equations. Equations are solved in the region from 120 km altitude to the equatorial plane along the field line, therefore coupling processes between the ionosphere and the protonosphere are taken into account. In addition, microprocesses controlling the energy flow in the thermosphere are treated precisely to evaluate the heating efficiency of EUV radiations. It is shown that the results calculated for the structure of the ionosphere based on MSIS (mass spectrometer and incoherent scatter data) atmospheric model show good agreements with observations. (35 refs.)

116376 A new solar index which leads to improved foF2 predictions using the CCIR Atlas. R.Y.Liu, P.A.Smith, J.W.King (Rutherford Appleton Lab., Chilton, England).

Telecommun. J. (Engl. Ed.) (Switzerland), vol.50, no.8, p.408-14 (Aug. 1983). A new index of solar activity which leads to more accurate ionospheric F2-layer critical frequency predictions, and which is intended for use with the 'CCIR Atlas of ionospheric characteristics', has been developed. An explanation of this new index, the 'global effective sunspot number', is presented together with results which indicate the extent to which the predictions of monthly median F2-layer critical frequencies are improved when it is used. (for planets, see 96.30)

116377 Trapping and loss boundaries for particles in the external radiation belt due to the magnetospheric magnetic field. V.A.Sergeev, N.A.Tsyganenko. *Cosmic Res. (USA)*, vol.20, no.6, p.612-16 (Nov.-Dec. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.6, p.866-71 (Nov.-Dec. 1982). [received: Sept. 1983]

A model of the quiet magnetospheric magnetic field is used to calculate the drift shells and rates of loss of high energy particles owing to pitch-angle scattering of particles crossing the equatorial current sheet on the night side. Numerical calculations of the magnitude of the angular scattering are presented. Losses in the external closed drift shells have a characteristic time ~ 1 h for high energy electrons and much longer for protons. (17 refs.)

- 116378** Positions of sources of sporadic radio emission in the frequency range 0.7-2.3 MHz, observed from the Elektron-2 and Elektron-4 satellites. G.M.Artem'eva, N.A.Mityakov, V.V.Pisareva, A.F.Tarasov. *Cosmic Res. (USA)*, vol.20, no.6, p.645-9 (Nov.-Dec. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.6, p.907-12 (Nov.-Dec. 1982). [received: Sept. 1983]
The space-time distribution of the intensity of sporadic radio emission of the Earth's magnetosphere in the frequency range 0.7-2.3 MHz is investigated. Radio emission sources are located on the nightside hemisphere at geocentric distances $R \sim (2-6)R_E$ and invariant latitudes $\sim 60-75^\circ S$. On the dayside hemisphere the radio emission sources are more often located in the region of the dayside polar cusp, and an indistinct maximum at 1110 kHz is also noted at invariant latitudes $66-76^\circ S$ and $R \sim (5-8)R_E$. (10 refs.)
- 116379** Charged-particle acceleration at a tangential discontinuity in the hydrodynamic velocity of a plasma in space. E.G.Berezhko (Inst. of Space Phys. Res. & Aeronomy, Acad. of Sci., USSR). *Geomagn. & Aeron. (USA)*, vol.22, no.3, p.303-5 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983]
As charged particles are scattered by inhomogeneities of the magnetic field in a collisionless plasma, and as they repeatedly cross a tangential discontinuity in the hydrodynamic velocity of the plasma, they can acquire energy. An expression is derived for the rate at which energy is acquired. The steady-state energy distribution of the accelerated particles is derived. This acceleration mechanism may be important in shaping the energy distributions of the particles in the plasma sheet in the earth's magnetosphere. (7 refs.)
- 116380** Motion of fast particles in the geomagnetic field. E.V.Gorchakov, V.I.Severinov, M.V.Ternovskaya (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR). *Geomagn. & Aeron. (USA)*, vol.22, no.3, p.306-8 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983]
Certain aspects of the motion of fast charged particles, for which the adiabatic approximation does not hold, in a dipole field are examined. The study is based on an analysis of numerically calculated proton paths. This path analysis yields estimates of the energies at which the bounce points of particles injected from low altitudes can lie above the injection point. (6 refs.)
- 116381** Relation between the Alfvén velocity and phase delays in a one-dimensionally inhomogeneous plasma. M.B.Gokhberg, A.L.Krylov, A.E.Lifshits (Inst. of Phys. of Earth, Acad. of Sci., USSR). *Geomagn. & Aeron. (USA)*, vol.22, no.3, p.337-9 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983]
Equations that describe the relation between the Alfvén velocity and phase delays are derived. An equation that permits solving the inverse problem and finding the Alfvén velocity from the known phase delays is obtained. (6 refs.)
- 116382** Interpolation equation for whistlers. A.V.Gul'yel'mi (Inst. of Phys. of Earth, Acad. of Sci., USSR). *Geomagn. & Aeron. (USA)*, vol.22, no.3, p.354-6 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983]
An interpolation equation is derived for whistlers. It describes the behavior of the dispersion curve over a wide range of frequencies ($0 < \omega < \Omega_e \Omega_i$) and the entire range of angles of propagation ($0 \leq \theta \leq \pi/2$). The equation is used to estimate the parameters of the trajectory of unchanneled whistlers in the meridional plane of the magnetosphere. (11 refs.)
- 116383** Helio-magnetic cycle in geomagnetic activity. N.S.Zaretskiy (Inst. of Space Phys. & Aeronomy, Acad. of Sci., USSR). *Geomagn. & Aeron. (USA)*, vol.22, no.3, p.372-5 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983]
The differential relations between the levels of geomagnetic activity during the even and odd eleven year solar cycles are analyzed on the basis of long time series of various characteristics of this activity. It is shown that the 22-year variation in the disturbance of the Earth's magnetic field is present in all phases of the sunspot-generating cycle. The helio-magnetic cycle of the integral amplitude of the activity is decomposed into two components with approximately opposite phases, corresponding to moderate and (very) large disturbances. (15 refs.)
- 116384** Electric field in the magnetospheric tail at various geomagnetic activity levels and at various strengths of E_y in the solar wind. M.I.Pudovkin, V.V.Osipov, M.A.Shukhtina, S.A.Zaytseva (Inst. of Phys., Leningrad State Univ., Leningrad, USSR). *Geomagn. & Aeron. (USA)*, vol.22, no.3, p.380-3 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983]
The large-scale electric field in the inner tail of the magnetosphere is evaluated from the time by which the variations in the AE index lag behind those in the interplanetary electric field. The electric field in the tail increases with increasing magnetic activity. The electric field of the solar wind penetrates at essentially full strength into the magnetosphere during a strong magnetic disturbance, while under magnetically quiet conditions it is substantially weakened. (13 refs.)
- 116385** Properties of the convective flow of magnetospheric plasma. I.M.Alekseyeva (Inst. of Nuclear Phys., Moscow State Univ., Moscow, USSR). *Geomagn. & Aeron. (USA)*, vol.22, no.3, p.392-4 (1982). Translation of: *Geomagn. & Aeron. (USSR)*, vol.22, no.3 (1982). [received: Sept. 1983]
A possible Hall-effect mechanism is discussed for the magnetohydrodynamic instability of a convective flow in the magnetosphere. The ohmic conductivity of the magnetospheric plasma is estimated to be $\sim 3 \times 10^3 \text{ s}^{-1}$. (15 refs.)
- 116386** Modeling of interactions of artificially released lithium with the Earth's bow shock. R.B.Decker, A.T.Y.Lui, S.M.Krimigis (Appl. Phys. Lab., Johns Hopkins Univ., Laurel, MD, USA). *Geophys. Res. Lett. (USA)*, vol.10, no.7, p.525-8 (July 1983).
A numerical simulation is used to predict the interaction between the Earth's bow shock and lithium to be released in the solar wind during the Active Magnetospheric Particle Tracer Explorers program in 1984. Based on the simulation results for a release near the subsolar point, it is recommended that a favorable release condition is when the garden-hose angle of the interplanetary magnetic field exceeds about 60 to 70° so that the transmission of Li^+ ions through the bow shock is optimized. The model also predicts that the Li^+ is 'shock-drift' accelerated at the bow shock. The energy gain of Li^+ ions is on the average less for the transmitted particles (below a factor of about 4) than for the reflected particles (below a factor of about 16). (12 refs.)
- 116387** Shape of the magnetosphere. C.C.Wu (Dept. of Phys., Univ. of California, Los Angeles, CA, USA). *Geophys. Res. Lett. (USA)*, vol.10, no.7, p.545-8 (July 1983).
The shape of the magnetosphere has been studied by using a global MHD model of the magnetosphere. It is found that MHD and the Chapman-Ferraro models agree in total magnetopause current distributions, but that the MHD model presents a very different physical picture from that of the Chapman-Ferraro model. In the MHD model with $B_{IMF}=0$ or northward, the cusp

is not exposed directly to the solar wind because the dayside magnetic field lines drape around the nightside magnetosphere. Furthermore, in the MHD model a current sheet exists above the cusp region. (10 refs.)

- 116388** On the injection boundary model and dispersing ion signatures at near-geosynchronous altitudes. R.J.Strangeway, R.G.Johnson (Lockheed Palo Alto Res. Lab., Palo Alto, CA, USA). *Geophys. Res. Lett. (USA)*, vol.10, no.7, p.549-52 (July 1983).
A simple particle drift model is used to investigate the applicability of the injection boundary concept to the ion dispersion event observed on March 22 (day 81), 1979. The model consists of a dipole magnetic field with a uniform cross-tail electric field plus a corotation field. A full spectrum of particles from 100 eV to 32 keV is injected at the $K_p=6$ —Mauk and McIlwain injection boundary at the time of substorm onset on this day (1100 UT). A new approach is presented for displaying the model-produced ion drift trajectories to make the large scale spatial characteristics of the evolving energy distributions easier to envision and to facilitate the comparison of the model results with experimental observations. (12 refs.)
- 116389** Heating of heavy ions on auroral field lines. K.-I.Nishikawa, H.Okuda (Plasma Phys. Lab., Princeton Univ., Princeton, NJ, USA), A.Hasegawa. *Geophys. Res. Lett. (USA)*, vol.10, no.7, p.553-6 (July 1983).
Heating of heavy ions is studied in the presence of a large amplitude hydrogen cyclotron wave. A three wave decay process, in which a large amplitude pump hydrogen cyclotron wave decays into a daughter hydrogen cyclotron wave and a low frequency oxygen cyclotron wave, is studied theoretically and by numerical simulations. The numerical simulations show a decay instability resulting in strong heating of both the oxygen ions and the hydrogen ions. In particular, the high energy tail of the oxygen ions is observed in the perpendicular distribution. (18 refs.)
- 116390** The relationship of total Birkeland currents to the merging electric field. P.F.Bythrow, T.A.Potemra (Appl. Phys. Lab., Johns Hopkins Univ., Laurel, MD, USA). *Geophys. Res. Lett. (USA)*, vol.10, no.7, p.573-6 (July 1983).
The Sun-synchronous orbit of the MAGSAT spacecraft has provided a new means to study the temporal response of large-scale Birkeland currents to variations in interplanetary parameters. The authors examined magnetic field data from 32 MAGSAT crossings of the northern auroral zone selected from 6 days in November and December, 1979. On each day at least 5 consecutive orbits were studied. The objectives of this study were to examine variations in the gross features of magnetic field disturbances observed on consecutive MAGSAT orbits, to investigate their relationship to interplanetary quantities, to estimate the total Birkeland current magnitude and correlate this current with various IMF parameters, and to study the relationship between the total Birkeland current and the inferred merging electric field E_M . (23 refs.)
- 116391** Ion acceleration in the supauroral region: a Monte Carlo model. J.M.Retterer (Space Data Analysis Lab., Boston Coll., Chestnut Hill, MA, USA), T.Chang, J.R.Jasperse. *Geophys. Res. Lett. (USA)*, vol.10, no.7, p.583-6 (July 1983).
The acceleration of ions and the formation of ion conics in the supauroral region is studied using a model which includes the effects of wave-particle interaction, the inhomogeneous geomagnetic field, and field-aligned potential drops. Particle acceleration by interaction with turbulence is treated as a random process in a simplified way using a Monte Carlo technique. Applying the model to ion acceleration by lower-hybrid turbulence between 1000 and 5000 km, it was found that the observed amplitudes of the waves are sufficient to accelerate ions to the energies often found in conics. (20 refs.)
- 116392** Electron acceleration by Landau resonance with whistler mode wave packets. D.A.Gurnett, L.A.Reinleitner (Dept. of Phys. & Astron., Univ. of Iowa, Iowa City, IA, USA). *Geophys. Res. Lett. (USA)*, vol.10, no.8, p.603-6 (1983). (American Geophysical Union Chapman Conference on Waves in Magnetospheric Plasma, Kona Coast, HI, USA, 7-11 Feb. 1983).
Observations of electrostatic waves associated with whistler mode chorus emissions provide evidence that electrons are being trapped by Landau resonance interactions with the chorus. The trapping, acceleration and escape of electrons in Landau resonance with a whistler mode wave packet are discussed. It is shown that acceleration can occur by both inhomogeneous and dispersive effects. The maximum energy gained is controlled by the points where trapping and escape occur. Large energy changes are possible if the frequency of the wave packet or the magnetic field strength increases between the trapping and escape points. Various trapping and escape mechanisms are discussed. (15 refs.)
- 116393** Computer simulation studies of VLF triggered emissions deformation of distribution function by trapping and detrappping. H.Matsumoto (Radio Atmospheric Sci. Center, Kyoto Univ., Kyoto, Japan), Y.Omura. *Geophys. Res. Lett. (USA)*, vol.10, no.8, p.607-10 (1983). (American Geophysical Union Chapman Conference on Waves in Magnetospheric Plasma, Kona Coast, HI, USA, 7-11 Feb. 1983).
A simulation study of VLF triggered emissions has been carried out in order to investigate quantitative changes of the velocity distribution function of resonant electrons caused by a combined action of nonlinear phase-trapping and geomagnetic inhomogeneity. It is a counterpart of the analytic theory proposed by Roux and Pellat (1978). (10 refs.)
- 116394** Observations of VLF transmitter-induced depletions of inner zone electrons. A.L.Vampola (Space Sci. Lab., Aerospace Corp., Los Angeles, CA, USA). *Geophys. Res. Lett. (USA)*, vol.10, no.8, p.619-22 (1983). (American Geophysical Union Chapman Conference on Waves in Magnetospheric Plasma, Kona Coast, HI, USA, 7-11 Feb. 1983).
Examines the relative rates of pitch-angle diffusion versus radial diffusion for electrons in the interval $2 > L > 1.5$. The result is that pitch-angle diffusion lifetimes due to interactions with the VLF waves are much shorter than the radial diffusion rate. Thus, the outer edge of the inner zone is controlled by, and is probably the result of, interactions with waves from ground-based VLF transmitters. (10 refs.)
- 116395** Observations on GEOS-1 of whistler mode turbulence generated by a ground-based VLF transmitter. T.Neubert (Danish Space Res. Inst., Lyngby, Denmark), F.Lefeuve, M.Parrot, N.Cornilleau-Wehrin. *Geophys. Res. Lett. (USA)*, vol.10, no.8, p.623-6 (1983). (American Geophysical Union Chapman Conference on Waves in Magnetospheric Plasma, Kona Coast, HI, USA, 7-11 Feb. 1983).
Signals from the NLK Jim Creek transmitter in Alaska at 18.60 and 18.65 kHz have been observed on GEOS-1. Data for one pass over Alaska on June 11, 1977, are presented. The peak amplitude of the signals is $\sim 5 \text{ pT}$ (0.6 mV/m), which is received when the satellite is close to exact conjugacy at 7500 km altitude. While the weaker signals received at some distance from conjugacy behave as expected from linear theory, the stronger signals received

closer to conjugacy have features which indicate that some non-linear process is active. (13 refs.)

116396 **Pc 1 pearl-electron interactions on the L=4.2 magnetic shell.** R.L.Arnoldy, R.L.Kaufmann (Space Sci. Center, Univ. of New Hampshire, Durham, NH, USA), L.J.Cahill, S.B.Mende. *Geophys. Res. Lett. (USA)*, vol.10, no.8, p.627-30 (1983). (American Geophysical Union Chapman Conference on Waves in Magnetospheric Plasma, Kona Coast, HI, USA, 7-11 Feb. 1983). A number of examples of auroral light bursts correlated with Pc 1 'pearl' wave packets have been recorded at Siple, Antarctica (L=4.2). The events are unique in that an individual light burst occurs at Siple not when the wave packet is recorded at Siple but rather when the wave is measured to be at the conjugate point over Roberval, Quebec. Although one can fit the observations to a model where ions are precipitated from an interaction region near the equator via cyclotron resonance, the number of ions required to produce the light and the above mentioned light burst-ULF wave phase relationship both make the precipitation of electrons a more plausible interpretation. (11 refs.)

116397 **Frequency gap formation in electromagnetic cyclotron wave distributions.** B.H.Mauk (Appl. Phys. Lab., Johns Hopkins Univ., Laurel, MD, USA). *Geophys. Res. Lett. (USA)*, vol.10, no.8, p.635-8 (1983). (American Geophysical Union Chapman Conference on Waves in Magnetospheric Plasma, Kona Coast, HI, USA, 7-11 Feb. 1983). Addresses in detail the structure of the gap near the helium cyclotron frequency observed within the statistical distribution of the frequencies of electromagnetic cyclotron waves encountered at synchronous altitudes. It is shown that, at most, two-thirds of the gap (the high frequency portion) results from linear dispersion effects. It is suggested that at least one-third of the gap (the low frequency portion) results from nonlinear, off-resonant absorption of the waves by means of near cyclotron resonance with singly charged helium ions. (13 refs.)

116398 **Drift boundaries and ULF wave generation near noon at geostationary orbit.** A.Korth, G.Kremser (Max-Planck-Inst. fur Aeronomie, Katlenburg Lindau, Germany), A.Roux, S.Perraut, J.-A.Sauvaud, J.-M.Bosqued, A.Pedersen, B.Aparicio. *Geophys. Res. Lett. (USA)*, vol.10, no.8, p.639-42 (1983). (American Geophysical Union Chapman Conference on Waves in Magnetospheric Plasma, Kona Coast, HI, USA, 7-11 Feb. 1983). Coordinated observations on board GEOS 2 of energetic particles (20 to 400 keV), plasma particles (300 eV to 20 keV), DC electric fields and ULF waves (0.2 to 10 Hz) at geostationary orbit reveal several occasions on which sharp increases in particle flux occurred near 1400 LT without any appreciable energy dispersion for ions at 90° pitch angle. The global electric field establishes boundaries that particles of given adiabatic invariants cannot penetrate. A change or reversal of the electric field moves these boundaries so as to permit their observation at GEOS 2. The waves may be compressional drift waves destabilized by plasma pressure gradients. The relationship between waves and gradients is discussed in detail for the event that occurred on August 17, 1978. (16 refs.)

116399 **Generation of Alfvén-ion cyclotron waves on auroral field lines in the presence of heavy ions.** R.L.Lysak (School of Phys. & Astron., Univ. of Minnesota, Minneapolis, MN, USA), M.A.Temerin. *Geophys. Res. Lett. (USA)*, vol.10, no.8, p.643-6 (1983). (American Geophysical Union Chapman Conference on Waves in Magnetospheric Plasma, Kona Coast, HI, USA, 7-11 Feb. 1983). Discusses the excitation of Alfvén-ion cyclotron waves in the presence of heavy ion species. The dispersion and growth of these waves in the presence of an electron beam are discussed. Wave spectra are computed using the local approximation and their dependence on various parameters is discussed. Finally, generation of ELF waves by the electron beam process is compared with the generation of the better known VLF hiss. (13 refs.)

116400 **Transfer of pulsation-related wave activity across the magnetopause observations of corresponding spectra by ISEE-1 and ISEE-2.** E.W.Greenstadi (Space Sci. Dept., TRW/STG, Redondo Beach, CA, USA), M.M.Mellott, R.L.McPherron, C.T.Russell, H.J.Singer, D.J.Knecht. *Geophys. Res. Lett. (USA)*, vol.10, no.8, p.659-62 (1983). (American Geophysical Union Chapman Conference on Waves in Magnetospheric Plasma, Kona Coast, HI, USA, 7-11 Feb. 1983). A comparison of power spectra of magnetic field data from ISEE-1 and -2 recorded simultaneously on both sides of the magnetopause shows that the power level inside the magnetosphere varies with the power level outside in the magnetosheath and suggests that the same frequencies are enhanced on the two sides of the boundary. Power levels are two to three orders of magnitude lower inside than outside the magnetosphere, indicating that wave energy is transmitted inside from the sheath, through a locally stable magnetopause. (16 refs.)

116401 **The rate of occurrence of dayside Pc 3,4 pulsations: the L-value dependence of the IMF cone angle effect.** C.T.Russell, J.G.Luhmann (Inst. of Geophys. & Planetary Phys., Univ. of California, Los Angeles, CA, USA), T.J.Odera, W.F.Stuart. *Geophys. Res. Lett. (USA)*, vol.10, no.8, p.663-6 (1983). (American Geophysical Union Chapman Conference on Waves in Magnetospheric Plasma, Kona Coast, HI, USA, 7-11 Feb. 1983). The normalized rate of occurrence of dayside Pc 3,4 pulsations from L=2.4 to 4.3 has a strong enhancement for low cone angles of the interplanetary magnetic field. When the angle of the IMF to the Earth-Sun-line is 15° or less the occurrence rate is 7-8 times the average rate at L=2.4 to 2.8 and 2.2 to 3.5 times the average rate at L=4 to 4.3. These waves disappear when the IMF is nearly at right angles to the Sun-Earth-line. The streamline geometry and its connection to the foreshock region is illustrated for a variety of IMF orientations using a simple approximation to the magnetosheath flow field. (33 refs.)

116402 **Plasma drift measurements with the electron beam experiment on GEOS-2 during long period pulsations on April 7, 1979.** H.Junginger, O.H.Bauer, G.Haerendel, F.Melzner (Max-Planck-Inst. fur Extraterrestrische Phys., Garching, Germany), B.Higel, E.Amata. *Geophys. Res. Lett. (USA)*, vol.10, no.8, p.667-70 (1983). (American Geophysical Union Chapman Conference on Waves in Magnetospheric Plasma, Kona Coast, HI, USA, 7-11 Feb. 1983). Illustrates the significance of sensitive electric field measurements inside the magnetosphere for the interpretation of long period magnetospheric pulsations. The electric field data presented have been measured by the electron beam experiment S-329, on ESA's geostationary satellite GEOS-2. The experiment measures the drift of 1.2 keV electrons injected by an electron gun perpendicular to the magnetic field. Drift velocities between 1 and 50 km/sec can be detected. (17 refs.)

116403 **Remote determination of the outer radial limit of stormtime Pc 5 wave occurrence using geosynchronous satellites.** J.N.Barfield, C.S.Lin (Dept. of Space Sci., Southwest Res. Inst., San Antonio, TX, USA). *Geophys. Res. Lett. (USA)*, vol.10, no.8, p.671-3 (1983). (American Geophysical Union Chapman Conference on Waves in Magnetospheric Plasma, Kona Coast, HI, USA, 7-11 Feb. 1983). Magnetic field data from the geostationary satellites GOES 2 and GOES 3 have shown the characteristics of stormtime Pc 5 waves to vary dramatically with local magnetic field inclination angle. To investigate this effect, data from GOES 2 and GOES 3 for the twelve-month period March 1979-February 1980 have been scanned. 105 Pc 5 events were observed at GOES 3, and 28 events at GOES 2. Using the GOES 3 Pc 5 events as a control set, the dependence of GOES 2 Pc 5 occurrence on the local magnetic field inclination angle is investigated. Further, using a simple partial ring current model to produce field distortion at GOES 2, the equivalent L value of GOES 2 is determined for each 10-minute interval during which Pc 5 waves were observed at both satellites. (4 refs.)

116404 **New observations of plasma vortices and insights into their interpretation.** E.W.Hones, J.Birn, S.J.Bame (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA), C.T.Russell. *Geophys. Res. Lett. (USA)*, vol.10, no.8, p.674-7 (1983). (American Geophysical Union Chapman Conference on Waves in Magnetospheric Plasma, Kona Coast, HI, USA, 7-11 Feb. 1983).

Two- and three-dimensional plasma measurements and three-dimensional magnetic field measurements made with the ISEE 1 and 2 satellites during sixteen plasma vortex occurrences in the magnetotail plasma sheet are used to develop a fuller description of the vortex phenomenon. The phase and energy propagation properties of the vortex waves are studied. (9 refs.)

116405 **Experimental modelling of satellite wakes in auroral arcs.** N.Wild (JAYCOR, San Diego, CA, USA), R.L.Stenzel, W.Gekelman. *Geophys. Res. Lett. (USA)*, vol.10, no.8, p.682-5 (1983). (American Geophysical Union Chapman Conference on Waves in Magnetospheric Plasma, Kona Coast, HI, USA, 7-11 Feb. 1983). Preliminary measurements have been made in a large laboratory discharge device configured to simulate plasma wake phenomena. A large relative electron drift impinging on a nonconducting disc gives rise to a perturbed density structure downstream, as well as a reflected beam of electrons upstream. Velocity distribution measurements were made using a novel analyzer with angular resolution. (18 refs.)

116406 **PiC magnetic pulsations and variations of the ionospheric electric field and conductivity.** J.Leinonen, J.Kangas (Dept. of Phys., Univ. of Oulu, Oulu, Finland), A.V.Kustov, G.S.Stepanov, M.V.Uspensky. *J. Atmos. & Terr. Phys. (GB)*, vol.45, no.8-9, p.579-85 (Aug.-Sept. 1983). The sources of PiC magnetic pulsations are investigated by using ground-based geomagnetic and radar auroral data. It is shown that one part of the magnetic pulsation intensity is due to electric field variations in the ionosphere whereas another part originates in conductivity variations. It is also shown that pulsations of radar auroral intensity are correlated with conductivity variations. (28 refs.)

116407 **The evolution of pearls in the Earth's magnetosphere.** V.A.Mazur, A.S.Potapov (Siberian Inst. of Terrestrial Magnetism, Ionosphere & Radio Wave Propagation, Acad. of Sci., Irkutsk, USSR). *Planet. & Space Sci. (GB)*, vol.31, no.8, p.859-63 (Aug. 1983). Propagation and amplification of the pearls are analysed, with diffusion of wave trains in the k-space taken into account. The competition between the instability-induced amplification and the diffusion determines the values of magnetospheric parameters at which the appearance of pearls is possible. Diffusion is particularly large under conditions of a thin plasmopause and generation of pearls there is hindered or is not possible at all. (12 refs.)

116408 **The viscous-like magnetospheric convection and the length of the Earth's magnetotail.** P.Oberc (Astron. Inst., Univ. of Bonn, Bonn, Germany). *Planet. & Space Sci. (GB)*, vol.31, no.8, p.885-8 (Aug. 1983). An estimate of an upper bound on the length of the Earth's magnetotail is made under the assumptions that (1) the flux of open magnetic field lines in the polar caps never vanishes, and (2) the annihilation of the open field line flux is extremely low during magnetically quiet periods. These two basic assumptions are discussed and justified. It is found that the tail may be as long as 6000 Re (0.25 AU) after a prolonged quiet time period. On the other hand, the length of the shortest tail, which would result from a sequence of strong magnetospheric substorms, is estimated to be ~600 Re. These events are thus capable of shortening the tail by an order of magnitude. (19 refs.)

116409 **On the ring current energy injection rate.** L.C.Lee, G.Corrick, S.-I.Akasofu (Geophys. Inst., Univ. of Alaska, Fairbanks, AK, USA). *Planet. & Space Sci. (GB)*, vol.31, no.8, p.901-11 (Aug. 1983). Assuming that the formation of the ring current belt is a direct consequence of an enhanced cross-tail electric field and hence of an enhanced convection, the authors calculate the total ring current kinetic energy and the ring current energy injection rate as a function of the cross-tail electric field; the cross-tail electric field is assumed to have a step function-like increase. The loss of ring current particles due to recombination and charge-exchange is assumed to be distributed over the whole ring current region. (13 refs.)

116410 **Propagation characteristics of hydromagnetic waves in a cold plasma mixed with a hot plasma and right-hand polarized Pc 1 and Pc 5.** T.Namikawa, H.Hamabata, Y.Hosoya (Dept. of Phys., Osaka City Univ., Osaka, Japan), S.Matsushita. *Planet. & Space Sci. (GB)*, vol.31, no.8, p.913-21 (Aug. 1983). Propagation characteristics of hydromagnetic waves in a cold plasma mixed with a hot plasma under a uniform static magnetic field are investigated. The existence of cold plasma seriously affects the polarization properties of the waves. The results are applied to the interpretation of Pc 1 and Pc 5 with right-hand polarizations guided along the geomagnetic field line. (20 refs.)

116411 **On the effect of oblique disturbances on Kelvin-Helmholtz instability at magnetospheric boundary layers and in solar wind.** V.V.Mishin, A.G.Morozov (Siberian Inst. of Terrestrial Magnetism, Ionosphere & Radio Wave Propagation, Acad. of Sci., Irkutsk, USSR). *Planet. & Space Sci. (GB)*, vol.31, no.8, p.821-8 (Aug. 1983). Discusses the Kelvin-Helmholtz instability in the indissipative plasma with an external magnetic field. A detailed analysis is made of the results known from the approximation of a tangential discontinuity. The finiteness of the interface thickness effect is considered numerically at the arbitrary distribution of the density, velocity and magnetic field vectors inside this shear layer. The influence of plasma compressibility with an arbitrarily varying magnetic field is investigated. A comparison is made of the instability period on discontinuities in the solar wind, and at magnetospheric and plasmaspheric boundaries, with the range of geomagnetic pulsations. (18 refs.)

116412 Cosmic ray acceleration in supernova blast waves. H.Moraal, W.I.Axford (Max-Planck-Inst. fur Aeronomie, Katlenburg-Lindau, Germany). *Astron. & Astrophys. (Germany)*, vol.125, no.2, pt.1, p.204-16 (Sept. 1983). The solution of the test particle approximation of diffusive shock acceleration in plane, steady shocks with homogeneous up-and downstream media is used to determine cosmic ray spectra produced over the lifetime of an evolving blast wave of a supernova remnant. Adiabatic cooling and acceleration time cutoff effects are included in this solution and it is shown that very early strong shocks contribute negligibly to the resulting spectra. Injection of $T \approx 500$ eV particles at the shock produces power laws up to at least 3×10^{12} eV. These power law spectra are at least as hard as the source spectra typically used in Leaky Box propagation calculations. (23 refs.)

116413 The maximum energy of cosmic rays accelerated by supernova shocks. P.O.Lagage, C.J.Cesarsky (Service d'Astrophys., CENS, Gif-sur-Yvette, France). *Astron. & Astrophys. (Germany)*, vol.125, no.2, pt.1, p.249-57 (Sept. 1983). Evaluates the maximum energy E_{\max} that particles subjected to the process of diffusive shock acceleration can acquire during the lifetime of a supernova remnant. The rate of acceleration depends on the particle diffusion coefficient, which is determined by the level of hydromagnetic wave energy present at a scale comparable to the particle Larmor radius. The authors study the variations of the diffusion coefficient as a function of momentum, space, and time. (47 refs.)

116414 Implications of high-energy neutron observations from solar flares. R.Ramaty (Lab. for High Energy Astrophys., NASA Goddard Space Flight Center, Greenbelt, MD, USA), R.J.Murphy, B.Kozlovsky, R.E.Lingenfelter. *Astrophys. J. Lett. Ed. (USA)*, vol.273, no.1, pt.2, p.L41-5 (1 Oct. 1983). The time-dependent flux of high-energy neutrons discovered from the solar flare of 1980 June 21 provides a new technique for determining the total number and energy spectrum of accelerated protons and nuclei at the Sun. The implications of these observations on gamma-ray emission, relativistic electron spectrum and number, proton and electron energy contents, and the location of the interaction region are also examined. 116415 Measurement of the relative composition of the cosmic-ray iron group with Lexan polycarbonate. M.Casas, C.Biaxeras, A.Vidal-Quadras, M.Ortega, F.Fernandez (Dept. de Fisica Fundamental, Univ. Autonoma de Barcelona, Barcelona, Spain). *Astrophys. & Space Sci. (Netherlands)*, vol.94, no.2, p.371-81 (Aug. 1983). Relative abundances for the VH group ($20 \leq Z \leq 28$) at energies $E \leq 600$ MeV nucl^{-1} have been measured by means of the plastic detector Lexan. The stack was exposed to cosmic rays during a 82 hr balloon flight from Sioux Falls (South Dakota) at an average altitude equivalent to 4 g cm^{-2} of residual atmosphere. A total number of 1058 events have been analyzed, out of which 675 have been unambiguously identified. In spite of the poor mass resolution, a high abundance of ^{54}Fe indicates a nonstellar origin for cosmic iron. (39 refs.)

116416 Upper limit for mediation of baryon decay by slow magnetic monopoles. N.A.Porter, J.Clear, D.J.Fegan, G.C.MacNeill (Dept. of Phys., Univ. Coll., Dublin, Ireland), K.Gibbs, T.C.Weekes. *Nature (GB)*, vol.304, no.5927, p.606-7 (18 Aug. 1983). Rubakov (1981) and Callan (1983) have pointed out that grand unified theory magnetic monopoles will mediate the decay of baryons, and find that the cross-section for the process should be in the strong interaction region. Others find a smaller cross-section but agree that the process will occur. Severe constraints on the density of these monopoles in the Galaxy can be deduced from astrophysical arguments, but it is possible that local clustering due to the Sun may produce a greater density at the Earth, particularly for particles with $\beta < 10^{-4}$. Using an atmospheric Cerenkov detector the authors describe how to set a limit to the flux of monopoles on the Earth's surface at these low velocities. (15 refs.)

(see also 96.60 Solar physics)

116417 Theoretical non-Maxwellian particle velocity distribution functions for spherically symmetric solar wind-like plasma systems and consequences. S.Superman (Space Environment Lab., NOAA, Boulder, CO, USA), I.Weiss, M.Dryer. *Astrophys. J. (USA)*, vol.273, no.1, pt.1, p.363-73 (1 Oct. 1983). The authors consider spherically symmetric solar wind-like situations in which each plasma component, a (electrons, protons, alpha particles, etc.), is adequately described by the first seven moments of the velocity distribution function, f_a . For such situations a variational principle is used in order to derive the most probable velocity distribution function for each component a , f_a . (15 refs.)

116418 Observations of the solar wind with high time resolution. G.N.Zastenker, Yu.I.Ermolaev, S.Pinter, Z.Nemecsek, Ya.Shafrankova, A.B.Belikova, A.V.Leibov, V.I.Prokhorenko, A.E.Stefanovich, A.G.Bedrikov, B.T.Karimov. *Cosmic Res. (USA)*, vol.20, no.6, p.640-5 (Nov.-Dec. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.6, p.900-6 (Nov.-Dec. 1982). [received: Sept. 1983]. Describes the methods and first results of high rates of measurement of the solar wind using the Soviet-Czechoslovakian plasma spectrometer 'Monitor'. (8 refs.)

116419 Upstream electron oscillations and ion overshoot at an interplanetary shock wave. D.W.Potter, G.K.Parks (Univ. of Washington, Seattle, WA, USA). *Geophys. Res. Lett. (USA)*, vol.10, no.7, p.529-32 (July 1983). During the passage of a large interplanetary shock on 13 October 1981, the ISEE-1 and -2 spacecraft were in the solar wind outside of the upstream region of the bow shock. The high time resolution data of the University of California particle instruments pinpointed the expected electron spikes as occurring just before the magnetic ramp. In addition, two features that occur at this shock have not been observed before: (1) electron oscillations associated with low frequency waves upstream of the shock and (2) sharp 'overshoot' (~ 1 sec) in the ion fluxes that occur right after the magnetic ramp. The interplanetary shock exhibits many of the same characteristics that are observed at the Earth's bow shock. (11 refs.)

116420 Solar wind disturbances in the outer heliosphere, caused by six successive solar flares from the same active region. S.-I.Akasofu, K.Hakamada (Geophys. Inst., Univ. of Alaska, Fairbanks, AK, USA). *Geophys. Res. Lett. (USA)*, vol.10, no.7, p.577-9 (July 1983). Solar wind disturbances caused by six hypothetical flares from the same active region are traced out to about 15 au, using a simple, empirical modeling method developed by Hakamada and Akasofu [1982]. This method provides a first order construction, temporal and spatial, of flare-induced shocks and their multiple interactions with each other, as well as with the corotating interaction regions. The results are discussed in connection with recent cosmic ray observations by space probes. (19 refs.)

- 116421** Motion of a man-made satellite in the Earth's atmosphere represented by spherical harmonic functions. M.Vyuktilova (Astron. Obs., Valasske Mezirici, Czechoslovakia). *Bull. Astron. Inst. Czech. (Czechoslovakia)*, vol.34, no.4, p.245-51 (July 1983).
Describes a special simplified model of the upper atmosphere which is based on the development of the density value in a specific layer into spherical harmonic functions and its application to computing the changes of orbital elements. The analytical theory is elaborated using the averaging method to remove the short-period terms. The theory is used to compute the perturbations of the orbital elements of the INTERKOSMOS 17 satellite. The results are compared to those computed using another theory (King-Hele) and also to the observed values of the changes of the orbital elements. (11 refs.)
- 116422** Algorithm for estimating the parameters of relative motion of two satellites with a complete set of measurements. A.A.Bermishev, A.F.Bragazin, I.P.Shmyglevskii, P.I.Smolkina. *Cosmic Res. (USA)*, vol.20, no.6, p.581-8 (Nov.-Dec. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.6, p.828-36 (Nov.-Dec. 1982). [received: Sept. 1983].
A suboptimal algorithm for estimating the relative motion of two satellites along nearly circular orbits with complete set of measurements is examined. The orbit of the passive satellite is assumed to be known. The orbital parameters of the active satellite are estimated. The problems of stability of the algorithm, its smoothing properties, and noise stability are examined. Results of modeling are presented. (7 refs.)
- 116423** Radiative heat exchange in the vicinity of the critical point of a blunt body with an intensely vaporizing surface in a three-dimensional hypersonic stream of a hydrogen-helium mixture [planetary atmosphere entry]. E.A.Gershbein, V.D.Gol'din, G.A.Tirskii. *Cosmic Res. (USA)*, vol.20, no.6, p.606-12 (Nov.-Dec. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.6, p.859-65 (Nov.-Dec. 1982). [received: Sept. 1983].
The three-dimensional flow over a blunt body of a hypersonic stream of selectively emitting and absorbing gas consisting of hydrogen and helium is analyzed with allowance for the strong injection of gaseous products of disintegration of the body. A solution of the problem is obtained in the vicinity of the critical point in an inviscid formulation with allowance for equilibrium reactions taking place in the gas stream. Both the emission in the continuous spectrum and spectral lines are taken into account in calculating the emission. The radiant fluxes are analyzed as functions of the ratios of radii of principal curvature of the body at the critical point and the conditions in the oncoming stream. (12 refs.)

Discusses the main characteristics of the Space Telescope. The main instrumentation is described together with the impact of this telescope on astronomy. (no refs.)
- 116426** A microwave scanning radiometer for Marine Observation Satellite-1. Y.Ishizawa, T.Imatani. *Mitsubishi Denki Gihō (Japan)*, vol.57, no.5, p.53-8 (1983). In Japanese.
A microwave scanning radiometer (MSR) will be carried into orbit in 1986 by Marine Observation Satellite-1 (MOS-1). This MSR is a remote sensing device designed for satellite-based measurement of weak microwave radiation from the Earth's atmosphere and surface. Measurement data from basic tests performed by the MSR will be used to determine marine atmospheric moisture and water-vapor levels, marine-ice distribution, snowpack size, and other physical quantities. The article discusses the principles of microwave radiometric observation, describes the MSR design and main operating characteristics, and reports on the results of development testing based on an engineering model. (1 ref.)
- 116427** Scientists gain a foothold in space. P.Marsh. *New Sci. (GB)*, vol.99, no.1376, p.874-9 (22 Sept. 1983).
Discusses the prospects for the Spacelab missions. Some of the experiments to be performed are discussed together with economic factors. (no refs.)

- 116429** Symmetric rectilinear periodic orbits of three bodies. P.C.Kam-meyer (Vitro Labs. Div., Automation Industries Inc., Silver Spring, MD, USA). *Celestial Mech. (Netherlands)*, vol.30, no.4, p.329-42 (Aug. 1983).
The existence of families of symmetric periodic orbits in the rectilinear three body problem with the middle mass much larger than the masses on the outside is rigorously established. A number of these families are continued numerically and their stability properties as orbits of the planar general problem of three bodies are studied. (6 refs.)
- 116430** A noncanonical analytic solution to the J_2 perturbed two-body problem. D.J.Jezewski (NASA, Lyndon B. Johnson Space Centre, Houston, TX, USA). *Celestial Mech. (Netherlands)*, vol.30, no.4, p.343-61 (Aug. 1983).
The motion of a satellite subject to an inverse-square gravitational force of attraction and a perturbation due to the Earth's oblateness as the J_2 term is analyzed, and a uniform, analytic solution correct to first-order in J_2 is obtained using a noncanonical approach. The basis for the solution is the transformation and uncoupling of the differential equations for the model. The resulting solution is expressed in terms of elementary functions of the independent variable (the 'true anomaly'), and is of a compact and simple form. Numerical results are comparable to existing solutions. (10 refs.)
- 116431** An analytic solution for the J_2 perturbed equatorial orbit. D.J.Jezewski (NASA, Lyndon B. Johnson Space Center, Houston, TX, USA). *Celestial Mech. (Netherlands)*, vol.30, no.4, p.363-71 (Aug. 1983).
An analytic solution for the J_2 perturbed equatorial orbit is obtained in terms of elliptic functions and integrals. The necessary equations for computing the position and velocity vectors, and the time are given in terms of known functions. The perturbed periaapsis and apoaapsis distances are determined from the roots of a characteristic cubic. (12 refs.)
- 116432** Theory of the Trojan asteroids. IV. B.Garfinkel (Yale Univ. Obs., New Haven, CT, USA). *Celestial Mech. (Netherlands)*, vol.30, no.4, p.373-83 (Aug. 1983).
For pt.III see *ibid.*, vol.22, no.3, p.267-87 (1980). In a previous publication (1977) the author has constructed a family \mathcal{A} of long-periodic orbits in the Trojan case of the restricted problems of three bodies. The author constructs the domain \mathcal{D} of the analytical solution of the problem of the motion, excluding the vicinity of the critical divisor which vanishes at the exact commensurability of the natural frequencies ω_1 and ω_2 . (9 refs.)

116433 Three-dimensional regions of stability about the triangular equilibrium points. A.L. Whipple (Univ. of Texas, Austin, TX, USA). *Celestial Mech. (Netherlands)*, vol.30, no.4, p.385-94 (Aug. 1983).

Within the context of the restricted problem of three bodies, an analytic upper bound on the three-dimensional regions of stability about the triangular equilibrium points is derived for general initial velocity limits and a wide class of bounding regions. This upper bound is illustrated and compared to numerical investigations for two bounding regions using the Earth-Moon mass ratio. (11 refs.)

116434 Existence of the solution of Szebehely's equation in three dimensions using a two-parametric family of orbits. F.Varadi, B.Erdi (Dept. of Astron., Eotvos Univ., Budapest, Hungary).

Celestial Mech. (Netherlands), vol.30, no.4, p.395-405 (Aug. 1983). The three-dimensional inverse problem is investigated. A quasi-linear system of partial differential equations is derived for the determination of the potential. The solution of this system is studied by a method of differential geometry. A necessary condition for the solution is derived and the determination of the potential is reduced to algebraic equations written in vectorial form. A few examples are also given. (13 refs.)

116435 A method for constructing families of spatial periodic orbits in the Hill problem. M.L.Lidov.

Cosmic Res. (USA), vol.20, no.6, p.547-64 (Nov.-Dec. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.6, p.787-807 (Nov.-Dec. 1982). [received: Sept. 1983]

Describes a method for establishing and constructing symmetric periodic orbits of the family L_0 using the invariance properties of the variational equations with respect to certain linear transformations. All the canonical linear variable transformations, which do not change the equations of the Hill problem, are determined. The problem of stability is based on the calculation of the eigenvalues of the monodromy matrix. (5 refs.)

116436 The angular momentum of celestial bodies and the fundamental dimensionless constants of nature. V.De Sabbata, M.Gasperini (Istituto di Fisica, Univ. di Ferrara, Ferrara, Italy).

Lett. Nuovo Cimento (Italy), vol.38, ser.2, no.3, p.93-5 (17 Sept. 1983). A possible connection is suggested between two empirical astrophysical laws concerning the angular momentum of celestial bodies. It is shown that both relations seem to indicate that the fine-structure constant α is the typical dimensionless parameter not only of atomic physics, but also of gravitational physics. (7 refs.)

95.30 FUNDAMENTAL ASPECTS OF ASTROPHYSICS

116437 Ambipolar diffusion in self-gravitating isothermal layers. F.H.Shu.

Astrophys. J. (USA), vol.273, no.1, pt.1, p.202-13 (1 Oct. 1983). The author formulates and solves the problem of the drift of magnetic field and ions embedded in a self-gravitating layer of neutral isothermal gas under the assumptions of quasi-magnetohydrostatic equilibrium and local ionization equilibrium. When Lagrangian coordinates referred to the neutral gas are introduced, it is found that the problem can be reduced to a nonlinear diffusion equation for the magnetic field. The shape-invariant solution for the problem is then sought and found. The results are interpreted physically, and possible implications for the problem of star formation are discussed. (25 refs.)

116438 On the propagation of acoustic waves in a radiating fluid. D.Mihalas, B.W.Mihalas (High Altitude Obs., Nat. Center for Atmospheric Res., Boulder, CO, USA).

Astrophys. J. (USA), vol.273, no.1, pt.1, p.355-62 (1 Oct. 1983). Previous discussions of the propagation of acoustic disturbances in a radiating fluid are extended by taking into account the time-dependence and dynamical behavior of the radiation field using the correct Lagrangian radiation energy and momentum equations (in the Eddington approximation). The analysis yields a much more complete, consistent, and physically satisfying picture than hitherto available. (12 refs.)

116439 Monodeuterated methane in the outer solar system. I. Spectroscopic analysis of the bands at 1.55 and 1.95 microns. B.L.Lutz (Planetary Res. Center, Lowell Obs., Flagstaff, AZ, USA), C.de Bergh, J.P.Maillard.

Astrophys. J. (USA), vol.273, no.1, pt.1, p.397-409 (1 Oct. 1983). The analysis of the near-infrared spectrum of monodeuterated methane (CH_3D) near 6400 cm^{-1} and 5100 cm^{-1} is presented. Three new parallel bands which have locally perturbed upper states connecting with the ground state are identified, and approximate rotational constants are derived. The band centered near 6425 cm^{-1} and the 9613 cm^{-1} band previously analyzed by Lutz, Daney, and Ramsay (1978) are found to form an apparent vibrational progression with the ν_2 fundamental at 2200 cm^{-1} , and vibrational assignments of $3\nu_2$ and $5\nu_2$, respectively, are proposed. Detailed comparison of the rotational constants of the states involved is shown to support these assignments. (20 refs.)

116440 Relativistic reductions for radiointerferometric observables. A.M.Finkelstein, V.Ja.Kreinovich, S.N.Pandey (Special Astrophys. Obs., Acad. of Sci., Leningrad, USSR).

Astrophys. & Space Sci. (Netherlands), vol.94, no.2, p.233-47 (Aug. 1983). The special and general relativistic corrections for the basic radiointerferometric observables—time-delay and fringe frequency—are studied with an accuracy of the order of 4×10^{-10} ('post-Newtonian approximation'). (8 refs.)

116441 Effect of rotation on magnetogravitational instability of finite conducting gas in presence of suspended particles. R.K.Chajlani, P.Purohit (School of Studies in Phys., Vikram Univ., Ujjain, India).

Astrophys. & Space Sci. (Netherlands), vol.94, no.2, p.425-36 (Aug. 1983). The effect of rotation on the self-gravitational instability of an infinite homogeneous magnetised gas-particle medium in the presence of suspended particles is investigated. The conductivity of the medium is assumed to be finite. The equations of the problem are linearized and the general dispersion relation is obtained. The rotation is assumed to be along two directions and separate dispersion relations for each case are obtained. The dispersion relation for propagation parallel and perpendicular to the uniform magnetic field along with rotation is derived. (13 refs.)

116442 Magnesium II line formation: the contribution of high atomic levels to the resonance lines. P.Lemaire, P.Gouttebroze (Lab. de Phys. Stellaire & Planetaire, Verrieres-le-Buisson, France).

Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.241-5 (Sept. 1983). Different atomic models for the Mg^+ ion are used in line profile computations in order to evaluate their consequences for the modelling of solar and stellar atmospheres. The cores of the h and k lines (280.3 , 279.6 nm) appear to be practically insensitive to the number of levels used in the profile computations. They are not affected either by a fluorescence mechanism induced by H I L β . However, a careful treatment of the blended wings of the resonance doublet appears to be necessary for atmospheric diagnostics using the subordinate (279.1 and 279.9 nm) lines. The cores and the near wings of h and k are strongly sensitive to the atmospheric model from the higher part of the photosphere to the upper part of the chromospheric plateau. (19 refs.)

116443 Propagation of Alfvén waves in an isothermal atmosphere when the displacement current is not neglected. B.Leroy (Dept. d'Astrophys. Fondamentale, Obs. de Paris, Meudon, France).

Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.371-4 (Sept. 1983). If the solar atmosphere is modelled by a medium with a (possibly piece-wise) exponentially decreasing density, permeated by a uniform magnetic field, for MHD waves with a period ranging between a few seconds and several hours the WKBJ approximation is nowhere valid. Consequently, the concept of a travelling wave is no longer meaningful and difficulties arise concerning the boundary condition that there be no incoming wave from infinity. In the past, these have been circumvented by confining arbitrarily the inhomogeneous medium to a region of finite extension. The author proposes an alternative solution devoid of this free parameter; it simply consists in not discarding the displacement current in Maxwell's equations. (15 refs.)

116444 A class of self-similar astrophysical explosions. M.Nepveu (Astron. Inst., Univ. Bonn, Bonn, Germany).

Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.375-7 (Sept. 1983). A class of gasdynamical explosions is presented in which the flows are continuously heated. The heating is produced by obstacles in the flow. The results of the calculations are applied to some features of galaxy cluster heating. (9 refs.)

116445 Determination of stellar neutron-capture rates for radioactive nuclei with the aid of β -delayed neutron emission. K.-L.Kratz, W.Ziegert (Inst. fur Kernchem., Univ. Mainz, Mainz, Germany), W.Hillebrandt, F.-K.Thielemann.

Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.381-7 (Sept. 1983). Demonstrates that the decay mode of β -delayed neutron emission can, in principle, be considered as the inverse process to neutron capture. This decay mode may reveal level parameters of neutron emitting states which can serve in two ways to predict neutron capture rates for unstable isotopes of astrophysical interest. (a) For medium and heavy mass nuclei, where due to the high level density the capture rate is not dominated by single resonances, information on the density and quantum numbers of states populated in Gamow-Teller β -decay yields a lower limit of the neutron capture cross section. (b) For nuclides near closed shells, in particular for light-mass nuclei, individual neutron-capture resonances may dominate the total cross section. (26 refs.)

116446 Dependence of MHD turbulence spectra on the velocity field-magnetic field correlation. R.Grappin (Obs. de Meudon, Meudon, France), A.Pouquet, J.Leorat.

Astron. & Astrophys. (Germany), vol.126, no.1, pt.2, p.51-8 (Sept. 1983). Steady-state MHD turbulence with non-zero velocity \mathbf{v} -magnetic field \mathbf{b} correlation is studied using both a two-point turbulence closure and phenomenological arguments. It is found that equilibrium spectra have power laws which may strongly depart from the $3/2$ law derived by Kraichnan (1965) in the uncorrelated case. This departure stems from the broken symmetry between the two fields $\mathbf{z}^{\pm} = \mathbf{v} \pm \mathbf{b}$ when the correlation is non-zero. For strong correlations, the spectral index for the total energy spectrum may lie anywhere between $3/2$ and 3 , depending on the correlation level whose maximum is determined by the molecular dissipation coefficients. (9 refs.)

116447 Dielectronic recombination at low temperatures. H.Nussbaumer (Inst. of Astron., ETH Zentrum, Zurich, Switzerland), P.J.Storey.

Astron. & Astrophys. (Germany), vol.126, no.1, pt.2, p.75-9 (Sept. 1983). Total dielectronic recombination coefficients are calculated for all ions of C, N and O for which the recombining ion has $n=2$ valence electrons in the temperature range 10^3 to $6 \times 10^4\text{ K}$. The coefficients are fitted to a convenient function of temperature. The dielectronic recombination coefficients are greater than those for direct radiative recombination in most of the cases considered over the main part of the temperature range. (15 refs.)

116448 Fundamental processes in pair plasmas. A.P.Lightman (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA).

AIP Conf. Proc. (USA), no.101, p.359-67 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). Reviews the various processes that produce and destroy electron-positron pairs, and then compares the timescales of these processes to thermalization, accretion, and cooling timescales. The author next considers the various radiation spectra produced by relativistic, thermal plasmas. Finally, he reviews recent results for the equilibria available to finite, thermal relativistic plasmas with and without embedded magnetic fields. Such plasmas, in steady state, have maximum temperatures, luminosities, and field strengths—useful diagnostics for interpreting quasars and active galaxies. (19 refs.)

116449 Temporal evolution of electron-positron plasmas. W.Brinkmann (Max-Planck-Inst. fur Phys. und Astrophys., Inst. fur Extraterrestrische Phys., Garching, Germany).

AIP Conf. Proc. (USA), no.101, p.368-72 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). Pair annihilation processes do not influence the temporal evolution of non-relativistic e^-e^+ -plasmas to a large degree. This is mainly due to the short thermalization time scale and the fact that the nonrelativistic annihilation cross section is nearly energy-independent. Nevertheless, the emitted spectrum might differ at first drastically from a thermal equilibrium form and observations of the annihilation radiation with high temporal and spectral resolution

gives valuable information about the state of the system. If the plasma contains protons at a different temperature, the pair component evolves as quasi Maxwellian on a much longer time scale ($\tau_{\text{e.m.}}/m_e$) towards total thermal equilibrium. In relativistic plasmas where the energy dependence of all cross sections is much more pronounced things will be different, but the strongest influence on the evolution of the plasma is expected from Compton scattering of the annihilation photons on the pairs. (15 refs.)

116450 Pair production in thermal plasmas: a computer model. S.Stepney (Inst. of Astron., Univ. of Cambridge, Cambridge, England). *AIP Conf. Proc. (USA)*, no.101, p.373-6 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). A computer code has been developed to follow the processes of electron-positron pair production, annihilation, bremsstrahlung and Comptonization in a slab of mildly relativistic thermal plasma. The resulting equilibrium solutions are compared with the semi-analytic calculations of Svensson (1982). (7 refs.)

116451 Monte Carlo calculations of pair annihilation and its inverse. P.D.Noerdlinger (Los Alamos Nat. Lab., Appl. Theoretical Phys. Div., Los Alamos, NM, USA). *AIP Conf. Proc. (USA)*, no.101, p.377-81 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). The reaction rates and product energy spectra were evaluated by Monte Carlo methods for the processes of electron positron pair annihilation and the inverse (pair production by the collision of gamma rays) in a relativistic, low density plasma. The results were applied to study the collision of isotropic power law spectra of pairs or gamma rays, respectively, as a model for processes of interest in winds from active galactic or QSO nuclei. As emphasized by Cavallo and Rees (1978), the annihilation spectra favored photons with a strong peak around the electron rest mass; extended tails persisted, however, with slope about 80% that of the incident particle spectra. In the case of pair production by gamma ray collision, the resulting pair spectra had much broader peaks near 5 to 10 electron rest masses, rather insensitive to the form of the photon spectra. If the two processes feed each other repeatedly, as expected in a wind flow, one expects substantial degradation of the emergent gamma ray spectrum toward the 0.5-1.0 MeV region. (4 refs.)

116452 The particle and photon spectrum of an optically thick relativistic wind. L.J.Caroff (NASA Ames Res. Center, Moffett Field, CA, USA), J.A.Eilek, P.D.Noerdlinger. *AIP Conf. Proc. (USA)*, no.101, p.382-6 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). Compact astrophysical sources of energetic particles and photons are somewhat optically thick to particle-particle, particle-photon and photon-photon interactions. These interactions include pair production and annihilation, Compton and inverse Compton scattering, and electron-electron collisions (including bremsstrahlung). The authors present preliminary results from a calculation in which they evaluate the modulation of an initial source spectrum by these processes in an expanding relativistic electron-photon wind. (7 refs.)

116453 Pair production and annihilation in strong magnetic fields. J.K.Daugherty (Univ. of North Carolina, Asheville, NC, USA), A.K.Harding. *AIP Conf. Proc. (USA)*, no.101, p.387-99 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). Electromagnetic phenomena occurring in the presence of strong magnetic fields are currently of great interest in high-energy astrophysics. In particular, the process of pair production by single photons in the presence of fields of order 10^{12} Gauss is of importance in cascade models of pulsar gamma ray emission, and may also become significant in theories of other radiation phenomena whose sources may be neutron stars (e.g. gamma ray bursts). In addition to pair production, the inverse process of pair annihilation is greatly affected by the presence of superstrong magnetic fields. The most significant departures from annihilation processes in free space are a reduction in the total rate for annihilation into two photons, a broadening of the familiar 511-keV line for annihilation at rest, and the possibility for annihilation into a single photon (which dominates the two-photon annihilation for $B > 10^{13}$ Gauss). The physics of these pair conversion processes, which is reviewed briefly, can become quite complex in the teragauss regime, and can involve calculations which are technically difficult to incorporate into models of emission mechanisms in neutron star magnetospheres. However, recent theoretical work, especially in the case of pair annihilation, also suggests potential techniques for more direct measurements of field strengths near the stellar surfaces. (21 refs.)

116454 Equilibrium pair density in a relativistic plasma with magnetic fields. F.Takahara (Tokyo Astron. Obs., Univ. of Tokyo, Nagano, Japan), M.Kusunose. *AIP Conf. Proc. (USA)*, no.101, p.400-4 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). Equilibrium e^+e^- pair density in an optically thin relativistic plasma with magnetic fields is numerically calculated. The authors examine how the properties of a plasma are affected by hard photons produced by the multiple inverse Compton scatterings of synchrotron photons. The effect of magnetic fields, i.e. copious production of synchrotron photons, turns out to be significant even if the energy density of magnetic fields is below the equipartition value by several orders of magnitude. Both maximum temperature attainable and allowable maximum thickness of a plasma are shown to decrease rapidly with the increase of magnetic fields. (6 refs.)

116455 Annihilation lines from confined plasmas. P.W.Guilbert (Joint Inst. for Lab. Astrophys., Univ. of Colorado, Boulder, CO, USA). *AIP Conf. Proc. (USA)*, no.101, p.405-10 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). The author investigates confined electron positron pair plasmas produced by the two photon process and by the magnetic single photon process. Two photon pair production is shown to be incapable of producing an annihilation line, however, sufficiently large magnetic fields cause single photon pair production which can give large luminosities in the annihilation line. (6 refs.)

116456 Electron-positron pair annihilation and creation in superstrong magnetic fields. G.Wunner, H.Herold, H.Ruder (Lehrstuhl für Theoretische Astrophys., Univ. Tübingen, Tübingen, Germany). *AIP Conf. Proc. (USA)*, no.101, p.411-15 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). The paper reviews the results obtained so far in recalculating the processes of one-photon and two-photon pair annihilation and creation in strong magnetic fields ($B \sim 10^{11}$ - 10^{13} G, as are characteristic of neutron stars), with special emphasis being laid on annihilation. (5 refs.)

116457 Comparison of photon-photon and photon-magnetic field pair production rates. M.L.Burns, A.K.Harding (NASA/Goddard Space Flight Center, Greenbelt, MD, USA). *AIP Conf. Proc. (USA)*, no.101, p.416-20 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). Neutron stars have been proposed as the site of gamma-ray burst activity and the copious supply of MeV photons admits the possibility of electron-positron pair production. It the neutron star magnetic field is sufficiently intense ($>10^{12}$ G), both photon-photon (2γ) and photon-magnetic field (1γ) pair production should be important mechanisms. Rates for the two processes have been calculated using a Maxwellian distribution for the photons. The ratio of 1γ to 2γ pair production rates has been obtained as a function of photon temperature and magnetic field strength. (6 refs.)

116458 Conditions for stimulated-annihilation in a degenerate e^-e^+ fluid at the surface of pulsars. C.M.Varma (Bell Labs., Murray Hill, NJ, USA). *AIP Conf. Proc. (USA)*, no.101, p.421-7 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). Electrons and positrons in the large magnetic fields at the surface of pulsars condense into rod shaped droplets. The conditions for stimulated annihilation in such droplets are examined. The motivation for this investigation are the observation of Leventhal et al. (1977) of very narrow γ -ray lines emanating from the Crab nebula. (11 refs.)

116459 The production of spinless hadron pairs via virtual photon exchange in uniform magnetic fields. D.White (Dept. of Phys., Roosevelt Univ., Chicago, IL, USA). *AIP Conf. Proc. (USA)*, no.101, p.444-7 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). The method involved in bridging the gap between production of lepton pairs (as per the Kallen virtual photon formalism) and production of spinless hadron pairs is outlined. Some results associated with transitions to the ground state are displayed. (8 refs.)

116460 $^{12}\text{CH}_3\text{D}$ rovibrational intensities and the Jovian D/H ratio. C.Chackerian, Jr. (Space Sci. Div., NASA Ames Res. Center, Moffett Field, CA, USA). *Astrophys. J. Lett. Ed. (USA)*, vol.273, no.1, pt.2, p.L47-9 (1 Oct. 1983). Presents a tabulation of line intensities for the ν_2 band of CH_3D which have absolute accuracies of $\pm 3\%$. These intensities are used to interpret some of the previous Jovian D/H determinations. (11 refs.)

116461 A second-order correlation approximation for thermal conductivity and Prandtl number of free turbulence. K.-O.Eschrich, G.Rudiger (Zentralinst. für Astrophys., Akad. der Wissenschaften, Potsdam, Germany). *Astron. Nachr. (Germany)*, vol.304, no.4, p.171-80 (1983). The authors determine the dependence of the scalar thermal eddy conductivity (χ_T) on the spectral function of the turbulence and the microscopic conductivity (χ). The profile $\chi_T(\chi)$ is strongly dependent on the shape of the frequency spectrum of the velocity fluctuations. Very small molecular diffusivities generally lead to a turbulent Prandtl number of 0.4, whereas for large diffusivities the turbulent Prandtl number varies inversely with the molecular Prandtl number. The effective Prandtl number of the Sun is found to be $\text{Pr}_{\text{eff}} < 0.3$; and that of the small-scale motions in the outer core of the Earth is $\text{Pr}_{\text{eff}} = 0.4$. (31 refs.)

116462 Fourier spectroscopy of the $^{12}\text{C}_2$, $^{13}\text{C}_2$, and $^{12}\text{C}^{13}\text{C}$ (0-0) Swann bands. C.Amiot (Lab. de Phys. Moléculaire et d'Optique Atmosphérique, CNRS, Orsay, France). *Astrophys. J. Suppl. Ser. (USA)*, vol.52, no.3, p.329-40 (July 1983). The (O-O) band of the C_2 Swann electronic system $d^3\Pi_g \rightarrow a^3\Pi_u$ has been recorded by Fourier spectroscopy. The three isotopic species $^{12}\text{C}_2$, $^{13}\text{C}_2$, and $^{12}\text{C}^{13}\text{C}$ were investigated. The observed wavenumbers were reduced to molecular parameters using a nonlinear least-squares fitting procedure. Well-known perturbations at $N'=47$ and $N'=51$ are again observed in the $^{12}\text{C}_2$ $d^3\Pi_g$ ($v=0$) level. Perturbations of the same kind are present in the $^{13}\text{C}_2$ spectrum at $N'=34$ and $N'=44, 48, 52$. The $^{12}\text{C}^{13}\text{C}$ spectrum exhibits in the observed spectral range a unique perturbation for $N'=41$. (25 refs.)

116463 A simple kinetic model of a multi-particle cloud. P.Hadrava (Astron. Inst., Czechoslovak Acad. of Sci., Ondrejov, Czechoslovakia). *Bull. Astron. Inst. Czech. (Czechoslovakia)*, vol.34, no.4, p.234-41 (July 1983). A simple method for modelling the evolution of a cloud of particles is given. This method, based on the assumption of a Gaussian distribution function, enables one to treat the shape, velocity gradient and the stress tensor of the cloud. Two analytical solutions are given as examples. The first one, corresponding to moving groups of stars, shows focusing by galactic potential. The second one, appropriate to viscous gaseous discs (for example around a binary component), leads to a different form of expansion (a thick ring or flat disc) and to oscillation frequencies within the limits of an optically thick or thin ring, respectively. (6 refs.)

116464 The existence of a black hole due to condensation of matter. R.Schoen (Dept. of Maths., Univ. of California, Berkeley, CA, USA), S.-T.Yau. *Commun. Math. Phys. (Germany)*, vol.90, no.4, p.575-9 (1983). When enough matter is condensed in a small region, gravitational effects will be strong enough to cause collapse and a black hole will be formed. The authors formulate and prove here such a statement in the language of general relativity. (5 refs.)

116465 On the dynamics of a thin spherically symmetric radiating shell, its classical model, and relativistic effects. M.Castagnino (CONICET, Univ. Nacional de Rosario, Rosario, Argentina), N.Umerez. *Gen. Relativ. & Gravitation (USA)*, vol.15, no.7, p.625-34 (July 1983). A general relativity model of nova and supernova explosions is studied and improved. Its classical limit is found, and the magnitude of the velocity and mass necessary to detect relativistic effects are computed. (6 refs.)

116466 Reynolds stresses and differential rotation. III. Zonal momentum fluxes in rapidly rotating stars. G.Rudiger (Akad. der Wissenschaften, Astrophys. Obs. Potsdam, Potsdam, Germany). *Geophys. & Astrophys. Fluid Dyn. (GB)*, vol.25, no.3, p.213-33 (1983). For pt.II see ibid., vol.21, no.1 and 2, p.1-25 (1982). The author considers the influence of the Coriolis force on given turbulence models. For solar applications it is found that the basic rotation must be assumed to be neither too slow nor too rapid in order to allow a non-trivial expansion of the non-diffusive zonal momentum fluxes. Two different turbulence fields provide the desired latitudinal profiles but give different radial rotation laws: turbulence with a dominant horizontal (vertical) intensity always yields equatorial acceleration as well as the observed horizontal Reynolds stresses in connection with radial superrotation, $\partial\Omega/\partial r > 0$ (subrotation, $\partial\Omega/\partial r < 0$). In both cases the turbulent cells must be rather flat. (25 refs.)

116467 Numerical fits to important rates in high temperature astrophysical plasmas. S.Stepney (Inst. of Astron., Univ. of Cambridge, Cambridge, England), P.W.Guilbert.
Mon. Not. R. Astron. Soc. (GB), vol.204, no.3, p.1269-77 (Sept. 1983).
The authors give simple but accurate numerical fits to various two-body rates in relativistic thermal plasmas, in the temperature range $kT_e \sim 50$ keV-1 MeV. The processes discussed are bremsstrahlung, Coulomb heating and electron-positron pair production and annihilation. In particular the authors present a fit to the thermal electron-electron bremsstrahlung spectrum which is accurate to better than 5 per cent. The results are suitable for semi-analytic or computer modelling of hot plasmas. (16 refs.)

116468 Ca XVII line ratios in solar flares. P.L.Dufton (Dept. of Pure & Appl. Phys., Queen's Univ. of Belfast, N Ireland), A.E.Kingston, J.G.Doyle, K.G.Widing.
Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.81-90 (Oct. 1983).
New electron impact collision rates are presented for transitions between the 10 lowest states of Ca XVII. These data are then used to predict Ca XVII level populations and emission-line intensity ratios for electron densities and temperatures appropriate to solar flares. A comparison is made with observations obtained with the NRL spectroheliograph aboard Skylab. (38 refs.)

116469 The evolution of viscous discs. IV. Stream penetration effects. G.T.Bath, A.C.Edwards, V.J.Mantle (Dept. of Astrophys., Univ. of Oxford, Oxford, England).
Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.171-85 (Oct. 1983).
For pt.III see ibid., vol.201, no.1, p.345-55 (1982). The interaction between the mass transfer stream and a circularized accretion disc is described in terms of a general transport equation including sources of mass and angular momentum from the stream. The stream stripping process associated with disc penetration is parameterized in terms of the impact momentum of disc material. The anisotropic radiation pattern generated by the stream/disc interaction is discussed. Evidence is presented that suggests the superhumps are not a disc phenomenon, but are due to asymmetric structure on a non-synchronously rotating red component. (15 refs.)

116470 The expansion of a plasma into a vacuum: basic phenomena and processes and applications to space plasma physics. U.Samir (Space Phys. Res. Lab., Univ. of Michigan, Ann Arbor, MI, USA), K.H.Wright,Jr., N.H.Stone.
Rev. Geophys. & Space Phys. (USA), vol.21, no.7, p.1631-46 (Aug. 1983).
The authors call attention to basic phenomena and physical processes involved in the expansion of a plasma into a vacuum, or the expansion of a plasma into a more tenuous plasma, in particular the fact that upon expansion ions are accelerated and reach energies well above their thermal energy. Also, in the process of the expansion a rarefaction wave propagates into the ambient plasma, an ion front moves into the expansion volume, and discontinuities in plasma parameters occur. The physical processes which cause the above phenomena are discussed, and their possible applications are described. (89 refs.)

95.45 OBSERVATORIES

116471 Northern skies. Britain's new telescopes in the Canary Islands. P.Murdin.
Phys. Bull. (GB), vol.34, no.9, p.377-9 (Sept. 1983).
This year (1983) sees the rebirth of Britain's largest astronomical telescope, the 2.5 m Isaac Newton Telescope, at its new observatory on the island of La Palma in the Canaries. Dismantled in 1979 from its dome at the site of the Royal Greenwich Observatory near Herstmonceux in Sussex, the telescope has been renovated by its original builders, Grubb-Parsons in Newcastle, and re-erected at a height of 2400 m in the Observatorio del Roque de los Muchachos. It will be joined quickly by a 1 m reflecting telescope. In 1984, the Carlsberg Automatic Transit Circle, in which Britain has an equal share

with Denmark, will begin operation and in 1986 the largest of the telescopes already planned for the mountain top will be completed, the 4.2 m William Herschel Telescope. Two telescopes belonging to Sweden are already at work on La Palma, and other European countries are contemplating erection of telescopes in the observatorio. (no refs.)

95.55 ASTRONOMICAL INSTRUMENTS

116472 An imaging gas scintillation proportional counter for use in X-ray astronomy. C.J.Hailey, W.H.-M.Ku, M.H.Vartanian (Dept. of Astron. & Phys., Columbia Univ., New York, NY, USA). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.213, no.2-3, p.397-410 (1 Aug. 1983).

An imaging gas scintillation proportional counter (GSPC) has been constructed for use in X-ray astronomy. The IGSPC consists of a gas scintillation proportional counter (GSPC) with a 1 μ m polypropylene window coupled to a multiwire proportional counter (MWPC) via a calcium fluoride window. The MWPC, filled with a mixture of argon, methane, and tetrakis (dimethylamino) ethylene, detects the UV photons emitted by the xenon gas in the GSPC. The measured energy resolution is 17.0% (FWHM) and 8.0% (FWHM) at 1.5 keV and 5.9 keV, respectively. The measured position resolution is 1.9 mm (FWHM) and 0.9 mm (FWHM) at 1.5 and 5.9 keV, respectively. The authors also discuss possible astrophysical observations which can be performed with an IGSPC at the focal plane of a grazing incidence telescope. (41 refs.)

116473 A proportional counter with one dimensional position sensitivity for image scanning in the soft X-ray region. K.H.Stephán, M.Henne (Max-Planck-Inst. für Extraterrestrische Phys., Garching bei München, Germany). *Nucl. Instrum. & Methods Phys. Res. (Netherlands)*, vol.213, no.2-3, p.411-14 (1 Aug. 1983).

A device is described to measure spatial intensity distributions of images of the soft X-ray region by means of a proportional counter which has positional sensitivity capability in one dimension. Collection, reduction and storing of the data are controlled by a desktop computer with specially written software to provide data transfer from a multichannel analyser. The measuring unit is used in a long beam X-ray testing facility to study the features of rocket and satellite borne instrumentation under simulated outer space conditions in the laboratory. (7 refs.)

116474 Design and performance of a one square meter proportional counter system for hard X-ray astronomy. A.Bazzano, L.Boccacini, C.D.La Padula, M.Mastropietro, R.Patriarca, F.Polcaro, P.Ubertini, R.K.Manchanda (Istituto di Astrofisica Spaziale, CNR, Rome, Italy).

Nucl. Instrum. & Methods Phys. Res. (Netherlands), vol.214, no.2-3, p.481-90 (1 Sept. 1983).

A versatile balloon-borne hard X-ray experiment with a very large area (≈ 1.1 m²) and high spectral resolution has been developed for the study of the hard X-ray sources in the energy range 20-180 keV. The telescope consists of four multiwire proportional chambers (MWPC) that have a geometrical sensitive area of 2700 cm² each. The detector system has a sensitivity of $\sim 10^{-3}$ photons cm⁻² s⁻¹ keV⁻¹ during a typical balloon observation. A background rate of $\sim 3 \times 10^{-4}$ counts cm⁻² s⁻¹ keV⁻¹ was observed in the operative energy range at 2.4 gm/cm² ceiling altitude and geographic latitude of 38°N. The design details, fabrication and flight performance of the instrument are briefly discussed with reference to the effectiveness of background reduction and other test parameters. (19 refs.)

116475 Helium-II application in space cooling systems. G.Klippling (Fachbereich Phys., Freie Univ. Berlin, Berlin, Germany). *Indian J. Cryog.*, vol.6, no.4, p.147-53 (1981).

The cooling of IR telescopes requires temperatures below 2K for long term missions. Therefore He-II cooling systems are to be developed which provide a favourable relation between cooling power and the amount of coolant, uniform temperature distribution and the advantage of the special properties of He-II. A most important part of such a cooling system is the phase separator which must work reliably under zero g conditions. A number of interesting problems of He-II physics are to be solved in connection with these developments. (10 refs.)

116476 The Couder telescope-better than the Schmidt?. R.V.Willstop (Inst. of Astron., Obs., Cambridge, England). *Mon. Not. R. Astron. Soc. (GB)*, vol.204, no.3, p.99P-103 (Sept. 1983).

The optical quality of the Couder telescope is examined, and it is shown that with small modifications to the original design it is comparable with, or better than, the Schmidt camera. (9 refs.)

116477 Low-noise MM-wave receivers with quasioptical inputs [for radioastronomical observations]. P.Zimmerman (Jet Propulsion Lab., Pasadena, CA, USA).

Mikrowellen Mag. (Germany), vol.8, no.5, p.552-6 (Oct. 1982). [received: Aug. 1983]

Describes two systems with cooled Schottky-barrier-diode mixers at 183 GHz and 230 GHz, which have been used for observations of molecular line emission in galactic objects. Low loss coupling of signal- and local-oscillator-frequencies was provided at 183 GHz through a folded Fabry-Perot-Resonator and at 230 GHz through a Mach-Zehnder-Diplexer. System noise temperatures of 750K (DSB) at 183 GHz and 260K (DSB) at 230 GHz were measured. The decrease in system noise temperature at the higher frequency is mainly due to improvements in diode- and FET-technology over the years 1978 to 1981. (11 refs.)

116478 On the instrumental and atmospheric stray-light for solar observations. W.Mattig (Kiepenheuer-Inst. für Sonnenphys., Freiburg, Germany). *Sol. Phys. (Netherlands)*, vol.87, no.1, p.187-93 (Aug. 1983).

From aureole measurements made with the 40 cm-Vacuum-Telescope at Izana (Tenerife) in the wavelength region 417 nm < λ < 785 nm and from a comparison with other aureole measurements it is concluded that: (a) within one solar radius from the limb, the aureole is mostly of instrumental origin; (b) beyond that distance, the contribution of atmospheric stray-light becomes noticeable; (c) the atmospheric contribution to the aureole intensity is, under good conditions at mountain stations, a very slowly decreasing function, and amounts to some 10^{-3} of the solar disk intensity. A procedure is given to separate the variable atmospheric component of the stray-light from the constant instrumental one. (2 refs.)

116479 The Mount Wilson magnetograph. R.Howard, J.E.Boyden, D.H.Bruning, M.K.Clark, H.W.Crist, B.J.Labonte (Mount Wilson & Las Campanas Obs., Carnegie Inst. of Washington, Pasadena, CA, USA).

Sol. Phys. (Netherlands), vol.87, no.1, p.195-203 (Aug. 1983). Alterations to the Mount Wilson Observatory solar magnetograph were made during 1981. The present state of the instrument, including the spectrograph, is described. The magnetic and Doppler velocity signals and the setup procedure for the magnetogram observation are discussed. The advantages of the new system are described. (7 refs.)

116480 Galileo Jupiter probe Atmosphere Structure Instrument. J.R.Padilla (Martin Marietta Corp., Denver, CO, USA).

ITC/USA/82. International Telemetering Conference, San Diego, CA, USA, 28-30 Sept. 1982 (Woodland Hills, CA, USA: Int. Found. Telemetering 1982), p.711-18

The scientific objective is to define the profiles of the Jovian atmospheric static and dynamic state properties over a wide altitude range. The acceleration measurement system provides data on probe deceleration and velocity from early entry through descent. Associated pressure and temperature data will help to define density, atmospheric turbulence and the radial distance of the probe from the center of Jupiter. The accelerometers are of the pendulous mass-displacement type which operate in an oil fluid medium. Each accelerometer is accompanied with a set of hybrid electronics which converts pendulum mass-displacement into volts per g. Four ranges are possible for each axial accelerometer and three ranges for the lateral accelerometers. (3 refs.)

95.65 AUXILIARY AND RECORDING INSTRUMENTS

116481 Near-infrared photopolarimeter for astronomical observations. T.Sajo (Lab. of Cosmic Phys. & Relative Technol., Nat. Res. Council of Italy, Milan, Italy).

Infrared Phys. (GB), vol.23, no.3, p.125-30 (May 1983).

The construction of a near-infrared (1.9-2.5 μ m) photopolarimeter for linear polarization analysis and corresponding testing is described. Details of the polarimetric components are shown. A description is given of the manufacture and features of a mica sheet half-wave phase retarder, which allows the rotation of the polarization plane of incident radiation in front of an analyzer. Observations of radiation from the planet Mars and a few standard unpolarized stars, utilizing the bent Cassegrain-type reflector (1.37 m dia) of the Merate Observatory, are reported. The interpretation of measurements, in terms of the extraction of information on polarization percentages from experimental curves, is obtained by means of an analytical treatment which involves the behaviour of the incident light passing through the instrumental components. (11 refs.)

116482 Four-centimeter traveling-wave maser with high amplitude and phase stability [radioastronomy application]. Ya.L.Shamfarov, A.I.Stetsenko, S.K.Kondrashin (Radiophys. & Electronics Inst., Acad. of Sci., Kharkov, Ukrainian SSR).

Instrum. & Exp. Tech. (USA), vol.25, no.5, pt.1, p.1157-9 (Sept.-Oct. 1982). Translation of: *Prib. & Tekh. Eksp. (USSR)*, vol.25, no.5, p.104-7 (Sept.-Oct. 1982). [received: Sept. 1983]

A traveling-wave maser for the 4 cm wavelength range with high amplitude and phase stability is described. The device is intended for use in the receiver system of a radioastronomical interferometer. Measures taken to eliminate amplitude and phase instability sources are described. Phase and amplitude noise produced by passage of gas bubbles through the electric field region of the retarding structure is eliminated. Phase instability over the course of 45 min is $\pm 0.03^\circ$, with gain varying over the same time by $\leq \pm 0.03$ dB. (5 refs.)

116483 Electronographic polarimetry: the Durham polarimeter. S.M.Scarrott, R.F.Warren-Smith, W.S.Pallister, D.J.Axon (Phys. Dept., Univ. of Durham, Durham, England), R.G.Bingham.

Mon. Not. R. Astron. Soc. (GB), vol.204, no.3, p.1163-77 (Sept. 1983).

An imaging polarimeter has been constructed for use with a McMullan electronographic camera and is designed to suit a telescope with an $f/15$ focus. The polarimeter enables linear optical polarization to be measured in a 40-mm diameter image with a spatial resolution limited by atmospheric 'seeing'. The method is independent of variations in background sky brightness and polarization and in atmospheric transparency. The optical system is suitable for use with other types of area detector such as CCD cameras. (21 refs.)

116484 High precision spectropolarimetry of stars and planets. I. The ROE spectropolarimeter. R.D.Wolstencroft, W.A.Cormack, J.W.Campbell (Royal Obs., Edinburgh, Scotland), R.J.Smith.

Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.23-38 (Oct. 1983).

A spectropolarimeter is described which is capable of measuring linear and circular polarization between 3000 and 8000 Å at a resolution of between 5 and 400 Å. Narrow-band observations of unpolarized stars are presented which demonstrate that the instrumental polarization is very small (≤ 0.01 per cent). (9 refs.)

Use of BPS-75+'Elektronika-100I' scanning-measuring system for analysis of photographs from wide-gap chambers See Entry 112576

95.70 OTHER INSTRUMENTATION AND TECHNIQUES

(inc. clocks, frequency standards)

116485 Parametric detector as a tunable antenna for continuous gravitational radiation. F.Bordoni, F.Fulgini (Istituto di Fisica dello Spazio Interplanetario, CNR, Frascati, Italy).

Phys. Rev. D (USA), vol.28, no.6, p.1285-90 (15 Sept. 1983).

A way of using Weber-type antennas as tunable detectors of gravitational radiation from pulsars is described. Preliminary laboratory tests on the feasibility of such an instrument give encouraging results. (6 refs.)

116486 Planetary Soil Water Analyzer (PSWA) prototype. W.F.Cashin (Ball Aerospace Systems Div., Huntington Beach, CA, USA), D.M.Anderson. ITC/USA/82. International Telemetering Conference, San Diego, CA, USA, 28-30 Sept. 1982 (Woodland Hills, CA, USA: Int. Found. Telemetering 1982), p.701-8

The use of differential scanning calorimetry is advantageous in determining water content of soil samples. The basic idea is to use two matched ovens, one with a soil sample included. The average temperature of the ovens is forced to track a desired programmed temperature (normally a slow ramp) with one control loop, while a second control loop forces the oven temperatures to be equal, even during a transition. The power necessary to keep the temperatures equal is monitored, containing information as to the transition energy, and thus the water content at programmed water transition temperatures. This approach uses the microprocessor to close both of the loops, taking oven sensor temperatures as an input, and providing power duty cycles as outputs. In actuality, two microprocessors are used—a slave to accumulate and process sensor information, and a master to generate the loop control, output data control, and temperature program control. The PSWA perfor-

mance is compared with that of a state-of-the-art commercial instrument using analog loop control. (8 refs.)

Design and performance of a one square meter proportional counter system for hard X-ray astronomySee Entry 116474

95.75 TECHNIQUES OF OBSERVATION AND REDUCTION

116487 IUE data reduction. C.Morossi, G.Sedmak (Oservatorio Astron. di Trieste, Trieste, Italy). *Mem. Soc. Astron. Ital. (Italy)*, vol.54, no.2, p.373-84 (1983).

IUE data reduction is examined with regard to the present and future importance of IUE astronomy in the UV range of evaluating the standard IUE-SIPS (spectral image processing system) procedure and the alternative Italian procedures. The IUESIPS version presently available for high and low spectral resolution modes is described. (21 refs.)

116488 Galactic profiles and the point spread function. G.F.R.Ellis, L.Lawrence, G.B.Brundrit. *Mon. Notes Astron. Soc. South Afr. (S. Africa)*, vol.41, no.11-12, p.107-17 (Dec. 1982).

Because of point-spread effects, the photographic image of a galaxy is significantly different from the 'true' image that would be obtained on a screen near the galaxy. The authors point out how this resolves a paradox concerning the visibility of distant galaxies, and give a simple model that may be used to estimate such point-spread effects. In particular, the authors obtain a simple analytic formula for estimating the averaging effect of the point-spread function on the image profile. (6 refs.)

116489 Effects of photon noise on speckle image reconstruction with the Knox-Thompson algorithm. P.Nisenson (Harvard-Smithsonian Center for Astrophys., Harvard Univ., Cambridge, MA, USA), C.Papaliolios. *Opt. Commun. (Netherlands)*, vol.47, no.2, p.91-6 (15 Aug. 1983). An analysis of the effects of photon noise on astronomical speckle image reconstruction using the Knox-Thompson algorithm (1974) is presented. It is shown that the quantities resulting from the speckle average are biased, but that the biases are easily estimated and compensated. Calculations are also made of the convergence rate for the speckle average as a function of the source brightness. An illustration of the effects of photon noise on the image recovery process is included. (11 refs.)

116490 On the possibility of seasonal corrections while adjusting coordinates of stars. V.L.Gorshkov. *Pis'ma v Astron. Zh. (USSR)*, vol.9, no.8, p.500-3 (1983). In Russian. English translation in: *Sov. Astron. Lett. (USA)* A modification for the chain adjustment of the coordinates of stars is proposed, which makes it possible to correct instrumental and refraction errors if they are linear night trends. The method is tested for group as well as for nongroup observations. The advantages of the method are demonstrated using Pulkovo time service observations. (10 refs.)

95.85 CATALOGUES, ATLASES ETC

116491 Second catalogue of H α line profiles in 55 Be star spectra. Y.Andrillat (Obs. de Haute Provence, Saint-Michael-l'Observatoire, France). *Astron. & Astrophys. Suppl. Ser. (France)*, vol.53, no.3, p.319-38 (Sept. 1983). In French.
For first catalogue, entitled 'Study of H α profile in 72 Be stars', see *ibid.*, vol.48, no.1, p.93-136 (1983). Presents the second catalogue of H α line profiles in 55 Be star spectra. With those published in the first catalogue, (Andrillat and Fehrenbach 1982) the sample now comprises 127 stars. It is found that the H α emission is so strong that in most cases (64%) the underlying photospheric absorption line is not visible. A central absorption is detected in the H α emission line for 73% of the stars; this absorption feature presents a large diversity of aspects. The width measured at half maximum of emission intensity is correlated with the rotational velocity of the star. The extension of the line wings is correlated with the spectral type and with the rotational velocity of the star. (15 refs.)
116492 Galaxies rotation curves: a catalogue. G.C.Baiesi-Pillastrini, G.G.C.Palumbo, G.Vetolani. *Astron. & Astrophys. Suppl. Ser. (France)*, vol.53, no.3, p.373-81 (Sept. 1983).
The catalogue contains all bibliographical information pertaining to rotation curves of external galaxies which have appeared in the astronomical literature up to December 1981. Information about 271 galaxies is given from 332 papers. (334 refs.)
116493 New double stars (18th series) discovered at Nice. P.Couteau (Obs. de Nice, Nice, France). *Astron. & Astrophys. Suppl. Ser. (France)*, vol.53, no.3, p.441-4 (Sept. 1983). In French.
For 17th series see *ibid.*, vol.48, no.3, p.443-7 (1982). Presents a list of 150 close visual binaries discovered at the 50 cm and the 74 cm refractors. (3 refs.)
116494 A catalog of high accuracy circular polarization measurements. K.W.Weiler (Div. of Astron. Sci., Nat. Sci. Found., Washington, DC, USA), I.de Pater. *Astrophys. J. Suppl. Ser. (USA)*, vol.52, no.3, p.293-327 (July 1983).
An attempt has been made to collect into one catalog all high accuracy circular polarization measurements of the nonthermal synchrotron radiation from nonstellar, extra-solar system radio sources published by early 1982. 'High accuracy' has been defined for this purpose as a quoted standard error of better than 0.1%. For those sources having measurements in the catalog at at least three different frequencies, the spectrum of the circular polarization is plotted. For those having measurements at at least four different times at any one frequency, the time dependence is plotted. Whenever total intensity and

linear polarization measurements were published concurrently with the circular polarization results, these are included in the catalog. (68 refs.)
116495 A photoelectric *UBV* catalogue of 610 stars in Puppis. B.C.Reed, M.P.FitzGerald (Dept. of Phys., Univ. of Waterloo, Waterloo, Ontario, Canada). *Mon. Not. R. Astron. Soc. (GB)*, vol.205, no.1, p.241-64 (Oct. 1983).
Presents a catalogue of photoelectric *UBV* photometry and some spectral types for 610 stars in a field in Puppis centred at (*l*,*b*)=(245°, 0°). This catalogue reports results taken from the literature, as well as observations recently obtained by the authors, all reduced to a homogeneous *UBV* system. (27 refs.)

95.90 OTHER TOPICS IN ASTRONOMY AND ASTROPHYSICS

116496 If they are here, where are they? Observational and search considerations. R.A.Freitas,Jr. (Xenology Res. Inst., Sacramento, CA, USA). *Icarus (USA)*, vol.55, no.2, p.337-43 (Aug. 1983).
Discusses observational considerations in a search for extraterrestrial intelligence (SETI) program to detect extraterrestrial messenger probes in the Solar System. Observable artifacts will most likely be found in a search space consisting of geocentric, selenocentric, Earth-Moon libration, and Earth-Moon halo orbits, which may be searched to a limiting artifact size of 1-10 m(*p*_v=0.1) using existing or foreseeable instrumentation. (57 refs.)
Proceedings of the Eighteenth General Assembly of the IAU See Entry 111314
Finite exposure time, astronomical speckle transfer function See Entry 116274

96.10 GENERAL, SOLAR NEBULA, AND COSMOGONY

Evolution of the surface of Mars See Entry 116510
Distribution of cometary binding energies based on the assumption of steady state See Entry 116547

96.20 MOON

116497 The direct planetary perturbations of the rotation of the Moon. I.Pesek (Astron. Obs., Tech. Univ., Praha, Czechoslovakia). *Bull. Astron. Inst. Czech. (Czechoslovakia)*, vol.34, no.4, p.242-4 (July 1983).
Direct planetary perturbations of lunar rotation are derived. (5 refs.)
116498 The Danjon limit of lunar visibility: a re-examination. M.Ilyas. *J. R. Astron. Soc. Can. (Canada)*, vol.77, no.4, p.214-19 (Aug. 1983).
It is found that the correct value of the Danjon's limiting elongation for lunar visibility is close to 10.5°C. The limit provides only a general guide, not sufficient for calendrical purposes. (13 refs.)
116499 Analysis of lunar occultations. V. Grazing occultations 1964-1977. G.M.Appleby, L.V.Morrison (Royal Greenwich Obs., Hailsham, England). *Mon. Not. R. Astron. Soc. (GB)*, vol.205, no.1, p.57-65 (Oct. 1983).
For pt.IV see *ibid.*, 1982, no.3, p.1119-25 (1982). Observations of 800 grazing occultations of stars at the polar regions of the Moon, which occurred in the years 1964-77, are analysed for corrections to Watt's (1963) charts of the lunar profile, systematic errors in the analytical lunar ephemeris *j*=2, and for the correction to the zero point of right ascension in the FK4 catalogue. (15 refs.)
116500 Lunar magnetism, polar displacements and primeval satellites in the Earth-Moon system. S.K.Runcorn (Inst. of Lunar & Planetary Sci., Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England). *Nature (GB)*, vol.304, no.5927, p.589-96 (18 Aug. 1983).
The discovery that rocks of the lunar crust possess remanent magnetism is a surprising result in view of the fact that the present Moon does not exhibit a magnetic field, nor was there once evidence of an iron core in which one could be generated. This review looks at the concept of lunar palaeomagnetism and discusses its implications for lunar science as a whole. (86 refs.)

96.30 PLANETS AND SATELLITES

(*exc. the Moon; for celestial mechanics, see 95.10; for Earth as an astronomical body, see 91. Geophysics*)

116501 Reflection of light by a multilayered planetary atmosphere. Zh.M.Dlugach (Primary Astron. Obs., Acad. of Sci., Kiev, Ukrainian SSR). *Sol. Syst. Res. (USA)*, vol.17, no.1, p.14-19 (Jan.-March 1983). Translation of: *Astron. Vestn. (USSR)*, vol.17, no.1, p.20-6 (Jan.-March 1983). [received: Sept. 1983]
A layer addition method is presented that is modified for multilayer media. Some numerical results for two-layer atmospheres are given, which can be useful in interpretation of planetary observational data. (9 refs.)
Adiabatic lapse rates of planet atmospheres See Entry 111368
Surface illuminance and albedo of a planetary atmosphere with nearly conservative scattering See Entry 116270
Planetary Soil Water Analyzer (PSWA) prototype See Entry 116486
The direct planetary perturbations of the rotation of the Moon See Entry 116497

96.30D Mercury

116502 Additive remarks to the problem of Mercury's motion of the perihelion. V.E.R.Bagge (Inst. fur Reine und Angewandte Kernphys., Christian-Albrechts-Univ., Kiel, Germany). *Atomkernenerg. Kerntechnik. (Germany)*, vol.42, no.2, p.130-4 (1983). In German.
It is shown that the value for the secular motion of Mercury's perihelion received by the numerical solution of the Newtonian equation of motion at very fine intervals for the steps of integration is sustained always. In these calculations the relativistic change of mass at varying velocity is taken in

account not only at the acceleration term but also at the gravitational force between the Sun and the moving planet. The numerical calculations have been confirmed by two completely different programs, one formulated in cartesian coordinates the other one in polar coordinates; the two results are exactly the same. (no refs.)

96.30E Venus

116503 Stratosphere of Venus according to the data of the accelerometer measurements of the Venera-11 and Venera-12 spacecraft. V.S.Avduevskii, V.V.Semenchenko, G.R.Uspenskii, Z.P.Cheremukhina.

Cosmic Res. (USA), vol.20, no.6, p.649-55 (Nov.-Dec. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.6, p.913-20 (Nov.-Dec. 1982). [received: Sept. 1983]

A description is given of the instrumentation onboard the Venera-11 and Venera-12 spacecraft. The measurement results and the procedure for their analysis are given. The altitude distributions of the pressure, density, and temperature of the stratosphere are constructed. (11 refs.)

116504 Magnetic field fluctuations in the Venus magnetosheath. J.G.Luhmann, M.Tatraliyay, C.T.Russell, D.Winterhalter (Inst. of Geophys. & Planetary Phys., Univ. of California, Los Angeles, CA, USA).

Geophys. Res. Lett. (USA), vol.10, no.8, p.655-8 (1983). (American Geophysical Union Chapman Conference on Waves in Magnetospheric Plasma, Kona Coast, HI, USA, 7-11 Feb. 1983).

Using a model for the convection pattern of the shocked solar wind flow around Venus, Pioneer Venus observations of ultra-low-frequency (~10-40 s period) magnetic field fluctuations in the magnetosheath have been traced along streamlines to the region of the quasi-parallel bow shock. The periods and polarizations of the sinusoidal fluctuations are similar to those observed upstream of the quasi-parallel bow shock, where streaming superthermal particles are believed to produce MHD waves by a beam-plasma instability. The results suggest that both disturbances at the ionopause at Venus and the Earth's magnetopause may be caused by convection of turbulent magnetic fields from the subsolar bow shock, when the interplanetary field direction produces a quasi-parallel shock there. (17 refs.)

116505 Spectroscopy of molecular oxygen in the atmospheres of Venus and Mars. J.T.Trauger, J.I.Lunine (Div. of Geological & Planetary Sci., California Inst. of Technol., Pasadena, CA, USA).

Icarus (USA), vol.55, no.2, p.272-81 (Aug. 1983).

The abundances of molecular oxygen in the atmospheres of Venus and Mars are sensitive to fundamental photochemical processes. A new upper limit is reported for the molecular oxygen mixing ratio ($O_2/CO_2 < 3 \times 10^{-7}$) in the integrated column above the visible cloud tops of Venus, based on spectroscopic observations carried out in early spring, 1982. During the same observing period, an O_2 column abundance of 8.5 cm-am for the atmosphere of Mars was measured, slightly below the O_2 abundances measured a decade earlier. (34 refs.)

116506 Fluctuations of frequency and phase of radio waves propagating through the atmosphere of Venus. A.I.Yefinov, V.M.Razmanov, T.S.Timofeyeva, O.I.Yakovlev.

Radio Eng. & Electron. Phys. (USA), vol.27, no.12, p.38-41 (Dec. 1982). Translation of: *Radioelektr. & Elektron. (USSR)*, vol.27, no.12, p.2318-22 (Dec. 1982). [received: Sept. 1983]

Experimental data, gathered during radio sounding of the Venus atmosphere by the Venera-10 probe, are used to analyze the effect of atmospheric inhomogeneities of that planet on fluctuations of frequency and phase of radio waves. An analysis of the data obtained indicates that, just as in the case of amplitude fluctuations, the frequency and phase fluctuations increase when the beam axis passes at a distance of 58-60 km above the Venus surface and are attenuated at the altitude of 54-56 km. The external scale of turbulence of the Venus atmosphere, equal to 4.5-6 km, is determined from the obtained experimental data for the upper turbulence region, localized near the altitude of 60 kilometers. (7 refs.)

96.30G Mars

116507 CO₂ altimetry of the Memnonia Fossae-Margaritifer Sinus region by the Mars-5 probe. L.V.Zasova, V.M.Zubkova, V.S.Zhegulev, L.V.Ksanfomaliti, V.I.Moroz, E.V.Petrova.

Cosmic Res. (USA), vol.20, no.6, p.655-9 (Nov.-Dec. 1982). Translation of: *Kosm. Issled. (USSR)*, vol.20, no.6, p.921-7 (Nov.-Dec. 1982). [received: Sept. 1983]

The relief of Mars is studied along a line extending south from the rift valley Marineris Valles. The measurements were made in a complex experiment including studies of the thermal properties of the soil, the structure of the surface, its photometric characteristics, and the relief. CO₂-altimetry was used in the latter study. The measurements were made in 1974 onboard the Mars-5 probe. Changes in altitude of up to 6 km over a baseline of 50 km were seen (Claritas Fossae). The regions of the Holden-Hale craters and the Nirgal Vallis are extended areas of low elevation. (15 refs.)

116508 Variability of carbon monoxide in the Mars atmosphere. R.T.Clancy, D.O.Muhleman, B.M.Jakosky (Div. of Geological & Planetary Sci., California Inst. of Technol., Pasadena, CA, USA).

Icarus (USA), vol.55, no.2, p.282-301 (Aug. 1983).

In January of 1982 the authors measured a microwave spectrum of CO in the Martian atmosphere utilizing the rotational J=1-2 transition of CO. The authors analyze data and reanalyze the microwave spectra of Kakar, Waters, and Wilson (1977) and Good and Schloerb (1981) in order to constrain estimates of the temporal variability of CO abundance in the Martian atmosphere. Values of CO column density are given. The most recent estimate of CO column density from the 1967 infrared spectra of Connes, Connes, and Maillard (1969), is discussed. The large uncertainties given for the microwave measurements are due primarily to uncertainty in the difference between the continuum brightness temperature and atmospheric temperatures of Mars. The authors calculate the variation among the observations of the continuum (surface) brightness temperature of Mars, which is primarily a function of the observed aspect of Mars. The authors also consider variability of global atmospheric temperatures among the observations, particularly the effects of global dust storms and the ellipticity of the orbit of Mars. (40 refs.)

116509 Martian great dust storms: interpretive axially symmetric models. E.K.Schneider (Center for Earth & Planetary Phys., Harvard Univ., Cambridge, MA, USA).

Icarus (USA), vol.55, no.2, p.302-31 (Aug. 1983).

The simplified theory of steady, nearly inviscid, thermally forced axially symmetric atmospheric motions developed by Schneider (1977) is applied to the study of the problem of the Martian great dust storms. A highly idealized calculation of the atmospheric response to heating concentrated in a small latitude band is carried out. Qualitatively different local and global response

regimes are identified. As the heating is increased from zero, some critical value is reached at which the response jumps from local to global. It is suggested that this transition from local to global response may be related to the observed explosive growth of great dust storms. The steady axially symmetric Martian response to solar forcing is examined. Modification to the solar forced response due to an added latitudinally localized heat source is briefly discussed. Implications of the dynamical model for the dependence of the occurrence of great dust storms on orbital parameters are remarked on. (26 refs.)

116510 Evolution of the surface of Mars. A.J.Connell, M.M.Woolfson (Phys. Dept., Univ. of York, Heslington, England).

Mon. Not. R. Astron. Soc. (GB), vol.204, no.3, p.1221-30 (Sept. 1983).

Various models of the Martian crust, differing in the amount of water content, are evaluated in terms of a satellite origin for the planet. It is shown that the hemispherical asymmetry of the planet, in particular the low elevation and smoothness of the northern plain can be accounted for by the abrasion of material from the northern crust by projectiles from a planetary collision. An estimate of ~2.8 km is found for the centre-of-mass centre-of-figure offset which agrees quite well with observation. (18 refs.)

96.30H Asteroids

116511 Photoelectric photometry of asteroids 45, 120, 776, 804, 814, and 1982DV. H.Debhogne (Obs. Royal de Belgique, Bruxelles, Belgium), G.De Sanctis, V.Zappala.

Icarus (USA), vol.55, no.2, p.236-44 (Aug. 1983).

Photoelectric lightcurves of six asteroids, observed at the ESO 50-cm photometric telescope, are presented. 45 Eugenia, observed for pole determination program, showed a small amplitude of light variation. For 120 Lachesis, no period of rotation was deduced from three observing nights; it is probably longer than 20 hr. 776 Berbericia was observed again to eliminate the ambiguity between 23^h and 15.3^h periods, as pointed out by Schober (1979). The longer period is ruled out, but the authors suggest a very plausible shorter period of 7.762^h, implying, at least at this opposition, one maximum and one minimum per cycle. A similar ambiguity is present for 804 Hispania also. The period could be either 14.84^h or 7.42^h. For 814 Tauris a long period of 35.8 hr is found, confirming the tendency of dark asteroids of intermediate size to rotate more slowly than larger ones. Finally a single-night lightcurve of the fast-moving object 1982DV is presented. (18 refs.)

116512 Observations of asteroids in the 3- to 4-μm region. N.Eaton (Astron. Dept., Univ. of Leicester, Leicester, England), S.F.Green, R.S.McCheyne, A.J.Meadows, G.J.Veeder.

Icarus (USA), vol.55, no.2, p.245-9 (Aug. 1983).

Spectra of eleven asteroids (1, 2, 8, 10, 15, 16, 22, 83, 386, 433, 471) have been obtained in the 3- to 4-μm region. Of these, only Ceres and Pallas have previously been observed in this wavelength region. Spectra of the S- and M-type asteroids are generally featureless, but 8 Flora may be an exception. None of the three new C-type spectra show significant absorption. (11 refs.)

116513 1983 RB. C.Shoemaker, C.M.Bardwell.

I.A.U. Circ. (USA), no.3861, 1 pp. (14 Sept. 1983).

Reports the discovery of a 15th-magnitude fast-moving asteroidal object in Aquarius. Precise positions are reported for the period 1983 September 7 to 12. Orbital elements are given, together with an ephemeris for the period 1983 September 13 to October 13 at five-day intervals: the object is an Amor-type asteroid. (no refs.)

116514 1983 RD. R.S.Dunbar, A.Harris, C.S.Shoemaker, B.G.Marsden.

I.A.U. Circ. (USA), no.3862, 1 pp. (14 Sept. 1983).

Reports the discovery of a 12th-magnitude fast-moving asteroidal object in Pegasus. Precise and semi-accurate positions are reported for the period 1983 September 7 to 13. Tentative orbital elements are given, together with an ephemeris for the period 1983 September 13 to 23 at one-day intervals: the object is an Amor-type asteroid. (no refs.)

116515 Occultation of 14 Piscium by (51) Nemausa. D.W.Dunham.

I.A.U. Circ. (USA), no.3869, 1 pp. (23 Sept. 1983).

It is reported that this occultation, on 1983 September 11, was observed throughout the southeastern United States. The northern limit was defined by an observation of a 2.3 s occultation at Yorktown, Virginia. The longest reported chord (13.5 s), observed in central North Carolina, corresponds to a diameter of 160 km for Nemausa. The southernmost positive observation, at Greenville, North Carolina, was of an 8.2 s occultation. No well-established secondary occultations were observed. (no refs.)

116516 Results of astrophysical investigations of asteroids (survey). II. D.F.Lupishko, I.N.Bel'skaya (A.M. Gor'ki State Univ., Kharkov, Ukrainian SSR).

Sol. Syst. Res. (USA), vol.17, no.1, p.1-13 (Jan.-March 1983). Translation of: *Astron. Vestn. (USSR)*, vol.17, no.1, p.5-19 (Jan.-March 1983). [received: Sept. 1983]

For pt.I see *Astron. Vestn.*, vol.16, no.4, p.195-208 (1982) and *Solar System research*, vol.16, no.4, p.153-64 (1983). The results of polarimetric, spectrophotometric and radiometric investigations of asteroids are presented, and the principal problems for future investigations are briefly formulated. (50 refs.)

96.30K Jupiter

116517 Observations of Jupiter with the astrolabe of the CERGA Observatory (February 1980-May 1981). G.Vigouroux, G.Dudognon, P.Granes, F.Mignard, J.Pham-Van (CERGA, Grasse, France).

Astron. & Astrophys. Suppl. Ser. (France), vol.53, no.3, p.361-2 (Sept. 1983). In French.

Contains the results of the third Jupiter campaign with the CERGA astrolabe. Because of the low declination of this planet (10° to 1°) it was only observed at 45° of elevation: 41 east and west transits were recorded. The table gives the dates, the zenith distance residuals, the corrections for defective illumination as usual and the indication of the observer and of the reference groups. (4 refs.)

116518 Ion cyclotron waves in the Io plasma torus: polarization reversal of whistler mode noise. D.A.Gurnett, C.K.Goertz (Dept. of Phys. & Astron., Univ. of Iowa, Iowa City, IA, USA). *Geophys. Res. Lett. (USA)*, vol.10, no.7, p.587-90 (July 1983). Because of the presence of multiple ion species in the Io plasma torus whistler mode noise can be converted to ion cyclotron waves via a polarization reversal process at the local crossover frequency. Using whistler mode intensity measurements in the Jovian magnetosphere from Voyager 1 the authors estimate the pitch-angle diffusion rates that would occur if the noise is converted to ion cyclotron waves. Typical pitch-angle diffusion coefficients range from $D_{\alpha\alpha} \approx 10^{-6} \text{ sec}^{-1}$ for protons resonating near the equator to $D_{\alpha\alpha} \approx 10^{-4} \text{ sec}^{-1}$ for 10 keV O^+ ions resonating at high latitudes. Although complete bounce averaged diffusion coefficients have not yet been computed, preliminary estimates indicate that the energetic ion precipitation caused by these waves may be able to account for the EUV auroral emissions at the foot of the torus field lines. (19 refs.)

116519 Electromagnetic ion-cyclotron instability in the multi-ion Jovian magnetosphere. R.M.Thorne, J.Moses (Dept. of Atmospheric Sci., Univ. of California, Los Angeles, CA, USA). *Geophys. Res. Lett. (USA)*, vol.10, no.8, p.631-4 (1983). (American Geophysical Union Chapman Conference on Waves in Magnetospheric Plasma, Kona Coast, HI, USA, 7-11 Feb. 1983). Propagation characteristics of electromagnetic ion-cyclotron waves are extremely sensitive to the relative composition of thermal ions: this can consequently control the instability properties of resonant energetic ions in the Jovian magnetosphere. The dominance of heavy ions in the Io plasma torus will suppress ion-cyclotron instability near the equatorial plane. Wave growth, however, can still occur away from the equator in the region where thermal hydrogen is expected to predominate. A theoretical assessment of the convective L-mode gain indicates that Voyager 1 did not enter the preferred region of instability. Evidence for instability may nevertheless be available since oblique ion-cyclotron waves are expected to experience a natural polarization reversal to the R-mode which is able to propagate from high latitudes to the equator. (25 refs.)

116520 Two classes of volcanic plumes on Io. A.S.McEwen, L.A.Soderblom (US Geological Survey, Flagstaff, AZ, USA). *Icarus (USA)*, vol.55, no.2, p.191-217 (Aug. 1983). The authors discuss the eruptions of Pele and Surt. The authors describe the discovery of yet another large eruption, from the caldera named Aten Patera, that also occurred between the two encounters, this time in the south polar region, and with surface changes almost identical to those at Surt. The recognition of the strong similarity of scale and appearance of the deposits from these three large plume eruptions led the authors to investigate the possible existence of discrete classes of volcanic plumes on Io. Evidently, Pele, Surt, and Aten Patera represent a class of plume eruptions that are larger and shorter lived than a second class of smaller plumes. Albedos and colors of source regions and plume deposits, along with evidence for sizes, durations, and temperatures, suggest that there are, in fact, two distinct and very different types of volcanic plumes. The authors present the results of the analysis and examine proposed models for Io's volcanism in the context of the two classes. (44 refs.)

116521 On the detectability of H_2S in Jupiter. B.Bezard (Lab. d'Astron. Infrarouge, Obs. de Meudon, Meudon, France), A.Marten, J.P.Baluteau, D.Gautier, J.-M.Flaud, C.Camy-Peyret. *Icarus (USA)*, vol.55, no.2, p.259-71 (Aug. 1983). The influence of hydrogen sulfide, a still-undetected key molecule for the Jovian atmospheric chemistry in the infrared spectrum, is investigated. Synthetic spectra including various vertical distribution profiles of H_2S are computed and compared with observational data for Jupiter in the 2- to 15-cm^{-1} and 1160- to 1200-cm^{-1} spectral ranges. No firm conclusion about the presence of H_2S can be drawn from the latter spectral region because of large uncertainties in gaseous opacities. In the microwave range, H_2S is found to be a possible candidate to explain the measurements. Constraints to its vertical distribution which would imply a significant supersaturation in the troposphere are derived. Physical and chemical processes involving H_2S in the atmosphere are discussed in the light of this hypothesis. (40 refs.)

116522 High precision spectropolarimetry of stars and planets. II. Spectropolarimetry of Jupiter and Saturn. R.J.Smith (Dept. of Astron., Univ. of Edinburgh, Edinburgh, Scotland), R.D.Wolstencroft. *Mon. Not. R. Astron. Soc. (GB)*, vol.205, no.1, p.39-55 (Oct. 1983). For pt.1 see ibid., vol.205, no.1, p.23-38 (1983). A rise in the linear polarization detected from the integrated disc of Jupiter across the 7270 Å methane band is confirmed. The effect is also shown to be present across the same band for Saturn. A large enhancement in the circular polarization of Saturn at phase angle 2.7° has been seen, and its remarkable wavelength dependence studied. These observations provide useful constraints for the more sophisticated models that are clearly needed for the atmospheres of these planets. (23 refs.)

116523 Tidal dissipation in small viscoelastic ice moons: the case of Enceladus. J.P.Poirier, L.Boloh, P.Chambon (Inst. de Phys. du Globe, Univ. Paris VI, Paris, France). *Icarus (USA)*, vol.55, no.2, p.218-30 (Aug. 1983). Tidal dissipation is investigated in a viscoelastic homogeneous sphere having the orbital and physical characteristics of the icy inner satellite of Saturn, Enceladus. The dissipated power is calculated for Kelvin-Voigt and Maxwell rheologies, whose dissipation function can be expressed in terms of viscosity. Expressions for the dissipated power as a function of viscosity is calculated in both cases and compared to the expression found for a lossy elastic body. A physical law relating viscosity of water ice to temperature and grain size is introduced and the feedback between dissipated power and temperature is investigated. (15 refs.)

116524 A new system of orbital elements of Saturn's satellites. I.G.Chugunov. *Pis'ma v Astron. Zh. (USSR)*, vol.9, no.8, p.508-12 (1983). In Russian. English translation in: *Sov. Astron. Lett. (USA)* Elements of the orbits of Saturn I-VI are given, based on 285000 measurements covering the period 1682-1981. The correlation matrix is analysed. (7 refs.)

116525 Speckle interferometry observations of Pluto's moon Charon. N.Hetterich, G.Weigelt (Phys. Inst., Univ. Erlangen, Erlangen, Germany). *Astron. & Astrophys. (Germany)*, vol.125, no.2, pt.1, p.246-8 (Sept. 1983). Performs photon-counting speckle interferometry of Pluto and its moon Charon. 12000 speckle interferograms were recorded in two different nights with the 1.5 m Danish telescope at the European Southern Observatory, Chile. (12 refs.)

116526 The obliquity of Pluto. A.R.Dobrovolskis, A.W.Harris (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA). *Icarus (USA)*, vol.55, no.2, p.231-5 (Aug. 1983). Pluto's obliquity (the angle between its spin axis and orbit normal) varies between $\sim 102^\circ$ and $\sim 126^\circ$ over a period of about 3 million years. These oscillations are nearly sinusoidal and quite stable, leading to only modest changes in the isolation regime. Thus, Pluto's rotation has been slightly retrograde ever since its current orbit and rotation rate were established. (15 refs.)

116527 The structure of Neptune's upper atmosphere: the stellar occultation of 24 May 1981. R.G.French (Dept. of Earth & Planetary Sci., MIT, Cambridge, MA, USA), J.H.Elias, D.J.Mink, J.L.Elliott. *Icarus (USA)*, vol.55, no.2, p.332-6 (Aug. 1983). Observations of the 24 May 1981 occultation of an uncatalogued star by Neptune made at the Cerro Tololo Inter-American Observatory are analyzed to yield temperature profiles of Neptune's upper atmosphere for number densities near $5 \times 10^{13} \text{ cm}^{-3}$. The mean temperatures at immersion (latitude 56°) and emersion (latitude 16°) obtained by numerical inversion were $140 \pm 10\text{K}$ and $154 \pm 10\text{K}$, respectively. The immersion and emersion profiles are remarkably similar in overall shape, suggestive of global atmospheric layering. From the astrometry of the event, precise relative positions of Neptune and the occulted star are obtained. (15 refs.)

116528 Photolysis of methane and the ionosphere of Uranus. S.K.Atreya, J.J.Ponthieu (Dept. of Atmospheric & Oceanic Sci., Univ. of Michigan, Ann Arbor, MI, USA). *Planet. & Space Sci. (GB)*, vol.31, no.8, p.939-44 (Aug. 1983). Photochemical calculations for Uranus predict an extensive region of condensation of acetylene, ethane and methane in the vicinity of the temperature inversion layer. This could explain why ethane was not detected on Uranus, unlike Neptune which has a much warmer inversion layer. Subsequent snow-out of the condensibles is expected to result in reduced visibility in the troposphere. Ionospheric calculations for the equatorial region to be probed by Voyager, indicate peak electron concentrations on the order of $5 \times 10^4 \text{ cm}^{-3}$ if dynamical effects are important. Upper limit to the electron peak is $3 \times 10^4 \text{ cm}^{-3}$. Exospheric temperatures are discussed. (26 refs.)

116529 Entwined and parallel bundled orbits as alternative models for narrow planetary ringlets. R.Eshleman (Stanford Univ., Stanford, CA, USA). *Science (USA)*, vol.221, no.4608, p.361-4 (22 July 1983). Particle orbits can be bundled in two different ways to produce narrow, Uranus-type ringlets. The usual assumption is that they are packed in a parallel manner in a structure that is essentially only two-dimensional. The alternative of a bundle of entwined orbits produces a three-dimensional structure of potentially large protected areal density. The two models might be discriminated observationally by differences in the motion of the line of intersection of the orbital and equatorial planes, and by the predicted radial reversal (entwined) or nonreversal (parallel) of features in occultation signatures taken at certain longitudes. (12 refs.)

116531 The atmosphere of a dirty-clathrate cometary nucleus: a two-phase, multifluid model. M.L.Marconi, D.A.Mendis (Dept. of Electrical Engng. & Computer Sci., Univ. of California, San Diego, CA, USA). *Astrophys. J. (USA)*, vol.273, no.1, pt.1, p.381-96 (1 Oct. 1983). A self-consistent, transonic, multifluid solution of the dynamical and thermal structure of a dusty gas atmosphere of a dirty-clathrate cometary nucleus is

presented. While the heavy neutral and ion species are treated as a single fluid in the collision-dominated region, the photo-produced hydrogen is treated separately. It is assumed to be composed of a thermalized component and a prethermal component which gradually thermalizes by elastic collisions with the heavier species. Also, the photoelectrons are considered as a separate fluid. The thermal profile of the atmosphere is entirely different from those predicted by earlier models. (42 refs.)

116532 Radio observations of Comet 1983d. W.J.Altenhoff, W.Batrla, W.K.Huchtmeier, J.Schmidt, P.Stumpff, M.Walmsley (Max-Planck-Inst. für Radioastron., Bonn, Germany).

Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.L19-22 (Sept. 1983). Radio continuum and spectral line observations of Comet 1983d (Iras-Araki-Alcock) have been made using the Effelsberg 100-m telescope at a wavelength of 1.3 cm. A continuum point source of strength 9 mJy was detected at the time of perigee (May 11), and this emission persisted throughout the next day. The authors have probably detected both the NH_3 (3,3) and H_2O (6_16-5_23) lines from the comet. The derived ammonia production rate of $6 \cdot 10^{26} \text{ s}^{-1}$ suggests that NH_3 forms roughly six percent of the gases sublimating from the cometary nucleus. (4 refs.)

116533 Infrared fluorescence of molecules in comets: the general synthetic spectrum. J.Crovisier, T.Encrenaz (Obs. de Paris-Meudon, Meudon, France). *Astron. & Astrophys. (Germany)*, vol.126, no.1, pt.2, p.170-82 (Sept. 1983). Medium infrared is a spectral range suitable for the study of parent molecules in cometary atmospheres. In order to prepare infrared observations of comets from the Earth or from fly-by probes, the authors list 130 vibration-rotation bands of 20 possible parent molecules, and consider their plausible excitation mechanisms. Band emission may occur through excitation by direct solar radiation field, by solar radiation reflected or scattered by the dust or nucleus, by thermal radiation of the dust or nucleus; collisions may also provide thermal excitation. The authors show that the main emission process is expected to be resonant fluorescence of the fundamental vibrational bands by direct solar excitation. The authors compute synthetic spectra in the range 2.5-16 μ . (47 refs.)

116534 Calculations of comet orbits from observations of 1980/81. L.Buffoni, A.Manara, M.Scardia (Osservatorio Astron. di Brera, Milano, Italy).

Astron. Nachr. (Germany), vol.304, no.4, p.189-93 (1983). From observations published in Smithsonian Astrophysical Observatory and the Minor Planet Circulars, corrected orbits of 26 comets have been calculated. (6 refs.)

116535 The disappearance of OH from Comet P/Encke. M.F.A'Hearn (Univ. of Maryland, College Park, MD, USA), R.L.Millis, D.T.Thompson. *Icarus (USA)*, vol.55, no.2, p.250-8 (Aug. 1983).

Photoelectric observations of comet P/Encke during its 1980 apparition are combined with other published data to relate molecular production rates to the visual lightcurve. In addition to a substantial asymmetry about perihelion which is already well known, there are shorter-term variations in specific molecules which have not been duplicated by models. The most dramatic of these fluctuations is a rapid decrease by more than a factor of 3 in the production of OH at 0.75 AU preperihelion. (16 refs.)

116536 Comet Shoemaker (1983p). C.Shoemaker.

I.A.U. Circ. (USA), no.3863, 1 pp. (14 Sept. 1983). Reports the discovery of a 16th-magnitude comet in Pegasus. Two precise positions are reported for the epoch 1983 September 7. (no refs.)

116537 Comet Cernis (1983l). J.Bortle, C.E.Spratt, C.S.Morris.

I.A.U. Circ. (USA), no.3863, 1 pp. (14 Sept. 1983). Presents total visual magnitude estimates for the period 1983 September 4 to 9. (no refs.)

116538 Periodic Comet IRAS (1983j). C.E.Spratt, C.S.Morris, J.Bortle.

I.A.U. Circ. (USA), no.3863, 1 pp. (14 Sept. 1983). Reports total visual magnitude estimates for the period 1983 August 13 to September 9. (no refs.)

116540 Periodic Comet Arend (1983q). J.Gibson.

I.A.U. Circ. (USA), no.3867, 1 pp. (23 Sept. 1983). Reports the recovery of this comet as a 20th-magnitude object in Lynx. Two precise positions are given for 1983 September 16 and 17. (2 refs.)

116541 Periodic Comet Harrington-Abell (1983r). J.Gibson.

I.A.U. Circ. (USA), no.3867, 1 pp. (23 Sept. 1983). Reports the recovery of this comet as a 20th-magnitude object in Gemini. Two precise positions are reported for 1983 September 17 and 18. (2 refs.)

116542 Periodic Comet Wild 2 (1983s). J.Gibson.

I.A.U. Circ. (USA), no.3867, 1 pp. (23 Sept. 1983). Reports the recovery of this comet as a 20th-magnitude object in Taurus. A single precise position is reported for the epoch 1983 September 18. (2 refs.)

116543 Comet Kowal (1983t). C.T.Kowal, B.G.Marsden.

I.A.U. Circ. (USA), no.3868, 1 pp. (23 Sept. 1983). Reports the discovery of a 16th-magnitude comet in Libra. Precise positions are given for the period 1983 May 8 to 15. Parabolic and elliptical orbital elements have been determined: it is quite probable that the object is a short-period comet, but the orbit is completely indeterminate. Three ephemerides are presented for the period 1983 June 15 to October 13, at ten-day intervals. (no refs.)

116544 Comet Cernis (1983l). B.G.Marsden.

I.A.U. Circ. (USA), no.3869, 1 pp. (23 Sept. 1983). Presents an ephemeris for the period 1983 September 23 to 1984 January 1 at ten-day intervals. (1 ref.)

116545 Periodic Comet IRAS (1983j). B.G.Marsden.

I.A.U. Circ. (USA), no.3870, 1 pp. (23 Sept. 1983). Presents an ephemeris for the period 1983 September 23 to 1984 January 1, at ten-day intervals. (1 ref.)

116546 Periodic Comet Kopff (1982k). C.E.Spratt, J.E.Bortle, C.S.Morris.

I.A.U. Circ. (USA), no.3870, 1 pp. (23 Sept. 1983). Reports total visual magnitude estimates for the period 1983 August 2 to September 9. (no refs.)

116547 Distribution of cometary binding energies based on the assumption of steady state. S.Yabushita (Dept. of Appl. Maths. & Phys., Kyoto Univ., Kyoto, Japan).

Mon. Not. R. Astron. Soc. (GB), vol.204, no.3, p.1185-91 (Sept. 1983). Long-period comets are continually expelled from the Solar System by planetary perturbations, so that the cometary population can be in a steady state if

the loss of observable comets is compensated by the injection of new comets. An integral equation derived on the steady-state assumption is adopted and analytical solutions thereof are compared with observational data. It is shown that there is a considerable excess of new comets in Oort's sense in accordance with an earlier result obtained by Everhart (1979). It is further shown that cometary decay is inadequate to account for the discrepancy. (12 refs.)

116548 Temporal variations of the absolute magnitude of Halley's comet. D.W.Hughes (Dept. of Phys., Univ. of Sheffield, Sheffield, England).

Mon. Not. R. Astron. Soc. (GB), vol.204, no.3, p.1291-5 (Sept. 1983). The variation of the absolute magnitude H_0 of Halley's comet, 1910 II, as a function of the apparition number, A , ($1910 \equiv -1$) is given by $H_0 = (6.028 \pm 0.329) + (0.0205 \pm 0.0210)A$. The comet was about 0.5 ± 0.5 mag brighter 2000 years ago and is losing about 2.3 ± 2.3 per cent of its mass at each apparition. (7 refs.)

116549 Velocities of ejection of comets by Jupiter and Saturn. M.A.Mamedov (Yu. Mamedaliev Astrophys. Obs., Shemakhinsk, USSR).

Sol. Syst. Res. (USA), vol.17, no.1, p.33-5 (Jan.-March 1983). Translation of: *Astron. Vestn. (USSR)*, vol.17, no.1, p.45-8 (Jan.-March 1983). [received: Sept. 1983]

The velocity of the ejection of a small body into a heliocentric orbit from any of the major planets is considered in general form. The distribution for aperiodic comets is obtained. (2 refs.)

116550 Motion of dust particles in cometary atmospheres. A.Korosmezey, I.Yusupov.

Report KFKI-1983-67, Hungarian Acad. Sci., Budapest (1983), 9 pp.

The motion of dust particles in a cometary coma is examined. The dust grains are assumed to be accelerated initially by the outstreaming gas up to a certain velocity and then to move solely under the influence of the light pressure of the Sun. Calculations are made according to Mie's theory to determine the maximal cometocentric distance in the sunward direction and the dust density distribution, for dust particles of several materials of various grain size. (14 refs.)

96.50K Meteors, showers and meteoroids

116551 European Network fireballs photographed in 1977. Z.Cepelach, J.Bocek, M.Novakova-Jezkova (Astron. Inst., Czechoslovak Acad. of Sci., Ondrejov, Czechoslovakia), V.Porubcan, T.Kirsten, J.Kiko.

Bull. Astron. Inst. Czech. (Czechoslovakia), vol.34, no.4, p.195-212 (July 1983).

Geometric, dynamic, photometric, and orbital data on all 29 fireballs photographed within the European Network in the year 1977 are given. In two cases, meteorite impacts are predicted and their impact points and areas given. A few remarks on the measuring and reduction procedures are included, especially on the problem of standard deviations of computed velocities. (18 refs.)

116552 Correction of meteor radiants for zenith attraction. G.V.Andreev (Tomsk Univ. Sci.-Res. Inst. for Appl. Math. & Mech., Tomsk, USSR).

Sol. Syst. Res. (USA), vol.17, no.1, p.43-5 (Jan.-March 1983). Translation of: *Astron. Vestn. (USSR)*, vol.17, no.1, p.56-9 (Jan.-March 1983). [received: Sept. 1983]

A general formula is given for the zenith attraction of meteor radiants which is valid for all meteor zenith distances. The accuracy of the Schiaparelli formula used previously is evaluated. It is shown that it is quite accurate for fast meteors, and may give errors of several degrees for slow ones. (2 refs.)

Distribution of meteor heights and sunrise See Entry 116322

Upper atmosphere wind observations of waves and tides with the UNH Meteor Radar System at Durham 43°N (1977, 1978 and 1979) See Entry 116329

96.50M Meteorites, micrometeorites

116553 Fission track age and cooling rate of the Marjalahti pallasite. P.Pellias, C.Perron, G.Crozaz (Lab. de Mineralogie du Museum, Paris, France), V.P.Perelygin, S.G.Stetsenko.

Earth & Planet. Sci. Lett. (Netherlands), vol.64, no.3, p.319-26 (Sept. 1983). Nuclear tracks were studied in olivine and merrillite from the Marjalahti pallasite. The merrillite contains an important fission contribution due mainly to the spontaneous decay of now extinct ^{244}Pu . The U contents of 29 merrillite grains range from 60 to 140 ppb (median value: 85 ppb). Assuming a reasonable fractionation temperature of $\sim 1750\text{K}$ for the pre-pallasitic material, a lower limit of $\sim 5 \text{ K/Myr}$ is obtained for the cooling rate, in strong contrast with the previous metallographic result ($\sim 0.5 \text{ K/Myr}$). This disagreement, together with those observed in the case of mesosiderites, strengthens the need for a revision of the metallographic method of retracing the cooling histories of meteorites. (35 refs.)

116554 Chemical and isotopic study of extraterrestrial particles from the ocean floor. D.A.Papanastassiou, G.J.Wasserburg, D.E.Brownlee (California Inst. of Technol., Pasadena, CA, USA).

Earth & Planet. Sci. Lett. (Netherlands), vol.64, no.3, p.341-55 (Sept. 1983). The authors report chemical, mineralogical and Rb-Sr data on deep-sea spherules and on particles from an Antarctic Ocean core in which an excess Ir content has been identified. The $^{87}\text{Sr}/^{86}\text{Sr}$ compositions and the Sr concentrations are in the range observed for the majority of chondritic meteorites. Extreme depletion of Rb relative to the chondritic abundance is found in the deep-sea spherules. These data support the inference that the deep-sea spherules are produced by the ablation or heating of meteoroids in the Earth's atmosphere. Most terrestrial sources for the deep-sea spherules can be excluded, based on the chemical composition and on the Sr isotopic composition. The results on vesicular, Ir-rich particles from the Antarctic Ocean core are also discussed. (46 refs.)

116555 Terrestrial age of an Antarctic meteorite by thermoluminescence technique. K.Ninagawa (Dept. of Appl. Phys., Okayama Univ. of Sci., Okayama, Japan), S.Miono, M.Yoshida, N.Takooka.

Lett. Nuovo Cimento (Italy), vol.38, ser.2, no.2, p.33-6 (10 Sept. 1983).

The authors have determined the terrestrial age of an Antarctic meteorite by measuring the terrestrial growth of thermoluminescence (TL) on the meteorite surface. The TL technique employed for the determination of the terrestrial age so far is based on natural fading of the TL intensity acquired during cosmic-ray exposure in space. The meteorite acquires a high intensity of TL in space by cosmic-ray bombardment. Once it falls on the Earth, the cosmic-ray irradiation decreases and the environmental temperature becomes higher comparatively, however. Therefore, the fading of TL is enhanced and overwhelms the growth. The terrestrial age has been estimated from the magnitude of fading at the inner position of meteorite. (5 refs.)

96.60 SOLAR PHYSICS

116556 Fluid motions in the solar chromosphere-corona transition region. IV. Mass motions over sunspot umbrae. J.B.Gurman, R.G.Athay (SMM Experiment Operations Facility, Goddard Space Flight Center, Greenbelt, MD, USA).

Astrophys. J. (USA), vol.273, no.1, pt.1, p.374-80 (1 Oct. 1983). For pt.III see *ibid.*, vol.269, no.2, pt.1, p.706-14 (1983). Doppler velocity measurements in the C IV resonance line $\lambda 1548.19$ have been obtained over the umbrae of eight sunspots with the ultraviolet spectrometer and polarimeter (UVSP) on the Solar Maximum Mission. The velocity bandpass of these observations is approximately $\pm 30 \text{ km s}^{-1}$, and their spatial resolution is $3'' \times 3''$. Although a few individual resolution elements display flow velocities $\sim \pm 15 \text{ km s}^{-1}$ relative to the quiet network, the mean upflow is $(1.2 \pm 5.6) \text{ km s}^{-1}$ when averaged over all the resolution elements. Means over individual umbrae frequently show smaller variances, which is evidence for a real distribution of umbral transition region velocity fields. Two possible explanations for the smaller nonthermal broadening of the sunspot C IV line are examined. (31 refs.)

116557 Comments on the solar neutrino problem. R.Opher (Inst. Astron. e Geofisico, Univ. de Sao Paulo, Sao Paulo, Brazil).

Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.L9-11 (Sept. 1983). Suggests that electrons of energy $E \sim 7 \text{ keV}$ (responsible for the opacity) gain energy from the electrons of energy $E \sim \text{keV}$ (electrons of greater density which produce plasma excitations) by means of the interaction with plasma excitations. Electrons $E \sim \text{keV}$ interact only with plasma excitations of wave number $0.7 \leq k/k_D \leq 1$ while electrons $E \sim 7 \text{ keV}$ interact only with plasma excitations $0.25 \leq k/k_D \leq 1$. Only the plasma excitations $0.7 \leq k/k_D \leq 1$ are common to both groups of electrons. The author suggests that the most likely explanation of the solar neutrino problem is the strong electron interaction with the plasma at the centre of the Sun. Due to this interaction, the group of electrons above the threshold for plasma excitation share their energy among themselves such that a distorted Maxwellian distribution results. Electrons $E \sim \text{keV}$ transfer energy to electrons $E \sim 7 \text{ keV}$, distorting the electron distribution in the Sun sufficient to resolve the solar neutrino problem. (8 refs.)

116558 Solar diameter measurements. F.Laclaire (Centre d'Etudes & Recherches Geodynamiques & Astron., Grasse, France).

Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.200-3 (Sept. 1983). In French.

Since 1975 Sun observations have been regularly made at CERGA Observatory with an astrolabe with the purpose of improving the Earth's orbit around the Sun. The accuracy of the results leads the author to investigate whether this type of observation could contribute to determine the value of the Sun's radius. The principle of the procedure used involves determining this parameter from the difference between the crossing times of two successive edges by the same almucaantar. The use of reflector prisms makes it possible to observe at three different zenithal distances, allowing one to cover at CERGA the apparent orbit for a period of about 8 to 9 months. For all the measurements made between 1975 and 1982 (totalling 842 Sun crossings) the author obtains the following mean value of the radius reduced to one astronomical unit: $959.37'' \pm 0.02''$. During the period 1978 to 1982, a cycle of about 900 d is detected, reaching an amplitude of $0.5''$. (17 refs.)

116559 Photospheric faculae. III. Intensity, and magnetic field mapping of a typical element of the photospheric network. H.Daras-Papamargaritis (Center for Astron., Athens, Greece), S.Koutchmy.

Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.280-6 (Sept. 1983). For pt.II see *ibid.*, vol.67, no.1, p.93-102 (1978). Studies a typical quiet Sun magnetic network element. Without introducing any correction, high spatial resolution spectra ($\approx 0.75''$) of two Fe I lines (5576 and 6302.5 Å), simultaneous CA II K and white-light slit-jaw pictures as well as spectroheliograms in H_α and Mg b₁—0.4 Å of a typical quiet region of the solar photosphere were analyzed in order: to map the intensity, the velocity field and the magnetic field of a typical element of this region; to study the underlying solar granulation, which seems to have a lower contrast; and to get from H_α filtergrams the fibril structure around the rosette, where the magnetic field is supposed to be dispersed. Finally the magnetic flux of a large region of the quiet Sun using Mg b₁ 0.4 Å spectroheliograms is estimated. (19 refs.)

116560 Solar rotation 1947-1981—determined from sunspot data.

G.Lustig (Sonnenobs. Kanzelhoehe, Univ. Graz, Graz, Austria). *Astron. & Astrophys. (Germany)*, vol.125, no.2, pt.1, p.355-8 (Sept. 1983). Positions of sunspots between 1947 and 1981 as observed at the Solar-Observatory Kanzelhoehe are used to determine the differential rotation of the Sun. Whereas equatorial velocities increased, the gradient of the differential rotation decreased during this period. Further, velocities at the equator during solar-minimum years are greater than in the neighbouring maxima. The rotational behavior during the various spot cycles is examined. (24 refs.)

116561 Calculation of stellar structure. III. Solar models that satisfy the necessary conditions for a unique solution to the stellar structure equations. C.A.Rouse (General Atomic Co., San Diego, CA, USA).

Astron. & Astrophys. (Germany), vol.126, no.1, pt.2, p.102-10 (Sept. 1983). For pt.II see *Progress in High Temperature Physics and Chemistry*, vol.4, (Pergamon) p.139 (1971). A series of provisional solar models are calculated that satisfy the necessary conditions for a unique solution to the stellar structure equations (Rouse, 1975). The models are qualitatively consistent with the solar neutrino experiment results through the magnitude of the central temperature ($\sim 14 \times 10^6 \text{ K}$) or its variation near the center. A fundamental modification of one basic standard model assumption is that each helium nucleus is not assumed to stay at the same radius where it is produced. The most important fundamental consequence of this preliminary study is that in order not to arbitrarily reduce the opacity in such a manner, it is deduced that the Sun has a small high- Z iron-like core with a mass of about $0.005 M_\odot$ in a radius of about $0.05 R_\odot$. Various periods of oscillation calculated for each model are discussed. (47 refs.)

116562 Analysis of solar observations made with the CERGA astrolabe.

M.Bougard (Univ. de Paris XI, Sceaux, France), F.Chollet, F.Laclaire. *Astron. & Astrophys. (Germany)*, vol.126, no.1, pt.2, p.161-9 (Sept. 1983). In French.

Describes the method of analysis of solar observations made at the CERGA Observatory and gives the results obtained during the campaigns of 1978, 1979 and 1980. The observational residuals are expressed as functions of corrections to zenith distance, and to solar right ascension, declination and semi-diameter. Several relations obtained by observations of upper and lower sides of the Sun during some east and west transits, are solved by least squares method to give the unknowns $\Delta\alpha$, $\Delta z + \Delta d \cos S$ and Δd . Corrections of the main parameters of the solar orbit are made. (19 refs.)

116563 The MHD Kelvin-Helmholtz instability in the solar photosphere. I.C.Rae (Dept. of Appl. Math., Univ. of St. Andrews, St. Andrews, Scotland).

Astron. & Astrophys. (Germany), vol.126, no.1, pt.2, p.209-15 (Sept. 1983). Recent studies indicate the possibility of MHD surface and body wave propagation along magnetic structures in the solar atmosphere. Observations indicate the existence of guided flows in these structures. Under certain flow and plasma conditions, the surface and body waves become unstable, possibly leading to secondary wave propagation and microturbulence. The study of this (Kelvin-Helmholtz) instability under solar conditions is therefore important. The author surveys the relevant published literature for planar geometries. (80 refs.)

116564 Solar γ -ray lines. D.J.Forrest (Univ. of New Hampshire, Durham, NH, USA).

AIP Conf. Proc. (USA), no.101, p.3-14 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). The Gamma Ray Spectrometer on the Solar Maximum Mission satellite has observed emissions produced by nuclear reactions in over 20 separate solar flares. The observed intensity from different flares of some of these emissions ranges over a factor of 100 and the time scale for their production ranges from 10 s pulses, to complete events lasting over 1000 s. The emissions include narrow and broadened prompt γ -ray lines from numerous isotopes (from ^7Li to ^{56}Fe and cover the energy range 0.431 MeV (^7Be) to 7.12 MeV (^{16}O). The instrument has also observed emissions at energies greater than 10 MeV from the decay of π^0 mesons, from electron bremsstrahlung, and from the direct observation of $> 10^2$ MeV solar neutrons. The intensity, temporal and spectral properties of these emissions are reviewed from the point of view that solar flares represent an astrophysical particle acceleration site. (28 refs.)

116565 Positron annihilation radiation from solar flares. G.H.Share (Naval Res. Lab., E.O. Hulburt Center for Space Res., Washington, DC, USA), E.L.Chupp, D.J.Forrest, E.Rieger.

AIP Conf. Proc. (USA), no.101, p.15-20 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). Positron annihilation radiation has been observed from the 21 June 1980 and 3 June 1982 flares by the gamma-ray spectrometer on the Solar Maximum Mission satellite. The observed 0.511 MeV line fluences from the flares were $14.6 \pm 3.3 \text{ } \gamma/\text{cm}^2$ and $103 \pm 8 \text{ } \gamma/\text{cm}^2$, respectively. Measurement of the line width allows the authors to set an upper limit to the temperature in the annihilation region of $3 \times 10^6 \text{ K}$. The time dependence of the 0.511 MeV line during the 21 June 1980 flare is consistent with Ramaty et al.'s (1983) calculations¹ for positrons created in the decay of radioactive nuclei. The time dependence of 0.511 MeV line for the 3 June 1982 flare is more complex and requires more detailed study. (12 refs.)

116566 How does the magnetic field of an usual active region develop? V.Bumba (Astron. Inst., Czechoslovak Acad. of Sci., Ondrejov, Czechoslovakia).

Bull. Astron. Inst. Czech. (Czechoslovakia), vol.34, no.4, p.219-29 (July 1983).

Using more than 160 'qualitative' magnetic maps in series of 36 new regions, the author describes the standard features of the morphological development of a usual active region's magnetic field in connection with the formation of its sunspot group. The author derives a pattern of magnetic field distribution for small and large active regions in their several evolutionary stages. He finds not only signs of the influence of solar differential rotation on the shape of the magnetic field, but also indications of other dynamical forces acting on the active region as the photospheric matter flows around it. New observational facts concerning the role of the magnetic singularity in the active region's 'centre' (centre of magnetic activity), lying in the middle part of the group at the magnetic boundary, are demonstrated. (9 refs.)

116567 Frequency dependent characteristics of solar impulsive radio bursts. T.K.Das, M.K.Das Gupta (Centre of Advanced Study in Radio Phys. & Electronics, Calcutta, India).

Bull. Astron. Inst. Czech. (Czechoslovakia), vol.34, no.4, p.229-33 (July 1983).

An investigation is made of the impulsive radio bursts observed in the frequency range 0.245-35 GHz. Important results obtained are (i) simple 1 type with intensities 0-10 f.u. and simple 2 type with intensities 10-500 f.u. are more predominant in the frequency ranges 1.415-4.995 GHz and 4.995-8.8 GHz, respectively; (ii) with maxima around 2.7 GHz and 4 GHz for the first and second types respectively, the durations of the radio bursts decrease gradually both towards lower and higher frequencies; (iii) as regards occurrences, the first type dominates in the southern solar hemisphere peaking around 8.8 GHz, whereas the second type favours the north and with no well-defined maximum in any frequency; (iv) both types prefer the eastern hemisphere, the peak occurrences being around 8.8 GHz and 5 GHz for the two successive types, respectively; (v) the spectra of impulsive radio bursts are generally inverted U-type with the maximum emission intensity between 5 and 15 GHz. (30 refs.)

116568 Solar irradiance modulation by active regions from 1969 through 1981. D.V.Hoyt, J.A.Eddy (High Altitude Obs., Nat. Centre for Atmospheric Res., Boulder, CO, USA).

Geophys. Res. Lett. (USA), vol.10, no.7, p.509-12 (July 1983). Recent satellite measurements of the solar total irradiance (S) indicate that on time scales of days to months the solar constant varies by a few tenths of a percent. The predominant part of these variations can be explained by blocking of the upward solar flux by sunspots. The observations are consistent with current theoretical models of energy storage in which the energy blocked by the sunspots is temporarily stored in the convective zone. The authors present modelled solar constant variations on a day by day basis selected from model calculations for the period 1874 through 1981. Because neither faculae nor bright rings about sunspots balance the net blocking by sunspots, there is a net eleven year modulation in irradiance with a relative depression of as much as 0.07% for the period 1969-1981. (23 refs.)

116569 Solar-flared prognostication by the empirical-statistical approach.

P.A.Stahl. *J. R. Astron. Soc. Can. (Canada)*, vol.77, no.4, p.203-13 (Aug. 1983).

Social emphasis is placed on factors affecting one particular technique, multiple regression. The points made are illustrated by way of example, as applied to ex post facto predictions of solar flares. It is concluded that the elucidation of a flare 'trigger', with its correspondent pre-flare recognition, is indispensable to the further refinement of empirical-statistical schemes. (15 refs.)

116570 On a possible mechanism of quasi-periodic pulses of the quiet Sun decametric radio emission. B.N.Levin, S.D.Snegirev.

Pis'ma v Astron. Zh. (USSR), vol.9, no.8, p.490-4 (1983). In Russian. English translation in: *Sov. Astron. Lett. (USA)*.

The observed fluctuations of the decametric, radio emission of the quiet Sun are interpreted on the basis of the plasma mechanism of generation. These

fluctuations may be caused by modulation of the optical depth of the radio source due to propagation of the sound wave packet through the corona. (6 refs.)

116571 On the relation of local sources of centimeter solar radioemission with noise storms based on the RATAN-600 observations. T.A.Bravova, G.B.Gel'freikh, A.A.Gnedzilov. *Pis'ma v Astron. Zh. (USSR)*, vol.9, no.8, p.495-9 (1983). In Russian. English translation in: *Sov. Astron. Lett. (USA)*. The RATAN-600 observations of local sources of the solar radioemission S-component in the range of 2-4 cm are compared with data on noise storms at 169 and 204 MHz. It is found that intensification of noise storms at 169 and 204 MHz. It is found that intensification of noise storms was closely connected with an increase the cyclotron component of local sources. Noise storm appearances were preceded by an increase of the magnetic field in the corona above the spot from 1800 to 2500 Oe. (6 refs.)

116572 Power spectrum of brightness temperature fluctuations derived from solar eclipse observations at 2.8 GHz. S.K.Alurkar, S.S.Degaonkar, R.V.Bhonsle (Phys. Res. Lab., Ahmedabad, India). *Proc. Indian Acad. Sci. Earth & Planet. Sci.*, vol.92, no.1, p.57-61 (March 1983). [received: Sept. 1983] Reports on the maximum entropy method power spectrum analysis of brightness temperature fluctuations observed at 2.8 GHz during the total solar eclipse of 16 February 1980. The observed periodicities range from 3.5 min to 64 min. These periodicities may arise due to spatial and/or temporal variations in the solar radio emission. The observed periodicities imply presence of scale sizes ranging from 70000 to 600000 km assuming that the brightness fluctuations arise because of spatial variation only. On the other hand, if these fluctuations are due to temporal variation, the observed periodicities correspond well to predicted modes of solar global oscillations. (5 refs.)

116573 Late phase gradual enhancements in microwaves and hard X-rays of the 6 November 1980 flare. K.Kai, H.Nakajima, T.Kosugi (Tokyo Astronomical Obs., Univ. of Tokyo, Tokyo, Japan), S.R.Kane. *Sol. Phys. (Netherlands)*, vol.86, no.1-2, p.231-6 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982). Gradual enhancements which repeatedly appeared 20-50 min after the onset of an impulsive burst were observed in microwaves and hard X-rays. The observed characteristics of the gradual enhancements are (i) the similarity of time profiles in both the frequency range of 17 GHz to 160 MHz and the energy range of 40 to ~400 keV, (ii) the low peak frequency of the microwave spectrum (~4 GHz), and (iii) the flat X-ray spectrum with the power-law exponent of ~1.7. It is suggested that the radio and X-ray gradual enhancements are due to a single population of energetic electrons which extend high in the corona (at least 1.4×10^5 km). (11 refs.)

116574 Hard X-ray dynamic spectrum of flares observed by Hinotori. N.Nitta, T.Takakura (Dept. of Astron., Univ. of Tokyo, Tokyo, Japan), K.Ohki, M.Yoshimori. *Sol. Phys. (Netherlands)*, vol.86, no.1-2, p.241-6 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982). Time variations of the hard X-ray spectrum in solar flares are observed by the hard X-ray spectrometer aboard the Hinotori satellite. With a new presentation of the dynamic spectrum the authors study the differences between impulsive and gradual hard X-ray bursts. In the impulsive events a 'bent' spectrum up to some hundred keV persists at least until the main peak. In the gradual events, on the other hand, a power-law spectrum augmented by a low-energy excess is dominant.

116575 A flare model deduced from Hinotori and millimeterwave interferometer observations. K.Kawabata, H.Ogawa, I.Suzuki (Dept. of Phys. & Astrophys., Nagoya Univ., Nagoya, Japan). *Sol. Phys. (Netherlands)*, vol.86, no.1-2, p.247-52 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982). The γ -ray and white-light flare of 13 May, 1981 is used for a study of spatial distributions of energetic electrons and high-temperature plasma. (6 refs.)

116576 Relation between hard X-ray spectra and electron energy spectra. I.Suzuki, K.Kawabata (Dept. of Phys. & Astrophys., Nagoya Univ., Nagoya, Japan). *Sol. Phys. (Netherlands)*, vol.86, no.1-2, p.253-7 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982). The relationship between hard X-ray spectra and energetic spectra in solar X-ray bursts is investigated, and a simplified cross-section for Bremsstrahlung which is applicable to the region of mildly relativistic energies is proposed. Using the proposed cross section, the authors solve an integral equation to obtain the electron energy spectrum. The validity of the proposed cross-section is checked by comparing the spectrum calculated by the exact Bethe-Heitler formula. (7 refs.)

116577 A comparison of high-energy events in the quiet Sun with solar flares. G.E.Brueckner (E.O. Hulbert Center for Space Res., Naval Res. Lab., Washington, DC, USA). *Sol. Phys. (Netherlands)*, vol.86, no.1-2, p.259-65 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982). Observations of high-speed coronal clouds (OSO-7), flare ejecta (Skylab) and high-energy jets are compared. It is possible that the same physical mechanism—an expanding loop—which is responsible for the high speed jets (400 km sec^{-1} , 2.5×10^{26} ergs) can also account for the high-speed coronal clouds (1300 km sec^{-1} , 4×10^{30} ergs), which were correlated with a flare-connected spray. Field strength of 15 gauss and 2500 gauss are required for the jets and the sprays, respectively. (7 refs.)

116578 Pre- and post-flare X-ray variations in active regions. Z.Svestka, A.Schadee (Space Res. Lab., Astronomical Inst., Utrecht, Netherlands). *Sol. Phys. (Netherlands)*, vol.86, no.1-2, p.267-77 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982). Extremely low background noise of the HXIS experiment aboard the SMM made it possible to detect >3.5 keV X-ray emissions from nonflaring active regions which are 10^3 - 10^4 times weaker than the X-ray flux from flares. Short-lived X-ray bursts and long-lived X-ray enhancements of various intensities seem to characterize active regions in different phases of their development. After major two ribbon-flares, giant X-ray arches are seen in the corona, slowly decaying for many hours after the flare end. Associated with these arches appear to be quasi-periodic flare-like variations of purely coronal nature. (7 refs.)

116579 Imaging of impulsive solar flare phenomena. A.Duijveman, P.Hoynig (Astronomical Inst., Space Res. Lab., Utrecht, Netherlands). *Sol. Phys. (Netherlands)*, vol.86, no.1-2, p.279-88 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982). Reviews some advances in the understanding of impulsive solar flare phenomena obtained through new hard X-ray and radio imaging instruments (the Solar Maximum Mission and Hinotori satellites, the VLA and VLBI). (31 refs.)

116580 Temperature structure of spatially resolved hard X-ray flares. G.M.Simnett (Dept. of Space Res., Univ. of Birmingham, Birmingham, England). *Sol. Phys. (Netherlands)*, vol.86, no.1-2, p.289-99 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982). High resolution X-ray images are used to study the temperature structure and evolution of two spatially resolved, but compact, solar flares. Both flares developed within a magnetic loop whose footpoints were separated by typically 15000 km, and involved primary energy release at one footpoint. This was followed by transfer of chromospheric material into and around the loop. The flares involved total energies differing by over an order of magnitude, and they follow different evolutionary paths because of this. (5 refs.)

116581 General aspects of hard X-ray flares observed by Hinotori: gradual burst and impulsive burst. K.Ohki (Tokyo Astronomical Obs., Tokyo, Japan), T.Takakura, S.Tsuneta, N.Nitta. *Sol. Phys. (Netherlands)*, vol.86, no.1-2, p.301-12 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982). Surveys the observational results on five gradual and four impulsive type events from the hard X-ray imaging (SXT) and spectrometer (HXM) instruments on the Hinotori satellite. A set of differences are clearly recognized between the gradual and impulsive type bursts. These are: (1) Hard X-ray images show the existence of a large coronal source for each gradual burst and a wide variety of source structures for impulsive bursts. (2) The source heights of the impulsive bursts appear to be low. (3) All gradual bursts show power-law spectra while impulsive bursts show exponential thermal spectra at least before the maximum phase. (4) Energy-dependent peak delays are observed only in gradual bursts. The authors suggest that two different acceleration and emission mechanisms are involved with these two kinds of hard X-ray bursts. (17 refs.)

116582 Vertical structure of hard X-ray flare. S.Tsuneta, T.Takakura, N.Nitta (Dept. of Astron., Univ. of Tokyo, Tokyo, Japan), K.Ohki, K.Makishima, T.Murakami, M.Oda, Y.Ogawara. *Sol. Phys. (Netherlands)*, vol.86, no.1-2, p.313-21 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982). Presents studies of the vertical structure of hard X-ray flares for two contrasting examples. The 1981 May 13 flare contained a coronal hard X-ray source which was located above 50000 km above the photosphere. On the other hand, the 1981 July 20 flare had a chromospheric double source structure in the initial phase. Electrons in this case were able to stream freely from the corona to the chromosphere. (10 refs.)

116583 Hard X-ray images of impulsive bursts. T.Takakura (Dept. of Astron., Univ. of Tokyo, Tokyo, Japan), K.Ohki, S.Tsuneta, N.Nitta. *Sol. Phys. (Netherlands)*, vol.86, no.1-2, p.323-31 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982). A morphological study is made for the hard X-ray images (25-50 keV) of nine impulsive bursts observed by Hinotori. Most of them revealed single sources, either extended or compact, during the whole duration of the bursts. The sources of all of four spike bursts in the sample are compact. After the main phase of the impulsive bursts, generally the source size becomes smaller accompanying a shift of position. The X-ray source size is much greater than that of the H α kernel in two events out of three. Four possible explanations for the X-ray source to be single are suggested. (10 refs.)

116584 Time variations of hard X-ray bursts observed with the solar X-ray Telescope aboard Hinotori (with a movie). T.Kosugi (Tokyo Astronomical Obs., Univ. of Tokyo, Tokyo, Japan), S.Tsuneta. *Sol. Phys. (Netherlands)*, vol.86, no.1-2, p.333-8 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982). A new method for synthesizing hard X-ray maps from the raw data of the Solar X-ray Telescope (SXT) aboard Hinotori has been developed. Using this method, five typical SXT events have been analyzed and their images collected in a movie with a time resolution of about 8 s (the half spin period of the satellite). The movie clearly shows that (1) three different classes of bursts, i.e. the gradual thermal burst, the multiple impulsive burst, and the extended outburst, have different structures and show quite different variations from each other, and that (2) the source of the extended outburst is located in the corona above 10^4 km and its shape appears to be a large loop. (14 refs.)

116585 Computed magnetic field structure of the flares observed by the Hinotori hard X-ray telescope. T.Sakurai (Dept. of Astron., Univ. of Tokyo, Tokyo, Japan). *Sol. Phys. (Netherlands)*, vol.86, no.1-2, p.339-44 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982). Potential field computations have been carried out to study the location of hard X-ray sources observed by the Hinotori hard X-ray imaging instrument, SXT. Of the two flares studied, the X-ray source of the 1981 May 13 event, a very unusual gradual flare, appears to lie at the top of an arcade of field lines. In the other event, the 1981 October 15 flare, the observed double source structure is not explained implying the existence of nonnegligible electric currents in the flare region. (11 refs.)

116586 Dynamical interpretation of the very hot region appearing at the top of a loop. K.Shibata (Dept. of Earth Sci., Aichi Univ. of Education, Aichi Prefecture, Japan), Y.Uchida, T.Sakurai. *Sol. Phys. (Netherlands)*, vol.86, no.1-2, p.345-51 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982). In order to explain the appearance of a hard X-ray source at the top of a loop, a model is presented in which the dynamical effects of the dark filament mass infalling along the loop in association with the 'disruption brusque' plays an important role. The crash of the infalling mass produces high temperature regions in the low corona above the two footpoints of the loop. The up-going shocks, created in the crash and strengthened in the steep density gradient, produce a very high temperature (10^8 K) near the top of the loop. This process in successively higher loops may account for the sources of

gradual hard X-ray bursts appearing at the top of the loop-like structure. (13 refs.)

116587 Spatial structure of high energy photon sources in solar flares. S.R.Kane (Space Sci. Lab., Univ. of California, Berkeley, CA, USA).

Sol. Phys. (Netherlands), vol.86, no.1-2, p.355-65 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).

Stereoscopic observations of high energy (≥ 100 keV) photon emission from five solar flares have been made with the X-ray spectrometers aboard the International Sun Earth Explorer-3 and Pioneer Venus Orbiter spacecraft. The observed altitude structure of the photon source and its dependence on the photon energy and time during a flare are compared with the predictions of thermal and nonthermal models of the hard X-ray source. (19 refs.)

116588 Observations of fine time structure in solar flare hard X-ray bursts. K.Hurly, M.Niel, R.Talon (Centre d'Etude Spatiale des Rayonnements, Toulouse, France), I.V.Estulin, V.Ch.Dolidze.

Sol. Phys. (Netherlands), vol.86, no.1-2, p.367-73 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).

Hard X-ray (≥ 100 keV) time histories of the solar flares which occurred on 1978 December 4 and 1979 February 18 are presented. The first flare was observed by three identical instruments from near-earth orbit (Prognostic 7) and interplanetary space (Venera 11 and 12). Fine time structure is present down to the 55 ms level for the e-folding rise and fall times. These data may be used to localize the emission region by the method of arrival time analysis. (8 refs.)

116589 Gamma-ray observations from Hinotori. M.Yoshimori, K.Okudaira, Y.Hirasima (Dept. of Phys., Rikkyo Univ., Tokyo, Japan), I.Kondo.

Sol. Phys. (Netherlands), vol.86, no.1-2, p.375-82 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).

Some interesting results on gamma-ray line emission and its time profiles observed by Hinotori are presented. Possible explanations of gamma-ray line and hard X-ray emissions for the impulsive and gradual flares are discussed. The relationship between the gamma-ray line emission and acceleration and escape of the solar particles is also studied. (15 refs.)

116590 High energy particle acceleration in solar flares—observational evidence. E.L.Chupp (Univ. of New Hampshire, Durham, NH, USA).

Sol. Phys. (Netherlands), vol.86, no.1-2, p.383-93 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).

Gamma ray and neutron observations made by the SMM Gamma Ray Spectrometer are reviewed. The implication these observations hold for understanding particle acceleration in solar flares are discussed. The data require that both electrons and ions must be accelerated together to relativistic energies and interact with matter in a time scale of seconds. (19 refs.)

116591 Gamma-ray lines and neutrons from solar flares. R.Ramaty, R.J.Murphy (Goddard Space Flight Center, Greenbelt, MD, USA), B.Kozlovsky, R.E.Lingenfelter.

Sol. Phys. (Netherlands), vol.86, no.1-2, p.395-408 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).

Derives the energy spectrum of accelerated protons and nuclei at the site of the June 21, 1980 limb flare by a new technique, using observations of the time-dependent flux of high-energy neutrons at the Earth. The authors find that this energy spectrum is very similar to the energy spectra of 7 disk flares for which the accelerated particle spectra have been previously derived using observations of 4-7 MeV-to-2.223 MeV fluence ratios. The implied spectra for all of these flares are too steep ($\alpha T \approx 0.02$) to produce any significant amount of radiation from π meson decay. The authors suggest that the observed >10 MeV gamma rays from the June 21, 1980 flare are bremsstrahlung of relativistic electrons. (30 refs.)

116592 Characteristics of gamma-ray line flares as observed in hard X-ray emissions and other phenomena. T.Bai (Inst. for Plasma Res., Stanford Univ., Stanford, CA, USA), B.R.Dennis, A.L.Kiplinger, L.E.Orwig, K.J.Frost.

Sol. Phys. (Netherlands), vol.86, no.1-2, p.409-19 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).

Observations of gamma-ray lines from solar flares by SMM demonstrated that energetic protons and heavy ions are accelerated during the impulsive phase. In order to understand the acceleration mechanism for gamma-ray producing protons and heavy ions, the authors study the characteristics of the flares from which gamma-ray lines were observed by SMM. In order to identify the characteristics unique to the gamma-ray line flares, the authors study intense hard X-ray flares with no gamma-ray line emissions. (38 refs.)

116593 Narrow-band decimeter bursts and X-ray emissions—possible evidence of negative absorption or maser effect. S.Enome (Toyokawa Obs., Res. Inst. of Atmospheric, Nagoya Univ., Toyokawa, Japan).

Sol. Phys. (Netherlands), vol.86, no.1-2, p.421-6 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).

Bursts with peculiar time evolution and narrow-band microwave spectra are studied in detail using X-ray data from the satellite HINOTORI and microwave data from Toyokawa Observatory. Discussions are given for emission mechanisms and a burst scenario. (10 refs.)

116594 Particle acceleration in the 1981 April 1 flare. H.Nakajima (Nobeyama Solar Radio Obs. of the Tokyo Astronomical Obs., Univ. of Tokyo, Tokyo, Japan).

Sol. Phys. (Netherlands), vol.86, no.1-2, p.427-32 (1983). (Proceedings of the US-Japan Seminar on Recent Advances in the Understanding of Solar Flares, Tokyo, Japan, 5-8 Oct. 1982).

The large microwave burst of 1981 April 1, which was accompanied by both hard X-ray and γ -ray emissions, has been analyzed to study the acceleration of particles in the impulsive phase. (15 refs.)

116595 The spatial distribution of umbral dots and granules. J.K.Lawrence (Dept. of Phys. & Astron., San Fernando Obs., California State Univ., Northridge, CA, USA).

Sol. Phys. (Netherlands), vol.87, no.1, p.1-5 (Aug. 1983).

A statistical analysis is made of the spatial distribution of umbral dots and photospheric granules. The dots and granules are more evenly spaced than random points, though dots mapped by different observers have different distributions. (12 refs.)

116596 The study of umbral flashes in the umbrae of two sunspots. I.P.Turova, R.B.Teplitskaja, G.V.Kuklin (Siberian Inst. of Terrestrial Magnetism, Ionosphere & Radiowave Propagation, Irkutsk, USSR).

Sol. Phys. (Netherlands), vol.87, no.1, p.7-22 (Aug. 1983).

The results of observations of the umbral flashes in two sunspots are reported. The sunspots differ in their morphological properties (evolution rates and activity levels) and in observation conditions (heliocentric distances). The oscillation parameters of the two sunspots do not coincide. The most significant differences are pronounced in the phase relations and amplitudes of observed oscillations. (20 refs.)

116597 Preferred longitudes of sunspot groups and high-speed solar wind streams: evidence for a 'solar memory'. H.Balthasar, M.Schussler (Univ.-Sternwarte, Göttingen, Germany).

Sol. Phys. (Netherlands), vol.87, no.1, p.23-36 (Aug. 1983).

Correlation analysis of the mean longitude distribution of sunspot groups (taken from the Greenwich Photoheliographic Results) and high-speed wind streams (inferred from the C9 index for geomagnetic disturbances) with the Bartels rotation period $P=27.0$ days shows anticorrelation for individual cycles. In particular, the longitudes of post-maximum stable streams of cycle 18 and 19 are well anticorrelated with the preferred longitudes of sunspot groups during the maximum activity periods of these cycles. This is further analyzed using the daily Zurich sunspot number, R , between 1932 and 1980. The authors conclude that there is a 'solar memory' for preferred longitudes of activity extending at least over one, probably two cycles. (43 refs.)

116598 Magnetic canopies in unipolar regions. H.P.Jones (Lab. for Astron. & Solar Phys., NASA/Goddard Space Flight Center, Greenbelt, MD, USA), R.G.Giovanelli.

Sol. Phys. (Netherlands), vol.87, no.1, p.37-42 (Aug. 1983).

Base-height statistics are presented for magnetic canopies in six unipolar magnetic regions which were observed near the limb with the Kitt Peak Vacuum Telescope and Diode Array Magnetograph during the period 25 April-3 July, 1980. As in earlier studies, extensive areas are found to be covered by low-lying canopies. (5 refs.)

116599 A model of a quiescent prominence on the basis of studying the K Ca⁺ line fine structure. M.S.Gigolashvili (Abastumani Astrophys. Obs., Georgia, USSR), Yu.D.Zhugzhda.

Sol. Phys. (Netherlands), vol.87, no.1, p.43-6 (Aug. 1983).

Constructs a model of a quiescent prominence with nonparallel structural elements, based on a study of the K Ca⁺ line fine structure of two quiescent prominences. The dependences of the radial velocities on the height found for the structural elements making up the prominence gives information on the inner spatial structure of the prominence. The available data suggest an alternative model of quiescent prominences. (5 refs.)

116600 Comparison of coronal holes observed in soft X-ray and He I 10830 Å spectroheliograms. S.W.Kahler, J.M.Davis (American Sci. & Engng. Inc., Fort Washington, Cambridge, MA, USA), J.W.Harvey.

Sol. Phys. (Netherlands), vol.87, no.1, p.47-56 (Aug. 1983).

Compares coronal holes observed in solar soft X-ray images obtained with rocket-borne telescopes during 1974 to 1981 with holes observed on nearly simultaneous 10830 Å maps. The results appear inconsistent with the popular view that the quiet corona is sharply separated into open magnetic field regions consisting of coronal holes and closed field regions consisting of the large scale structure. (25 refs.)

116601 Line profile analysis of an active region corona observed successively at the east and west limb. T.Tsubaki (Dept. of Earth Sci., Shiga Univ., Otsu, Japan).

Sol. Phys. (Netherlands), vol.87, no.1, p.57-63 (Aug. 1983).

A systematic line profile analysis of the Fe XIV $\lambda 5303$ coronal line was carried out for a single active region successively observed both above the east and west solar limb (4, 18 and 19 October, 1974). Cross-correlations of the intensity, temperature and velocity structures among these three sets of observations show that although considerable variations are seen in intensity with accompanying change in temperature, the velocity field can be stable as long as the magnetic field configuration remains stable. It is also pointed out that the standard wavelength of the green line is 5302.81 Å which is somewhat shorter than the currently adopted value of 5302.86 Å, and that a 'general' flow from west to east might exist in this region superimposed on the local velocity field. (6 refs.)

116602 Simple models for magnetic flux tubes. G.W.Simon (Air Force Geophys. Lab., Sacramento Peak Obs., Sunspot, NM, USA), N.O.Weiss, A.H.Nye.

Sol. Phys. (Netherlands), vol.87, no.1, p.65-75 (Aug. 1983).

Known potential field solutions can be used to model the structure of magnetic fields in the solar photosphere. Several two-dimensional and axisymmetric solutions are compared. In the most satisfactory model the vertical component of the field is prescribed on a horizontal plane so as to be uniform within a finite disc and zero outside it. The resulting flux distribution provides a good description of small scale intergranular magnetic fields and of the observed field structure in a pore, but is inadequate for sunspots. (24 refs.)

116603 Wave propagation in intense flux tubes. B.Roberts (Dept. of Appl. Math., Univ. of St. Andrews, St. Andrews, Scotland).

Sol. Phys. (Netherlands), vol.87, no.1, p.77-93 (Aug. 1983).

The nature of non-adiabatic wave propagation in a slender magnetic flux tube is explored. The results of the theory are compared with the observations of Giovanelli et al. (1978). Those observations of tubes in the photosphere-chromosphere show outwardly propagating waves, with periods of 300 s, which take some 19 s to propagate from one level of line formation to another level higher in the atmosphere. In sharp contrast to this is the time of 7 s for a similar disturbance outside the tube to propagate between the same two levels of line formation, estimated to be some 600 km apart in the field-free atmosphere. It is argued that the sharply contrasting propagation times for the tube and its environment is principally due to the elasticity of the tube and its subsequent propensity for propagation. The theory suggests that the observed disturbances are non-adiabatic, acoustic-gravity waves channelled along a magnetic flux tube and modulated by external pressure variations. (22 refs.)

116604 Heating of chromospheric magnetic features by direct current dissipation. S.Hinata (Phys. Dept., Auburn Univ., Auburn, AL, USA).

Sol. Phys. (Netherlands), vol.87, no.1, p.95-101 (Aug. 1983).

It is shown that the direct current dissipation is very unlikely to be the heat source of the coronal loop, because it accompanies an unacceptably high heating rate in the chromospheric portion of the loop. This also suggests that a rather weak current density can supply the heat to small ($R < 10^7$ cm) chromospheric magnetic features. A larger magnetic element may be heated by the direct current dissipation only if the current changes direction within a single element so that the generated magnetic field is sufficiently weak to insure MHD stability. (13 refs.)

116605 Stability of two-dimensional pre-flare structures. K.Schindler, J.Birn, L.Janicke (Ruhr-Univ. Bochum, Bochum, Germany).

Sol. Phys. (Netherlands), vol.87, no.1, p.103-33 (Aug. 1983).

Several theoretical approaches to the problem of the onset of solar flares identify the point of onset as a 'critical' point, where the solution curve turns back. In other theories, a flare occurs at a conventional transition from stability to instability. The present paper provides stability results relevant for both

types of approaches. Restricting the discussion of two-dimensional configurations (e.g. models for two-ribbon flares), stability is discussed in the framework of ideal MHD, resistive MHD and Vlasov theory. Several rather general criteria for stability of the lower part of the solution curve ('minimal solutions') are derived. The results provide support to the concept of flare onset at a critical point. (28 refs.)

116606 On the mass motions and the atmospheric states of moustaches. R.Kitai (Dept. of Astron., Faculty of Sci., Univ. of Kyoto, Kyoto, Japan).

Sol. Phys. (Netherlands), vol.87, no.1, p.135-54 (Aug. 1983). Analyses of broad moustache profiles of Balmer lines and Ca II H and K lines are performed based on spectroscopic observations under good seeing conditions. H α emission profiles are found to consist of three components, i.e. a central absorption, a Gaussian core and a power-law wing. Each of them has a different Doppler shift. From the Doppler shifts, mass motions with velocity of about 6 km s⁻¹ are found to be present in chromospheric levels of moustache atmospheres. Computations of H α emission profiles from a variety of model atmospheres are compared with observed ones leading to the conclusion that a broad H α profile is due to a formation of heated ($\Delta T=1500$ K) and condensed ($\rho/\rho_0=5$) chromospheric layers. (21 refs.)

116607 The Ha-cyclonic spectra of a flare loop system on 1981 April 27. X.M.Gu, B.S.Li, Y.J.Ding, S.C.Li, Z.Li (Yunnan Obs., Acad. Sinica, Yunnan, China).

Sol. Phys. (Netherlands), vol.87, no.1, p.155-64 (Aug. 1983). H α -spectrum-spectroheliographic observations and H α -chromospheric observations of a flare-loop prominence which occurred on the western solar limb on 1981 April 27 have been obtained at Yunnan Observatory. The distribution of the internal and macroscopic motions of the flare loop prominence in time and space in the course of its eruption is derived. The instability of the loop is inferred and discussed. (12 refs.)

116608 Correlation of hard X-ray and type III bursts in solar flares. V.Petrosian, J.Leach (Inst. for Plasma Res., Stanford Univ., Stanford, CA, USA).

Sol. Phys. (Netherlands), vol.87, no.1, p.165-75 (Aug. 1983). The observed correlations between X-ray and type III radio emissions from solar bursts are described by means of a bivariate distribution function. Procedures for determining the form of this distribution are described using data analyzed by Kane (1981). With the help of this distribution a model is constructed to explain the correlation between the X-ray spectral index and the ratio of X-ray to radio intensities. Implications of the model are described. (7 refs.)

116609 A torsional wave model for solar radio pulsations. K.F.Tapping (Herzberg Inst. of Astrophys., Nat. Res. Council, Ottawa, Ontario, Canada).

Sol. Phys. (Netherlands), vol.87, no.1, p.177-86 (Aug. 1983). One of the widely accepted models for solar radio pulsations invokes radial oscillations of a magnetic flux tube. Due to acoustic, radiative damping, this theory does not easily explain the long length of the pulse trains, the large modulation depths or the great stability of the pulse repetition rate often observed. Torsional waves efficiently modulate synchrotron emission, and since they do not undergo radiative damping, can produce stable pulse repetition rates and long pulse trains. (15 refs.)

116610 Low- l 5-min oscillation observations. J.R.Kuhn, M.O'Hanlon (Phys. Dept., Princeton Univ., Princeton, NJ, USA).

Sol. Phys. (Netherlands), vol.87, no.2, p.207-19 (Sept. 1983). Medium resolution CCD-spectrograph observations have been obtained that are suitable for studying long spatial wavelength 5-min oscillations. Evidence is found that at wavelengths of the order of one solar radius the oscillation field is not isotropic. It is also not well described by modes of uniform excitation. The velocity power density per spherical harmonic increases with decreasing l to 1.1×10^3 cm² s⁻² per 3.5×10^{-4} Hz angular frequency bandwidth at $l=4$. These results are inconsistent with the data of Fossat and Ricort (1975), who found a substantially constant modal amplitude at intermediate l values. (20 refs.)

116611 Asymmetries in Stokes profiles of magnetic lines: a linear analysis in terms of velocity gradients. E.Landi Degl'innocenti, M.Landolfi (Astrophys. Obs. of Arcetri, Firenze, Italy).

Sol. Phys. (Netherlands), vol.87, no.2, p.221-31 (Sept. 1983). A linear analysis of the asymmetries in Stokes profiles of magnetic lines is performed. The asymmetries in the linear and circular polarization profiles are characterized by suitable quantities, δQ and δV , strictly related to the observed profiles. The response functions of δQ and δV to velocity fields are introduced and computed for various configurations of the magnetic field vector in a Milne-Eddington atmosphere. Some conclusions are drawn as to the importance of the asymmetries in the Stokes profiles for recovering the velocity gradients from observations. (14 refs.)

116612 Calculation of coronal line intensities for boron-like ions. H.P.Saha, E.Treffitz (Max-Planck-Inst. fur Phys. und Astrophys., Inst. fur Astrophys., Garching, Germany).

Sol. Phys. (Netherlands), vol.87, no.2, p.233-42 (Sept. 1983). New atomic data (Saha and Treffitz, 1982a) have been used to calculate line intensities of S XII for the physical conditions found in the solar corona. They are compared with similar calculations for Si X (Saha and Treffitz, 1982b) and with published work. For the density sensitive intensity ratio I_{227}/I_{1218} the new values give the observed ratio (Malinowski and Heroux, 1973) for an electron density of $\log N_e=8.5$ which is more likely than the density deduced from the values of Flower and Nussbaumer (1975), $\log N_e \leq 7$. (13 refs.)

116613 The characteristic size and brightness of facular points in the quiet photosphere. R.Muller, S.L.Keil (Air Force Geophys. Lab., Sacramento Peak Obs., Sunspot, NM, USA).

Sol. Phys. (Netherlands), vol.87, no.2, p.243-50 (Sept. 1983). Using two very high resolution, white-light plates of the solar granulation, the authors have measured a characteristic size and intensity for facular points. The plates were obtained with the 50 cm refractor at Pic-du-Midi Observatory using a 60 Å bandpass filter center at 5750 Å. After adjustment for atmospheric and instrumental smearing the authors find a characteristic size of 0.22 arc sec and a characteristic intensity of 1.3 to 1.5 times the mean continuum intensity. (9 refs.)

116614 Solar cycle dynamo wave origin of sunspot intensity and X-ray bright point number variation. H.Yoshimura (Dept. of Astron., Univ. of Tokyo, Tokyo, Japan).

Sol. Phys. (Netherlands), vol.87, no.2, p.251-9 (Sept. 1983). A new concept concerning sunspot cooling and X-ray bright point heating is presented. Sunspot and X-ray bright point small scale flux ropes are detached from global scale solar cycle main flux tubes created by the dynamo in the convection zone. The main flux tubes, and the associated roots of small scale ropes, gradually rise to the surface. When the roots are deep in the beginning and maximum phases of the solar cycle, the cooling mechanism works efficiently, sunspots look darker and the number of bright points is small. In the

ending and minimum phases when the roots are shallow, the number of phenomena take place. (31 refs.)

116615 Kinematics of solar prominences. J.L.Ballester (Dept. de Fisica de la Tierra y del Cosmos, Facultad de Ciencias, Univ. de Palma de Mallorca, Baleares, Spain), J.Kleckzek.

Sol. Phys. (Netherlands), vol.87, no.2, p.261-9 (Sept. 1983). Using a 16-mm film recorded by Dunn at Sacramento Peak Observatory with a 15-inch coronagraph, the authors have studied motions of three solar prominences from the kinematic point of view. Three methods proposed earlier (Billings and Pecker, 1954; Palus, 1972; Makhmudov et al., 1980) are applied to three prominences. A new method based on geometrical considerations is introduced. The results of all the four methods are compared and discussed. (19 refs.)

116616 Transient brightenings of interconnecting loops. III. Interpretation. D.S.Spicer (Inst. for Astron., ETH-Center, Zurich, Switzerland), Z.Svestka.

Sol. Phys. (Netherlands), vol.87, no.2, p.271-8 (Sept. 1983). For pt.II see ibid., vol.71, no.2, p.349-59 (1981). The authors present two alternative interpretations of the sudden X-ray brightenings observed in loops that interconnect active regions. They argue that a fast tearing mode may be the cause of brightenings in the young newly formed interconnecting loops, whereas anomalous Joule heating might occur in old loop connections when an external disturbance propagates through them. (13 refs.)

116617 Magnetic stability of coronal arcades relevant to two-ribbon flares. A.W.Hood (Dept. of Math., Napier Coll., Edinburgh, Scotland).

Sol. Phys. (Netherlands), vol.87, no.2, p.279-99 (Sept. 1983). The dense photosphere provides an extremely efficient mechanism, called line-tying, for stabilising coronal magnetic fields. The author studies the ideal MHD stability of cylindrically symmetric arcades, the field structure thought to be present prior to the onset of a large two-ribbon flare. It is found that, when the axis of symmetry lies on the photosphere, a wide range of force-free fields are completely stable to all possible perturbations. Instability will occur if the symmetry axis, assumed to coincide with an active-region filament is too high above the photosphere to benefit from its stabilising influence. (28 refs.)

116618 Magnetic equilibrium in coronal arcades. J.P.Melville, A.W.Hood (Dept. of Math., Napier Coll., Edinburgh, Scotland), E.R.Priest.

Sol. Phys. (Netherlands), vol.87, no.2, p.301-7 (Sept. 1983). An analytical solution to the magnetohydrostatic equations is presented that generalises a solution due to Birn et al. (1978) to include the effect of gravity. There exists two solutions to the same boundary conditions for small base pressures. If the base pressure exceeds a critical value, then 'non-equilibrium' may occur and initiate a two-ribbon flare. (9 refs.)

116619 The emerging magnetic flux and the elementary eruptive phenomenon. Z.Mouradian, M.J.Martres, I.Soru-Escout (Obs. de Paris, Meudon, France).

Sol. Phys. (Netherlands), vol.87, no.2, p.309-28 (Sept. 1983). Observational studies before and during the beginning of the flare were made in H α on a large sample of 'elementary' flares, both on the disk and along the limb of the Sun. The concept of elementary eruptive phenomenon (EEP) is proposed to describe these observational data. The EEP may be considered as the basic element of complex flares. In the inferred scenario, the chromospheric eruptive phenomenon consists of two systems of loops: one cold, the surging arch, $T \approx 10^4$ K; the other hot, the flaring arch, covering a temperature range up to 10^6 K. (44 refs.)

116620 White-light radiation from semi-empirical flare models. L.Dame (Lab. de Phys. Stellaire et Planetaire, Verrieres-le-Buisson, France), L.Cram.

Sol. Phys. (Netherlands), vol.87, no.2, p.329-35 (Sept. 1983). It is shown that some semi-empirical models for solar flares predict a significant flux of visible continuum radiation, due to bound-free radiation from hydrogen atoms and H⁺ ions in the chromospheric flare. The ratio of the emergent intensity in one flare model to that in the quiet Sun is more than 100% at the head of the Balmer continuum for a large flare close to the limb, and 8% at disk centre. The predicted flare spectrum has a relatively strong Balmer jump. The authors compare the theoretical flare continuum with observations and find disagreements in several important respects. (6 refs.)

116621 On the storage of high-energy protons in the solar corona: the cyclotron instability. B.I.Meerson, I.V.Rogachevskii (Inst. of Appl. Geophys., State Committee for Hydrometeorology & Control of the Natural Environment, Moscow, USSR).

Sol. Phys. (Netherlands), vol.87, no.2, p.337-57 (Sept. 1983). The authors consider the problem of long-time storage of high-energy protons, accelerated in the process of a flare, in coronal magnetic traps. From the viewpoint of storage, one of the most important plasma instabilities is the kinetic cyclotron instability of Alfvén waves. The instability is analysed for typical conditions of the solar corona. It is the refraction of Alfvén waves in combination with a drastic decrease of the instability growth rate with an increase of the angle between the wave vector and the stationary magnetic field that leads to the possibility of the long-term storage of flare protons. (19 refs.)

116622 Frequency splitting in stria bursts: possible roles of low-frequency waves. D.B.Melrose (School of Phys., Univ. of Sydney, Sydney, NSW, Australia).

Sol. Phys. (Netherlands), vol.87, no.2, p.359-71 (Sept. 1983). The kinematics of the process $L \pm F \rightarrow L'$ are explored where L represents a parallel Langmuir wave, F represents a low frequency fluctuation and L' represents a secondary Langmuir wave, and the results are used to discuss a possible interpretation of the frequency splitting in stria bursts in terms of the processes $L \pm F \rightarrow L'$, $L' \pm F \rightarrow L$, where l represents a transverse wave, and second harmonic emission due to the processes $L \pm s \rightarrow L'$, $L' \pm s \rightarrow L$, where s represents an ion sound wave. (27 refs.)

116623 Source characteristics of main and post-burst-increase phases of solar bursts at 17 GHz. T.Kosugi, K.Kai, T.Suzuki (Tokyo Astronomical Obs., Tokyo, Japan).

Sol. Phys. (Netherlands), vol.87, no.2, p.373-90 (Sept. 1983). Twenty four solar bursts of peak fluxes above 50 sfu were observed with the 17 GHz interferometer at Nobeyama during the period from 1978 September to 1979 December. The source characteristics and their temporal evolutions are investigated on a statistical basis with high time resolutions up to 0.8 s. A model-fitting technique recently developed by Kosugi (1982) is used to derive both the centroid position and the size (\sim FWHM) of the burst source with an uncertainty of a few arc secs. (24 refs.)

116624 Observations on the slowly varying component of solar radio emission at decameter wavelengths. C.V.Sastry, R.K.Shevgaonkar, M.N.Ramanuja (Indian Inst. of Astrophys., Bangalore, India).

Sol. Phys. (Netherlands), vol.87, no.2, p.391-9 (Sept. 1983). The authors have made two-dimensional maps of the slowly varying component (SVC) of solar radio emission at a frequency of 34.5 MHz with a half

power beam width of 26' and 40'. It is found that a majority of SVC sources have brightness temperatures of the order of $0.5 \times 10^6 \text{ K}$ and half power widths of about $4 R_{\odot}$. The shifts in the positions of the centroids of the SVC sources from the center of the Sun were in the range of 1.5 to $2 R_{\odot}$. These observations can be explained in terms of thermal emission from coronal regions of the enhanced density and temperature. (8 refs.)

116625 The relationships between disappearing solar filaments, coronal mass ejections, and geomagnetic activity. C.S.Wright, L.F.McNamara (Ionospheric Prediction Service, Darlinghurst, NSW, Australia). *Sol. Phys. (Netherlands)*, vol.87, no.2, p.401-17 (Sept. 1983). The relationships between disappearing solar filaments and geomagnetic activity are examined using data obtained between 1974 and 1980. The average level of geomagnetic activity is found to increase after the disappearance of large filaments. The magnitudes of the geomagnetic disturbances depend upon the sizes and, to a lesser extent, upon the darkness of the filaments. The delays between filament disappearances and resulting geomagnetic disturbances are typically 3-6 days, corresponding to Sun-Earth velocities of $580\text{--}290 \text{ km s}^{-1}$. These are consistent with the observed velocities of those coronal mass ejections that are associated with disappearing filaments. (50 refs.)

116626 Static equilibrium of horizontal ring prominence. Wang Zhengzhi, Lin Yuanzhang (Beijing Obs., Acad. Sinica, Beijing, China), Hu Wenrui. *Sci. Sin. (China)*, vol.26, no.7, p.739-52 (July 1983). In 1980 the Beijing Observatory successively observed several rare completely closed ring prominences whose ring plane was approximately parallel to the solar surface with a characteristic life about 1-2 days. The authors discuss the static equilibrium of this kind of horizontal ring plasma under the simultaneous actions of magnetic force, gravity and pressure gradients. Assuming a ring plasma with axisymmetry and rectangular plasma cross-section, and adopting a closed magnetic field boundary condition from the basic equations they obtain the exact zero order general solutions for the magnetic field (force-free field) and density (pressure). They further obtain an eigensolution for the zero order magnetic field and density as well as the first order magnetic field, thus giving a possible distribution of magnetic field and density for the horizontal closed ring prominence. (7 refs.)

96.90 OTHER TOPICS ON THE SOLAR SYSTEM

116627 The pulsar P/P distribution and the postulated solar companion. S.A.Cowling (Dept. of Appl. Maths. & Astron., Univ. Coll., Cardiff, Wales). *Mon. Not. R. Astron. Soc. (GB)*, vol.204, no.3, p.1237-44 (Sept. 1983). Evidence for the existence of a companion object in a closed or open orbit about the Sun is reviewed. It is shown that such an object, postulated by Harrison (1977) in order to explain anomalies in the period derivatives of certain pulsars, would have a high probability of being detected, by the gravitational deflection of light, using the ESA Astrometry Satellite Hipparcos. An analysis of up-to-date pulsar statistics does not appear to support the existence of a companion. An upper limit of $\sim 10^{-8} \text{ ms}^{-2}$ is placed on any Solar System acceleration. (13 refs.)

97.00 STARS

97.10 STELLAR CHARACTERISTICS

116628 Self-regulated star formation in the Galaxy. J.Franco, D.P.Cox (Dept. of Phys., Univ. of Wisconsin, Madison, WI, USA). *Astrophys. J. (USA)*, vol.273, no.1, pt.1, p.243-8 (1 Oct. 1983). The stellar birthrate is obtained under the assumption that the regions of star formation are supported against gravity by winds from low-mass young objects. For winds interacting in the momentum conservation stage, it is found that the rate is correlated with the molecular gas density of the parent fragment as $n^{13/8}$ or $n^{5/8}$, for rates per unit volume or per unit mass, respectively. In particular, the birthrates derived from protostellar rotationally driven winds are in good agreement with the observed star production in the cloud B18. With the aid of the observed properties of the Taurus-Auriga complex, the model is extrapolated to the Galaxy as a whole. (34 refs.)

116629 The formation of emission lines in the expanding chromospheres of luminous cool stars. I. The importance of atmospheric extension and partial redistribution effects. S.A.Drake, J.L.Linsky (Joint Inst. for Lab. Astrophys., Univ. of Colorado, Boulder, CO, USA). *Astrophys. J. (USA)*, vol.273, no.1, pt.1, p.299-308 (1 Oct. 1983). Most late-type luminous stars are losing mass in cool stellar winds. In many red giants the only evidence for mass loss is the presence of a characteristic asymmetry in the strongest ultraviolet resonance lines, such as the Mg II k line. The available methods for treating radiative transfer in such chromospheric lines in an expanding, extended medium are discussed, and the comoving frame method (including partial redistribution) is selected as the most suitable. This technique is outlined in the context of a two-level atom. The difference in the computed line profiles between assuming partial and complete redistribution is illustrated for a wide range of atmospheric and wind parameters. (55 refs.)

116630 Temperature-grid coordinates for treating pulsations in the hydrogen ionization zone. T.Aikawa, N.R.Simon (Dept. of Phys. & Astron., Univ. of Nebraska, Lincoln, NE, USA). *Astrophys. J. (USA)*, vol.273, no.1, pt.1, p.346-54 (1 Oct. 1983). A temperature grid is used for the description of motion in the hydrogen ionization region (HIR). This means zones are labeled by temperature rather than mass. Outside the HIR, the conventional Lagrangian grid is used, with

transitional coordinates at the boundaries. Although the final object is to apply this scheme to the nonlinear periodic integration problem, the authors have first constructed a linear version as a test. It is found that periods and growth rates agree very well with those calculated using pure Lagrangian coordinates, but the temperature grid scheme proves less sensitive to a reduction of zones in the HIR. (16 refs.)

116631 Effect of excited states on thermonuclear reaction rates. D.G.Sargood (School of Phys., Univ. of Melbourne, Parkville, Victoria, Australia). *Aust. J. Phys. (Australia)*, vol.36, no.4, p.583-9 (1983).

Values of the ratio of the thermonuclear reaction rate of a reaction, with target nuclei in a thermal distribution of energy states, to the reaction rate with all target nuclei in their ground states are tabulated for neutron, proton and α -particle induced reactions on the naturally occurring nuclei from ^{20}Ne to ^{70}Zn , at temperatures of 1, 2, 3.5 and $5 \times 10^9 \text{ K}$. The ratios are determined from reaction rates based on statistical model cross sections. (15 refs.)

116632 Objective-prism discoveries in the northern sky. I. W.P.Bidelman (Warner & Swasey Obs., Case Western Reserve Univ., Cleveland, OH, USA).

Astron. J. (USA), vol.88, no.8, p.1182-6 (Aug. 1983). Lists 175 newly recognized peculiar or otherwise interesting northern-hemisphere stars noted in a preliminary inspection of moderate-dispersion objective-prism plates obtained with the new 10° prism of the Burrell Schmidt, located at the Warner and Swasey Observatory's Kitt Peak Station. (10 refs.)

116633 Observationally-based infrared efficiencies and Planck means for circumstellar dust grains. T.Henning, J.Gurtler, J.Dorschner (Univ. Sternwarte Jena, Jena, Germany).

Astrophys. & Space Sci. (Netherlands), vol.94, no.2, p.333-49 (Aug. 1983). The mean relative efficiency factors for absorption of dust grains in the wavelength range from 8 to $22 \mu\text{m}$ are derived from IR spectra of the optically thin dust shells surrounding the O-rich supergiants $\mu \text{ Cep}$, $\alpha \text{ Ori}$, X Her and R Cas. The resulting absorption efficiency curve is extrapolated into the near as well as the far infrared regions. Planck mean efficiency factors are calculated for the temperature range 30 to 1500 K . (37 refs.)

116634 Adiabatic radial pulsations of a composite stellar model. M.Singh, S.R.Agarwal (Dept. of Math., Univ. of Roorkee, Roorkee, India).

Astrophys. & Space Sci. (Netherlands), vol.94, no.2, p.351-9 (Aug. 1983). Small adiabatic radial oscillations of composite models are investigated. The effect of a central condensation $\rho_c/\bar{\rho}$ on the period of pulsation is also examined. It is shown that the second moment of the mass concentration characterizes the periods of pulsations more effectively than the central condensation. (13 refs.)

116635 The equations that govern rotational and tidal perturbations of stellar oscillations. P.Smeyers, L.Martens (Astron. Inst., Katholieke Univ. Leuven, Leuven, Belgium).

Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.193-9 (Sept. 1983). Uses a perturbation method to determine linear oscillations in a uniformly rotating star and in a uniformly and synchronously rotating component of a binary system accurate to the second order in the slow angular velocity. In this approximation, one has to deal with a surface perturbation due to the distortion of the star's equilibrium configuration. It is noted that the procedures applied by Simon (1969) for pseudo-radial oscillations and by Smeyers and Denis (1971) for non-radial oscillations allow the distortion of the star's equilibrium surface to be taken into account both by an appropriate transformation of the operator in the vector wave equation and by a parallel transport of the Lagrangian displacement from each point to an associated neighbouring point in a spherical domain. The emphasis is placed on the parallel transport since this part of the procedure has been omitted in the recent investigations of Saio (1981, 1982). The correct equations are established. (17 refs.)

116636 Phase transitions in stellar cores. I. Equilibrium configurations. R.Schaeffer (Service de Phys. Theorique, CENS, Gif-sur-Yvette, France), P.Haensel, L.Zdunik.

Astron. & Astrophys. (Germany), vol.126, no.1, pt.2, p.121-45 (Sept. 1983). The effect of a first order phase transition occurring in the central core of a degenerate star is studied within the Newtonian theory of gravitation. The changes of parameters such as the radius (δR), the moment of inertia (δI) or the energy (δE) during the transition from a one-phase to a two-space star are expressed by means of analytical formulae that are valid for any equation of state. They turn out to be accurate even for moderately large changes of the stellar parameters, typically a sizeable fraction of their initial value. In the limit where the radius r_s of the condensed core made out of the new phase is small, scaling laws ($\delta R, \delta I \sim r_s^3, \delta E \sim r_s^5$) are derived. The stability of the two-phase stars with respect to small radial perturbations is studied, and the properties of polytropic condensed cores are investigated. (17 refs.)

116637 The disk-star boundary layer and its effect on the accretion disk structure. O.Regev (Dept. of Phys., Technion-Israel Inst. of Technol., Haifa, Israel).

Astron. & Astrophys. (Germany), vol.126, no.1, pt.2, p.146-51 (Sept. 1983). The method of matched asymptotic expansions is proposed for a self-consistent calculation of an accretion disk and the disk-accreting star boundary layer. A model of a thin, optically thick, region (c) accretion disk and boundary layer is calculated with the help of the method. The disk in this model is hotter and denser than in the corresponding Shakura and Sunyaev (1973) model. The significance of the model is discussed and the method is proposed for other cases of interest. (10 refs.)

116638 Far ultraviolet colors of B and Be stars. J.Zorec (Inst. d'Astrophys., Paris, France), D.Briot, L.Divan.

Astron. & Astrophys. (Germany), vol.126, no.1, pt.2, p.192-204 (Sept. 1983). A G index, free of interstellar reddening and characterizing the ultraviolet color of the star, is defined by using observations of B and Be stars with the TD-1 satellite. For each luminosity class of normal B stars, a mean sequence of G index, against the spectral type, is obtained. Most of the Be stars show ultraviolet color indices less negative than those of normal B stars but sometimes such color indices are more negative. Be stars are divided into two categories according to the strength of the emission features: the strong Be stars and the weak Be stars. Characteristics of each are discussed. (59 refs.)

116639 Semiconvective diffusion and energy transport. N.Langer, D.Sugimoto, K.J.Fricke (Univ.-Sternwarte Gottingen, Gottingen, Germany).

Astron. & Astrophys. (Germany), vol.126, no.1, pt.2, p.207-8 (Sept. 1983). On the basis of the theories of radiation-driven overstability and non-radial oscillations, an expression is proposed with which semiconvective mixing in stellar interiors may be handled. Deviations from the Schwarzschild as well as from the Ledoux criterion and mixing of chemical elements can then be treated time-dependently by means of a diffusion equation. (9 refs.)

- 116640 Broadband linear polarization from magnetized stellar atmospheres. II. The influence of damping on net spectral line polarization.** G.Calamai, E.Landi Degl'Innocenti (Astrophys. Obs. of Arcetri, Firenze, Italy). *Astron. & Astrophys. Suppl. Ser. (France)*, vol.53, no.3, p.311-18 (Sept. 1983).
For pt.1 see ibid., vol.49, no.4, p.677-85 (1982). The influence of broadening by damping on broadband linear polarization expected from a stellar atmosphere through the mechanism of magnetic intensification is investigated. Numerical tables are presented. (3 refs.)
- 116641 Narrow-band photometry of G and K stars near the North Galactic Pole.** L.Hansen, G.A.Radford (Copenhagen Univ. Obs., Copenhagen, Denmark). *Astron. & Astrophys. Suppl. Ser. (France)*, vol.53, no.3, p.427-31 (Sept. 1983).
Narrow-band photometry of 292 late type stars within 15° of the North Galactic Pole has been obtained in the Copenhagen g, n, k, m, f -system. For most of the stars estimates of the following quantities have been derived: V -magnitude, $R-I$ colour, metal abundance, M_V and a duplicity parameter $res(k)$. (12 refs.)
- 116642 Radial velocities for early type stars in six galactic regions.** N.Zentis (Stockholm Obs., Saltsjobaden, Sweden). *Astron. & Astrophys. Suppl. Ser. (France)*, vol.53, no.3, p.445-53 (Sept. 1983).
Coude spectroscopy has been carried out for 353 stars of spectral types B0-A0 and V magnitudes between 6.5^m and 10.8^m , selected in six regions (three northern and three southern) close to the galactic plane at the galactic longitudes 135° , 175° , 315° and 350° . The radial velocities were obtained by cross-correlating each spectrogram with a reference spectrogram giving an internal error of 1.4 km/s. (6 refs.)
- 116643 Vibrating-dust spheres in the Reissner-Nordstrom metric.** F.de Felice (Internat. School for Advanced Studies, SISSA, Trieste, Italy), Yu Yunqiang. *Nuovo Cimento B (Italy)*, vol.76B, ser.2, no.1, p.28-34 (11 July 1983).
The authors consider the collapse of a charged dust sphere with a charge Q larger than the mass M (both in geometrized units). They show that the outcome of collapse is most likely a stable, vibrating configuration. The period of the vibrations is of the order of 10^{-4} s for masses of the order of a solar mass. Optically such an object shows a quasi-steady red-shift which can be very large when Q is close to M . (3 refs.)
- 116644 Stellar collapse without singularities?.** T.A.Roman (Dept. of Phys., Syracuse Univ., Syracuse, NY, USA), P.G.Bergman. *Phys. Rev. D (USA)*, vol.28, no.6, p.1265-77 (15 Sept. 1983).
For the singularity theorems of Hawking and Penrose to hold, the stress-energy tensor of matter must satisfy certain restrictions. A model is developed representing the interior of a collapsing, spherically symmetric cloud of matter, which is everywhere free of singularities, due to a relaxation of the so-called 'weak energy condition'. The regions of the model in which the condition must be violated, and the properties of matter and energy which result, are determined. The indications are that, at least in spherically symmetric cases involving very large masses, the energy condition must be violated in a region where the density is no larger than normal matter densities, which seems physically implausible. Hence suspending the energy conditions may not be a reasonable approach to the avoidance of singularities. (17 refs.)
- 116645 Matter transfer by MHD waves in stellar atmospheres.** E.A.Rudenchik. *Pis'ma v Astron. Zh. (USSR)*, vol.9, no.8, p.504-7 (1983). In Russian. English translation in: *Sov. Astron. Lett. (USA)*
It is shown, that fast MHD waves can transfer significant amounts of matter together with the frozen magnetic field through a stratified atmosphere. For a wave propagating through an atmosphere with a strong horizontal magnetic field an increase is found in the acoustic flow. (4 refs.)
- 116646 On influence of the magnitude equation in proper motions of stars on the determination of some astronomical constants.** V.V.Vityazev. *Vestn. Leningr. Univ. Ser. Mat. Mekh. & Astron. (USSR)*, no.3, p.75-81 (July 1983). In Russian.
Provided that the systematic errors in the proper motions are represented by means of spherical functions analytical expressions showing the influence of different harmonics on the determination of the solar motion, galactic rotation and precession corrections are derived. These results are generalized to consider the dependence of systematic errors on the magnitude equation. It is shown that the discovered magnitude equation for the proper motions of FK4 stars has only a small influence on the results for galactic rotation and precession determination. (8 refs.)

97.20 NORMAL STARS (BY CLASS): GENERAL OR INDIVIDUAL

- 116647 The extreme LMC supergiant HD 38489: an optical and ultraviolet study.** S.N.Shore, N.Sanduleak (Warner & Swasey Obs., Dept. of Astron., Case Western Reserve Univ., Cleveland, OH, USA). *Astrophys. J. (USA)*, vol.273, no.1, pt.1, p.177-86 (1 Oct. 1983). This investigation combines near-infrared, optical, and ultraviolet observations covering λ 1200-7000 to study the extremely luminous B star HD 38489=S134. The star is found to be an evolved B star with $T_{\text{eff}} \approx 25000\text{K}$, $M \sim 80\text{-}90 M_{\odot}$, and $R \sim 70 R_{\odot}$. Estimates of mass loss suggest $\dot{M} \approx 10^{-5} M_{\odot} \text{ yr}^{-1}$, comparable to galactic stars. Similarity is shown to stars of the Hubble-Sandage class and to several transition-type stars. A nitrogen enhancement of a factor of 6-20 is suggested, and model envelope derived. (52 refs.)
- 116648 Collapse and explosion of white dwarfs. I. Precollapse evolution.** J.Isern, J.Labay, M.Hernanz, R.Canal (Dept. de Física de la Tierra y del Cosmos, Univ. de Barcelona, Barcelona, Spain). *Astrophys. J. (USA)*, vol.273, no.1, pt.1, p.320-9 (1 Oct. 1983). The long-term evolution of accreting carbon-oxygen white dwarfs in close binary systems is considered. Depending on the time of onset of mass accretion, thermonuclear ignition happens when the star's center is either in the fluid or in the solid phase. In the last case, burning propagation should be slow, and previous carbon-oxygen separation is likely. It is shown that by considering different degrees of chemical separation (associated with different cooling times) diverse outcomes are possible: total collapse for maximum separation and off-center ignitions for partial chemical differentiation. The off-center ignitions might provide a mechanism for Type I supernova outbursts. (68 refs.)
- 116649 The reddening, metal abundance, and luminosity of high-luminosity G-type stars.** O.J.Eggen (Cerro Tololo Inter-American Obs., La Serena, Chile). *Astron. J. (USA)*, vol.88, no.8, p.1187-98 (Aug. 1983). Photometry of some 100 G-type bright giants and supergiants is discussed. The sample is less than half of the observed 'G'-type supergiants, but the remaining majority are actually F-type stars with heavy line blanketing and they will be discussed elsewhere. The abundance parameters of this sample of stars indicate values of [Fe/H] between about +0.6 dex and the solar value, using a preliminary calibration of the photometric indices. The luminosities are derived from previously calibrated photometric results and are in reasonably good agreement with spectroscopically assigned luminosity classes. The few long-period Cepheids that are not heavily blanketed F-type stars give reddening values in agreement with current results from other methods of analyses. The supergiants show no obvious gradients in the galactic distribution of abundances and those nearest the Sun range from very overabundant ([Fe/H] $\sim +0.3$ dex), for members of the Local Association (Pleiades Group), to near solar abundance. A small sample of LMC supergiants shows nearly the same range in metal abundance as the galactic stars and gives a modulus for the LMC of $18.3 \pm 0.20(\sigma)$ mag. (22 refs.)
- 116650 On the T Tauri nature of the variable star BM Cha.** J.Krautter (Max-Planck-Inst. für Extraterrestrische Phys., Garching bei München, Germany), M.Mouchet. *Astron. & Astrophys. (Germany)*, vol.125, no.2, pt.1, p.378-80 (Sept. 1983). The variable star BM Cha has been shown to be a T Tauri star. Unusually strong variations of the Fe II emission lines on a time scale of one day were found. (13 refs.)
- 116651 The temperature of central stars of planetary nebulae: the energy-balance method.** A.Preite-Martinez, S.R.Pottasch (Kapteyn Astron. Inst., Groningen, Netherlands). *Astron. & Astrophys. (Germany)*, vol.126, no.1, pt.2, p.31-44 (Sept. 1983). The authors present a method for determining the color temperature of the ionizing continuum of the central star photoionizing a surrounding nebula. The method is based on the assumption that energy balance holds in the photoionized nebula. A simple analytical expression is derived for the energy-balance temperature T_{EB} of the central stars of low excitation nebulae and T_{EB} is found for a sample of 51 planetary nebulae. A good consistency is found between the computed T_{EB} and Zanstra temperature. The authors also predict the apparent visual magnitude of central stars not yet observed or only marginally detected. (51 refs.)
- 116652 The detection limits in ground based measurements of stellar microvariability.** F.-L.Deubner, J.Isserstedt (Inst. für Astron. & Astrophys., Univ. Würzburg, Würzburg, Germany). *Astron. & Astrophys. (Germany)*, vol.126, no.1, pt.2, p.216-19 (Sept. 1983). With photoelectric photometry in the VBLUW system the authors tried to detect short period brightness fluctuations in solar-like stars. Although the result of this experiment is negative, the RMS noise level per frequency band of ca. 2.5×10^{-5} mag in the data appears low enough to encourage the ground-based search for low-l p -mode oscillations in F-type main sequence stars. (13 refs.)
- 116653 Recent photometry of the central star of NGC 2346.** L.Kohoutek (Hamburg Obs., Hamburg, Germany). *Mon. Not. R. Astron. Soc. (GB)*, vol.204, no.3, p.93P-7 (Sept. 1983). The light curve of the variable central star of NGC 2346 has been observed in 1983 January and shows substantial changes compared with 1982. The end of 1981 November is estimated as being the beginning of the present eclipsing behaviour with photometric period $P=15.957$ day. The slope of the (V , $B-V$) relation is interpreted as the ratio $R=6.6$ of total to selective extinction which may arise in a dust cloud moving from the planetary nucleus. (12 refs.)
- 116654 Visible and UV observations of the giant early-type members of the Large Magellanic Cloud.** K.Nandy, G.I.Thompson (Royal Obs., Edinburgh, Scotland), D.H.Morgan, A.J.Willis, R.Wilson, L.Houziaux. *Mon. Not. R. Astron. Soc. (GB)*, vol.205, no.1, p.231-9 (Oct. 1983). Visible and UV observations of a sample of LMC members with $V > 14$ mag are presented. The sample contains an O9 V star and B0-B3 giants. Their flux distributions in the IUE range are found to be the same as those of galactic giants. The effective temperatures and radii of the LMC members are determined by comparison with models. (22 refs.)
- 116655 Far ultraviolet observations of Population II.** V.Caloi (Istituto di Astrofisica Spaziale, Frascati, Italy), V.Castellani. *Mem. Soc. Astron. Ital. (Italy)*, vol.54, no.2, p.419-41 (1983). Far UV observations of galactic and extragalactic Population II objects are reported and the relevance of this type of information for the understanding of stellar and galactic evolution is discussed. (30 refs.)

- 116656** Some aspects of the velocity fields in early-type stars. M.L.Franco, R.Stalio (Osservatorio Astron. di Trieste, Trieste, Italy). *Mem. Soc. Astron. Ital. (Italy)*, vol.54, no.2, p.537-52 (1983). Considers the structure and dynamics of the outer atmospheric layers of early-type stars and the interaction of these layers with the interstellar medium. (30 refs.)
- 116657** Late type stars [IUE observations]. S.Catalano (Istituto di Astron., Univ. di Catania, Catania, Italy). *Mem. Soc. Astron. Ital. (Italy)*, vol.54, no.2, p.553-69 (1983). The study of the outer atmospheres of cool stars, achieved with IUE observations are reviewed. The main results are summarized. The main widely accepted result that is emerging from IUE observations of cool stars is that magnetic fields control the structure and energy balance of the outer atmospheres of stars later than A7-F0. (50 refs.)
- 116658** The disc-like envelopes around young stars seen in the maser lines. V.P.Grinin, S.A.Grigor'ev. *Pis'ma v Astron. Zh. (USSR)*, vol.9, no.8, p.463-8 (1983). In Russian. English translation in: *Sov. Astron. Lett. (USA)*
The observational profiles of the SiO and H₂O maser lines in sources connected with star formation regions are analysed on the basis of theoretical profiles corresponding to different stages of axial-symmetric collapse. A number of sources whose profiles have special features typical of accretion motions and of quasi-Keplerian rotation are selected. Since the objects are young it is supposed that these stars are in the early phases of forming either protoplanetary discs or disc-like envelopes connected with the origin of binary systems. (23 refs.)

97.30 VARIABLE AND PECULIAR STARS (inc. novae)

- 116659** Cessation of the 63 second periodicity in the light curve of V533 Herculis. E.L.Robinson, R.E.Nather (McDonald Obs., Dept. of Astron., Univ. of Texas, Austin, TX, USA). *Astrophys. J. (USA)*, vol.273, no.1, pt.1, p.255-60 (1 Oct. 1983). In 1978 and 1980 the old nova V533 Her had a 63.6 s periodic variation in its light curve. The authors present high-speed photometry of V533 Her obtained in 1982. Although mass transfer and accretion are still taking place, the 63.6 s periodicity has disappeared. The available data on V533 Her now cast serious doubt on the magnetic rotator model for the periodicity. It is shown that the 63.6 s periodicity in V533 Her was similar to periodicities in the cataclysmic variable WZ Sge. The authors suggest that V533 Her should more properly be classified as a WZ Sge star, not a DQ Her star. (26 refs.)
- 116660** The outbursts of symbiotic novae. S.J.Kenyon, J.W.Truran (Dept. of Astron., Univ. of Illinois, Urbana, IL, USA). *Astrophys. J. (USA)*, vol.273, no.1, pt.1, p.280-8 (1 Oct. 1983). Discusses possible conditions under which thermonuclear burning episodes in the hydrogen-rich envelopes of accreting white dwarfs give rise to outbursts similar in nature to those observed in the symbiotic stars AG Peg, RT Ser, RR Tel, AS 239, V1016 Cyg, V1329 Cyg, and HM Sge. In principle, thermonuclear runaways involving low-luminosity white dwarfs accreting matter at low rates produce configurations that evolve into A-F supergiants at maximum visual light and which resemble the outbursts of RR Tel, RT Ser, and AG Peg. Very weak, nondegenerate hydrogen shell flashes on white dwarfs accreting matter at high rates may explain the outbursts in V1016 Cyg, V1329 Cyg, and HM Sge. (59 refs.)
- 116661** Mixing by shear instabilities in differentially rotating inhomogeneous stars with application to accreting white dwarf models for novae. J.MacDonald (Dept. of Astron., Univ. of Illinois, Urbana-Champaign, IL, USA). *Astrophys. J. (USA)*, vol.273, no.1, pt.1, p.289-98 (1 Oct. 1983). The problem of how shear instabilities redistribute matter and angular momentum accreted by a star from a disk is considered. Necessary conditions for stability of the star to nonaxisymmetric perturbations are derived by use of the short wavelength approximation. By considering growth rates, it is shown that freshly accreted material rapidly takes up a quasi-spherical distribution due to dynamical instabilities. However, mixing inward toward the stellar interior occurs on a thermal time scale or longer. The application of these results to accreting white dwarf models of classical novae is discussed. (25 refs.)
- 116662** PI Gruis: molecular identifications and spectral classification. P.S.Murty (Indian Inst. of Astrophys., Kodaikanal, India). *Astrophys. & Space Sci. (Netherlands)*, vol.94, no.2, p.295-305 (Aug. 1983). Identifications of the molecular absorption feature in the visible spectrum of the S star pi Gruis are presented. Moderate dispersion spectrum of π^1 Gru covering the region 5800-7300 Å, demonstrates the presence of a multitude of molecular bands. Wavelength measures of well over 150 red-degraded band heads are listed. Nearly 80% of the observed features are identified with the ZrO, LaO, YO, and CeO molecules. Many molecular bands due to ZrO, YO, and CeO are reported identified for the first time. Neither TiO molecular features nor any Ba compounds are detectable. (64 refs.)
- 116663** Star-planet systems as progenitors of cataclysmic binaries: tidal effects. M.Livio, N.Soker (Dept. of Phys., Technion-Israel Inst. of Technol., Haifa, Israel). *Astron. & Astrophys. (Germany)*, vol.125, no.2, pt.1, p.L12-15 (Sept. 1983). The evolution of a star-planet system is calculated at a stage in which a planet accretes from a red giant star's wind. Tidal interaction is included. For initial separations larger than a certain critical value, the separation is found to increase, while for smaller initial separations a tidally induced spiralling-in ensues. A second (smaller) critical initial separation is found to exist. For initial separations smaller than this second critical value, the planet manages to penetrate the giant's envelope before the latter is lost via the stellar wind. It is suggested that the spiralling-in process combined with accretion inside the giant's envelope, as calculated by Livio and Soker (1983), can lead to the formation of low-mass cataclysmic binaries. (16 refs.)
- 116664** Superoutbursts: a general phenomenon in dwarf novae. J.van Paradijs (Astronomical Inst. 'Anton Pannekoek', Univ. of Amsterdam, Amsterdam, Netherlands). *Astron. & Astrophys. (Germany)*, vol.125, no.2, pt.1, p.L16-18 (Sept. 1983). The occurrence of a bimodal distribution of outburst durations is a general property of dwarf novae. The intrinsic duration of the long outbursts is not correlated with the orbital period; that of short outbursts tends to increase with orbital period. The impressive contrast between the short and long outbursts in SU UMa type systems is a consequence of this, in combination with the positive correlation between the decay time of the outbursts and the orbital period (Bailey relation). Thus the restriction of the term 'superoutburst' to short-orbital-period systems is misleading. (7 refs.)
- 116665** The dust envelope of the Herbig Ae star, AB Aur. C.Catala (DESPA, Obs. de Paris-Meudon, Meudon, France). *Astron. & Astrophys. (Germany)*, vol.125, no.2, pt.1, p.313-19 (Sept. 1983). Ultraviolet low resolution observations of a Herbig Ae star, AB Aur, when compared with a theoretical energy distribution for the same spectral type, show the existence of an anomalous extinction, which is believed to be due to a circumstellar dust envelope surrounding the star. The study of this anomalous extinction can be used to determine the properties of the grains responsible for it. These properties can then be tested by comparing a computed infrared energy distribution with infrared calibrated observations. (56 refs.)
- 116666** The ultraviolet variability of the symbiotic star HBV 475. H.Nussbaumer, W.Schmutz (Inst. of Astron., Zurich, Switzerland). *Astron. & Astrophys. (Germany)*, vol.126, no.1, pt.2, p.59-69 (Sept. 1983). The authors present evidence for the binary nature of the symbiotic star HBV 475 (=V1329 Cyg). Changes in line and continuum fluxes, observed in the far ultraviolet (1200 Å-3200 Å), are consistent with the 950^d period found

from the visual luminosity variations. Periodicity and amplitudes found in the wavelength shifts, indicate a size of the binary system of $\approx 2 \times 10^{14}$ cm. The emission lines originate in a radiatively ionized gas with $10^6 < N_e [\text{cm}^{-3}] < 10^7$ and $T_e < 15000\text{K}$. Evidence has been discussed for a hot outer envelope around the whole system. (40 refs.)

116667 Photometric search for Ap-stars in open clusters. IV. NGC 2287, Cr 121, NGC 2422 and supplementary measurements in NGC 1662 and NGC 2516. H.M.Maitzen (Inst. fur Astron., Univ. Wien, Wien, Austria), H.J.Wood.

Astron. & Astrophys. (Germany), vol.126, no.1, pt.2, p.80-5 (Sept. 1983). For pt.III entitled 'A photoelectric investigation of Ap-stars in open clusters', see *ibid.*, vol.115, no.2, p.275-9 (1982). The authors have continued the search for Ap-stars in open clusters with the photoelectric peculiarity index Δa (Maitzen, 1976) and found NGC 2287-56, NGC 2422-P3, NGC 1662-4 to be CP2-stars as members in their respective clusters. HD 51088 which is also peculiar according to its Δa -value, may be a member of one of the two very young star concentrations previously called Cr 121. There is only a small probability that HD 49333 is a member of NGC 2287. It is a CP4 (=He weak) star with a Δa significant for peculiarity. (33 refs.)

116668 The runaway Wolf-Rayet star HD 143414: evidence for a low-mass companion. J.Isserstedt, A.F.J.Moffat, V.S.Niemela (Inst. fur Astron. & Astrophys., Univ. Wurzburg, Wurzburg, Germany). *Astron. & Astrophys. (Germany)*, vol.126, no.1, pt.2, p.183-91 (Sept. 1983). Extensive photoelectric photometry and photographic spectroscopy reveal HD 143414 to be a single-line binary with a 7.690-d orbit. The mass function is low, $0.007 M_\odot$. This leads to a mass for the companion star of $\sim 2.8 M_\odot$, assuming the WN6 component to have a mass of $40 M_\odot$ and the orbital inclination to be 60° . Its large displacement from the galactic plane ($z = -44$ pc) and its high peculiar radial velocity (-107 km s^{-1} in excess of differential galactic rotation) suggest that HD 143414 is a runaway. This is likely the result of a recoil after a supernova explosion of the original primary, which would have occurred $< 5 \times 10^6$ yr ago near the galactic plane. (29 refs.)

116669 Far ultraviolet colors of β Cephei stars. J.Zorec (Inst. d'Astrophys., Paris, France), D.Briot, L.Divan. *Astron. & Astrophys. (Germany)*, vol.126, no.1, pt.2, p.205-6 (Sept. 1983). Studies the ultraviolet colors of β Cephei-type stars using a G index independent of a mean interstellar reddening. The G index characterizes the ultraviolet energy distribution of the stars in the range $\lambda\lambda$ 1460-2740 Å. The β Cephei stars have ultraviolet colors which correspond to those of normal B stars having the same spectral type and luminosity class, that is, colors of normal B stars between those of luminosity classes IV and V and those of luminosity class III. However, the G index of σ Sco is quite different from that of normal stars. It identifies an abnormal energy distribution, interpreted up to now as due to a peculiar interstellar absorption law. (10 refs.)

116670 Study of the variability of the delta Scuti stars. VI. Pulsational behaviour of HR 1392 (69 Tau). M.Bossi, G.Guerrero, L.Mantegazza, M.Scardia (Osservatorio Astron. di Brera, Merate, Italy). *Astron. & Astrophys. Suppl. Ser. (France)*, vol.53, no.3, p.395-7 (Sept. 1983). Photoelectric observations of the delta Scuti star 69 Tau are presented. The analysis of the light curves shows a single sinusoidal component over the detectability threshold. The observed frequency does not agree with the fundamental pulsation mode. The small observed amplitude is probably connected with the high rotational velocity. However the presence in the same region of the HR diagram of monopulsating delta Scuti stars involving pulsational energies which differ by orders of magnitude, remains an open problem. (15 refs.)

116671 Study of the variability of the delta Scuti stars. VII. The problem of stability and monopulsation in 20 CVn. M.Bossi, G.Guerrero, L.Mantegazza, M.Scardia (Osservatorio Astron. di Brera, Merate, Italy). *Astron. & Astrophys. Suppl. Ser. (France)*, vol.53, no.3, p.399-402 (Sept. 1983).

For pt.VI see *ibid.*, vol.53, no.3, p.395-97 (1983). The long term stability of the delta Scuti star 20 CVn is established from the results of 17 hours of observations obtained in 1982. However the presence of a second pulsation mode is suspected although this star has so far been considered as a monopulsator. The small pulsational amplitude, like that of many other similar variable stars, still needs an exhaustive explanation. In this case, it may be connected with the excitation of several high order modes, which would be photometrically undetectable, and/or with a possible peculiar metallicity. (19 refs.)

116672 Absolute measurements of flux in the continuum of galactic Wolf-Rayet stars: comparison with main-sequence OB stars. Hua Chon-Trung, Woo Jong-Ok (Lab. d'Astron. Spatiale, Marseille, France), Nguyen Huu-Doan. *Astron. & Astrophys. Suppl. Ser. (France)*, vol.53, no.3, p.407-17 (Sept. 1983). In French.

The authors present absolute measurements of the flux emitted in the visible continua of some galactic Wolf-Rayet stars, carried out by means of a two-channel scanner. The dereddened fluxes are combined with IUE and ANS of Kurucz (1979) in order to derive the effective temperatures and angular diameters of the programme stars. The authors then compute $\log L/L_\odot$ and thereby locate the WR stars in the HR diagram: the WR stars are cooler than the ZAMS, and the WN7, WN8 types appear more luminous than the other subclasses. (38 refs.)

116673 HR 981—a new USPC. T.T.Moon, D.W.Coates, L.Halprin, K.Thompson (Dept. of Phys., Monash Univ., Clayton, Victoria, Australia).

Inf. Bull. Variable Stars (Hungary), no.2383, p.1-4 (15 Aug. 1983). The authors report V-band photometry of the visual binary star HR 981 (=HD 20313; F0 II) during 1981 and 1982. Light variations are found with an amplitude of about 0.02 magnitudes, and with periods of 0.065 and 0.041 days. The period ratio (0.63 ± 0.03) indicates pulsation in the fundamental mode and the second overtone. This interpretation is consistent with the PLC relation for ultra-short-period Cepheids. It is concluded that the variable star is the primary component of the visual binary (HR 981A), since HR 981B is too late in spectral type to be an ultra-short-period Cepheid. (3 refs.)

116674 On the pulsation of HD 201601. W.W.Weiss (Inst. fur Astron., Wien, Austria).

Inf. Bull. Variable Stars (Hungary), no.2384, p.1-2 (15 Aug. 1983). The author reports photometric observations of the rapidly oscillating Ap star γ Equulei (=HR 8097=HD 201601) between 9 and 11 July 1983. Light variations with an amplitude of about 0.8 mmag and a frequency of 0.079/min were observed on all three nights. (4 refs.)

116675 B and V photometry of the southern RS CVn candidate HD 196818. J.L.Innis, D.W.Coates, S.W.B.Dieters, T.T.Moon, K.Thompson (Dept. of Phys., Monash Univ., Clayton, Victoria, Australia).

Inf. Bull. Variable Stars (Hungary), no.2386, p.1-4 (18 Aug. 1983). The authors report photoelectric BV photometry of HD 196818 (K0 IIIp), alias BV 893, between August 1982 and July 1983. Small-amplitude light

variations ($\Delta V \sim 0.3$ mag.) have been observed; the photometric period is estimated to be 20.31 days. The light curve resembles a 'sawtooth' wave, with an almost linear rise and fall. The light variations are consistent with the presence of cool active regions on the surface of the star. (5 refs.)

116676 On some remarkable pulsation properties of the high-latitude F-type supergiants. D.D.Sasselov (Dept. of Astron., Univ. of Sofia, Sofia, Bulgaria).

Inf. Bull. Variable Stars (Hungary), no.2387, p.1-3 (18 Aug. 1983). The author describes a class of variable F-type supergiant stars, designated UU Herculis stars, which occur far above the galactic plane and which are distinguished by unusual photometric behaviour. These stars show at least two distinct alternating pulsational modes, with periods between 40 and 90 days, and switch from one mode to the other; UU Herculis itself has three modes, with periods of 71, 80 and 90 days. Another common phenomenon among these stars is that their pulsations may cease abruptly, and the star may remain constant for a couple of months before beginning to pulsate again. Five stars of this class have been identified, namely UU Herculis, 89 Herculis, BL Telescopii (F), HD 161796 and HD 112374; they are interpreted as luminous passive Population I stars pulsating in nonradial modes. (9 refs.)

116677 Optical behavior of EZ Pegasi. S.K.Pope (American Assoc. of Variable Star Observers, Cambridge, MA, USA).

Inf. Bull. Variable Stars (Hungary), no.2388, p.1-4 (19 Aug. 1983). The author reports observations of the unique, possibly cataclysmic, variable star EZ Pegasi. Spectroscopic observations between October 1971 and January 1972 showed normal G5 V spectra in the blue region, except that H δ appeared as a very broad, weak absorption line with possible core emission; spectra in the visual region revealed short term fluctuations in the intensity of the H α emission. Visual magnitude estimates for the star are reported, and a light curve for the period 1972 to 1982 is presented; the brightness of the star is found to be essentially constant. (3 refs.)

116678 HR 5=ADS 61: a new variable star. O.H.Brettman (Braeside-Midwest Obs., Huntley, IL, USA), R.E.Fried, W.M.Duvall, D.S.Hall, C.H.Poe, J.S.Shaw.

Inf. Bull. Variable Stars (Hungary), no.2389, p.1-3 (22 Aug. 1983). The authors report differential photoelectric photometry of the visual binary star HR 5 (=HD 123=ADS 61: dG4+dG8) during 1981 and 1982. The star is found to be variable ($\Delta V \sim 0.2$ mag.), with a period of 1.0819 days; the amplitude of the variation increases by a factor of 3 from the infrared to the ultraviolet. It is not known which component of the binary is variable, and the mechanism of the light variations is uncertain; the authors tentatively attribute them to the rapid rotation of an unevenly-spotted star or to the existence of a short-period spectroscopic binary in the system. (1 ref.)

116679 Photometry of FK Comae. E.Bohusz, A.Udalski (Warsaw Univ. Obs., Warsaw, Poland).

Inf. Bull. Variable Stars (Hungary), no.2390, p.1-3 (25 Aug. 1983). The authors report BV photometry of the rapidly-rotating giant star FK Comae Berenice (BD+24°2592) during May and June 1982. The light curve is similar to that found by Rucinski (1981). The phase found for maximum light (0.4 to 0.5) suggests that the region of the star responsible for the light variations did not move on the stellar surface during the period 1974 to 1982. (2 refs.)

116680 On delta Scuti stars in open clusters. M.Breger (Inst. for Astron., Wien, Austria).

Inf. Bull. Variable Stars (Hungary), no.2393, p.1-4 (30 Aug. 1983). The observational correlations for delta Scuti stars in clusters reported by Frolov and Irkaev (1982) between average period and cluster age, as well as average absolute magnitude and age, are examined. These correlations are shown to be a natural consequence of the systematically different color-magnitude diagrams for clusters of different ages, and the existence of a period-luminosity-colour relation for delta Scuti stars. (8 refs.)

116681 Search for ultra short period variations in Epsilon Octantis. T.T.Moon, D.W.Coates, J.L.Innis, K.Thompson (Dept. of Phys., Monash Univ., Clayton, Victoria, Australia).

Inf. Bull. Variable Stars (Hungary), no.2394, p.1-3 (1 Sept. 1983). The authors report photoelectric photometry of the semiregular variable star ϵ Octantis (=HR 8481=HD 210967; M5 III) between May and July 1983. The star faded in V-light by about 0.5 mag. from May 18 to June 17, with a corresponding change of about 0.1 mag. in B-V; it is deduced that the temperature of the star decreased from about 3890 to 3760K in this time. A search on July 18 for light variations attributable to ultrashort period oscillations was unsuccessful; no such variations were observed to a limit of ± 0.005 mag. (3 refs.)

116682 Magnetometric measurements of the carbon star Y CVn. M.Vetesk (Dept. of Astron., Brno Univ., Brno, Czechoslovakia).

Inf. Bull. Variable Stars (Hungary), no.2395, p.1 (2 Sept. 1983). The author reports measurements of Zeeman spectra of the N-type carbon star Y Canum Venaticorum. No magnetic field was detected; the mean value of the magnetic induction was found to be $B = 0.005 \pm 0.010$ Tesla. (no refs.)

116683 V436 Cen revisited. B.Warner (Dept. of Astron., Univ. of Cape Town, Cape Town, S Africa).

Inf. Bull. Variable Stars (Hungary), no.2397, p.1-3 (5 Sept. 1983). The author discusses the observation by Semenik (1980) of an increasing superhump period in the SU Ursae Majoris star V436 Centauri during the supermaximum of May 1978. It is suggested that the superhumps observed towards the end of this outburst were 'late superhumps', similar to those observed in VW Hydri, which have periods similar to those of normal superhumps but which are displaced 0.5P in phase with respect to them; and that as a result the superhump elements found by Semenik have been distorted. It is concluded that the superhumps of V436 Cen have an apparently decreasing period, similar to those of the other SU Ursae Majoris stars. (6 refs.)

116684 PU Vulpeculae. A.Purgathofer, A.Schnell. *I.A.U. Circ. (USA)*, no.3859, 1 pp. (14 Sept. 1983).

The authors report spectroscopic observations of PU Vulpeculae during July and September 1983. The star has a late F-type spectrum of luminosity class I. Observations between 4 and 8 September 1983 show H α and H β only in emission; O III 501 nm and O II 373 nm emission lines are also present. In addition the star has been brightening in the U-band since around July 5, at a rate between 0.004 and 0.03 mag/day. (no refs.)

116685 R Coronae Borealis. K.Hirosawa, K.Meday, M.Verdenet, J.Shanklin, C.Hurless, G.Chaple, L.Hiett, C.E.Spratt, C.Scovill, J.Bortle. *I.A.U. Circ. (USA)*, no.3859, 1 pp. (14 Sept. 1983).

Visual magnitude estimates are reported for the period 1983 August 26 to September 9. (no refs.)

116686 U Aquarii. *I.A.U. Circ. (USA)*, no.3859, 1 pp. (14 Sept. 1983).

Visual magnitude estimates are reported for 1983 August 21 and September 5: the star is recovering from its recent short, shallow minimum. (no refs.)

116687 GK Persei. C.E.Spratt.*I.A.U. Circ. (USA)*, no.3861, 1 pp. (14 Sept. 1983).

Visual magnitude estimates are reported for 1983 September 5 and 6. (no refs.)

116688 Novalike variable in Libra. B.E.J.Pagel, M.M.Phillips.*I.A.U. Circ. (USA)*, no.3863, 1 pp. (14 Sept. 1983).The authors report that a low-dispersion spectrogram obtained on 1983 September 1 showed strong H γ , H β and H α emission. The apparent visual continuum magnitude estimated from this spectrum was 14.1. (2 refs.)**116689 Possible novae. W.Liller, E.P.Aksenov.***I.A.U. Circ. (USA)*, no.3869, 1 pp. (23 Sept. 1983).It is reported that a possible nova has been discovered in Norma at $\alpha=16^h09^m51.0^s$, $\delta=-52^\circ11'32''$ (equinox 1950.0). The object was detected at magnitude 9.4 on 1983 September 19 but must have been fainter than magnitude 11.5 on September 10. In addition it is reported that a possible nova has been discovered in Triangulum at $\alpha=2^h42^m$, $\delta=+33^\circ19'$ (equinox 1950.0). The object was observed at $m_{pg}=15.0$ on 1983 September 11. (no refs.)**116690 Possible optical burster. S.Djorgovski.***I.A.U. Circ. (USA)*, no.3870, 1 pp. (23 Sept. 1983).Spectroscopic observations on 1983 September 11 have shown that the candidate object at $\alpha=00^h54^m50.10^s$, $\delta=-01^\circ38'06.7''$ (equinox 1950.0) proposed by Klemola (1983) for the possible optical burster found by Popovic (1982) is a normal galactic star. (2 refs.)**116691 Molecules in celestial objects. IV. IUE observation of CO lines towards Be stars with low reddening. S.P.Tarafdar (Tata Inst. of Fundamental Res., Bombay, India).***Mon. Not. R. Astron. Soc. (GB)*, vol.204, no.3, p.1081-9 (Sept. 1983).For pt.III see *ibid.*, vol.200, no.2, p.431-44 (1982). IUE spectra of two Be stars with small colour excesses are presented to show the presence of a number of absorption lines due to the A-X transition of ^{12}CO and ^{13}CO is shown that ^{12}CO towards Be stars comes from a region where the density of molecular hydrogen is large compared to that towards non-Be stars. As a high density of molecular hydrogen is favoured in the high density circumstellar material, it is suggested that the observed CO towards Be stars is circumstellar in origin. This suggestion is supported by the presence of absorption from excited $^2P_{3/2}$ level of Si II. (26 refs.)**116692 An infrared study of the eclipsing dwarf nova U Geminorum.**

G.Berriman (Div. of Phys., Maths. & Astron., California Inst. of Technol., Pasadena, CA, USA), D.H.Beattie, I.Gatley, T.J.Lee, S.W.Mochnecki, P.Szkody.

Mon. Not. R. Astron. Soc. (GB), vol.204, no.3, p.1105-15 (Sept. 1983).

Presents broadband infrared photometry (J, H, K) of the cataclysmic binary system U Geminorum throughout two orbital cycles, one series of data was obtained several days before an outburst, and a second series when the system had returned almost to quiescence from the same outburst. In quiescence, the red star, an M4-M5.5 dwarf, supplies most of the infrared luminosity of the system. The quiescent light curves are the tidally induced ellipsoidal variations of the red dwarf. The amplitude of the light curves is such that the red dwarf must fill, or nearly fill, its Roche lobe. (33 refs.)

116693 On the secular variation of amplitudes in double-mode Cepheids.

T.Aikawa (Dept. of Phys. & Astron., Univ. of Nebraska, Lincoln, NE, USA).

Mon. Not. R. Astron. Soc. (GB), vol.204, no.3, p.1193-202 (Sept. 1983).

Under the assumption that the resonant interactions among the fundamental, the first overtone and the third overtone radial modes cause the phenomenon of double periodicity of double-mode Cepheids, the secular variation of amplitudes is investigated theoretically. The magnitudes and period of the secular variation are determined in terms of mode-coupling constants. The possibility of alternate appearance of single and double periodicity in the vicinity of the resonance is suggested. (28 refs.)

116694 The discovery of 13.72-min oscillations in the cool magnetic Ap star HD 217522. D.W.Kurtz (Dept. of Astron., Univ. of Cape Town, Rondebosch, S Africa).*Mon. Not. R. Astron. Soc. (GB)*, vol.205, no.1, p.3-10 (Oct. 1983).Announces the discovery of oscillations with a period near 13.72 min in the cool magnetic Ap star HD 217522. The author presents 97 hr of high-speed photometric observations obtained on 18 nights spread over a time span of 74 days in 1982. The amplitude of the oscillations in HD 217522 is variable from night to night and also on a longer time-scale. A frequency analysis of the data identifies the principal frequency of oscillation to be $4.37435 \pm 0.00014 \text{ hr}^{-1}$. This star is the seventh member of the class of rapidly oscillating Ap stars. (9 refs.)**116695 Frequency analysis of the rapidly oscillating Ap star HR 1217 (HD 24712). D.W.Kurtz, J.Seeman (Dept. of Astron., Univ. of Cape Town, Rondebosch, S Africa).***Mon. Not. R. Astron. Soc. (GB)*, vol.205, no.1, p.11-22 (Oct. 1983).

High speed photometric observations of HR 1217 have been obtained during 119 hr on 18 nights in 1981. On five of these nights contemporaneous observations were obtained at the South African Astronomical Observatory and Cerro Tololo Inter-American Observatory which greatly reduce the severe daily aliasing problem in the frequency analysis of this star. A frequency analysis of three nights of data at the phase of pulsation amplitude maximum reveals six nearly uniformly spaced frequencies which the authors suggest are associated with six consecutive overtones of pulsation. From the frequency ratios the authors estimate the overtones of the pulsations. (12 refs.)

116696 Simultaneous infrared and optical photometry of cataclysmic variables. M.R.Sherrington, R.F.Jameson (Astron. Dept., Univ. of Leicester, Leicester, England).*Mon. Not. R. Astron. Soc. (GB)*, vol.205, no.1, p.265-73 (Oct. 1983).

Simultaneous infrared and optical photometry of 22 cataclysmic variables was obtained at the 1.5-m infrared flux collector at the Cabezon Observatory, Tenerife, in order to study the relative contributions of the disc and secondary across a wide wavelength range. The results allow one to estimate the spectral types of the secondaries and the distances of eight of the systems. (15 refs.)

116697 IUE observations of cataclysmic variables. P.L.Selvelli (Obs. Nacional de Brazil, Rio de Janeiro, Brazil), M.Hack.*Mem. Soc. Astron. Ital. (Italy)*, vol.54, no.2, p.467-91 (1983).

Illustrates the results of IUE observations of novae and old novae, recurrent novae, dwarf novae and nova-like variables. (71 refs.)

116698 New results on symbiotic stars [IUE observations]. G.B.Baratta (Osservatorio Astron., Roma, Italy), R.Viotti.*Mem. Soc. Astron. Ital. (Italy)*, vol.54, no.2, p.493-509 (1983).

A considerable amount of new results on symbiotic stars has been obtained during the first five years of operation of the IUE satellite. The authors review the UV properties of these stars, in particular the hot continuum, and the emission line intensities and profiles as a diagnostic of the physical processes which take place in their emitting regions. The various problems related to the symbiotic phenomenon such as stellar winds, accretion, Roche lobe

overflow, and the nature and IR variability of the cool star are also discussed. (52 refs.)

116699 Solar-like activity phenomena in stars. M.Rodono (Istituto di Astron., Univ. di Catania, Catania, Italy).*Mem. Soc. Astron. Ital. (Italy)*, vol.54, no.2, p.571-83 (1983).

The significant impact of the international ultraviolet explorer (IUE) in the study of stellar variability is presented. Specifically, the key role played by IUE observations in the stellar activity is emphasized. Variability phenomena, due to flares and surface inhomogeneities occurring in the atmospheres of cool stars and systems, are remarkably similar to the solar ones, but develop under rather different physical conditions. This provides a powerful tool in investigating the physical structure and evolution of stellar atmospheres. The potentially wide scientific benefit of the study of solar-like activity in stars has yet to be fully exploited. (30 refs.)

116700 Chemically peculiar stars [IUE observations]. F.Castelli (Osservatorio Astron. di Trieste, Trieste, Italy).*Mem. Soc. Astron. Ital. (Italy)*, vol.54, no.2, p.585-99 (1983).On a first, rough inspection, the IUE files appear to include numerous observations of all classes of chemically peculiar stars. However, a more careful inspection of the data and of the results so far obtained shows that this material is not sufficient to clarify the many unsolved problems regarding chemically peculiar stars. In order to derive reliable T_{eff} , $\log g$ values from the observed flux distribution of chemically peculiar stars, both corrections on IUE data of higher quality than those made at present at VILSPA and ad hoc models calculated with the proper abundance values for these stars are needed. Studies of variability of chemically peculiar stars carried out with IUE data are very scanty; they require a lot of observations at different epochs and accurate reduction procedures are essential. IUE observations on variability have confirmed previous results obtained from ground observations. New information on the line spectrum and the discovery of highly excited ions and multiple structures point up the need to make a thorough study of these problems. (45 refs.)**116701 Infrared photometry of HD 101065. I.S.Glass.***Mon. Notes Astron. Soc. South Afr. (S. Africa)*, vol.41, no.11-12, p.117-18 (Dec. 1982).

JHK photometry of Przybylski's star, HD 101065 is presented. The apparent colours are similar to those of FO dwarfs. (5 refs.)

116702 On the correlation between H α line intensity and SiO maser emission of the long-period variable χ cygni. T.E.Derviz.*Pis'ma v Astron. Zh. (USSR)*, vol.9, no.8, p.461-2 (1983). In Russian.English translation in: *Sov. Astron. Lett. (USA)*The results of 1975 and 1978-79 observations of the H α emission line in the spectrum of χ Cyg are given. Comparison of the data with the observations of the SiO maser line ($J=2-1$, $v=1$) by Wolff and Carlsson (1982) suggests a correlation between the intensities of the H α and SiO lines. (5 refs.)**116703 Frequency of novae in M33. A.S.Sharov.***Pis'ma v Astron. Zh. (USSR)*, vol.9, no.8, p.478-81 (1983). In Russian.English translation in: *Sov. Astron. Lett. (USA)*

It is shown that the frequency of novae in M33 is about one or possibly two per year. (19 refs.)

116704 Variation of the profile of H α line in the spectrum of DH Pegasi. G.A.Garbulov.*Pis'ma v Astron. Zh. (USSR)*, vol.9, no.8, p.482-5 (1983). In Russian.English translation in: *Sov. Astron. Lett. (USA)*Splitting of the H α line and emission in the line core were discovered in the spectrum of the RRc-type pulsating variable DH Peg. These phenomena are attributed to the existence of a shock wave in the atmosphere of this star. An anomalous shortward displacement of the H α line at light minimum is noted. (8 refs.)**116705 Optical variability of PU Vulpeculae (nova-like Kuwano's object 1979) in 1982. E.A.Kolotilov.***Pis'ma v Astron. Zh. (USSR)*, vol.9, no.8, p.486-9 (1983). In Russian.English translation in: *Sov. Astron. Lett. (USA)*Results of photoelectric UVB observations of PU Vul made in March 1982-January 1983 are presented. During this period the star remained in the state of maximum brightness ($V \approx 8.50^m$) which started in the autumn of 1981. The observed small variations of brightness did not reveal the presence of periodicity which was characteristic of the star in the 1979 maximum. A small increase of V magnitude and a significant decrease of $U-B$ and $B-V$ colours were recorded in October 1982. Spectral observations indicate that these changes resulted from an increase in the temperature of the star. (16 refs.)

116706 Neutrino emission from a hot, dense, plane-parallel atmosphere in hydrostatic equilibrium. III. The three-flavored atmosphere. P.J.Schinder, S.L.Shapiro (Center for Radiophys. & Space Res., Cornell Univ., Ithaca, NY, USA).

Astrophys. J. (USA), vol.273, no.1, pt.1, p.330-45 (1 Oct. 1983). For pt.II see *Astrophys. J. Suppl. Ser.*, vol.50, no.1, p.23-38 (1982). The authors continue their investigation of plane-parallel neutrino atmospheres in hydrostatic equilibrium by relaxing one of the assumptions made in paper I and allowing transport by all three flavors of neutrinos; electron, μ , and τ . As in paper I, it is assumed that the gas through which the neutrinos flow consists of free, nondegenerate, nonrelativistic nucleons, extreme relativistic positrons and electrons of arbitrary degeneracy, and photons. It is found that the three-flavored atmospheres are cooler and denser than the corresponding electron-flavored atmospheres. (6 refs.)

116707 Do filaments form at the time of supernova explosions? R.Bandiera (European Southern Obs., Garching bei Munchen, Germany), F.Pacini, M.Salvati.

Astron. & Astrophys. (Germany), vol.126, no.1, pt.2, p.7-9 (Sept. 1983). The authors consider the evidence that, at least in the case of the Crab Nebula filaments are formed much before a substantial interaction with the interstellar medium has taken place. It is suggested that in supernovae with a central pulsar the envelope is fragmented shortly after the explosion because of a Rayleigh-Taylor instability. The emission from a pulsar-powered bubble would then become visible, in agreement with the radio supernova phenomenon. (14 refs.)

116708 Softening effects in the equation of state and influence of general relativity on the outcome of stellar collapse. B.Kampfer (Zentralinst. fur Kernforschung, Acad. der Wissenschaften Rossendorf, Germany).

Astron. Nachr. (Germany), vol.304, no.4, p.167-70 (1983). The hydrodynamical evolution of a collapsing stellar core is followed to test the influence of general relativity and of softening effects in the equation of states. The general relativistic treatment of the collapse does not show any spectacular deviation from the Newtonian treatment. In particular there is no indication within the standard scenario for potential barrier penetration and continued collapse to a black hole. In the case of strong electron capture during the collapse the nuclear matter equation of state is of importance. A softening according to a phase transition below the bounce density is found to reduce the shock strength, but the shock is strong enough to cause the usual blowing-off. (25 refs.)

116709 BV photometry of the supernova 1982 in NGC 2268. R.Cadonau, C.Trefzger.

Inf. Bull. Variable Stars (Hungary), no.2382, p.1-3 (12 Aug. 1983). The authors report photographic BV photometry and a light curve for this supernova, covering the period 1982 February 27 to May 14. BV magnitudes are also given for a sequence of comparison stars surrounding the supernova. (3 refs.)

116710 Supernova in faint spiral galaxy. J.Maza.

I.A.U. Circ. (USA), no.3859, 1 pp. (14 Sept. 1983). Reports the discovery on 1983 July 12 of an 18th-magnitude supernova 4" east and 18" south of the nucleus of a faint spiral galaxy at $\alpha=0^h15.6^m$, $\delta=-37^\circ59'$ (equinox 1950.0), in Sculptor. Photographic magnitude estimates are reported for 1983 July 12 and September 6. (no refs.)

116711 Possible supernova in NGC 7418. J.Maza.

I.A.U. Circ. (USA), no.3867, 1 pp. (23 Sept. 1983). Reports the discovery on 1983 September 3 of a 15th-magnitude possible supernova $11''$ west and $52''$ south of the nucleus of the Sc-type galaxy NGC 7418 ($\alpha=22^h53.8^m$, $\delta=-37^\circ18'$, equinox 1950.0) in Grus. (no refs.)

116712 [IUE observations]. N.Panagia (Istituto di Radioastron., CNR, Bologna, Italy).

Mem. Soc. Astron. Ital. (Italy), vol.54, no.2, p.443-52 (1983). The results of IUE observations of supernovae are reviewed and discussed. A comparison with the spectral properties at other frequencies is also presented. (29 refs.)

116713 Similarity solutions for explosions in radiating stars with time-dependent energy and idealized magnetic field. B.G.Verma, J.P.Vishwakarma, V.Sharan (Dept. of Maths., Univ. of Gorakhpur, Gorakhpur, India).

Nuovo Cimento B (Italy), vol.76B, ser.2, no.1, p.62-72 (11 July 1983). A stellar model in which density in the undisturbed conducting-gas medium is assumed to obey a power law is considered. Similarity solutions for central explosion in radiating stars have been obtained under the assumption of isothermal-shock conditions. For the existence on self-similar character, the authors have assumed that both radiation pressure and energy are negligible. The results of numerical calculations for different models are illustrated through graphs. Moreover, a comparative study has been made between the results in ordinary gasdynamics and those obtained in magnetogasdynamics. (10 refs.)

116714 On the two possible progenitors of type I super nova. I.S.Shklovskii.

Pis'ma v Astron. Zh. (USSR), vol.9, no.8, p.474-7 (1983). In Russian. English translation in: *Sov. Astron. Lett. (USA)*. It is concluded from the observational data that there are two classes of stars outbursting as type I supernovae: relatively massive ($M\sim 3-6 M_\odot$) young ($T<10^9$ years) stars, and white dwarf components of low-mass binary systems with ages of $\sim 10^{10}$ years. The identical spectral and photometric characteristics of the two kinds of SN I imply the identity of the exploding nuclei of evolved stars. This is only possible if the mass of the nucleus of an evolved relatively massive star slightly exceeds the Chandrasekhar limit. (9 refs.)

97.60G Pulsars

116715 Infrared study of the Crab pulsar: the 'shoulder' pulse and the 3.45 micron pulse profile. J.Middleditch, C.Pennypacker, M.S.Burns.

Astrophys. J. (USA), vol.273, no.1, pt.1, p.261-6 (1 Oct. 1983). Infrared measurements of the Crab pulsar with the NASA IRTF 3.0 m telescope show that the spectrum of the main pulse turns downward for

wavelengths longer than $3 \mu\text{m}$. The 'shoulder' pulse discovered by Penny-packer (1981) is measured in the 0.9-2.4 μm region, but disappears at 3.5 μm . This pulse rises from 0 to 20% of the height of the main pulse within 1 to 2 ms after the main pulse peak and decays with a 4 to 5 ms time constant. Excess infrared flux also appears after the interpulse. The main peak itself may be narrower at 3.45 μm than in the optical to 2.2 μm band. (10 refs.)

116716 General track of pulsar evolution. O.H.Guseinov, I.M.Yusifov (Phys. Inst., Acad. of Sci., Baku, Azerbaidzhan, SSR).

Astrophys. & Space Sci. (Netherlands), vol.94, no.2, p.249-52 (Aug. 1983). It is shown that large nulling, small luminosity and a large value of polarization angle variation are, together, a good indication of a pulsar's old age. Selection effects connected with the discovery of pulsars are analyzed. The general track of pulsar evolution, along which the diagram of pulsar emission and the angle between the magnetic and rotation axes decrease, is found. (7 refs.)

116717 Radio pulsars: intensity, polarization, and rotation fluctuations. J.M.Cordes (NAIC & Cornell Univ., Ithaca, NY, USA).

AIP Conf. Proc. (USA), no.101, p.98-112 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). In this review of radio emission phenomena emphasis is given to observables that may constrain the particle content in pulsar magnetospheres. These include intensity variations within single pulses (time scales from 1 μs to tens of milliseconds); pulse-to-pulse variations (one period to years) which are both 'continuous' (drifts of subpulse features through pulse phase and other quasi-periodic and aperiodic variations) and 'discontinuous' (pulse nulling, average pulse shape changes, changes in drift rates); polarization transitions between orthogonal modes; relationship of drifting subpulses to nulling; constraints on emission altitudes; and rotation noise due to internal and magnetospheric torque fluctuations. (54 refs.)

116718 The effect of nulls on the drifting subpulses in PSR 0809+74. A.V.Filipenko, A.C.S.Readhead, M.S.Ewing (Dept. of Astron., California Inst. of Technol., Pasadena, CA, USA).

AIP Conf. Proc. (USA), no.101, p.113-17 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). The manner in which nulls affect the drifting subpulses of PSR 0809+74 has been investigated. Immediately following a null, subpulses reappear at approximately the longitudes expected for subpulses in the first nulled pulse, as previously reported. The higher quality of the new data, however, has made it possible to demonstrate that the 'phase memory' is not perfect; there is a small systematic phase shift in the direction of normal drift. This result is probably inconsistent with the hypothesis that during a null, electron-positron pair production in the polar gap is absent and local 'hot spots' identify the regions over which discharges last occurred. On the other hand, if nulling is the manifestation of temporally steady discharge within discrete regions in the polar gap, a slight phase shift is expected, but the observations do not confirm the prediction that its magnitude should be proportional to null length. In addition, this scenario has difficulty explaining the abnormally slow subpulse drift following long nulls and the absence of radio radiation during nulls associated with large phase shifts. (10 refs.)

116719 Discovery of a millisecond pulsar. S.R.Kulkarni (Dept. of Astron., Univ. of California, Berkeley, CA, USA).

AIP Conf. Proc. (USA), no.101, p.118-28 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). The authors have discovered a pulsar with a period of about 1.556 milliseconds. The discovery of the pulsar has cleared up the mystery surrounding the enigmatic source, 4C 21.53. An exposition of the history of the search process, results from the timing program, the pulse waveform, the distance and the origin of the pulsar are discussed. (33 refs.)

116720 High energy observations of pulsars. G.Kanbach (Max-Planck-Inst. fur Phys. und Astrophys., Inst. fur Extraterrestrische Phys., Garching, Germany).

AIP Conf. Proc. (USA), no.101, p.129-40 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). High energy emissions have so far only been definitely observed from two pulsars: Crab (PSR 0531+21) and Vela (PSR 0833-45). In these sources, however, the luminosity at gamma-ray energies surpasses the radio luminosity by approximately 10^6 which demonstrates the basic importance of this emission for the pulsar radiation budget. Deep observations performed with the COS-B instrument in the 0.1 to 1 GeV gamma-ray energy range have revealed several previously unknown details. The Vela pulsar gamma-ray spectrum changes with light-curve phase such that the second peak of emission exhibits a harder spectrum than the first peak. In the Crab pulsar a secular change of the relative strength of the two peaks of emission has been detected with high probability in the course of observations spread over 5 years. It is remarkable that concurrent observations of the X-ray (2-12 keV) pulse profile of Crab do not show this variation. The search for gamma-ray emission from further radio pulsars has up to now been inconclusive. From the estimated flux limits it is however possible to derive limits to the contribution of pulsars to the high energy luminosity of the Galaxy. It is expected that the next generation of telescopes on board the Gamma Ray Observatory will discern several more gamma-ray pulsars. (33 refs.)

116721 Properties of the Crab pulsar inferred from the phase-averaged spectrum. F.K.Knight (Naval Res. Lab., E.O. Hulbert Center for Space Res., Washington, DC, USA).

AIP Conf. Proc. (USA), no.101, p.141-6 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). The Crab pulsar emission can be described adequately by using the phase-averaged spectrum, which is continuous from the near infrared to the γ -ray range. Using most of the published observations over this energy range, a power law fit to the emission requires at least two power laws with a break of 0.74 ± 0.02 in spectral index at 39 ± 3 keV. If this emission is synchrotron radiation, then the emitting electron spectrum is continuous over about five decades and has a break of ~ 1.5 in spectral index at $\gamma = E/mc^2 = 1900 \pm 200$ (10^6 gauss/B) $^{1/2}$. With $B_\perp = 10^6$ gauss, the electrons emitting in the infrared have $\gamma = 10$. Because a fit with three power laws has approximately the same χ^2 , a gradual turnover is consistent with the data, as one would expect from synchrotron emission. (20 refs.)

116722 COS-B upper limits on gamma-ray emission from radio pulsars. R.Buccheri (IFCAI-CNR, Palermo, Italy).

AIP Conf. Proc. (USA), no.101, p.147-51 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). Reports on the results of a search for pulsed gamma-ray emission from old radio pulsars in the COS-B data in the energy range 50 MeV to 2 GeV. The analysis has been done by using either pulsar parameters obtained in simultaneous radio and gamma-ray observations or parameters which could be reliably derived by interpolation from radio observations spanning the COS-B observations. (16 refs.)

116723 Energy spectra of very high energy γ -rays from the Crab and Vela pulsars. S.K.Gupta, P.V.Ramana Murthy, B.V.Sreekantan, S.C.Tonwar, P.R.Viswanath (Tata Inst. of Fundamental Res., Bombay, India). *AIP Conf. Proc. (USA)*, no.101, p.157-62 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983).

Using the atmospheric Cerenkov radiation technique the authors have observed pulsed emission of very high energy, $E_{\gamma} \geq 10^{12}$ eV, γ -rays from the Crab and Vela pulsars. Ooty Cerenkov telescope composed of 18 reflectors has been used in the 'distributed mode' for these observations during early 1981. In this mode the arrival direction of individual showers has been measured to an accuracy $\sim 0.3^\circ$ which has made possible a more reliable estimation of the γ -ray energy thresholds in the direction of these two pulsars. Observations on the Crab pulsar show evidence of sporadic emission with significant variability of the pulsed flux over periods as short as tens of minutes. The measured pulsed flux of $2.2 \pm 0.5 \times 10^{-11}$ ph. $\text{cm}^{-2} \text{s}^{-1}$ at energies $> 9 \times 10^{11}$ eV during the active phase agrees well with the extrapolation of the Cos-B spectra $2.9 \times 10^{-11} \text{ GeV}^{-1.17} \text{ ph. cm}^{-2} \text{s}^{-1}$, both in amplitude and spectral slope. The time averaged flux is however considerably smaller. On the other hand the time averaged pulsed flux of $1.0 \pm 0.4 \times 10^{-11} \text{ ph. cm}^{-2} \text{s}^{-1}$ at energies $> 2.3 \times 10^{12}$ eV for the Vela pulsar is about two orders of magnitude smaller than the extrapolated value from the Cos-B spectrum, $1.8 \times 10^{-7} \text{ E}_{\text{GeV}}^{-1.11} \text{ ph. cm}^{-2} \text{s}^{-1}$. Also the energy spectrum for the Vela pulsar at energies $\sim 2.5 \times 10^{12}$ eV with a slope of -2.2 ± 0.2 is much steeper than at lower energies. These observations suggest significant differences between γ -ray emission from these two pulsars. (9 refs.)

116724 Electron positron pairs in radio pulsars. J.Arons (Astron. Dept., Univ. of California, Berkeley, CA, USA). *AIP Conf. Proc. (USA)*, no.101, p.163-93 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). Outlines the role of electron-positron pairs in some theoretical models of the magnetospheres of radio pulsars. While there is little direct evidence for the presence of pairs in the form of an observed recombination line, their formation leads to many promising features in theories of the electrodynamics and plasma physics of these objects' magnetospheric structure and for the interpretation of the observed photon emissions, both from pulsars themselves and from the surrounding interstellar medium. (128 refs.)

116725 Pair production near threshold in pulsar magnetic fields. A.K.Harding (NASA/Goddard Space Flight Center, Greenbelt, MD, USA), J.K.Daugherty. *AIP Conf. Proc. (USA)*, no.101, p.194-8 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). In pulsar polar cap models, curvature radiation γ -rays produce e^+e^- pairs in the strong magnetic fields near the surface of the neutron star. While these γ -rays have energies $E_{\gamma} \gg mc^2$, they also propagate at very small angles to the field, such that the threshold condition, $E_{\gamma} > 2 mc^2/\sin\theta$ is just barely satisfied when they pair produce. Threshold effects on the pair production attenuation coefficient, which are due to the discreteness of the e^+e^- Landau states, must therefore be considered when computing the mean free paths of curvature radiation photons in pulsar magnetic fields. These effects, which are not incorporated in the asymptotic expression for the attenuation coefficient, have some interesting consequences for pulsar models. Since pair production is suppressed near threshold, the photon mean free paths are longer than previously thought. In magnetic fields $\geq 6 \times 10^{12}$ G, the pairs tend to be produced in the ground state Landau level and will not synchrotron radiate. Since synchrotron radiation is an essential ingredient in the electromagnetic cascades which produce low energy pairs above the acceleration region, pulsars with very high magnetic fields may not produce many pairs. (8 refs.)

116726 Polarization mode coupling in radio pulsars. D.R.Stinebring (Nat. Radio Astron. Obs., Charlottesville, VA, USA), J.M.Cordes. *AIP Conf. Proc. (USA)*, no.101, p.199-203 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). Mode coupling (polarization limiting) has been proposed as an explanation for the orthogonally polarized radiation (OPR) observed from pulsars. Using a simplified magnetospheric model the authors show that it cannot account for the presence of circular polarization in the OPR phenomenon. Mode coupling occurs much closer to the star than the point at which the normal modes of the plasma become significantly elliptically polarized. (11 refs.)

116727 Pulsar gamma-ray lines from quarkonium systems. G.Kanbach (Inst. fur Extraterrestrische Phys., Max-Planck-Inst. fur Phys. und Astrophys., Garching, Germany), R.Schlickeiser. *AIP Conf. Proc. (USA)*, no.101, p.204-10 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). Excited states of heavy quark-antiquark systems (quarkonium) might be created by colliding e^-e^+ beams in the magnetospheres of gamma-ray pulsars. The authors investigate the hypothesis that radiative transitions to the ground state, in particular of charmonium, may lead to observable fluxes of gamma-ray lines in the 120-450 MeV range and compare the estimates to the continuum flux expected from curvature radiation. If the particle density in the source volumes is high enough the lines could be resolvable with the next generation of high-energy gamma-ray telescopes (Gamma Ray Observatory). (20 refs.)

116728 The pulsar oblique rotator: numerical solution of an illustrative problem. V.G.Endean (Dept. of Engng., Univ. of Durham, Durham, England).

Mon. Not. R. Astron. Soc. (GB), vol.204, no.3, p.1067-79 (Sept. 1983). A series solution of the force-free pulsar magnetosphere equations inside the velocity-of-light cylinder and excluding conduction current along the field lines, is developed. Computer-generated field line plots for the fully oblique rotator are presented. These illustrate the topology of the closed field line, open field line and vacuum regions which contains some unexpected features. Implications for pulse emission theories are briefly discussed. (22 refs.)

116729 Pulsar electrodynamics: cylindrical model and radio and gamma-ray radiation. A.A.da Costa (Dept. of Astron., Univ. of Manchester, Manchester, England). *Mon. Not. R. Astron. Soc. (GB)*, vol.204, no.3, p.1125-44 (Sept. 1983). Magnetospheres of pulsars contain charged particles. The motion of electrons and positrons in a simplified cylindrical model is discussed for pulsars with three different periods. It will be shown that this motion near the region $E=cB$ provides not only a mechanism for the production of incoherent radiation at gamma-ray frequencies but also the basis to explain the radio emission. A single region to explain the radiation in both frequency domains is supported by observations of the Crab Pulsar. (27 refs.)

116730 The evolution of radio pulsars. B.N.Candy, D.G.Blair (Dept. of Phys., Univ. of Western Australia, Nedlands, Australia). *Mon. Not. R. Astron. Soc. (GB)*, vol.205, no.1, p.281-4 (Oct. 1983). Considers a model for the evolution of radio pulsars which incorporates decay of the emission-cone angle and alignment of the emission cone with the spin axis. This model predicts that decay of the emission-cone angle dominates for the youngest pulsars, producing a decrease in the observed pulsewidth. Align-

ment of the emission cone dominates for the oldest pulsars, producing a rapid increase in the observed pulsewidth. The authors show that radio pulsars do indeed have a dependence of pulsewidth on characteristic age which is in good agreement with this model. The results suggest that the emission cone aligns on a time-scale $\approx 10^7$ yr. (8 refs.)

116731 Gravitational radiation reaction in the binary pulsar and the quadrupole-formula controversy. T.Damour (Groupe d'Astrophys. Relativiste, Obs. de Paris-Meudon, Meudon, France). *Phys. Rev. Lett. (USA)*, vol.51, no.12, p.1019-21 (19 Sept. 1983). The evolution of the orbit of a binary pulsar under the action of gravitational radiation reaction is calculated. No approximation is made of weak gravity inside the individual stars; the details of the orbital motion are given directly (to order c^{-5} and G^3). The calculation reveals no acceleration of the center of mass of the system, and a secular decrease of the time of return to periastron. The quantitative results agree both with the well-known 'quadrupole formula' and with observations. (12 refs.)

116732 Phase transitions in dense stars. J.Diaz Alonso (Groupe d'Astrophys. Relativiste, Obs. de Paris, Meudon, France).

Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.287-301 (Sept. 1983). In order to analyze the effects of first-order phase transitions of dense matter on the structure and collapse of dense stars, a simple analytically-solvable model is proposed. The model shows the existence of two kinds of stable spherically-symmetric equilibrium configurations: the one-phase configurations with a central pressure which is lower than the phase-transition pressure, and the two-phase (mixed) configurations with a dense-phase core and a diluted-phase envelope. The stability of the static configurations is analyzed. Some (eventually observable) parameters characterizing the collapse such as the characteristic time of collapse, the energy release and the small-oscillation frequencies near the final equilibrium configuration are estimated. (22 refs.)

116733 Resonant free-free emission from electrons in magnetic polar regions of accreting neutron stars. R.Lieu (Dept. of Phys., Univ. of Calgary, Calgary, Alberta, Canada).

AIP Conf. Proc. (USA), no.101, p.438-43 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). Near the magnetic polar cap of an accreting neutron star, emission of photons at cyclotron resonance is accompanied with the transition of electrons between Landau levels as a result of free-free collisions with ions. In quantum electrodynamics, the resonance condition is satisfied whenever the energy denominators of the two possible time orderings in electron free-free emission become singular. In the absence of motion along the magnetic field, both singularities occur near the cyclotron frequency. If there is a definite longitudinal momentum due to bulk motion of the accreting plasma, the singularities for forward and backward scattering can occur at different frequencies. Moreover, the frequencies are dependent on the pitch angle of photon emission. For a given line-of-sight direction, this is a line splitting effect, the observability of which depends on the degree of Comptonization and the plasma temperature. (2 refs.)

97.60L Black holes

116734 Black hole electromagnetic fields and negative energy states for charged particles. A.R.Prasanna (Max-Planck-Inst. fur Astrophys., Garching, München, Germany).

Astron. & Astrophys. (Germany), vol.126, no.1, pt.2, p.111-14 (Sept. 1983). Compares two kinds of electromagnetic fields of a black hole space-time between (i) the field due to a Kerr-Newmann black hole and that of (ii) the field due to current rings outside the event horizon of an uncharged black hole. Further, the author considers the effective potentials for charged particles in both fields and finds that a potential well with stable negative energy states occurs in the latter case, whereas in the former the negative energy states occur only for capture orbits. (6 refs.)

116735 Electron-positron processes and spectral evolution in black hole accretion disk dynamo models for AGN sources of the cosmic X-ray and gamma ray backgrounds. D.Leiter (Lab. for High Energy Astrophys., NASA Goddard Space Flight Center, Greenbelt, MD, USA).

AIP Conf. Proc. (USA), no.101, p.337-42 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). The author discusses a black hole accretion disk dynamo model for active galactic nuclei (AGN) sources of the cosmic X-ray and gamma ray backgrounds which involves both thermal and nonthermal accretion disk processes around $\geq 10^8 M_\odot$ Kerr black holes. Before black hole spin-up to the Kerr metric state, the large value of the compactness parameter $> 10^{30}$ erg/cm-sec associated with the $L/L_{\text{Edd}} \leq 1$ luminosity ratio in precursor active galaxies (PAG) suppresses all nonthermal emission mechanisms. In this PAG state the resulting emission is predominantly thermal and is due to comptonization of soft photons by an electron-positron plasma, generated within the hot accretion disk region by $\gamma + \gamma \rightarrow e^+e^-$ processes in the transrelativistic regime. While the underlying plasma in the PAG accretion disk hot inner region may be optically thin initially, the overall effect of the copious $\gamma + \gamma \rightarrow e^+e^-$ generated electron-positron plasma is to push the overall optical depth to $\tau \geq 1$. (16 refs.)

116736 High energy spectrum of spherically accreting black holes. P.Meszaros (Harvard-Smithsonian Center for Astrophys., Cambridge, MA, USA), J.P.Ostriker.
AIP Conf. Proc. (USA), no.101, p.348-52 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983).
Spherically accreting black holes may sustain strong collisionless shocks, downstream of which the fluid approximation is not valid. The proton-electron Coulomb exchange provides for the downstream matter diffusion into the hole. Energy conversion efficiencies upward of 10-30% are obtained, with most of the luminosity in hard X-rays and γ -rays. The authors discuss the whole spectrum and its application for radio-quiet QSOs and galactic X- and γ -ray sources. (11 refs.)

116737 Hot accretion disks and γ -ray cosmic sources. M.Kafatos (George Mason Univ., Fairfax, VA, USA), J.A.Eilek.
AIP Conf. Proc. (USA), no.101, p.354-8 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983).
Hot accretion disks around rotating black holes produce copious amounts of X-rays, γ -rays and e^+e^- pairs. These complexized models with an energy flux spectral index of the X-ray spectrum ~ 1 are optically thick to $\gamma\gamma$ pair production. The resultant high energy spectrum steepens above a few MeV. The few γ -ray spectra of active galactic nuclei that are available show this steepening as well as the γ -ray diffuse background. The same processes that take place in a hot accretion disk around a supermassive black hole at the center of an active nucleus also operate in a hot accretion disk around a stellar mass black hole. The authors examine the implications for the two galactic sources Cygnus X-1 and particularly the positron source at the galactic nucleus. (19 refs.)

116738 Rotating black hole in asymptotic de Sitter space: perturbation of the space-time with spin fields. U.Khanal (Dept. of Phys., Tribhuvan Univ., Kirtipur, Nepal).
Phys. Rev. D (USA), vol.28, no.6, p.1291-7 (15 Sept. 1983).
The Newman-Penrose formalism is used to work with gravitational, electromagnetic, and Dirac field perturbations of the Kerr-de Sitter space. It is shown that the resulting equations are separable, and the radial parts (for the massless fields) combine into a master equation resembling that of Teukolsky. This master equation includes the Teukolsky equation and the equation arising from the de Sitter-Schwarzschild Universe, and can be reduced to these cases under appropriate limiting conditions. Finally, the radial parts of the electromagnetic and neutrino fields are transformed to the form of the one-dimensional barrier-penetration equation. (12 refs.)

116739 Black holes. W.Israel (Dept. of Appl. Math., Univ. of Cape Town, Rondebosch, South Africa).
Sci. Prog. (GB), vol.68, no.271, p.333-63 (Autumn 1983).
A review of black holes is presented. The author follows roughly the historical evolution of the theories, beginning with the 1930s work by Chandrasekhar, Landau and Oppenheimer on the inevitability of collapse for sufficiently heavy cold stars, and culminating with an account of the unsuspected connections between thermodynamics, quantum theory and gravitation revealed by Hawking's celebrated discovery that black holes evaporate thermally by a quantum tunnelling process. 97.80 BINARY AND MULTIPLE STARS
(inc. extrasolar planetary systems)

116740 Radio emission from AM Herculis: the quiescent component and an outburst. G.A.Dulk, T.S.Bastian (Dept. of Astro-Geophys., Univ. of Colorado, Boulder, CO, USA), G.Chanmugam.
Astrophys. J. (USA), vol.273, no.1, pt.1, p.249-54 (1 Oct. 1983).
The Very Large Array was used to search for radio emission from AM Herculis type binaries. The detection of 4.9 GHz radio emission from AM Her was verified. Upper limits of about 0.2 mJy (3 σ) for the 4.9 GHz radiation from VV Pup, EF Eri, PG 1550+191, CW 1103+254, and AN UMa were also obtained. A remarkable outburst of radiation from AM Her at 4.9 GHz was also detected. It is suggested that electrons with energies of ~ 500 keV trapped in the magnetosphere of the white dwarf can account for the quiescent emission of AM Her. The outburst is probably due to an electron-cyclotron maser which operates near the surface of the red-dwarf companion. (28 refs.)

116741 The F-type eclipsing binaries ZZ Bootis, CW Eridani, and BK Pegasi. D.M.Popper (Dept. of Astron., Univ. of California, Los Angeles, CA, USA).
Astron. J. (USA), vol.88, no.8, p.1242-56 (Aug. 1983).
Spectrographic orbits of these three double-lined binaries are determined from spectrograms obtained at the Lick Observatory. The photometric observations of ZZ Boo by McNamara et al. and of CW Eri by Chen are reanalyzed, and revised properties of the components are derived. The properties of the most definitive F-type stars are shown in the mass-radius, mass-luminosity, and color-magnitude planes, along with zero-age relations. The components of the three systems analyzed are among the more evolved binaries having both components in the state of core hydrogen burning. (27 refs.)

116742 SS Bootis: a totally eclipsing binary of the RS CVn type. J.W.Wilson (Dyer Obs., Vanderbilt Univ., Nashville, TN, USA), S.D.Hall, G.W.Henry, C.A.Vaucher, J.L.Africano.
Astron. J. (USA), vol.88, no.8, p.1257-63 (Aug. 1983).
Six years of photoelectric photometry, from 1976 to 1981, are presented. The distortion wave has varied in amplitude from 0.05^m to 0.20^m, with no apparent pattern; one change in 1980, from 0.05^m to 0.10^m, occurred within three months. In 1980 to 1981 the wave migration, which a few years before had been towards increasing orbital phase and quite rapid, appears to have stopped. Between 1976 and 1981 the mean brightness outside eclipse has increased by 0.075^m in V. From the rectified light curve a new time of midprimary eclipse is found to be JD(hel.) = 2444332.0335 \pm 0.0005^d. Solutions of the primary eclipse data, rectified for starspots as well as for ellipticity and reflection, yield $L_1(V) = 0.4163 \pm 0.0006$, $L_1(B) = 0.5000 \pm 0.0009$, $r_1 = 0.064 \pm 0.002$, $r_c = 0.160 \pm 0.001$, and $i = 88.8^\circ \pm 0.3^\circ$. Using values of $M \sin^2 i = 1.00 M_\odot$ for each star, the authors $M_h = 1.00 M_\odot$, $M_c = 1.00 M_\odot$, $R_h = 1.31 R_\odot$. (22 refs.)

116743 The effect of low-velocity, low-mass intruders (collisionless gas) on the dynamical evolution of a binary system. J.G.Hills (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).
Astron. J. (USA), vol.88, no.8, p.1269-83 (Aug. 1983).
More than 20000 computer-simulated encounters between low-mass (compared to the binary components) intruders and binary systems are made. These calculations are made in the important (and difficult) limit where the intruder velocity is small compared to the orbital velocity of the binary. The dependence of the encounters on orbital eccentricity, on the mass ratios of the binary components, and on the impact parameter is found. These encounters increase the binding energy of the binary. At zero impact parameter, the average increase in the binding energy is proportional to the square of the binary orbital eccentricity. However, the increase in the binding energy decreases much faster with increasing impact parameter as the eccentricity increases. The net result is that the total cross section for increasing the binding energy of a binary through encounters with low-mass intruders is independent of the orbital eccentricity of the binary. The average increase in the binding energy per encounter is directly proportional to the mass of the intruder. (14 refs.)

116744 The multiple system β Sco and the age of the Upper Scorpius complex. M.A.Giannuzzi (Osservatorio Astron. di Roma, Roma, Italy).
Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.302-7 (Sept. 1983).
Physical quantities for the massive components of β Sco A, the brightest member of the multiple system β Sco, are calculated on the basis of the spectroscopic orbit elements and of the photometric measurements carried out when the system underwent occultations. The age of the system is determined by using Stother's (1972) evolutionary models. The stars of the Upper Scorpius complex (to which β Sco belongs), that are earlier than ($B - V_0 = -0.20$, agree with the same value of the age (log t ranging from 6.7 and 6.8, t in years), but later stars appear to be older. An analysis of the various data used supports the value of 170 pc as the mean distance to Upper Scorpius. (34 refs.)

116745 Mass transfer in close binary systems: original and remnant masses. G.Giuricin, F.Mardirossian, M.Mezzetti (Osservatorio Astron., Trieste, Italy).
Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.388-90 (Sept. 1983).
The comparison of the masses of numerous Algol binaries (and a few Wolf-Rayet systems) with some new relevant theoretical predictions, in which the influence of overshooting in stellar interiors is considered, appears to reconfirm that usual mass transfer computations cannot satisfactorily account for the observed masses of the post-mass exchange (case B) remnants. (15 refs.)

116746 The possible long-period eclipsing binary BM Eri. P.Ahlin, A.Sundman (Stockholms Obs., Saltsjobaden, Sweden).
Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.391-3 (Sept. 1983).
BM Eri, an M giant which had a drop in brightness of about 0.8 in photographic magnitude in 1944 and is suspected to be a long period eclipsing binary, has been observed for radial velocity (-1.4 km s⁻¹) and spectral type and luminosity (M6 III, $M_V = -2.5$). The absolute magnitude is determined from the Wilson-Bappu effect. No secondary spectrum is observed. The star cannot be confirmed to be an eclipsing binary, but possible periods are discussed. Because of the long period of the object the observations are described in more detail than would normally be necessary. (21 refs.)

116747 Ultra high energy gamma rays from Cygnus X-3. J.C.Dowthwaite, A.I.Gibson, A.B.Harrison, I.W.Kirkman, A.P.Lotts, J.H.Macrae, K.J.Orford, K.E.Turver, M.Walmsley (Dept. of Phys., Univ. of Durham, Durham, England).
Astron. & Astrophys. (Germany), vol.126, no.1, pt.2, p.1-6 (Sept. 1983).
Results of two years of observation of Cygnus X-3 using the Dugway gamma ray telescopes are presented. The suggested variability of ultra high energy (UHE) gamma ray intensity on a time scale of 4.8 h is investigated. Evidence for a 4.8 h modulation was obtained from drift scan observations indicating that UHE gamma rays of energy > 1300 GeV are emitted with an average peak strength of about 2×10^{-10} cm⁻² s⁻¹, with the maximum in gamma rays coinciding with the X-ray maximum. A 34d variation in the strength of the 4.8 h maximum, as already noted in X-rays, has been observed in UHE gamma rays. (25 refs.)

116748 Photometric observations. Is HZ Herculis getting darker? H.-C.Thomas (Max-Planck-Inst. fur Phys. & Astrophys., Garching, Munchen, Germany), J.Africano, A.J.Delgado, H.U.Schmidt.
Astron. & Astrophys. (Germany), vol.126, no.1, pt.2, p.45-50 (Sept. 1983).
New photometric measurements of HZ Her in the B-filter are presented and analyzed, together with some of the older observations, for their dependence on orbital phase and phase in the 35^d-cycle. It is shown that conclusions can be drawn for turn-on times, light curve asymmetries, and brightness variations of this source. (17 refs.)

116749 Photometric observations and elements of the eclipsing binary TT Herculis. K.K.Kwee, A.M.van Genderen (Leiden Obs., Leiden, Netherlands).
Astron. & Astrophys. (Germany), vol.126, no.1, pt.2, p.94-101 (Sept. 1983).
Photoelectric observations in yellow and blue light (UBV system) made in 1962 and 1963 of the β Lyrae type eclipsing binary TT Her are presented and discussed. The period appears to be variable. Photometric and absolute dimensions are determined and discussed. (24 refs.)

116750 The BUSS spectrum of β Lyrae. M.Hack, J.Sahade (Astron. Obs., Trieste, Italy), C.de Jager, Y.Kondo.
Astron. & Astrophys. (Germany), vol.126, no.1, pt.2, p.115-20 (Sept. 1983).
The spectrum of β Lyrae taken with the Balloon-borne ultraviolet Stellar Spectrograph experiment in May, 1976, at phase 0.61 p, has disclosed the presence of N II emission and has provided evidence for about the same location, in the outer envelope of the system, of the layers responsible for the resonance Mg II doublet emissions and for the 'narrow' H α emission. Three sets of absorption lines, P Cygni profiles of Fe III and broad Beals type III emissions of Mg II, are also present. (20 refs.)

116751 The light curve changes of VW Cephei. I.Kotarska, Z.Glownia (Inst. of Phys., Silesian Univ., Katowice, Poland).
Astron. Nachr. (Germany), vol.304, no.4, p.181-8 (1983).
A long series of photoelectric observations of the W UMa type eclipsing binary VW Cephei collected since 1952 is discussed. The so-called Kwee effect is examined—regarding the heights of maxima and the depths of minima—in order to detect periodicities in the light curve changes. The frequency analysis reveals periodicities only in small homogeneous observational domains, but the power spectrum (in the sense of a discrete Fourier transform) of all the observations is very complicated for exact interpretation. The light curve changes are much larger than the possible errors, but they have lost their periodic character in the whole of the time interval under discussion. (27 refs.)

116752 A study of ultraviolet spectra of ζ Aur/VV Cep systems. III. Atlas of theoretical curves of growth. K.Hempe (Univ. Hamburg, Hamburg, Germany). *Astron. & Astrophys. Suppl. Ser. (France)*, vol.53, no.3, p.339-46 (Sept. 1983).
An atlas of theoretical curves of growth calculated for pure absorption lines formed in the winds of the cool component of ζ Aur/VV Cep systems is presented. The envelope structure is characterized by the wind velocity which has been assumed to be constant, the dimensions of the system and the atomic parameters of the line under study. The phase dependence of equivalent widths and the effect of different velocity laws are discussed. Observed UV absorption lines such as those of Fe II multiplet 9 can be used to determine wind velocities, stochastic velocities and mass loss rates from the calculated curves of growth. (6 refs.)

116753 Infrared photometry of the RS CVn binaries. III. *JHK* light curves of UV Psc. E.Antonopoulou (Royal Obs. of Edinburgh, Edinburgh, Scotland). *Astron. & Astrophys. Suppl. Ser. (France)*, vol.53, no.3, p.347-9 (Sept. 1983).
For pt.II see *ibid.*, vol.52, no.3, p.381-2 (1983). *JHK* light curves of the RS CVn binary UV Psc are presented. A detailed analysis of the light curves is published separately. (3 refs.)

116754 A photometric study of the eclipsing binary V478 Cygni. C.Sezer (Ege Univ. Obs., Izmir, Turkey), N.Gudur, O.Gulmen, H.Sengonca. *Astron. & Astrophys. Suppl. Ser. (France)*, vol.53, no.3, p.363-72 (Sept. 1983).
Nearly 1100 new photoelectric observations of the photometrically neglected eclipsing binary V478 Cygni in blue and yellow colours are presented. The improved light elements are calculated from the new photoelectric minima. The light curves were analyzed using Wood's (1972) model simulation program WINK. The system was found to be a detached binary. (14 refs.)

116755 Micrometric measurements of binary stars (first list). M.Scardia (Osservatorio Astron. di Brera, Merate, Italy). *Astron. & Astrophys. Suppl. Ser. (France)*, vol.53, no.3, p.433-40 (Sept. 1983). In French.
The results of 167 micrometric measurements of 48 binaries, obtained at Brera-Merate Observatory with a 23 cm refractor during the period September 1982-February 1983, are given. 85 measurements of 30 systems that were found in the archives of 'Urania' of the association of amateur astronomers of Genoa are also given. These measurements were made during the period 1935-1937 with the Salmoiraghi, refractor of 156 mm diameter by the Genoese amateur Ugo Mantelli. (8 refs.)

116756 Photoelectric minima of eclipsing binaries. E.Pohl (Nurnberg Obs., Nurnberg, Germany), E.Hamzaoglu, N.Gudur, C.Ibanoglu. *Inf. Bull. Variable Stars (Hungary)*, no.2385, p.1-6 (18 Aug. 1983).
The authors report photoelectric times of minima, mostly obtained during 1982, for 30 eclipsing binary stars. (no refs.)

116757 Eclipse timings of 31 Cygni. P.C.Schmidtke (Kitt Peak Nat. Obs., Tucson, AZ, USA), R.E.Fried, J.L.Hopkins, R.E.Stencel. *Inf. Bull. Variable Stars (Hungary)*, no.2392, p.1-2 (26 Aug. 1983).
The authors report photoelectric UVB observations of the total eclipse of 31 Cygni during 1982. The time of mid-eclipse is given, together with the times t_{50} when 50% of the light of the secondary is transmitted at ingress and egress. The mean duration of the eclipse is found to be 64.03 days in U and 62.94 days in B. The mean orbital period, from 1962 to 1982, is 3784.34 days. (3 refs.)

116758 Spectroscopic observations of the cool eclipsing X-ray binary HD 155638. D.M.Popper (Dept. of Astron., Univ. of California, Los Angeles, CA, USA). *Inf. Bull. Variable Stars (Hungary)*, no.2396, p.1-4 (5 Sept. 1983).
The author describes spectroscopic observations of HD 155638 (G8 IV+F?). The velocity amplitudes are found to be 46 km/s for the cooler star and about 50 km/s for the hotter star. The masses and radii are $1.3 M_{\odot}$ and $1.2 M_{\odot}$, and $8.2 R_{\odot}$ and $2.5 R_{\odot}$. These results suggest that HD 155638 may be considered as an RS Canum Venaticorum system intermediated between typical double-lined systems (e.g. RS CVn) and single-lined systems such as λ And. Some discrepancies between these results and the photometry of Bloomer et al. (1983) are discussed. (3 refs.)

116759 A 0538-66. S.Tjemkes. *I.A.U. Circ. (USA)*; no.3870, 1 pp. (23 Sept. 1983).
Reports photometric observations of the LMC recurrent transient X-ray source A 0538-66 during the optical outburst of August to September 1983. It is found that the difference in brightness between on and off states exceeds 1 magnitude, and that on 1983 September 12, during the decay of the outburst, the object was of magnitude 14.5. (2 refs.)

116760 HZ Her: the nature and origin of the emission lines. I.D.Howarth, B.Wilson (Dept. of Phys. & Astron., Univ. Coll. London, London, England). *Mon. Not. R. Astron. Soc. (GB)*, vol.204, no.3, p.1091-104 (Sept. 1983).
High- and low-dispersion IUE spectroscopy of the HZ Her/Her X-1 system is used to investigate the line spectrum. Velocity arguments discredit the classical sites of emission (primary's X-ray heated photosphere, accretion stream and disc) but support an origin in discrete blobs of material orbiting at the rim of the accretion disc. Analysis of the line intensity data suggests $T_e \approx 10^4$ K, $n_e \approx 10^{13.3}$ cm $^{-3}$ in the blobs. It is argued that these blobs can be identified with the material responsible for X-ray dips. (34 refs.)

116761 A model for A 0538-66: the fast flaring pulsar. L.Maraschi, R.Traversini, A.Treves (Dipartimento di Fisica, Univ. di Milano, Milano, Italy). *Mon. Not. R. Astron. Soc. (GB)*, vol.204, no.3, p.1179-84 (Sept. 1983).
A model of A 0538-66, where the X-ray and optical outbursts are associated with impulsive accretion on to a neutron star, is explored. The critical density for the onset of accretion on to a fast pulsar is discussed. The region emitting optical outbursts is substantially larger than the accretion disc and its mass greatly exceeds that of an ordinary Be envelope. The optical outbursts may be due to X-ray reprocessing in the primary's envelope and/or to cooling of an expanding shell accelerated by the X-ray burst. (22 refs.)

116762 Analytic treatment of polarization by arbitrary scattering mechanisms in circumstellar envelopes. II. Binary stars. J.F.L.Simmons (Dept. of Astron., Univ. of Glasgow, Glasgow, Scotland). *Mon. Not. R. Astron. Soc. (GB)*, vol.205, no.1, p.153-70 (Oct. 1983).
For pt.I see *ibid.*, vol.200, no.1, p.91-113 (1982). Extends the treatment given in Paper I of the linear polarization produced by scattering in circumstellar envelopes of arbitrary form to corotating envelopes of binary stars. As in Paper I the scattering mechanism assumed is very general, the only assumption being that it is spherically symmetric. Series expressions are derived for the Fourier components of the variable linear polarization, and the results of Brown, McLean & Emslie (1978) for Thomson scattering are re-derived as a special case. The author illustrates the results by considering Mie scattering

in envelopes of specified geometry. The inverse problem, that of determining the density distribution of scatterers, the scattering mechanism and the inclination of the binary axis, is briefly discussed. (12 refs.)

116763 Ultraviolet observations of binary X-ray sources. L.Maraschi (Dipartimento di Fisica, Univ. di Milano, Milano, Italy), E.G.Tanzi, A.Treves. *Mem. Soc. Astron. Ital. (Italy)*, vol.54, no.2, p.453-66 (1983).
Considers low mass X-ray binaries and UV observations in relation to visible and IR studies of line emitting regions and accretion disks. (28 refs.)

116764 Magnetic focusing in the Sco X-1 radio source. A.Achterberg, R.D.Blandford, P.Goldreich (Theoretical Astrophys., California Inst. of Technol., Pasadena, CA, USA). *Nature (GB)*, vol.304, no.5927, p.607-9 (18 Aug. 1983).
There has been much theoretical discussion of the confinement of the radio jets associated with extragalactic radio sources. There are now several examples of sources where the minimum pressure inferred in the jets appears to exceed the external gas pressure, which suggests that magnetic pinching may be playing an important part in the confinement. The authors argue that the results necessitate magnetic focusing and that this also strengthens the case for magnetic focusing in the extragalactic sources. (11 refs.)

98.20 STELLAR CLUSTERS AND ASSOCIATIONS

116765 The chemical composition of distant globular clusters: are there any metal-poor clusters?. C.A.Pilachowski (Kitt Peak Nat. Obs., Tucson, AZ, USA), G.D.Bothun, E.W.Olszewski, A.Odell. *Astrophys. J. (USA)*, vol.273, no.1, pt.1, p.187-94 (1 Oct. 1983).
The authors report echelle spectroscopy of giants in the distant clusters NGC 4147, M53, NGC 5466, and NGC 6229. Abundances are determined from model atmosphere analyses of the equivalent widths of the metal lines. The analyses yield [Fe/H] values in the range of -1.3 to -1.9. These values are moderately high for clusters at these galactocentric distances ($R \sim 20$ kpc). In particular, these data argue against the existence of a strong metallicity gradient in the halo. These data may also suggest that the cluster system of the Galaxy predates the formation of the bulge and halo system. (40 refs.)

116766 On the intrinsic width and luminosity function of the M92 main sequence. A.Sandage, B.Katem (Mount Wilson & Las Campanas Obs., Carnegie Inst. of Washington, Pasadena, CA, USA). *Astron. J. (USA)*, vol.88, no.8, p.1146-58 (Aug. 1983).
Measurements of B and V magnitudes of ~ 475 identified stars in the magnitude interval $18.0 \leq V \leq 22.0$ are given. They occupy an area ~ 35 square arcminutes located $\sim 8'$ north of the center of M92. The measurements were

made on seven Hale 5-m reflector plates in each of two colors, relative to a faint photoelectric sequence determined earlier. The measuring errors, determined from the deviations from the mean values, are listed for each star so as to test if the observed width of the main sequence is due to measuring errors alone. The resulting distribution of errors is used to predict the observed width of the MS. Comparison with the observations shows that the intrinsic width could be zero, with an upper limit of $\sigma(B-V) \approx 0.02$ mag. Comparison with theoretical evolutionary models by Vandenberg shows that this gives an upper limit for the variation of the helium abundance star-to-star, to be $\sigma(\delta Y) \leq 0.1$. As in M15, the variation of the metal abundance is not well measured by the sharpness of the M92 main sequence because the metal abundance at $Z = 10^{-4}$ is too low. The luminosity function, obtained from the present data, is compared with that determined earlier by Taylor, by Hartwick, by van den Bergh, and with Fukuoka and Simoda, with good agreement. The evidence favors that $\phi(M_V)$ flattens fainter than $M_V \approx +6$ as predicted in some dynamical models, due to loss of loss mass stars. (25 refs.)

116767 On the age of M92 and M15. A.Sandage (Mount Wilson & Las Campanas Obs. Carnegie Inst. of Washington, Pasadena, CA, USA). *Astron. J. (USA)*, vol.88, no.8, p.1159-65 (Aug. 1983). Comparison of Vandenberg's isochrones for globular clusters with the photometry of many main-sequence stars in M92 and M15 gives an age $T = 18 \pm 2 \times 10^9$ years for both clusters, using a vertical fit to the turn-off luminosity, together with distance moduli found from the period-color-luminosity relation of their RR Lyrae stars. Comparison of the systematics of the composite CM diagram for clusters of different metallicity with that predicted from Vandenberg's isochrones, all for $T = 18 \times 10^9$ years, shows good agreement. Justification of the adopted zero-point value of $M_V(RR, M92) = +0.63$ is made by comparing the main sequences of M92, M3, and M5 with that defined by 11 field subdwarfs whose metallicities lie between $[Fe/H]$ of -2.2 and -1.2 for which adequate astrometric distances exist. (36 refs.)

116768 The globular cluster NGC 6638. G.Alcaino, W.Liller (Inst. Isaac Newton, Ministerio de Educacion de Chile, Santiago, Chile). *Astron. J. (USA)*, vol.88, no.8, p.1166-74 (Aug. 1983). Presents photographic photometry for 219 stars in the previously unstudied globular cluster NGC 6638, as well as for 187 stars in two neighboring zones equal in area to that measured for the cluster. A Pickering-Racine wedge has been used with the CTIO 1-m Yale telescope and the Las Campanas 2.5-m du Pont telescope to extend the limit of the photoelectric sequence from $V \sim 15.7$ to $V \sim 18.9$. Giant branch members, difficult to pick out due to the abundance of field stars, appear to define a steep sequence. A stubby red horizontal branch is well outlined by a group of 13 stars at $V_{HB} = 16.5 \pm 0.2$ within the narrow color range $0.92 < B-V < 1.06$, and 13 blue stars with $0.27 < B-V < 0.76$ populate a blue horizontal branch. Assuming the horizontal branch absolute magnitude $M_{VHB} = +0.6$ and the interstellar reddening $E(B-V) = 0.40$, the authors find NGC 6638 to be 8.7 ± 0.5 kpc from the Sun and 1.7 kpc from the galactic center. (20 refs.)

116769 The WN4.5 component of HD 219460 in the open cluster Markarian 50. D.G.Turner (Dept. of Phys. & Astron., Laurentian Univ., Sudbury, Ontario, Canada), A.F.J.Moffat, R.Lamontagne, H.M.Maitzen. *Astron. J. (USA)*, vol.88, no.8, p.1199-1209 (Aug. 1983). The open cluster Markarian 50 is reinvestigated using photoelectric *UBV* photometry, resulting in a newly determined distance of 3.55 ± 0.20 kpc, an age of $\sim 7(\pm 2) \times 10^6$ yr, and a space reddening for HD 219460 of $E_{B-V} = 0.90 \pm 0.01$. As delineated by star counts, the cluster is small and very poorly populated, with nuclear and coronal radii of 1.75 arcmin (1.8 pc) and 3.5 arcmin (3.6 pc), respectively. The optical components of HD 219460 are identified as a possibly variable WN4.5 star and a brighter B1 II companion, with luminosities of $M_V = -4.85$ ($M_V = -4.92$) and $M_V = -5.05$, respectively. Both stars appear to be single on the basis of new radial velocity data obtained for them over a three year time span, and seem certain to be cluster members. The location of the WR star in the cluster H-R diagram is, in fact, consistent with evolution with a high rate of mass loss from a star of initially $\sim 30 M_\odot$. The cluster and WR star are probably physically associated with portions of the surrounding H II region Sharpless 157, despite the fact that this produces a discrepancy with previously published radial velocity data for Markarian 50 members. (27 refs.)

116770 Cool neutral hydrogen in the direction of an anonymous OB association. T.M.Bania (Dept. of Astron., Boston Univ., Boston, MA, USA). *Astron. J. (USA)*, vol.88, no.8, p.1222-27 (Aug. 1983). H I self-absorption is seen in the direction $l = 55.6^\circ$ probably physically associated with an anonymous OB association which has the Cepheid GY Sagittae as a member. The cool H I is in two clouds at least 15 pc in diameter located 3.25 kpc from the Sun. If their temperature is ~ 50 K, the cloud masses are $\sim 10^3 M_\odot$. The neutral atomic hydrogen clouds are probably warm envelopes surrounding cold molecular cloud cores because CO observations in this region show two molecular clouds nearly coincident with the absorbing H I gas. Since the OB association is only $\sim 10^7$ years old, these clouds are likely to be part of the original cloud complex from which the stellar cluster formed. The H I clouds are part of the larger Arcicob survey of self-absorption which suggests that many of the Arcicob clouds are associated with heretofore unidentified star clusters. Even if this is generally not the case, the Arcicob objects have accurate kinematic distances and thus provide a new sample of cool H I clouds whose thermodynamic properties can be studied. (21 refs.)

116771 Variable stars in NGC 6397. H.M.H.El-Worfalli, E.Budding (Dept. of Astron., Univ. of Manchester, Manchester, England). *Astrophys. & Space Sci. (Netherlands)*, vol.94, no.2, p.253-72 (Aug. 1983). Thirty-four deep sky plates of NGC 6397 taken from AAO, UKSTU and SAAO sources were examined with the aim of checking parameters of (three) known variables in the cluster, and also to discover new and generally fainter (main-sequence) variables. The search methods have included various visual and automated procedures, a comparison of which provides another aspect of the present work. At least two faint variables have been identified. A number of other candidates for genuine stellar variability are presented. (32 refs.)

116772 A search for neutral hydrogen near nine globular clusters. M.Birkinshaw (Mullard Radio Astron. Obs., Cavendish Lab., Cambridge, England), P.T.P.Ho, B.Baud. *Astron. & Astrophys. (Germany)*, vol.125, no.2, pt.1, p.271-5 (Sept. 1983). A search for neutral hydrogen in emission or absorption near nine globular clusters has been made and limits to the masses of neutral hydrogen towards eight are presented. A large mass of H I lies near M56, a part of this may be associated with the cluster. (21 refs.)

116773 Ellipticity variations within some globular clusters of the Galaxy and the Magellanic Clouds. E.H.Geyer (Obs. Hoher List, Univ. Bonn, Daun, Germany), U.Hopp, B.Nelles. *Astron. & Astrophys. (Germany)*, vol.125, no.2, pt.1, p.359-67 (Sept. 1983). The apparent flattening-variations of 20 galactic- and four Magellanic Cloud globular clusters have been investigated by means of the Agfa-Contourfilm

technique and an objective reduction method on plates obtained with telescopes of different f -ratios and scales. It is shown that in reality an individual isodensity contour can be approximated by an ellipse with an accuracy of only ± 0.05 for the axis ratio, and, as to be expected, the position angle of the major axis becomes more and more indefinite for $b/a > 0.92$. (23 refs.)

116774 VBLUW photometry of the open cluster NGC 2516. J.N.Verschoor, A.M.van Genderen (Leiden Obs., Leiden, Netherlands). *Astron. & Astrophys. Suppl. Ser. (France)*, vol.53, no.3, p.419-25 (Sept. 1983).

VBLUW photometry of the young open cluster NGC 2516 is presented and discussed. Temperatures and gravities for most of the stars and reddenings for nearly all stars could be determined. The reddening and the distance are in good agreement with the results of other references. (25 refs.)

116775 The chemical composition of stars in globular clusters. C.A.Pilachowski (Kitt Peak Nat. Obs., Tucson, AZ, USA), C.Snedden, G.Wallerstein. *Astrophys. J. Suppl. Ser. (USA)*, vol.52, no.3, p.241-87 (July 1983). The authors present detailed analyses for stars in seven globular clusters, bringing the total number of globular clusters analyzed using high resolution spectroscopy and model atmospheres to 23. Equivalent-width data published by other investigators for some clusters have been reanalyzed to derive abundances on a uniform scale. Values of $[Fe/H]$ range from -2.2 (NGC 6397) to -0.9 (NGC 362). Abundance ratios of various elements relative to iron are significantly different from their solar ratios. The α elements represented largely by calcium and titanium, are substantially enhanced in most clusters, with values of $[\alpha/H]$ ranging from -0.45 (NGC 362) to -1.8 (NGC 6397). (141 refs.)

98.40 INTERSTELLAR MATTER; AND NEBULAE

116776 Isotopic fractionation and mass motion in giant molecular clouds. A.A.Penzias (Bell Labs., Murray Hill, NJ, USA).

Astrophys. J. (USA), vol.273, no.1, pt.1, p.195-201 (1 Oct. 1983). Millimeter-wave rotation spectra of the $^{12}C^{16}O$, $^{13}C^{16}O$, and $^{12}C^{18}O$ isotopes of carbon monoxide were mapped in two giant molecular clouds in the Galaxy, NGC 2264 and W3(OH). The data were used to derive $^{13}C^{16}O/^{12}C^{16}O$ abundance ratios as a function of velocity, as well as position, in these sources. Two key features emerge from these observations. First, carbon-13 isotopic abundance determinations, particularly those involving carbon monoxide, are more subject to chemical enhancement effects than had been previously realized. Second, there is a suggestive association between velocity wings and cloud edges. This latter feature fits predictions of cloud evolution models involving large-scale radial motion. (18 refs.)

116777 The abundance of carbon in planetary nebulae. H.B.French (Dept. of Phys. & Astron., Univ. of Oklahoma, Norman, OK, USA). *Astrophys. J. (USA)*, vol.273, no.1, pt.1, p.214-18 (1 Oct. 1983). New photoelectric observations of the C II $\lambda 4267$, C III $\lambda 4647$, 4650, 4651, and C IV $\lambda 4659$ recombination lines have been obtained for 14 bright planetary nebulae and used to derive carbon abundances for these objects. The results indicate that carbon was enhanced in the progenitor by a factor of about 2 at the time of planetary nebula ejection presumably from the dredge-up of newly synthesized triple- α carbon. It appears that C/O ≥ 1 , indicating that the progenitor was a carbon star at that time. Planetary nebulae may be important contributors to galactic carbon enrichment, perhaps equaling or exceeding supernovae in this respect. (44 refs.)

116778 Digital analysis of narrow-band imagery of the Cygnus Loop. J.J.Hester (Rice Univ., Houston, TX, USA), R.A.R.Parker, R.J.Dufour.

Astrophys. J. (USA), vol.273, no.1, pt.1, p.219-42 (1 Oct. 1983). Digital analysis of narrow passband direct imagery of a field in the southeast part of the Cygnus Loop SNR is presented. Calibrated surface brightness and spectral line ratio maps involving emission from six different ionic species are shown. Features present in surface brightness maps are not generally apparent as features in line ratio maps. Differences in the morphologies of the remnant as viewed in different emission lines and gradients in spectral line ratios are interpreted as a continuous transition with distance behind the blast wave from nonsteady flow shocks with velocities ≥ 130 km s $^{-1}$ to steady flow shocks with velocities ≈ 60 km s $^{-1}$. (36 refs.)

116779 Semianalytical treatment of the hydrodynamics of supernova remnants during the snowplow phase. B.Gaffet (Section d'Astrophys., CENS, Gif-sur-Yvette, France).

Astrophys. J. (USA), vol.273, no.1, pt.1, p.267-79 (1 Oct. 1983). The author presents a semianalytical solution for the hydrodynamical evolution of a supernova remnant during the snowplow phase, making the following idealizations or approximations. First, remembering that, according to the standard model, cooling occurs only near the outer edge of the remnant, near the neutral shell, it is assumed that adiabaticity holds throughout most of the volume of the hot interior. The outer regions where radiative cooling is important, on either side of the neutral shell, are treated by means of Bernoulli's theorem. The first-order solution does not give good results, so a second-order expansion of the solution was undertaken. (19 refs.)

116780 Spectrophotometry of the optical emission from RCW 103 and Milne 23. M.T.Ruiz (Dept. de Astron., Univ. de Chile, Santiago, Chile).

Astron. J. (USA), vol.88, no.8, p.1210-21 (Aug. 1983). Spectrograms of five different filaments in RCW 103 and three filaments in Milne 23 were obtained using a SIT Vidicon tube at the 1.5-m and 4-m telescopes of CTIO. The region between 3700 Å and 7400 Å was covered with overlapping spectra. In RCW 103 the observed H_α/H_β ratio indicates variations in the visual absorption of up to 1.5 mag for different filaments. The minimum value found is 4.4 mag, implying a distance of 6.5 kpc from the Sun and a galactocentric distance of 4 kpc. Comparison of observed line ratios with models gives temperatures of about 10 4 K and densities between 10 cm $^{-3}$ and 100 cm $^{-3}$. An overabundance of nitrogen by a factor of 2 is found that can be explained as due to a galactic abundance gradient. The observed H_α/H_β ratios obtained for the filaments of Milne 23 imply a visual absorption of about 0.5 mag. Line ratios suggest densities about 5 cm $^{-3}$ and temperatures over 2.5 $\times 10^4$ K. (21 refs.)

116781 The temperature of molecular gas in the galactic center region. M.Morris, N.Polish (Astron. Dept., Columbia Univ., New York, NY, USA), B.Zuckerman, N.Kaifu.

Astron. J. (USA), vol.88, no.8, p.1228-35 (Aug. 1983).

The (1,1), (2,2), and (3,3) inversion lines of NH_3 were observed with a 5.3' telescope beam at 1.3 cm wavelength along a portion of the galactic plane centered on the galactic nucleus. The maps of antenna temperature in the longitude-velocity plane are used to construct maps of line intensity ratios. An analytical expression is derived which relates the gas kinetic temperature to the line ratios under the assumption of large opacity in the inversion lines. This relationship is (1) insensitive to assumptions about the collision rates and the magnitude of the opacity, and (2) in the temperature range of interest, similar to the relationship derived assuming optical thinness. It is therefore argued that the maps of line ratios can be used to derive an approximate kinetic temperature for the molecular gas, independent of assumptions about opacity. The implied temperatures are relatively high (30-60K) and roughly uniform over several hundred parsecs. A number of heating mechanisms which might account for these characteristics are examined. The authors cannot decide on the basis of presently available data which mechanism, if any, is dominant. (31 refs.)

116782 Far-infrared and CO observations of Cep F: implications for star formation in Cepheus OB3. A.I.Sargent (Owens Valley Radio Obs., California Inst. of Technol., Pasadena, CA, USA), R.J.van Duinen, H.L.Nordh, C.V.M.Fridlund, J.W.G.Aalders, D.Beintema.

Astron. J. (USA), vol.88, no.8, p.1236-41 (Aug. 1983).

Observations at 80- μm and 130- μm have revealed a source of far-infrared emission in the Cep F portion of the Cepheus OB3 molecular cloud. Molecular line measurements of this region, at the CO $J=1-0$ line frequency, have led to the discovery of two CO maxima. One of these coincides with the new far-infrared source. The other is at least as intense as Cep B, until now considered to be the hottest part of the cloud. There is some evidence to suggest that a second far-infrared source is associated with this hotspot. If the far-infrared emission results from the presence of embedded protostars, their location, relative to the OB association stars and to the other active region, Cep A, requires a reexamination of how stars form in the Cepheus OB3 association. (27 refs.)

116783 Hydrogen and helium ionization structure of gaseous nebulae.

E.Oliva (Osservatorio Astrofisico di Arcetri, Firenze, Italy), N.Panagia.

Astrophys. & Space Sci. (Netherlands), vol.94, no.2, p.437-61 (Aug. 1983).

Discusses the ionization equilibrium of hydrogen and helium in a nebula with an arbitrary gas density distribution. Considering the spectral characteristics of hot stars, a power law is found to provide a good approximation to the Lyman continuum spectrum for stars with $T_{\text{eff}} \leq 100000\text{K}$. With this simplification the ionization equilibrium equation is analytically solved first for a pure hydrogen nebula, then for the general case of a nebula containing H, He and heavy elements. A simple and quite general formula for the determination of the size and the emission of the He^+ zone is obtained. Finally, the ionization equilibrium $\text{He}^{++}-\text{He}^+$ is considered. (13 refs.)

116784 Tentative detection of the CS^+ molecular ion in diffuse interstellar clouds. R.Ferlet (LPSP, Verrieres-le-Buisson, France), E.Roueff, M.Horani, J.Rostas.

Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.L5-8 (Sept. 1983).

Suggests the discovery of the CS^+ molecular ion observed in absorption in the diffuse interstellar clouds on the ζ Oph and δ Sco lines of sight. Synthetic spectra seem to favour a rotational excitation of the (3,0) band of the $\text{A}^{11}_{1/2}-\text{X}^2\Sigma^+$ transition by the cosmological radiation background. This is the first sulphur-bearing molecule detected in diffuse clouds. (24 refs.)

116785 The magnetic field of the NGC 2024 molecular cloud: detection of OH line Zeeman splitting. R.M.Crutchfield, I.Kazes (Dept. de Radioastron., Obs. de Paris-Meudon, Meudon, France).

Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.L23-6 (Sept. 1983).

Zeeman splitting of the main lines of OH in absorption has been detected for the first time. The derived magnetic field for a clump in the NGC 2024 molecular cloud is -38 ± 1 microgauss. (10 refs.)

116786 Diffuse light near zeta Orionis and the Horsehead nebula, and anomalous extinction of HD 37903, as measured with the ANS. K.S.de Boer (Astron. Inst. Tubingen, Tubingen, Germany).

Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.258-64 (Sept. 1983).

The light of ζ Ori, reflected by the diffuse interstellar medium to the SSE of this star, was measured with the UV-instrument onboard of the ANS. The diffuse light is bluer than the light of the stars. Possible contributions of emission by the gas are discussed. The gradient of the surface brightness in this region in front of the dark cloud L 1630 is steeper than the gradients reported from the OAO-2 and TD1 satellites, indicating a complicated geometry for the scattering material. The normalised surface brightness is small and is interpreted. The extinction of HD 37903 in L 1630 is found to be anomalous. (37 refs.)

116787 A comparison of high resolution optical and radio observations of W3. H.R.Dickel (Astron. Dept., Univ. of Illinois, Urbana, IL, USA), R.H.Harten, T.R.Gull.

Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.320-32 (Sept. 1983).

High resolution maps of the W3 complex are presented for radio continuum and selected optical emission lines. These maps are used to derive the visual extinction, the excitation and evolutionary state of the component H II regions. Three main ionized gas structures are identified: (1) a large diffuse H II region in the east which is the most evolved and least obscured H II region; (2) a southern complex of H II regions; and (3) a northern complex of young, compact H II regions which are still embedded in the W3 molecular core. These three regions represent different stages in the process of H II-blisters formation at the edge of the molecular cloud. The observed distribution of dust is compared with ionized and atomic hydrogen, and several molecules in W3. Detailed structure of the W3A source is presented which is interpreted as W3A being in the earliest stage of the 'Champagne' phenomena. (46 refs.)

116788 Special perturbations of rotating isothermal gas clouds with constant rotational velocity. F.Schmitz (Inst. fur Theoretische Astrophys., Univ. Heidelberg, Heidelberg, Germany).

Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.333-7 (Sept. 1983).

A class of special perturbations of stationary rotating and self-gravitating gaseous clouds with constant rotational velocity and constant temperature is studied. The perturbations are isothermal and are connected with displacements only in the direction of the rotation axis. A perturbation equation which can be separated is presented. The radial dependence of the perturbed variables is a simple closed expression, the angular dependence is given by an ordinary second order differential equation. The perturbed configurations show the asymptotic features of the regular solutions of the isothermal gas sphere. The relevance for the stability of the equilibrium state is discussed, and applications to the formation of the planetary system are considered. (10 refs.)

116789 Infrared objects near H_2O masers in regions of active star formation. III. Evolutionary phases deduced from IR recombination line and other data. A.F.M.Moorwood (European Southern Obs., Garching bei Munchen, Germany), P.Salinari.

Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.342-54 (Sept. 1983).

For pt.II see *ibid.*, vol.102, no.2, p.197-206 (1981). Spectroscopy of Br γ (2.17 μm), Pf γ (3.74 μm) and Br α (4.05 μm) hydrogen recombination line emission together with 2-20 μm photometry, continuously variable filter spectroscopy around 10 μm and 10 μm slit scans are used to define more precisely the nature of several compact infrared objects detected in systematic 3.6 μm surveys of H_2O masers. (65 refs.)

116790 Ammonia absorption toward W3(OH): 0.3' resolution maps in the (2,2) line. S.Guilloteau (Groupe d'Astrophys., Univ. Sci. et Medicale de Grenoble, Saint Martin d'Heres, France), M.T.Stier, D.Downs.

Astron. & Astrophys. (Germany), vol.126, no.1, pt.2, p.10-15 (Sept. 1983).

The authors present line maps of the ammonia (2,2) inversion line in absorption against the continuum source W3(OH), made with a spatial resolution of $0.26'' \times 0.26''$. The ammonia cloud covers the western part of the continuum source, coinciding with the OH masers in front of the continuum. Evidence for velocity and line width gradients within the NH_3 cloud has also been found. The cloud is clumpy, with some structure probably on scales down to $0.2''$ or less. The sharp edges of the opacity maps at the boundary of the H II region suggest that the cloud extends further, presumably as far as the OH masers. (22 refs.)

116791 The fraction of the sky screened by local diffuse dust clouds.

J.Knude (Copenhagen Univ. Obs., Copenhagen, Denmark).

Astron. & Astrophys. (Germany), vol.126, no.1, pt.2, p.89-93 (Sept. 1983).

An estimate of the interstellar cloud cover as a function of distance is presented. This estimate is based on detailed observations of local diffuse clouds in samples of the sky over all galactic latitudes and covering in total, $\sim 5\%$ of the celestial sphere. The spatial frequency of clouds observed in the distance interval from 50 to 150 pc may be evaluated. The fraction of sky covered by diffused dust clouds closer than the distance D , $CF(D)$, is evaluated. The coverage function $CF(D)$ is found to obey a power law. $CF(D) = -1.7777 + 0.4568 \ln(D(\text{pc})) \sim \ln(D^{1/2}/6)$. (11 refs.)

116792 Formaldehyde, cold neutral hydrogen and dust distribution in a globular filament in Taurus. W.G.Poppel (Inst. Argentino de Radioastron. & Obs. Astron., Univ. de La Plata, La Plata, Argentina), K.Rohlf, W.Celnik.

Astron. & Astrophys. (Germany), vol.126, no.1, pt.2, p.152-60 (Sept. 1983).

The distribution of the 4.83 GHz absorption line of the I_{10-11} rotational transition of formaldehyde H_2CO and of the 1420 MHz self-absorption of cold neutral hydrogen have been measured for the globular filament GF 16 in Taurus with the 100 m telescope at Effelsberg. A total of 128 positions spaced on an irregular grid with $\sim 4'$ spacing have been measured in formaldehyde. For the same area the self-absorption of cold neutral hydrogen was measured too. The whole region turns out to be rather quiescent with no noticeable streaming motions. For several individual globules D , E , C_4 , C_3+C_2 estimates of the total mass is derived. (50 refs.)

116793 The detection of butadiynyl (C_4H) in absorption against Cassiopeia A. M.B.Bell, P.A.Feldman, H.E.Matthews (Herzberg Inst. of Astrophys., Nat. Res. Council of Canada, Ottawa, Ontario, Canada).

Astrophys. J. Lett. Ed. (USA), vol.273, no.1, pt.2, p.135-9 (1 Oct. 1983).

Observations of the $N=1-0$ transition of the butadiynyl radical, C_4H , in absorption against Cas A are reported. The inferred column density of C_4H is $10^{12}-10^{13} \text{ cm}^{-2}$ in the Orion arm, and this is high enough to be of potential significance vis-a-vis the carriers of the diffuse interstellar bands. (30 refs.)

116794 The Rosette nebula. I. An absolutely calibrated photoelectric H α surface photometry. W.E.Celnik (Astron. Inst., Ruhr-Univ. Bochum, Bochum, Germany).

Astron. & Astrophys. Suppl. Ser. (France), vol.53, no.3, p.403-6 (Sept. 1983).

The brightness distribution of the $\text{H}\alpha$ emission line in the Rosette nebula has been measured for an area of $2.4'' \times 2.4''$ using the Bochum 61 cm telescope at ESO/La Silla equipped with a photoelectric photometer. An interference filter with 10 \AA bandwidth was used to exclude both [NII] lines at $\lambda\lambda 6548, 6584 \text{ \AA}$. The map, which has an angular resolution of 4.75 arcmin, was constructed from 76 scans measured with a stationary telescope; the intensity scale was calibrated using stars with absolutely calibrated continuum. In this, the detailed shape of the stellar $\text{H}\alpha$ absorption line was taken into account using both high resolution coude spectra and photoelectric scanner measurements. (15 refs.)

116795 Regions of low molecular column density near the galactic plane.

F.Verter, G.R.Knapp (Princeton Univ. Obs., Princeton, NJ, USA), A.A.Stark, R.W.Wilson.

Astrophys. J. Suppl. Ser. (USA), vol.52, no.3, p.289-92 (July 1983).

A partial survey of the first quadrant of the galactic plane in the ^{12}CO $J=1-0$ transition has been searched of emission-free positions. Over 100 directions at low galactic latitude have been found which have no molecular clouds along the line of sight. The antenna temperature in these directions is $< 0.5 \text{ K}$ for all galactic velocities implying $\text{N}(\text{H}_2) < 1 \times 10^{21} \text{ cm}^{-2}$ and $A_v < 1.5 \text{ mag}$. These directions may be used to study distant visual objects or as 'off' positions for radio and infrared spectroscopy. (2 refs.)

116796 Magnetic field lines in the Galaxy (Review of the interstellar magnetic field). J.P.Vallee (Section d'Astron., Inst. Herzberg d'Astrophys., Ottawa, Ontario, Canada).

J. R. Astron. Soc. Can. (Canada), vol.77, no.4, p.177-202 (Aug. 1983). In French.

A review of the interstellar magnetic field is given. The principle contributor to the present knowledge of the geometry of the interstellar magnetic field has been the observed angle of the linear polarization of the radio and optical radiations reaching the Earth. In particular, such optical observations in 1949 afforded the first proof of the existence of the interstellar magnetic field, while such radio observations since 1963 have revealed the various components of the interstellar magnetic field. The interaction of the interstellar magnetic field on the interstellar plasma and the observed percentage of the linear polarization of the radio and optical radiations reaching the Earth, are discussed. (116 refs.)

116797 CS $J=5-4$ observations of galactic molecular clouds. G.J.White, J.P.Phillips, K.J.Richardson, R.F.Frost, G.D.Watt, J.E.Beckman (Phys. Dept., Queen Mary Coll., Univ. of London, London, England), J.H.Davis.

Mon. Not. R. Astron. Soc. (GB), vol.204, no.3, p.1117-23 (Sept. 1983).

Observations are reported of a sample of six regions of star formation in the $J=5-4$ rotational transition of CS at 244 GHz. In combination with published results at lower frequencies, the authors show the $J=5-4$ line temperatures for OMC-1, M17 SW, W3(OH) and Ori B to be consistent with constant density large velocity gradient models, indicating typical abundances $X(\text{dV/dr}) \sim 4 \times 10^{-10} \text{ km}^{-1} \text{ s pc}$, and H_2 number densities $\sim 10^5 \text{ cm}^{-3}$. For two clouds, W51 and DR21(OH), however, the results may indi-

cate the need for substantial levels of CS thermalization, suggesting in turn high source densities and beam dilutions. (11 refs.)

116798 IUE observations of stars in the M8 nebula. B.Y.Welsh (Dept. of Phys. & Astron., Univ. Coll. London, London, England). *Mon. Not. R. Astron. Soc. (GB)*, vol.204, no.3, p.1203-19 (Sept. 1983). The early-type stars HD 164794, 164816, 164906 and 165052 belonging to the M8 nebula have been observed at high resolution using the IUE satellite. High velocity interstellar absorption components have been detected in each star's spectra at velocities of -32 and -53 km s^{-1} . A line profile fitting analysis has been carried out on all the UV interstellar lines to determine cloud component column densities and subsequently to determine the physical condition and chemical abundance of the associated interstellar gas. It is proposed that the stellar wind energy from the star HD 164794 (9 Sgr) may be sufficient to produce the high velocity gas motions. (41 refs.)

116799 Optical polarization in the bipolar nebula associated with LkH α 208. J.V.Shurt, R.F.Warren-Smith, S.M.Scarrott (Phys. Dept., Univ. of Durham, Durham, England). *Mon. Not. R. Astron. Soc. (GB)*, vol.204, no.3, p.1257-61 (Sept. 1983). Optical polarization data are presented for the archetypal premain-sequence bipolar nebula illuminated by LkH α 208. The data lead to an interpretation whereby the major axis of the nebula is close to the plane of the sky and the circumstellar ring is very extensive in the radial direction and partially obscures one of the lobes. The mass of the ring is estimated to be $0.3 M_{\odot}$. (9 refs.)

116800 Hydrodynamic models of Herbig-Haro objects. M.T.Sandford, II, R.W.Whitaker (Los Alamos Nat. Lab., Univ. of California, Los Alamos, NM, USA). *Mon. Not. R. Astron. Soc. (GB)*, vol.205, no.1, p.105-121 (Oct. 1983). Two-dimensional cylindrical hydrodynamic models of neutral and collisionally ionized stellar wind-cloudlet interactions are calculated as possible models for HH objects. For neutral winds, shocks propagate into the cloudlet and its shape is distorted and displaced in the direction of the wind. For hot ionized winds interacting with spherical mass concentrations a bow shock is formed, but the highest temperatures and largest ionization fraction occurs on the lee side of the cloudlet. Winds interacting with a neutral globule imbedded near the ionized surface of an elongated cloud are also discussed. (18 refs.)

116801 Ammonia observations of the Herbig-Haro objects HH 24-27. N.Matthews, L.T.Little (Electronics Labs., Univ. of Kent, Canterbury, England). *Mon. Not. R. Astron. Soc. (GB)*, vol.205, no.1, p.123-30 (Oct. 1983). The region centred on HH 25 has been mapped in the $J=1, K=1$ inversion line of ammonia, with spatial and velocity resolutions of 2.2 arcmin and 0.43 km s^{-1} respectively. The ammonia emission covers the known centres of activity HH 24-26, including the recently observed bipolar CO outflows. Its spatial distribution relative to the outflows probably implies a disc structure (of mass $\sim 70\text{-}210 M_{\odot}$), with the bipolar outflow perpendicular to the faces of the disc. The derived particle density is discussed. The abundance ratio of ammonia is estimated. (29 refs.)

116802 3 μm spectroscopy of IRS 7 towards the Galactic Centre. T.J.Jones (Dept. of Astron., Univ. of Minnesota, Minneapolis, MN, USA), A.R.Hyland, D.A.Allen. *Mon. Not. R. Astron. Soc. (GB)*, vol.205, no.1, p.187-90 (Oct. 1983). Intermediate and low resolution spectra of IRS 7 from $3.0\text{-}3.6 \mu\text{m}$ are presented. Sharp absorption features previously reported at 3.192 and $3.295 \mu\text{m}$ are not confirmed. The overall broad absorption characteristics and the presence of a shallow feature in the red wing of the broad $3.4 \mu\text{m}$ absorption are confirmed. This shallow feature is resolved, $\sim 0.036 \mu\text{m}$ wide with an equivalent width of $30 \pm 10 \text{ \AA}$ and centred at $3.489 \pm 0.005 \mu\text{m}$. (11 refs.)

116803 Observations of H $_2$ O maser emission in the Large Magellanic Cloud. J.B.Whiteoak, K.J.Wellington, D.L.Jauncey, F.F.Gardner, J.R.Forster, J.L.Caswell, R.A.Batchelor (Div. of Radiophys., CSIRO, Epping, NSW, Australia). *Mon. Not. R. Astron. Soc. (GB)*, vol.205, no.1, p.275-9 (Oct. 1983). A search for H $_2$ O maser emission towards 10 continuum sources in the Large Magellanic Cloud was made with the Parkes radio telescope (beamwidth 1.7 arcmin). Maser emission was detected near three H II regions, including the 30 Doradus nebula the positions of the main features are estimated with an accuracy of ± 15 arcsec. The maser luminosities are comparable to the typical value of H $_2$ O masers in galactic H II regions. Upper intensity limits for maser emission in the remaining sources were 0.5 Jy . In contrast with previous observations, no emission was detected near N159. (9 refs.)

116804 Planetary nebulae: IUE results. M.Cerruti-sola, M.Perinotto (Osservatorio Astrofisico di Arcetri, Firenze, Italy). *Mem. Soc. Astron. Ital. (Italy)*, vol.54, no.2, p.511-27 (1983). The IUE satellite has provided important information on both the nebulae and the central stars. For the nebulae the advances concern: (a) the density and temperature profiles across the nebula, (b) the nebular continuum, (c) the ionization structure, (d) the chemical composition and (e) the nebular dust. For the central stars: (a) the mass loss phenomenon from fast winds, (b) the determination of the temperature of the nuclei and therefore an improvement of their HR diagram, and possibly (c) the chemical composition of the stellar surface layers. (54 refs.)

116805 H II regions [IUE observations]. P.Patriarchi, M.Perinotto (Osservatorio Astrofisico di Arcetri, Firenze, Italy). *Mem. Soc. Astron. Ital. (Italy)*, vol.54, no.2, p.529-36 (1983). The IUE satellite has observed relatively few galactic and extragalactic H II regions because of the faintness of these sources. However, important results have been obtained in relation to chemical abundances in zones of recent star formation, the nature and amount of dust associated with gas in such zones, and the dynamical interaction of violent stellar winds. (29 refs.)

116806 Determination of the angular size of the H $_2$ O maser outburst region in Orion KL defined by a linearly polarized emission. L.I.Matveenko, A.M.Romanov, L.R.Kogan, I.G.Moiseev, R.L.Sorochenko, V.V.Timofeev. *Pis'ma v Astron. Zh. (USSR)*, vol.9, no.8, p.456-60 (1983). In Russian. English translation in: *Sov. Astron. Lett. (USA)*. The angular size of a region of linearly polarised emission observed in the Orion Kleinmann-Low nebula has been measured by the Simeiz-Pushchino radiointerferometer. The radial velocity of the outburst region is $+8 \text{ km/s}$. The radiation in the central part of the line profile comes from an elliptical region with axes of 0.75 and $1.0 \times 10^{13} \text{ cm}$. The higher-frequency radiation is related to a larger region. The degree of linear polarisation is in the range $0.5 < p < 0.7$: the polarised radio source is 1.5 to 2.0 times smaller than the unpolarised sources. (5 refs.)

116807 Ring nebulae associated with WR stars: stellar wind or stellar ejecta? T.A.Lozinkaya. *Pis'ma v Astron. Zh. (USSR)*, vol.9, no.8, p.469-73 (1983). In Russian. English translation in: *Sov. Astron. Lett. (USA)*. The statistics of Wolf-Rayet stars associated with H II regions (including ring nebulae) are presented. 29% of Wolf-Rayet stars (40% of early-type WN stars, 30% of late-type WN stars, and 17% of WC stars) are shown to be associated with ring nebulae. The data do not confirm the origin of ring nebulae due solely to sweeping of the interstellar gas by the stellar wind. A shell ejection is likely to precede the stellar wind stage. Some reasons for the fact that strong stellar winds do not necessarily from ring nebulae are discussed. (13 refs.)

116808 The determination of cloud masses and dust characteristics from submillimetre thermal emission. R.H.Hildebrand (Dept. of Astron. & Astrophys., Univ. of Chicago, Chicago, IL, USA). *Q. J. R. Astron. Soc. (GB)*, vol.24, no.3, p.267-82 (Sept. 1983). Reviews the principles by which the dust masses and total masses of interstellar clouds and certain characteristics of interstellar dust grains can be derived from observations of far-infrared and submillimetre thermal emission. To the extent possible, the discussion is independent of particular grain models. (41 refs.)

116809 Tracing the gas in galaxies. W.C.Keel (Kitt Peak Nat. Obs., Tucson, AZ, USA). *Sky & Telesc. (USA)*, vol.66, no.3, p.206-10 (Sept. 1983). The author describes optical methods of observing the distribution of interstellar gas in galaxies, based on the use of narrow-band filters that transmit only at the wavelengths of emission lines. These observations have shown that ionised gas is present in the nuclei of normal spiral galaxies and active galaxies (e.g. Seyfert galaxies and radio galaxies). The line-emitting gas forms relatively cool (10000 to 12000 K) dense clouds and filaments embedded in a hot, tenuous galactic wind. Systems of filaments also occur in active galaxies, particularly in the dominant central galaxies of rich clusters (e.g. M87 and NGC 1275), where they form vast networks more than 10 kpc in diameter. Finally, emission-line jets have been observed in a few active galaxies, notably in the Seyfert galaxy NGC 4151. (no refs.)

98.50 THE GALAXY, EXTRAGALACTIC OBJECTS AND SYSTEMS

116810 Optical spectroscopy of the radio-loud nuclei of spiral galaxies: starbursts or monsters? T.M.Heckman (Astron. Program, Univ. of Maryland, College Park, MD, USA), W.Van Breugel, G.K.Miley, H.R.Butcher. *Astron. J. (USA)*, vol.88, no.8, p.1077-87 (Aug. 1983). Presents optical spectroscopic data pertaining to the physical state, kinematics, and spatial extent of the emission-line gas near the radio-loud nuclei of spiral galaxies. These data are combined with published optical, radio, and infrared data to evaluate the suggestions by Condon et al. (1982) that the nuclear radio emission in this class of galaxy is produced by multiple supernova remnants generated as a consequence of a nuclear starburst. As a whole, the radio-loud nuclei have stronger emission lines than radio-quiet nuclei of galaxies of similar Hubble/de Vaucouleurs type. This emission-line gas is generally at least as spatially extended as the radio continuum emission. However, the authors find that only about $1/3$ of the spiral galaxies examined have optical spectroscopic properties consistent with those of 'extranuclear starbursts' (i.e. giant H II regions). The majority of the nuclei seem to require a form of energy input to the ionized gas which is 'harder' than the Lyman continuum radiation of OB stars, as their emission-line spectra are of the Seyfert or Liner variety. The nuclei with H II region spectra are distinct from the nuclei with Seyfert spectra in terms of radio morphology and radio spectral index, and tend to occur in spiral galaxies of much later Hubble type

than do the Seyfert or Liner nuclei (Sc vs. Sa). Moreover, the most luminous nuclear radio sources in the sample ($P_{1400\text{ MHz}} \geq 10^{22}$ Watts Hz^{-1} Sr^{-1}) are not associated with H II region nuclei. The authors summarize evidence that the putative nuclear starbursts must differ significantly from extranuclear starbursts. (74 refs.)

116811 Neutral hydrogen absorption in Mrk 6, NGC 3810, 1506+34, and NGC 1068. W.A.Baan (Dept. of Astron., Pennsylvania State Univ., University Park, PA, USA), A.D.Haschick.

Astron. J. (USA), vol.88, no.8, p.1088-93 (Aug. 1983). H I absorption has been reported in NGC 1068 and NGC 3810. The absorbing material in NGC 1068 has a low column density and is positioned in front of the compact nuclear source. Absorption in NGC 3810 occurs across a large fraction of the extended (4') radio source. Velocity offsets in NGC 3810 are due to disk rotation of the absorbing gas. Interpreting the features in these galaxies in terms of H I holes is considered implausible. H I absorption spectra are presented for Mrk 6 and a high resolution spectrum is given for 1506+34, suggesting the presence of distinct components in the 1506+34 absorption feature. (29 refs.)

116812 A survey of H α emission in normal galaxies. R.C.Kennicutt (Dept. of Astron., Univ. of Minnesota, Minneapolis, MN, USA), S.M.Kent.

Astron. J. (USA), vol.88, no.8, p.1094-1107 (Aug. 1983). Presents the combined results of photometric and spectrophotometric surveys of H α emission in 200 field and Virgo cluster galaxies. In most spiral galaxies the emission is dominated by normal disk H II regions, and consequently the integrated Balmer flux of a galaxy can be used as a quantitative index of its current OB star formation rate. Uncertainties due to instrumental effects, nuclear emission, [N II] emission, and extinction by dust are evaluated. The integrated emission of a galaxy is strongly correlated with its Hubble type and color, confirming the earlier conclusions of Cohen. Emission among galaxies of a given type varies greatly, however, and in most cases is due to a real dispersion in star formation activity. This activity is only weakly correlated with galaxy luminosity or H I content, suggesting that some other parameter is more important. (46 refs.)

116813 On the distance to M33 determined from magnitude corrections to Hubble's original Cepheid photometry. A.Sandage (Mount Wilson & Las Campanas Obs., Carnegie Inst. of Washington, Pasadena, CA, USA).

Astron. J. (USA), vol.88, no.8, p.1108-25 (Aug. 1983). New photoelectric photometry in Selected Area 45, and transfers from a faint photoelectric sequence adjacent to the south-preceding arm in M33 are made to the comparison stars for Hubble's Cepheids in M33. Progressive magnitude corrections are required to Hubble's M33 scales, reaching 2.8 mag at the limit of the Mount Wilson 2.5-m Hooker reflector. Hubble's Cepheid light curves are corrected to the B photoelectric system, and new photometric parameters are given for 35 of his variables. The P-L relation agrees in zero point to within 0.2 mag of the P-L relation from independent data by Sandage and Carlson for 12 new Cepheids in an outlying region of M33. Application of an adopted absolute P-L relation, calibrated by Martin, Warren, and Feast, to these data gives an apparent blue modulus of $(m-M)_{M33}^{AB} = 25.35$, which is 0.67 mag fainter than a previously adopted value, and represents a factor of 4.2 increase of Hubble's earliest distance. Three consequences of this larger apparent distance modulus are (1) the mean absolute magnitude of the first three brightest red supergiants is $M_{(V(3))}^{\max} = -8.7$ rather than ~ -8.0 in M33, complicating but not destroying use of red supergiants as distance indicators, (2) the mean absolute magnitude of the two brightest blue irregular supergiant variables is $M_{(B(2))} = -9.95$, which is close to the value for the brightest known supergiants in the galaxy, and (3) the absolute magnitude of M33 itself is brighter than heretofore assumed. (45 refs.)

116814 Arcsecond positions for milliarcsecond VLBI nuclei of extragalactic radio sources. II. 207 sources. D.D.Morabito, R.A.Preston, M.A.Slade (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA), D.L.Jauncey, G.D.Nicolson.

Astron. J. (USA), vol.88, no.8, p.1138-45 (Aug. 1983). For pt.I see *ibid.*, vol.87, no.3, p.517-27 (1982). VLBI measurements of time delay and fringe frequency at 2.29 GHz on baselines of $\sim 10^5$ km are used to determine the positions of the milliarcsecond nuclei in 207 extragalactic radio sources. Estimated accuracies generally range from $\sim 0.1''$ to $\sim 1.0''$ in both right ascension and declination, with all sources having uncertainties $< 4''$ in both coordinates. The observed sources are part of an all-sky VLBI catalog of milliarcsecond radio sources. Arcsecond positions have now been determined for 752 of these sources. (12 refs.)

116815 Space distribution of stars in the southern Milky Way. III. A region in Centaurus-Crux. S.W.McCuskey (Warner & Swasey Obs., Case Western Reserve Univ., Cleveland, OH, USA).

Astron. J. (USA), vol.88, no.8, p.1175-81 (Aug. 1983). The space density at various distances of stars of several spectral-type groupings is determined in a 20-square-degree area centered on $l=298^\circ$, $b=+1^\circ$ from objective-prism and photometric data on approximately 8000 stars of common spectral types and 158 OB stars. A rather pronounced maximum in the numbers of B8-A1 stars and G-K giants as well is found at a distance of about 350 parsecs; there is also some indication of a maximum in the OB-star distribution at a distance of the order of 2500 kpc. A sharp decrease in the numbers of later-type dwarfs with increasing distance from the Sun is found, though the data are reliable for only a few hundred parsecs or so. This is the final contribution by the author to a long-term project started in 1945 to evaluate star density and luminosity function variations in the Milky Way plane. (21 refs.)

116816 Chemical evolution of the galactic halo. II. Enrichment in primary elements. M.Busso (Osservatorio Astron. di Torino, Pino Torinese, Italy), R.Gallino.

Astrophys. & Space Sci. (Netherlands), vol.94, no.2, p.273-89 (Aug. 1983). For pt.I see *ibid.*, vol.90, no.2, p.277-98 (1983). The chemical enrichment in the galactic halo is studied with particular attention to the overabundances of O and light elements with respect to Fe shown by metal poor stars. Some representative nucleosynthesis pictures for stars of both Population I and Population II are considered and their yields are compared with observations of relative abundances in the Sun and in the halo, to identify the possible reasons of the observed compositional differences. (59 refs.)

116817 Determination of physical parameters in extragalactic radio jets from large scale, small amplitude oscillations. A.Ferrari, E.Trussani, L.Zaninetti (Istituto di Fisica Generale, Univ. di Torino, Torino, Italy).

Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.179-86 (Sept. 1983). Discusses the interpretation of large scale, small amplitude morphologies in jets (the so-called wiggles and knots) in terms of MHD Kelvin-Helmholtz instability in cylindrical supersonic flows. Theoretical growth rates and perturbation wavelengths are compared with observations of a VLA sample of well analysed jets. This model allows one to estimate the physical parameters of the jet plasma. Limits and approximations of the model are indicated. (31 refs.)

116818 The trivariate (radio, optical, X-ray) luminosity function of cD galaxies. I. New Westerbork observations of 22 cD galaxies and Einstein observations of A 1918 and A 2317. W.Bijleveld (Sterrewacht Leiden, Leiden, Netherlands), E.A.Valentijn.

Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.217-22 (Sept. 1983). Radio observations with the Westerbork Synthesis Radio Telescope at 1412 MHz continuum of 22 cD galaxies and Einstein Observatory X-ray observations of two cDs are reported. Six cDs are detected at 1412 MHz, while both the cD galaxies that have been surveyed in the X-ray band have been detected. The centres of the two detected X-ray sources coincide with the optical centres of the cD galaxies. This again shows the existence of a special class of X-ray sources associated with cD galaxies. (32 refs.)

116819 The trivariate (radio, optical, X-ray) luminosity function of cD galaxies. II. The fuelling of radio sources. E.A.Valentijn (European Southern Obs., Garching bei Munchen, Germany).

Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.223-40 (Sept. 1983). For pt.I see *ibid.*, vol.125, no.2, p.217-22 (1983). In order to test the hypothesis that radio sources in elliptical galaxies are fuelled by a fraction of accreted X-ray gas, a sample of 81 cD galaxies in clusters and 23 cD galaxies in poor groups is studied. Various subsamples are defined according to the origin of the cD galaxy classification (optically, radio or X-ray selected). A catalogue is presented, listing the measured optical, radio and X-ray luminosities from various origins, but all transformed to a uniform and homogeneous system: optical M_V (38 kpc metric diameter), radio $P_{1.4}$ (1.4 GHz monochromatic total radio power) and L_X (1 Mpc metric diameter 0.5-3.0 keV X-ray band). The three luminosity parameters are investigated for cross-correlations by studying power-power plots and by analysing how the integral radio luminosity function, expressed in fractions of radio detections ($F(>P_{1.4})$), depend on M_V and L_X . The physical origins of the relations between cluster richness R , L_X , M_V , and $P_{1.4}$ are discussed in detail. (65 refs.)

116820 ESO 438-G 9: a Seyfert galaxy with unusual properties. W.Koltschyn, K.J.Fricke (Univ. Gottingen, Gottingen, Germany).

Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.276-9 (Sept. 1983). Discusses optical and UV spectroscopic data of the 1.5 Seyfert galaxy ESO 438-G 9 found from a survey of barred galaxies. Its spectrum shows strong Fe II emission. A very steep continuum gradient in the UV is reflected in the absence of higher ionisation lines. A double absorption feature is present shortward of the H α and H β emission line centres at relative velocities 2500 and 3500 km s^{-1} . This Seyfert galaxy is a member of a cluster of galaxies. (17 refs.)

116821 Estimated energy and momentum input to the interstellar medium for several external galaxies. I.Tarrab (Inst. d'Astrophys., Paris, France).

Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.308-12 (Sept. 1983). Estimates the input of kinetic energy from stellar winds and supernovae explosions in several galaxies (LMC, SMC, NGC 6822, IC 1613, and M33) for comparison with the solar neighbourhood where a similar estimate has been made by Abbott (1982). The radiative energy and momentum input to the interstellar gas is also estimated. The amount of kinetic energy per unit mass of gas varies widely from galaxy to galaxy and is shown to be correlated with the presence of interstellar bubbles visible on H α photographs of these objects. (44 refs.)

116822 The tensor virial theorem for subsystems. P.Brosche (Obs. Hoher List, Univ.-Sternwarte Bonn, Daun, Germany), R.Caimmi, L.Secco.

Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.338-41 (Sept. 1983). An extension of the tensor virial theorem for subsystems is formulated. The new terms are evaluated for the special case of two homogeneous oblate spheroids, one lying completely within the other. A possible application to elliptical galaxies is given. (8 refs.)

116823 Rotation curves and masses of galaxies. J.Lequeux (Obs. de Marseille, Marseille, France).

Astron. & Astrophys. (Germany), vol.125, no.2, pt.1, p.394-5 (Sept. 1983). The determination of the mass $M(R)$ of a spiral galaxy interior to a radius R where the rotation velocity $V(R)$ has been measured is discussed. It is shown that in spiral galaxies $M(R)$ is almost certainly in the range (0.6 to 1.0) $RV^2(R)/G$. The value $M(R) = RV^2(R)/G$ might be the most appropriate at all radii in the case of galaxies with a massive halo. (8 refs.)

116824 Galactic gamma radiation: the contribution from discrete sources. B.P.Houston, A.W.Wolfendale (Dept. of Phys., Univ. of Durham, Durham, England).

Astron. & Astrophys. (Germany), vol.126, no.1, pt.2, p.22-30 (Sept. 1983). The contribution to the galactic gamma-ray emission from discrete sources is currently based on the analysis of the COS B data, i.e. the 2CG catalogue, which indicates the presence of 25 'sources' (actually localised peaks of emission). A check on this catalogue has been made by adopting the earlier SAS II data and using the cross-correlation technique developed by the COS B group. Many of the 2CG peaks have been confirmed, but there is evidence that many of the 'sources' in the catalogue could be extended regions of enhanced emission, unresolved by the detectors. (27 refs.)

116825 Observations of annihilation radiation from the galactic center region. C.J.MacCallum (Sandia Nat. Labs., Albuquerque, NM, USA), M.Leventhal.

AIP Conf. Proc. (USA), no.101, p.211-29 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). The experiments that have demonstrated variability of the 511 keV positron annihilation line from the galactic center region are reviewed. The simplest history consistent with all (but one) of the eleven measurements is that of a narrow (< 2.5 keV FWHM), unredshifted ($dE < 25$ keV) line, which was constant in intensity ($(1.6 \pm 0.1) \times 10^{-3}$ ph cm^{-2} s^{-1} at Earth) from before 1970 until the beginning of 1980, when it dropped to zero in less than a year. The limited evidence for detection of the continuum expected from the three-photon decay of orthopositronium is evaluated, with particular attention to the possibility of simulation by atmospheric scattering. The question of possible correlation between variations in the inverse-power-law galactic center continuum and the strength of the 511 keV annihilation line is discussed; the evidence is inconclusive. (26 refs.)

116826 The gamma-ray spectrum of the galactic-center region. G.R.Riegler, J.C.Ling, W.A.Mahoney, W.A.Wheaton, A.S.Jacobson (Jet Propulsion Lab., California Inst. of Technol., Pasadena, CA, USA).

AIP Conf. Proc. (USA), no.101, p.230-6 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). The HEAO-3 high resolution gamma-ray spectrometer observed the galactic center region in fall 1979 and in the spring of 1980. Variation of the positron annihilation line at 511 keV has been reported previously. The fall 1979 observations show a significant high-energy continuum at energies above 511 keV. The intensity of a possible positronium triplet-state continuum is found to be less than that expected for direct positron annihilation and positronium decay in an ionized, warm ($T \leq 10^5$ K) plasma; depending on assumption for the shape of the high-energy continuum spectrum, positronium fractions bet-

ween 0.0 and 0.75 (at 90% statistical confidence level) are consistent with the observations. (18 refs.)

116827 Effects of line width and spatial extent on measurements of the 0.51 MeV galactic center line. P.P.Dunphy, E.L.Chupp, D.J.Forrest (Univ. of New Hampshire, Durham, NH, USA). *AIP Conf. Proc. (USA)*, no.101, p.237-41 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). Over the past 15 years, a number of measurements have been made of positron-electron annihilation radiation from the galactic center region. The results after 1979 show a significant decrease in measured flux intensity from that previously observed with the same instruments. This is probably due to time variations; however, the contributions of a spatially extended and/or energy-broadened component should also be considered. The entire data set is consistent with a time variable point source plus a distribution along the galactic disk. There is no strong evidence for a component broadened in energy. (11 refs.)

116828 Low-temperature positron annihilation. R.J.Drachman (Lab. for Astron. & Solar Phys., NASA/Goddard Space Flight Center, Greenbelt, MD, USA). *AIP Conf. Proc. (USA)*, no.101, p.242-52 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). For a satisfactory understanding of astrophysical annihilation radiation, especially that observed from the galactic center direction, the interaction of positrons with the ambient medium must be carefully investigated. Although hot, ionized regions may be important sources of annihilation radiation, in this report the author examines the processes occurring in low-temperature neutral hydrogen gas. The goal is to set limits on conditions in the annihilation region by using the predictions of atomic theory compared with the observed γ -ray line width, continuum strength and time dependence. (23 refs.)

116829 'Gamma-gun' in the center of the Galaxy. N.S.Kardashev, I.D.Novikov, A.G.Polnarev, B.E.Stern (Space Res. Inst., Acad. of Sci., Moscow, USSR). *AIP Conf. Proc. (USA)*, no.101, p.253-66 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). The authors discuss a model of physical processes that occur in the center of the Galaxy and cause the emission of the 511 keV annihilation γ -line and of a continuous γ -spectrum. The hypothesis is that electron positron pairs whose annihilation produces the observed γ -line are formed when a gas-cloud target is irradiated by a directed beam of hard (~ 100 MeV) γ -quanta. A model is developed that shows how a γ -beam (gamma-gun) forms near a supermassive rotating black-hole surrounded by a gaseous accretion disk with a magnetic field. The results of numerical simulations are compared with observational data. (40 refs.)

116830 The origin of the galactic center annihilation radiation. R.E.Lingenfelter (Center for Astrophys. & Space Sci., Univ. of California, La Jolla, CA, USA), R.Ramaty. *AIP Conf. Proc. (USA)*, no.101, p.267-72 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). Observations of the e^+e^- annihilation radiation from the galactic center suggest that something truly extraordinary is occurring there. The authors review the observations of this intense, time-varying, 0.511 MeV emission and discuss the implications of these and other recent observations on the positron production process, the annihilation region and the fundamental nature of the galactic center source. (28 refs.)

116831 Positrons from supernovae and the origin of the galactic center positron annihilation radiation. S.A.Colgate (Los Alamos Nat. Lab., Los Alamos, NM, USA). *AIP Conf. Proc. (USA)*, no.101, p.273-80 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). The emission of positrons from supernova ejecta is discussed in terms of the galactic center annihilation radiation. The positrons from the radioactive sequences ^{56}Ni — ^{56}Co — ^{56}Fe are the most numerous source from supernova. Only Type I supernova will allow a significant fraction to escape the expanding ejecta. For a neutron star model of a Type I SN a fraction 4×10^{-3} of the escaped positron is enough to create the observed several year fluctuation of the annihilation radiation. The likelihood of this model is discussed in terms of other astrophysical evidence as well as the type I SN light curve. (21 refs.)

116832 An electron-positron jet model for the galactic center. M.L.Burns (NASA/Goddard Space Flight Center, Greenbelt, MD, USA). *AIP Conf. Proc. (USA)*, no.101, p.281-6 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). High energy observations of the galactic center on the subparsec scale seem to be consistent with electron-positron production in the form of relativistic jets. These jets could be produced by a $\sim 10^6 M_\odot$ black hole dynamo transporting pairs away from the massive core. An electromagnetic cascade shower would develop first from ambient soft photons and then non-linearly; the shower using itself as a scattering medium. This is suited to producing, cooling and transporting pairs to the observed annihilation region. It is possible the center of our galaxy is a miniature version of more powerful active galactic nuclei that exhibit jet activity. (15 refs.)

116833 Positron production by a hot, young pulsar. K.Brecher, A.Mastichiadis (Dept. of Astron., Boston Univ., Boston, MA, USA). *AIP Conf. Proc. (USA)*, no.101, p.287-90 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). The authors consider a way of positron production in pulsars: pair production from electron-photon collisions. They show that this process must be the dominant one for a young pulsar when its surface temperature is around 10⁸ K. They apply this model to the observed positron flux coming from the galactic center and show that a pulsar with parameters close to those of the Crab at birth can explain, in principle, the flux. (10 refs.)

116834 X-rays and gamma-rays from active galaxies. J.L.Matteson (Center for Astrophys. & Space Sci., Univ. of California, La Jolla, CA, USA). *AIP Conf. Proc. (USA)*, no.101, p.292-302 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). Photon-photon pair production in active galaxies is considered and the concept of the annihilation efficiency, the efficiency for the conversion of >511 keV continuum luminosity into positron annihilation luminosity, is introduced. Equations that give a source's annihilation luminosity and 511 keV flux as a function of its size, continuum luminosity and distance are developed. These are applied to the available X-ray and gamma-ray data on active galaxies in order to make specific predictions. Efficiencies as high as >6 percent and fluxes up to 8×10^{-4} ph/cm²-sec result. While the latter are below present limits, they are within the reach of advanced instruments now in development. (38 refs.)

116835 Are mildly active galaxies sources of e^\pm annihilation radiation? A.P.Marscher, K.Brecher (Dept. of Astron., Boston Univ., Boston, MA, USA), W.A.Wheaton, J.C.Ling. *AIP Conf. Proc. (USA)*, no.101, p.303-8 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). The authors propose 7 galaxies of various types, within an order of magnitude of the galactic center, as possible sources of positrons. They present a relation between these galaxies and the variation in electron-positron 511 keV annihilation radiation. (19 refs.)

116836 Upper limits to the annihilation radiation luminosity of Centaurus A. N.Gehrels, T.L.Cline, W.S.Paciesas, B.J.Teegarden, J.Tueller (NASA/Goddard Space Flight Center, Greenbelt, MD, USA). *AIP Conf. Proc. (USA)*, no.101, p.309-13 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). A high-resolution observation of the active nucleus galaxy Centaurus A (NGC 5128) was made by the GSFC low energy gamma-ray spectrometer (LEGS) during a balloon flight on 1981 November 19. The measured spectrum between 70 and 500 keV is well presented by a power law of the form $1.05 \times 10^{-4} (E/100 \text{ keV})^{-1.59} \text{ ph cm}^{-2} \text{ s}^{-1}$ with no breaks or line features observed. The 98% confidence (2 σ) flux upper limit for a narrow (<3 keV) 511-keV positron annihilation line is $9.9 \times 10^{-4} \text{ ph cm}^{-2} \text{ s}^{-1}$. Using this upper limit, the ratio of the narrow-line annihilation radiation luminosity to the integral ≥ 511 keV luminosity is estimated to be <0.09 (2 σ upper limit). This is compared with the measured value for the galactic center in the Fall of 1979 of 0.10-0.13, indicating a difference in the emission regions in the nuclei of the two galaxies. (16 refs.)

116837 Electron/positron/gamma ray beams in cosmic radio sources. R.V.E.Lovelace, C.B.Ruchi (Cornell Univ., Ithaca, NY, USA). *AIP Conf. Proc. (USA)*, no.101, p.314-31 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). Further study has been made of an electrodynamic model for the origin of the beams which are thought to power extra-galactic double radio sources. In this model the rotating magnetized accretion disk of a massive black hole acts as a unipolar induction dynamo. Energy and angular momentum of the infalling matter of the disk is extracted electromagnetically and propagated outward along the $\pm z$ axes initially as the Poynting flux of a relativistic space-charge flow. An analysis of the space charge flow is made utilizing the analogy with laboratory high-voltage, magnetically insulated transmission lines. The magnetic insulation is predicted to undergo electrical breakdown at a distance $\sim z_p$ providing a termination for the transmission line. At the termination the Poynting flux is transformed into particle kinetic energy. The remaining fraction of the energy is directed outward, and under appropriate conditions it gives rise to electromagnetic cascade showers. The showers result in collimated, $\pm z$ directed beams of electrons, positrons, and gamma rays. The relevant shower equations of Burns and Lovelace have been integrated numerically to determine the ratio of the energy in the gamma rays to the energy in the electrons and positrons for different physical conditions. The electron-positron beams are eventually stopped and scattered in pitch angle by the ram pressure of an external medium. Synchrotron radiation of the scattered electrons and positrons produces the observed radio lobes. (50 refs.)

116838 Compactness and pair production in active galactic nuclei. M.Salvati (European Southern Obs., Garching, Germany), A.Cavaliere, E.Costa, E.Massaro. *AIP Conf. Proc. (USA)*, no.101, p.332-6 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). Barring relativistic bulk motions, the continuum emitted by AGNs implies very compact sources. The authors find that the compactness parameter $k=L_c/R$ cannot, especially in the X-ray band, exceed a level interestingly close to the current data. In sources driven by high energy electrons, the main limitation is associated with pair production by heavily absorbed, inverse-Compton gamma-rays. (13 refs.)

116839 Discovery of a large intergalactic H I cloud in the M96 group. S.E.Schneider (Nat. Astron. & Ionosphere Center, Cornell Univ., Ithaca, NY, USA), G.Helou, E.E.Salpeter, Y.Terzian. *Astrophys. J. Lett. Ed. (USA)*, vol.273, no.1, pt.2, p.L1-5 (1 Oct. 1983). The authors report the discovery of an intergalactic H I cloud, found in the western part of the Leo group of galaxies, using the Arecibo 21 cm system. The cloud has a systemic radial velocity of about 960 km s⁻¹. The emission is found mainly in a region approximately 100 kpc long by 30 kpc wide midway between M96 and M105. The nominal H I mass of the whole cloud is about $10^9 M_\odot$. However, because of the low rate of collisional excitation, M_{HI} may be substantially underestimated for this cloud. The velocity structure of the cloud gives an indicative gravitational mass of at least $2 \times 10^{10} M_\odot$. (25 refs.)

116840 Einstein observations of NGC 4438: dynamical ablation of gas in the Virgo Cluster. C.Kotanyi (European Southern Obs., Garching, Germany), J.H.van Gorkom, R.D.Ekers. *Astrophys. J. Lett. Ed. (USA)*, vol.273, no.1, pt.2, p.L7-9 (1 Oct. 1983). High-resolution observations are presented of the X-ray emission of the peculiar galaxy NGC 4438 in the center of the Virgo Cluster. The observations, made with the HRI on the Einstein Observatory show a compact source (size $\leq 10''$) near the center of the galaxy with a luminosity $L_x = 1.5 \times 10^{39} \text{ ergs s}^{-1}$ (0.1-2 keV) and an extended region of emission about 3 kpc in size and with a luminosity $L_x = 3 \times 10^{39} \text{ ergs s}^{-1}$ situated asymmetrically to the NW of the galaxy. The asymmetry is similar to the asymmetry in the radio emission and could be due to ram-pressure sweeping of the interstellar gas from the disk of the galaxy. (16 refs.)

116841 VLA radio continuum observations of the edge-on spiral galaxy NGC 3079. N.Duric, E.R.Seaquist (Dept. of Astron., Univ. of Toronto, Toronto, Ontario, Canada), P.C.Crane, R.C.Bignell, L.E.Davis. *Astrophys. J. Lett. Ed. (USA)*, vol.273, no.1, pt.2, p.L11-15 (1 Oct. 1983). Radio continuum VLA maps of the edge-on spiral galaxy NGC 3079 are presented at 1.4 and 4.9 GHz. Extensions of emission along the minor axis are resolved at 4.9 GHz into lobes and bridges. The eastern component consists of a highly polarized ring-shaped lobe connected by a thin bridge to the central region of the galaxy and has an integrated flux density of 70 mJy at 1.4 GHz. The western component has an incomplete lobe, also connected to the center of the galaxy by a thin bridge and has a flux density of 90 mJy at 1.4 GHz. At 4.9 GHz, a nuclear point source (size <100 pc at a distance of 24 Mpc) has a flux density of 87 mJy. (15 refs.)

116842 The bend in the correlation function: the surviving imprint of adiabatic perturbations? A.L.Melott (Dept. of Phys. & Astron., Univ. of Pittsburgh, Pittsburgh, PA, USA). *Astrophys. J. Lett. Ed. (USA)*, vol.273, no.1, pt.2, p.L21-5 (1 Oct. 1983). Results are presented from numerical analysis of a two-dimensional simulation of the clustering of collisionless particles. The initial perturbation spectrum was cut off to simulate damping (as in the adiabatic theory of galaxy formation). The two-point correlation function was driven to a power law at small scales and remained small at large scales during nonlinear 'pancaking'.

There were small ($\sim 10^{-1}$) imprints of large-scale power in the form of bumps in the covariance function. During nonlinear evolution, these bumps were found to cause a downward bend in the correlation function, as observed in sky surveys. If the primordial spectral index was 0 or 1, anticorrelation was found just outside this bend. (23 refs.)

116843 Luminous molecular hydrogen emission in the galaxy system NGC 3690-IC 694. J.Fischer (E.O. Hulbert Center for Space Res., Naval Res. Lab., Washington, DC, USA), M.Simon, J.Benson, P.M.Solomon. *Astrophys. J. Lett. Ed. (USA)*, vol.273, no.1, pt.2, p.L27-30 (1 Oct. 1983). The authors report the detection of line emission of vibrationally excited H_2 from the galaxy system NGC 3690-IC 694. The line emission is distributed within the system. The total observed luminosity in the H_2 $v=1-0$ S(1) line alone is approximately $1.5 \times 10^7 L_\odot$. The authors also detected Br γ line emission from the system; its observed luminosity indicates that at least 4×10^{34} ionizing photons per second are required to maintain ionization of the H II. The H_2 is probably heated by shocks, and the mass of hot H_2 exceeds $2 \times 10^4 M_\odot$. (25 refs.)

116844 Upper limits to O III $\lambda 5592$ and [Ni IX] $\lambda 4594$ in Seyfert galaxies. D.E.Osterbrock (Inst. for Advanced Study, Princeton, NJ, USA), O.Dahari, J.O.Ekberg. *Astrophys. J. Lett. Ed. (USA)*, vol.273, no.1, pt.2, p.L31-4 (1 Oct. 1983). Observational upper limits are given to the strengths of the undetected emission lines O III $\lambda 5592$ and [Ni IX] $\lambda 4594$ in several well-observed Seyfert galaxies. The $\lambda 5592$ upper limits show that the O III charge-exchange process does not contribute appreciably to the observed strength of $\lambda 4363$ and thus does not appreciably modify the [O III] intensity ratio from which the temperature in the O^{++} zone is derived. The $\lambda 4594$ upper limits are consistent with 'normal' abundance ratios Ni:Fe ≈ 0.1 in these objects, but would not be consistent with Ni:Fe ≈ 1 . (19 refs.)

116845 Standard photometric diameters of galaxies. P.Fouque (Obs. de Meudon, DERADN, Meudon, France), G.Paturel. *Astron. & Astrophys. Suppl. Ser. (France)*, vol.53, no.3, p.351-9 (Sept. 1983). A sample of mean standard major axis diameters and axis ratios at 25 mag.arcsec $^{-2}$ and 26.5 mag. arcsec $^{-2}$ brightness levels for 237 galaxies has been built from new measurements and from a compilation in the literature. Only the best data are kept according to the results of intercomparisons in order to give a good reference sample of mean diameters. This sample will be used to reduce visual apparent diameters given in large catalogs to a homogeneous system. (18 refs.)

116846 High-resolution optical observations of NGC 3379. II. On the derivation of the East-West profile. J.-L.Nieto (Observatoires du Pic-du-Midi et de Toulouse, Bagneres-de-Bigorre, France). *Astron. & Astrophys. Suppl. Ser. (France)*, vol.53, no.3, p.383-93 (Sept. 1983). For pt.I see *ibid.*, vol.53, no.2, p.247-53 (1983). Presents high-resolution observations (FWHM $\sim 0.5''$ - $1.0''$) of the luminosity standard NGC 3379 obtained with the CHF telescope, and new regular-resolution data. The problems related to photography at high resolution are discussed. The consistency and accuracy of the new material are checked against previous data analysed in paper I (Nieto, 1983). Following the method of de Vaucouleurs and Capaccioli (1979), the composite high-resolution East-West profile of NGC 3379 is derived. (19 refs.)

116847 An H α [N II] survey of the nuclei of a complete sample of spiral galaxies. W.C.Keel (Lick Obs., Univ. of California, Santa Cruz, CA, USA). *Astrophys. J. Suppl. Ser. (USA)*, vol.52, no.3, p.229-39 (July 1983). New spectrophotometry of the nuclei of an optically complete sample of 93 spiral galaxies brighter than integrated magnitude $B_T=12.0$ is presented. All the nuclei exhibit emission lines. These are divided into those produced by stellar photoionization (H II regions) and low-ionization emission regions. In addition, five Seyfert nuclei occur in this sample, including one (NGC 4941) not previously identified. Relations between nuclear luminosity and emission-line luminosity, and between the character of the emission spectrum and line luminosity, are presented. (25 refs.)

116848 The reddening of radio elliptical galaxies. W.B.Sparks (Dept. of Appl. Maths. & Astron., Univ. Coll., Cardiff, Wales). *Mon. Not. R. Astron. Soc. (GB)*, vol.204, no.3, p.1049-66 (Sept. 1983). The photometric properties of radio-emitting and radio-quiet elliptical galaxies are compared. A statistically significant reddening of the radio ellipticals is evident for galaxies of a given optical luminosity. There is also evidence that radio ellipticals display less scatter in their colours. The reddening is interpreted as being due to extinction by dust within the radio ellipticals, requiring $\sim 10^6 M_\odot$ of gas. This supports the idea that a high gas content and nuclear activity are related, and may be accommodated within the framework of galactic wind models. (51 refs.)

116849 High-resolution images of the galactic centre. D.A.Allen (Anglo-Australian Obs., Epping, NSW, Australia), A.R.Hyland, T.J.Jones. *Mon. Not. R. Astron. Soc. (GB)*, vol.204, no.3, p.1145-52 (Sept. 1983). The authors present grey-scale images of the central 45 arcsec 2 region around the galactic centre at 2.2 μ m. The region is resolved into a great number of point sources whose distribution peaks strongly on the nonthermal radio source. The surface brightness distribution appears cusped. If this represents an isothermal spherical distribution of stars, then its innermost core must be smaller than that of any globular cluster, and very much smaller than that of M31. Alternatively, a large, compact mass lies within the central 2 arcsec. The luminosity function of the point sources is steeper than that of the old disc population. (27 refs.)

116850 The galactic nucleus. J.W.V.Storey, D.A.Allen (Anglo-Australian Obs., Epping, NSW, Australia). *Mon. Not. R. Astron. Soc. (GB)*, vol.204, no.3, p.1153-61 (Sept. 1983). The authors have observed the immediate vicinity of the galactic centre at optical and infrared wavelengths, and present images at 1.0, 1.2 and 2.2 μ m. A detailed map is given of the Brackett γ emission in the region, together with some measurements of the CO absorption at 2.3 μ m. By relating all positional measurements to the Perth catalogue, the authors locate the optical, infrared and radio data to a relative accuracy of 0.4 arcsec. (34 refs.)

116851 The high-ionization optical spectrum of the Seyfert galaxy Tololo 0109-383. R.A.E.Fosbury (Royal Greenwich Obs., Hailsham, England), A.E.Sansom. *Mon. Not. R. Astron. Soc. (GB)*, vol.204, no.3, p.1231-6 (Sept. 1983). Optical emission line intensity measurements are presented of the high-ionization Seyfert galaxy T 0109-383. Using the transauroral to nebular ratios of [O II] and [S II], the extinction to the forbidden line region is found to be $A_v=1.6$ mag. The reddening corrected [Fe VII] spectrum indicates a temperature and an electron density in the high-ionization zone of $<3.5 \times 10^4$ K and 2×10^6 cm $^{-3}$ respectively. While this supports the notion that the higher ions are photoionized in Seyfert galaxies, a significantly higher assumed value of the extinction ($A_v > 2$ mag) to the high-ionization

zone would be consistent with an [Fe VII] temperature of $\sim 10^5$ K and collisional ionization. (20 refs.)

116852 Central distribution of the near-infrared colours in two early-type spirals. T.J.Jones, A.R.Hyland (Mount Stromlo & Siding Spring Obs., Res. School of Phys. Sci., Australian Nat. Univ., Canberra, Australia), I.Gatley. *Mon. Not. R. Astron. Soc. (GB)*, vol.204, no.3, p.1263-7 (Sept. 1983). Point J-K colours at a number of positions in the galaxies NGC 7814 and 5746 are presented. The variation of colour with position is strongly correlated with the location of the optically visible disc component in both galaxies. This supports the conclusion of Griensmith, Hyland and Jones (1982) that the UVK and JHK colours for early-type spirals (with colours different from ellipticals) are due to contamination of the pure bulge light by a young dusty disc component. (6 refs.)

116853 Redshifts of five extragalactic radio sources. P.J.Warner, J.M.Riley, S.A.Eales, A.J.B.Downes, J.E.Baldwin (Mullard Radio Astron. Obs., Cambridge, England). *Mon. Not. R. Astron. Soc. (GB)*, vol.204, no.3, p.1279-83 (Sept. 1983). Redshifts have been measured for five optical objects associated with extragalactic radio sources. They are 0.1047, 0.1204, 0.0837 and 0.0600 for the radio galaxies 0908+37, 1141+37, 1227+11 and 1739+17 respectively and 0.2842 for the quasar 1255+37. (11 refs.)

116854 Slippery evidence on the Galaxy's invisible heavy halo. D.Lyndén-Bell (Inst. of Astron., Obs., Cambridge, England), R.D.Cannon, P.J.Godwin. *Mon. Not. R. Astron. Soc. (GB)*, vol.204, no.3, p.87P-92P (Sept. 1983). New measurements have been made of the velocities of carbon stars in the Carina and other dwarf galaxies, and of the planetary nebula in Fornax. Carina, previously thought to be the Galaxy's fastest moving satellite, is shown instead to be moving very slowly. The new result for Carina combined with the revised velocity of Sculptor (and a new distance reported for Palomar 1) removes some of the evidence for a heavy halo. The best modern data on all the nine satellites of the Galaxy now yield a total mass out to about 100 kpc of $(2.6 \pm 0.8) \times 10^{11} M_\odot$. (28 refs.)

116855 Six quasars near the jets of NGC 1097. R.D.Wolstencroft (Royal Obs., Edinburgh, Scotland), W.H.-M.Ku, H.C.Arps, S.M.Scarrott. *Mon. Not. R. Astron. Soc. (GB)*, vol.205, no.1, p.67-80 (Oct. 1983). Six quasars have been discovered in a 0.43 deg 2 field surrounding NGC 1097. The quasars are grouped in a small area of the field: five of the quasars lie within the area defined by the jets emanating from the galaxy. Four of the quasars are clearly detected in a deep X-ray map of the field. The probability of finding such an unusual configuration is discussed. (32 refs.)

116856 The galactic extinction towards Maffei 1. R.J.Buta, M.L.McCall (Dept. of Astron. & McDonald Obs., Univ. of Texas, TX, USA). *Mon. Not. R. Astron. Soc. (GB)*, vol.205, no.1, p.131-52 (Oct. 1983). The extinction of Maffei 1 has been measured by two new techniques. First, BV aperture photometry has been performed to obtain the colour excess from standard aperture-colour relations for early-type galaxies. Secondly, millimetre and radio observations of galactic CO and H I are used to calculate the total hydrogen column density along the line-of-sight, and thereby estimate the colour excess from the local dust-to-gas ratio. After consideration of all extinction measurements to date, it is concluded that $A_v=5.1 \pm 0.2$ mag. The isophotal diameter and the corrected apparent visual magnitude are estimated making Maffei 1 one of the biggest and brightest galaxies in the sky. The distance is found, indicating that Maffei 1 is probably associated with the Ursa Major-Camelopardalis cloud, not the Local Group. (45 refs.)

116857 Active galactic nuclei: IUE results on continuum, emission and absorption lines. G.C.Perola (Istituto Astron., Univ. di Roma, Roma, Italy). *Mem. Soc. Astron. Ital. (Italy)*, vol.54, no.2, p.385-97 (1983). Concentrates on results obtained with IUE concerning the continuum, emission and absorption lines. The reddening correction, the UV continuum and UV lines are discussed. (59 refs.)

116858 Far ultraviolet observations of BL Lac objects. L.Maraschi (Dipartimento di Fisica, Univ. di Milano, Milano, Italy), E.G.Tanzi, A.Treves. *Mem. Soc. Astron. Ital. (Italy)*, vol.54, no.2, p.399-413 (1983). These objects are discussed first with special regard to the overall energy distribution. The two cases of recorded UV observations are summarized, and some general considerations on the 'average spectrum' are advanced. (51 refs.)

116859 The UV spectrum of elliptical galaxies. F.Bertola, M.Capaccioli (Istituto di Astron., Univ. di Padova, Padova, Italy). *Mem. Soc. Astron. Ital. (Italy)*, vol.54, no.2, p.415-17 (1983). Examines IUE spatial and spectral resolution of the flux forming the so-called UV rising branch of E galaxies. (7 refs.)

116860 Is the polarisation of NGC 1068 evidence for a non-thermal source? I.S.McLean (Royal Obs., Univ. of Edinburgh, Edinburgh, Scotland), C.Aspin, S.R.Heathcote, M.J.McCaughrean. *Nature (GB)*, vol.304, no.5927, p.609-11 (18 Aug. 1983). Unresolved questions concern the nature and relationship of the sources of the excess flux seen in the UV and IR, their connection with the collimated jets apparent in high-resolution radio maps and their association with the extended region responsible for the broad emission lines. A further question is the location of any dust and its role in modifying the optical and UV spectrum. The authors report observations with two high-resolution optical spectropolarimeters which throw new light on these questions. The authors conclude that dilution by starlight modifies the polarisation to an extent not previously appreciated. In fact, the polarisation of the non-stellar flux in the optical and near IR is approximately independent of wavelength with a direction orthogonal to that of the radio jets. (33 refs.)

116861 Neutrino-gaseous 'Pancakes' and the problem of hidden mass. A.G.Doroshkevich. *Pis'ma v Astron. Zh. (USSR)*, vol.9, no.8, p.451-5 (1983). In Russian. English translation in: *Sov. Astron. Lett. (USA)*. Taking into account the peculiar velocities of neutrinos the gaseous component is shown to dominate in the central part of a cosmological 'pancake'. Therefore fragmentation of a gaseous 'pancake' and later clustering of the fragments into galaxies and groups of galaxies are determined by velocity distribution and self-gravity of the gaseous component. The hidden mass is formed by capture of neutrinos by clustering clouds. The formation of clusters of galaxies is connected with perturbations embracing the entire neutrino gaseous 'pancake'. 98.50K Groups, clusters, superclusters

116862 The Hydra I cluster of galaxies. II. First results from H I-observations. O.G.Richter, W.K.Huchtmeier (Max-Planck-Inst. fur Radioastron., Bonn, Germany). *Astron. & Astrophys. (Germany)*, vol.125, no.2, pt.1, p.187-92 (Sept. 1983). For pt.1 see ibid., vol.111, no.1, p.193-200 (1982). H I 21 cm-line observations of 42 galaxies in the field of the Hydra I (=Abell 1060) cluster are presented. 17 galaxies have been detected, raising the number of known redshifts in the area of the Hydra I cluster to 96. Although the authors detected only a few galaxies, they find evidence for an increase of the H I-deficiency factor radially inwards to the centre of the cluster. The distance modulus of the Hydra I cluster relative to the Virgo cluster from the (blue magnitude) Tully-Fisher relation ($2.68^m \pm 0.21^m$) is in agreement with other determinations and with the value based on the ratio of cluster redshifts ($2.61^m \pm 0.15^m$). Thus a constraint to the infall velocity of the Local Group toward the Virgo cluster is given to values less than 350 km s⁻¹. (34 refs.)

116863 Galaxy groups: correlations between luminosities, velocity dispersions, and virial radii. M.Mezzetti, G.Giuricin, M.L.Malagnini, F.Mardirossian (Osservatorio Astron. di Trieste, Trieste, Italy). *Astron. & Astrophys. (Germany)*, vol.125, no.2, pt.1, p.368-70 (Sept. 1983). Considers selection and contamination effects in a subsample of 49 groups extracted from the new, three-dimensional, catalogue of groups of galaxies made by Huchra and Geller (1982). It is possible to subdivide the groups into two sets: those (20) having the logarithm of the recession velocity smaller than 3.2, and the others with log W>3.2 (29). The nearer groups are little affected by selection effects and contain only a moderate fraction of interlopers (which is almost constant with the distance) while the opposite holds for the farther groups. The latter subsample of groups adds 'noise' when the correlations between the logarithms of the virial parameters are evaluated, and one is thus led to regard as reliable only the estimates based on the nearer groups. The most significant correlation turns out to be the one between the logarithms of the total luminosity and the velocity dispersion. (9 refs.)

116864 Poor evidence of merging in loose galaxy groups. F.Mardirossian, G.Giuricin, M.Mezzetti (Osservatorio Astron. di Trieste, Trieste, Italy). *Astron. & Astrophys. (Germany)*, vol.126, no.1, pt.2, p.86-8 (Sept. 1983). By examining a sample extracted from Huchra and Geller's (1982) catalogue of galaxy groups, poor evidence is found of galactic cannibalism. In particular, the correlations of the magnitude difference between the two brightest members of each group with group compactness or dynamical times turn out not to be significant. (11 refs.)

116865 The evolution of galaxies in clusters. III. Photometry of 17 intermediate redshift clusters. H.Butcher (Kitt Peak Nat. Obs., Tucson, AZ, USA), A.Oemler,Jr., D.C.Wells. *Astrophys. J. Suppl. Ser. (USA)*, vol.52, no.3, p.183-228 (July 1983). For pt.II see *Astrophys. J.*, vol.226, no.2, pt.1, p.559-65 (1978). The authors present photometry in two bands of 17 rich clusters of galaxies with redshifts between 0.17 and 0.39. Fifteen of the clusters were studied on *J* and *F* (or in case *N*) plates taken at the prime focus on the KPNO and CTIO 4 m telescopes. Two clusters were observed in *V* and *R* with the KPNO video-camera on the 2.1 m telescope. Photometry extends to, typically, a red magni-

tude of 22 mag, although there is some incompleteness near the limit. From internal error indicators, the colors are estimated to be accurate to, typically, 0.13 mag at a red magnitude of 21. (17 refs.)

116866 The Ursa Major supercluster. II. A statistical analysis of the radio survey. N.J.Schuch (Mullard Radio Astron. Obs., Cambridge, England). *Mon. Not. R. Astron. Soc. (GB)*, vol.204, no.3, p.1245-56 (Sept. 1983). For pt.1 see ibid., vol.196, no.2, p.695-704 (1981). A statistical analysis of the 5C 10 radio survey of the Ursa Major supercluster is used to derive estimates for the radio luminosity distribution of the central cluster (Abell 1318) and the whole supercluster. Galaxies within the supercluster only form about 12 per cent of the total number of radio sources, and only 3 per cent of the galaxies were detected. The overall radio source counts and spectral-index distribution are compatible with previous 5C surveys, but there is a significant difference between the spectral-index distribution and that found for more intense sources. This difference has implications for the radio source counts. (20 refs.)

116867 Identification of a blue object with a newly detected X-ray source. E.H.Geyer, M.Hoffmann (Obs. Hoher List, Univ. Sternwarte Bonn, Daun, Germany). *Astrophys. & Space Sci. (Netherlands)*, vol.94, no.2, p.291-3 (Aug. 1983). A blue object was identified on POSS prints. Its position coincides with an X-ray source (α 15^h07^m01^s, σ +40°18'7") found by the HEAO-B satellite. (2 refs.)

98.70D Discrete radio sources

116868 31.4 GHz flux density measurements of a complete sample of sources from the 5-GHz S5 survey. B.J.Geldzahler (E.O. Hulburt Center for Space Res., Naval Res. Lab., Washington, DC, USA), H.Kuhr. *Astron. J. (USA)*, vol.88, no.8, p.1126-32 (Aug. 1983). Measurements at 31.4-GHz (9.5-mm) are presented for the complete sample of 66 radio sources with declinations greater than +70° and 5-GHz flux densities greater than 0.5 Jy. About half the sources have the flat radio spectra characteristic of objects with compact components radiating most strongly in the mid-centimeter wavelength range, and about one third show evidence of very compact components ($\theta \leq 0.0001''$) radiating at short centimeter wavelengths regardless of morphological type. The median spectral index of all the sources, the quasars alone, and the galaxies alone tends to flatten with increasing frequency for steep spectrum sources, whereas a steepening was found with increasing frequency for the flat spectrum sources. (16 refs.)

116869 Flux density and linear polarization measurements of variable radio sources at λ 900 mm (33.5 GHz). A.M.Flett, C.Henderson. *Mon. Not. R. Astron. Soc. (GB)*, vol.204, no.3, p.1285-9 (Sept. 1983). Measurements of the flux densities of 12 extragalactic sources at λ 9 mm throughout 1980 June to 1982 March are presented. This period includes the decay of the 1980 outburst of BL Lac. Measurements of the integrated linear polarization of the stronger sources are also given and compared with those of other observers. 98.70J Quasars

- 116870 High precision astrometry via very-long-baseline radio interferometry: estimate of the angular separation between the quasars 1038+528A and B. J.M.Marcaide, I.I.Shapiro (MIT, Cambridge, MA, USA). *Astron. J. (USA)*, vol.88, no.8, p.1133-7 (Aug. 1983).
- Dual-wavelength VLBI observations with the Mark III system of the two radio quasars 1038+528A and B yield the following relative positions for the epoch 17 March 1981 (1950.0 coordinate system): $\Delta\alpha_{B-A} = 2.1205009'' \pm 0.0000002''$; $\Delta\delta_{B-A} = 27.429228'' \pm 0.000003''$ ($\lambda 3.6$ cm); $\Delta\alpha_{B-A} = 2.1204408'' \pm 0.0000006''$; $\Delta\delta_{B-A} = 27.428622'' \pm 0.000009''$ ($\lambda 13$ cm). The statistical standard errors represent fractional uncertainties of about 1 and 3 parts in 10^7 for $\lambda 3.6$ and $\lambda 13$ cm, respectively. The position of the brightest CLEAN component is chosen as the reference in each source at each wavelength. The difference found in the separations of these points at the two wavelengths, about $0.0008''$, is statistically very significant and probably represents the effect of wavelength-dependent opacity in the quasar 1038+528A (Marcaide and Shapiro 1983); plasma refraction contributes negligibly. Earlier, lower precision observations of these sources at these two wavelengths yield relative positions consistent with those from the March 1981 epoch. (8 refs.)
- 116871 Magnitude and redshift distributions of QSOs. D.Basu (Dept. of Phys., Univ. of the West Indies, St. Augustine, Trinidad). *Astrophys. & Space Sci. (Netherlands)*, vol.94, no.2, p.463-8 (Aug. 1983).
- The peak in the distribution of apparent magnitude (V) of QSOs at 18.0 can be explained by loss of QSOs for $V \leq 18.0$ arising out of selection effects due to the availability of search lines necessary for the determination of redshifts and due to the misidentification of QSOs as main-sequence stars. For $V > 18.0$, the number of objects seem to fall off as they become progressively fainter and detection efficiency goes down. The present analysis also shows that a strong correlation exists between apparent magnitude and redshift of QSOs indicating redshifts are of cosmological origin. (6 refs.)
- 116872 A VLBI search for compact components in extended high redshift quasars. P.D.Barthel (Sterrewacht Leiden, Leiden, Netherlands). *Astron. & Astrophys. (Germany)*, vol.126, no.1, pt.2, p.16-21 (Sept. 1983).
- Sensitive 21 cm VLBI observations of components in extended high-redshift quasars have been made with the European network. In most sources in the sample, compact (< 1 kpc) components of varying complexity were detected; these components account for a substantial fraction of the total source flux density. Identification with hot spots in the radio lobes was possible in most cases. Some ultracompact hot spots were detected with energy densities of the order of 10^{-6} erg/cm³. Two kpc-size double sources at redshifts of 1.875 and 2.594 have been found. Correlations between 'compactness' and other parameters are briefly discussed, as well as cosmological implications. 98.70Q X-ray and gamma-ray sources

- 116873 An optical test for the distance of gamma-ray burst sources. M.C.Jennings (Inst. of Geophys. & Planetary Phys., Univ. of California, Riverside, CA, USA). *Astrophys. J. (USA)*, vol.273, no.1, pt.1, p.309-19 (1 Oct. 1983).
- The possibility of observable H α produced by gamma-ray burst optical radiation reacting with a neutral hydrogen ambient medium is investigated. The ionization structure surrounding galactic bursts is determined by the hydrogen ionizing luminosity, L_1 , and geometric dilution when the ambient number density, N_H , is ≤ 15 cm⁻³. A model describing the H α fluence is derived and evaluated for representative L_1 and N_H . Optical bursts are classified into three groups based on the production of H α flux within (group 1), in the vicinity of (group 2), or beyond (group 3) the total ionization zone radius, R_1 . Analytic expressions estimate R_2 or its lower limit for group 1 and R_3 and N_H for groups 2 and 3. (24 refs.)
- 116874 Detection of an extended soft X-ray source H 2326-79 in the southern sky. P.C.Agrawal (Tata Inst. of Fundamental Res., Bombay, India), G.R.Riegler, K.P.Singh. *Astron. & Astrophys. (Germany)*, vol.126, no.1, pt.2, p.70-4 (Sept. 1983).
- Reports the detection of a new extended soft X-ray source H 2326-79 with the low energy detectors of the HEAO-1 A-2 experiment. The source has an angular size of $\sim 2.5''$ and is centered at RA(1950)=23^h26^m. Decl.(1950)=-79°24'. The observed energy flux, seen mainly in the 0.18-0.4 keV band, is about 2.6×10^{-11} erg cm⁻² s⁻¹. The source spectrum fits well with either an exponential model or with a Raymond Smith plasma model; the best fit values of temperature and hydrogen column density for the two models being: $T = 8 \times 10^5$ K and $N_H = 2 \times 10^{20}$ cm⁻² and $T = 6.3 \times 10^5$ K and $N_H = 1.6 \times 10^{20}$ cm⁻². (34 refs.)
- 116875 Gamma ray bursts. K.Hurley (Centre d'Etude Spatiale des Rayonnements, Toulouse, France). *AIP Conf. Proc. (USA)*, no.101, p.21-35 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983).
- The time histories, size spectrum, spatial distribution, and repetition rates of gamma ray bursts are reviewed briefly. Evidence for a neutron star origin for gamma ray bursts may be found in many of these aspects of bursters. New results from optical searches are described. Substantial progress has been made recently in the optical identification of the 1978 November 19 burst. (57 refs.)
- 116876 Energy spectra of the cosmic gamma-ray bursts. E.P.Mazets, S.V.Golenetskii, Yu.A.Guryan, R.L.Aptekar, V.N.Ilyinskii, V.N.Panov (A.F. Ioffe Phys.-Tech. Inst., Leningrad, USSR). *AIP Conf. Proc. (USA)*, no.101, p.36-53 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983).
- Preliminary results of a spectroscopic study of gamma bursts in the KONUS experiment on Venera 13 and 14 are surveyed. A brief description is given of the new instrumentation and data treatment procedure used. The characteristics of continuous spectra and of the absorption and emission features are considered. Evidence is presented for a fast spectral variability and a strong positive correlation between the hardness of the spectrum and gamma-ray intensity which suggests that the instantaneous values of the source luminosity are determined by the temperature in the emitting region. (22 refs.)
- 116877 Fine time resolution spectral analysis of the 1978 November 4 and 19 gamma-ray bursts. C.Barat (Centre d'Etude Spatiale des Rayonnements, Toulouse, France). *AIP Conf. Proc. (USA)*, no.101, p.54-8 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983).
- The French SIGNE experiments aboard the Soviet Venera probes allow a spectral analysis with a time resolution of 250 ms. From a study of the intense 1978 November 4 and 19 gamma-ray bursts, evidence is presented for (a) a significant evolution in the continuum spectra, (b) the appearance on a time scale of several hundred ms of spectral features such as emission lines around 400 keV, absorption lines ($E < 200$ keV), and a high energy cutoff ($E > 1$ MeV). (9 refs.)
- 116878 Upper limits on narrow annihilation lines in gamma-ray bursts. P.L.Nolan, G.H.Share (Naval Res. Lab., E.O. Hulburt Center for Space Res., Washington, DC, USA), D.J.Forrest, E.L.Chupp, S.Matz, E.Rieger. *AIP Conf. Proc. (USA)*, no.101, p.59-63 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983).
- The SMM gamma ray experiment has observed 60 gamma-ray bursts from March 1980 to August 1982. Details of one burst are illustrated. There is weak evidence for a broadened spectral feature early in the burst which was also detected by the Konus experiment. The detailed search was limited to narrow lines (< 70 keV FWHM) near 500 keV; the authors find none in any of the bursts. This absence contrasts with the reported detection of several broader features. The authors discuss the implications for the physical conditions in the annihilation region. (11 refs.)
- 116879 Theories of gamma-ray bursts. Katz, J.I. (Washington Univ., St. Louis, MO, USA). *AIP Conf. Proc. (USA)*, no.101, p.65-75 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983).
- Gamma ray bursts have remained an enigma for a decade. This is attributable to the difficulty of obtaining accurate positions, the low duty cycle of burst sources which prevents planned observations, and their low mean power which rules out arguments based on gross energetics. Several lines of evidence now point to an origin in neutron star magnetospheres. The evidence includes spectral features interpreted as cyclotron and gravitationally redshifted annihilation lines, and temporal periodicity interpreted as rotation. The reason for the outbursts remains as much a mystery as when they were first discovered. It is unclear whether gamma ray bursters are located in binary stars, or whether this is incidental or essential to their activity. It is not known if there is any evolutionary connection or physical resemblance between gamma ray bursters and pulsars or accretional X-ray sources. The author discusses some of the problems which arise in constructing models for gamma ray bursters, with particular attention to the event of March 5, 1979, physical processes at high energy density, and the role of electron-positron pairs in producing line and continuum radiation. (21 refs.)
- 116880 Emission model of gamma-ray bursts. E.P.Liang (Lawrence Livermore Nat. Lab., Univ. of California, Livermore, CA, USA). *AIP Conf. Proc. (USA)*, no.101, p.76-88 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983).
- Reviews the emission mechanisms of cosmic gamma-ray bursts. In particular, the thermal synchrotron model is discussed in detail as the most viable mechanism for the majority of the continuum emission. Within this framework various information about the source region can be extracted. The picture that emerges is that of a hot ($kT = 2-1.0$ mc²), thin sheet of dense pair-dominated plasma emitting via cyclo-synchrotron radiation in a strong magnetic field ($B \sim 10^{11}$ to 10^{12} gauss). Speculations on the origin and struc-

ture of this sheet are attempted. The author briefly discusses the problem of high-energy photons above pair production threshold escaping from the source. (26 refs.)

116881 A fireball model for the March 25, 1978 gamma ray burst. G.J.Hueter, R.E.Lingenfelter (Center for Astrophys. & Space Sci., Univ. of California, La Jolla, CA, USA). *AIP Conf. Proc. (USA)*, no.101, p.89-93 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). Suggests that the bulk of the gamma ray emission in the March 25, 1978 burst comes from a fireball of photons and e^+ pairs expanding from a jet off the polar cap of a neutron star and that the duration of the burst is defined by the expansion and dissipation times of the fireball. This model enables one to determine the total energy, $\sim 10^{39}$ ergs, and the distance, ~ 1 kpc, of the burst and should be applicable to a large class of gamma ray bursts. (12 refs.)

116882 Positrons from gamma bursts. S.A.Colgate, A.G.Petschek (Univ. of California, Los Alamos Nat. Lab., Los Alamos, NM, USA). *AIP Conf. Proc. (USA)*, no.101, p.94-7 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). The authors propose that the mechanism for the production of the hard spectrum of photons observed in the typical gamma burst is associated with the charge separation and electron-photon heating of Eddington limited accretion onto a neutron star. The charge separation occurs because of the radiation stress on the electrons and the gravitational stress on the ions and amounts to some 100 to 1000 volts cm^{-1} depending upon whether the accreting matter is dynamically decelerated by radiation or is accreted in quasistatic, steady flow. A positron produced in pair formation by the high energy part of the photon spectrum will be accelerated by both the radiation stress and the electrostatic field. Since for electrons these two stresses are equal and opposite, a positron will attain an energy significantly greater than the purely radiation driven free expansion limit where for these conditions $(1-\beta^2)^{0.5} = \gamma_{rel} \approx [(m_e MG/r)/(m_e c^2)]^{1/2} \approx 4$. This value of γ_{rel} is near the threshold for pair production on additional in-falling matter. Only electrostatic acceleration can produce significantly greater velocities. Hence the number of positrons produced will be much less than the number of high energy photons, but may contribute to the limitation of the photon heating by shorting out the electric field. (9 refs.)

116883 The quest for elusive Geminga: a unique object proposed as the counterpart of 2CG 195+04. P.A.Caraveo, G.F.Bignami (Istituto di Fisica Cosmica del CNR Milano, Milano, Italy), R.C.Lamb. *AIP Conf. Proc. (USA)*, no.101, p.152-6 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). Geminga is the brightest unidentified source in the COS-B catalogue, second only to the Vela pulsar PSR 0833-45, with a flux limit of 5×10^{-6} photons $(>100 \text{ MeV})/cm^2 \cdot s$, $\sim 2.4 \times 10^{-9}$ ergs $cm^{-2} \cdot s$ in the interval 50 MeV-3 GeV. The source, discovered during the SAS-2 mission, was repeatedly observed by COS-B. No long term variability was found. Short term variability was also actively sought, with no convincing success. The long observation times devoted by COS-B to Geminga, coupled with the relatively hard spectrum of the source allow for a positional accuracy unusually high for current γ -ray astronomy: the error box, centered at $l=195.1^\circ$ and $b=4.2^\circ$, has a radius of ~ 24 arcmins. The complete γ -ray error box could thus be contained in a single Einstein IPC field, providing a unique opportunity for in-depth search in the keV region. The several sources found were investigated at radio and optical wavelengths, leading to some identifications. (18 refs.)

116884 Criteria for grasar action in astrophysical sources. J.M.McKinley, R.Ramaty (Lab. for High Energy Astrophys., NASA/Goddard Space Flight Center, Greenbelt, MD, USA). *AIP Conf. Proc. (USA)*, no.101, p.428-32 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). The theory of gamma-ray amplification through stimulated annihilation radiation (grasar) was developed by Ramaty, McKinley and Jones (1982). For gamma-ray bursts similar to the March 5, 1979 burst, an observed annihilation line of width <0.03 MeV would imply a grasar source. The minimum pair density needed for the onset of grasar action is $\sim 10^{30} \text{ cm}^{-3}$ and the peak of the grasar line, without a gravitational redshift, is at <0.5 MeV. (8 refs.)

116885 Pair production and non-thermal radio stars. W.T.Vestrand (Nat. Radio Astron. Obs., Charlottesville, VA, USA). *AIP Conf. Proc. (USA)*, no.101, p.433-7 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). The generation of relativistic electrons and positrons in thermal material surrounding a γ -ray source is examined. This in situ generation of particles can resolve many of the problems associated with the quiescent emission from non-thermal radio stars. The most luminous radio star, Cyg X-3, is used as a paradigm throughout. (15 refs.)

116886 Gamma-ray astronomy. A.W.Wolfendale (Dept. of Phys., Univ. of Durham, Durham, England). *Q. J. R. Astron. Soc. (GB)*, vol.24, no.3, p.226-45 (Sept. 1983). Discusses the discovery of cosmic γ -rays and their methods of production. Galactic gamma-rays in the middle energy range, extragalactic gamma ray emission and possible future projects are discussed. (48 refs.)

116887 e^+e^- annihilation and the cosmic X-ray background. D.Kazanas, R.A.Shafer (NASA/Goddard Space Flight Center, Greenbelt, MD, USA). *AIP Conf. Proc. (USA)*, no.101, p.343-7 (1983). (Workshop on Positron-Electron Pairs in Astrophysics, Greenbelt, MD, USA, Jan. 1983). The possibility that the processes responsible for the cosmic X-ray background (CXB) would also produce an e^-e^+ annihilation feature is examined. Under the assumption that these processes are thermal, the absence of a strong e^-e^+ annihilation feature places constraints on the compactness (L/R ratio) of these sources. Observations favor sources of small compactness ratio. (13 refs.)

116888 Massive neutrinos and the anisotropy of the cosmic microwave background radiation. M.Szymanski, M.Jaroszynski (Warsaw Univ. Obs., Warszawa, Poland). *Mon. Not. R. Astron. Soc. (GB)*, vol.205, no.1, p.91-104 (Oct. 1983). The growth of primordial adiabatic density perturbations in a Universe model containing massive neutrinos is investigated in the linear approximation. The final spectra of perturbations are computed for the initial amplitudes obeying power laws: $|\delta|^2 \sim k^n$. The resulting spectra are not amplitude-modulated by an oscillatory function. The mass distribution auto-correlation function is also calculated. The comparison of the above characteristics of matter distribution with observations suggests that the initial spectrum of perturbations should be steep. These results are in agreement with those of Peebles (1982). The anisotropy of the relic radiation is predicted. (24 refs.)

116889 Low-frequency measurement of the spectrum of the cosmic background radiation. G.F.Smoot, G.De Amici, S.D.Friedman, C.Witebsky (Lawrence Berkeley Lab., Univ. of California, Berkeley, CA, USA), N.Mandolesi, R.B.Partridge, G.Sironi, L.Danese, G.De Zotti. *Phys. Rev. Lett. (USA)*, vol.51, no.12, p.1099-102 (19 Sept. 1983). Measurements have been made of the cosmic-background-radiation spectrum at five wavelengths (0.33, 0.9, 3, 6.3, and 12 cm) with use of radiometers with wavelength-scaled corrugated-horn antennas having very low sidelobes. A single large-mouth (0.7-m-diameter) liquid-helium-cooled absolute reference load was used for all five radiometers. The results of the observations are consistent with previous measurements and represent a significant improvement in accuracy at low frequencies. (14 refs.)

98.80 COSMOLOGY

(for observational cosmology, see 98.70V; for origin and evolution of galaxy, see 98.50)

116890 Plane symmetric vacuum Bianchi type I cosmological model in Brans-Dicke theory. Shri Ram (Appl. Math. Section, Inst. of Technol., Banaras Hindu Univ., Varanasi, India). *Astrophys. & Space Sci. (Netherlands)*, vol.94, no.2, p.307-10 (Aug. 1983). Presents an exact solution of the vacuum Brans-Dicke field equations for the metric tensor of a spatially homogeneous and anisotropic cosmological model. The kasner metric is shown as a special case. Some physical properties of the model are discussed. (5 refs.)

116891 Apparent superluminal velocities due to the curvature of space. J.Soucek (Astron. Society, Czechoslovak Acad. of Sci., Prague, Czechoslovakia). *Astrophys. & Space Sci. (Netherlands)*, vol.94, no.2, p.319-31 (Aug. 1983). Shows that it is important where the observer is located in the curved space of the Universe and that this positioning objectively determines the optical properties of curved space recorded by the observer usually associated with the properties of the observed objects. There may be many phenomena of this

category, one of which can be the superluminal velocities of assumed object components. The author carefully distinguishes between objective reality of objects in curved space on the one hand and the shape of distorted notion which, on the other hand, the observer inside his curved space must necessarily form. A model of a spherical surface, locally Euclidean, immersed in Euclidean three-dimensional space is adopted as the objective reality and for the distorted notion the term 'distorted shape' is adopted for unrealistic properties which prove to be objective as an optical illusion. (38 refs.)

116892 Fragmentation of the Universe. W.K.Brown, R.R.Karpp (Los Alamos Nat. Lab., Los Alamos, NM, USA), D.E.Grady. *Astrophys. & Space Sci. (Netherlands)*, vol.94, no.2, p.401-12 (Aug. 1983). Tests the hypothesis that the Universe underwent a single fragmentation event, separating into protogalactic volumes at a relatively early stage after the Big Bang. Assuming that the present total luminosity of each galaxy is proportional to its mass, the authors plot the number and mass distribution of a thousand nearby galaxies just as in an analysis of fragments from a laboratory high-explosive experiment. The results are consistent with the single-fragmentation hypothesis. (23 refs.)

116893 On the statistical distribution of massive fermions and bosons in a Friedmann Universe. R.Ruffini, D.J.Song, L.Stella (Istituto di Fisica 'G. Marconi', Univ. di Roma, Roma, Italy). *Astron. & Astrophys. (Germany)*, vol.125, no.2, pt.1, p.265-70 (Sept. 1983). The distribution function of massive Fermi and Bose particles in an expanding Universe is considered as well as some associated thermodynamic quantities, pressure and energy density. These considerations are then applied to cosmological neutrinos. A new limit is derived for the degeneracy of a cosmological gas of massive neutrinos. (24 refs.)

116894 Constraints on neutrino-dominated cosmologies from large-scale streaming motion. N.Kaiser (Dept. of Astron., Univ. of California, Berkeley, CA, USA). *Astrophys. J. Lett. Ed. (USA)*, vol.273, no.1, pt.2, p.L17-20 (1 Oct. 1983).

The streaming motion due to long-wavelength density perturbations is calculated for neutrino-dominated cosmological models. The predictions of the models are compared with the observed motion, relative to the background radiation of a region surrounding the Galaxy with an effective diameter of approximately $50 h^{-1}$ Mpc. If the velocity of this region is typical, then the primary structure ('pancakes') can only just be forming at the present; and the short-wavelength cutoff, which sets the scale of the structures, is limited to be approximately 12 Mpc. (21 refs.)

116895 The cosmological problem as initial value problem on the observer's past light cone: observations. G.Dautcourt (Zentralinst. fur Astrophys., Akad. der Wissenschaften, Potsdam-Babelsberg, Germany).

Astron. Nachr. (Germany), vol.304, no.4, p.153-61 (1983). In a previous paper (Dautcourt 1982) it was shown how cosmological models can be characterized by few initial data on the observer's past light cone. Part of the inner geometry of the past cone as well as some matter variables taken on the cone determine a world model uniquely within the past light cone. Since the initial data to some degree enter the relations between observable quantities such as redshift, luminosity, angular diameter, number counts, distortion parameters and background radiation intensity, it might be possible to determine the required initial data from observations. This problem is discussed. (30 refs.)

116896 Bianchi-I universes of the Brans-Dicke theory for the vacuum. U.Dyllong (Zentralinst. fur Astrophys., Akad. der Wissenschaften, Potsdam, Germany).

Astron. Nachr. (Germany), vol.304, no.4, p.163-6 (1983). In German. The field equations of the Brans-Dicke theory are solved for a vacuum with the aid of a space-time metric of Bianchi-I type. Two solutions are found. One of them corresponds to a generalisation of the flat de Sitter universe. The other solution represents the Kasner variant of the Brans-Dicke theory. (7 refs.)

116897 Neutrinos in cosmology. R.J.Tayler (Astron. Centre, Univ. of Sussex, Brighton, England).

Europhys. News (Switzerland), vol.14, no.7, p.1-3 (July 1983). Gives a broad outline of the principal aspects of the standard big bang theory as it involves neutrinos. Outside these are non standard versions containing degenerate neutrinos or a non-zero cosmological constant, the possible role of grand unified theories of elementary particles in providing the initial conditions, and the influence of what are at present hypothetical particles such as the gravitino and photino. (no refs.)

116898 Spatially homogeneous and anisotropic cosmological solution in Brans-Dicke theory. Shri Ram (Inst. of Technol., Banaras Hindu Univ., Varanasi, India).

Gen. Relativ. & Gravitation (USA), vol.15, no.7, p.635-40 (July 1983). An exact solution of the vacuum Brans-Dicke field equations has been obtained for the metric tensor of a spatially homogeneous and anisotropic Bianchi type-I cosmological model. The Kasner metric is shown to be a special case. Some physical properties of the model have been discussed. (11 refs.)

116899 Cosmic censorship and curvature growth. R.P.A.C.Newman (Dept. of Appl. Maths., Queen Mary Coll., London, England).

Gen. Relativ. & Gravitation (USA), vol.15, no.7, p.641-53 (July 1983). A censorship theorem is established concerning space-times which are weakly asymptotically simple and empty according to a new definition. Future asymptotic predictability is shown to be a consequence of a criterion which bounds components of the Riemann tensor from below near locally naked singularities of a certain type. (11 refs.)

116900 Proto-galactic perturbations. R.I.Epstein (Nordita, Copenhagen, Denmark).

Mon. Not. R. Astron. Soc. (GB), vol.205, no.1, p.207-29 (Oct. 1983). In the gravitational instability picture of galaxy formation, the precursor of a galaxy or a cluster of galaxies is a region with a significantly perturbed mean density or velocity field. This region may, and generally does, have considerable substructure. To relate the early perturbations to the currently observable structures it is necessary to distinguish between perturbations which merge with other perturbations and those, more encompassing ones, which form galaxies by themselves. The latter can be thought of as 'isolated' fluctuations. The relationship between isolated fluctuations and current observations is discussed in general terms. One of the main focuses is the computation of the mass spectra of 'extremal mass' fluctuations for a Poisson distribution of point masses. The spectra of isolated fluctuations can be derived from the spectra of extremal fluctuations when the dynamics of small perturbations in a uniform background is determined. (9 refs.)

116901 The cosmological constant and classical tests of general relativity. J.N.Islam (Dept. of Math., City Univ. London, London, England). *Phys. Lett. A (Netherlands)*, vol.97A, no.6, p.239-41 (5 Sept. 1983). An upper limit of 10^{-42} cm^{-2} is placed on the absolute value of the cosmological constant by comparing with the prediction of the perihelion shift of

Mercury. It is shown that the bending of starlight near the sun gives no limit on the cosmological constant since the equation for a null geodesic takes the same form with or without the cosmological constant. (4 refs.)

116902 Monopoles in the inflationary Universe. I.G.Moss (School of Phys., Univ. of Newcastle upon Tyne, Newcastle upon Tyne, England). *Phys. Lett. B (Netherlands)*, vol.128B, no.6, p.385-8 (8 Sept. 1983). Exponential expansion of the very early Universe caused by the vacuum energy of a metastable phase provides an attractive solution to the monopole problem. However, fluctuations in the Higgs field can still lead to appreciable monopole production. In the SU(5) grand unified theory their density depends on the gauge coupling constant g and can give important information about the parameters of the theory. (21 refs.)

116903 Modeling in chaotic relativity. A.Zardecki (Theoretical Div., Los Alamos Nat. Lab., Los Alamos, NM, USA).

Phys. Rev. D (USA), vol.28, no.6, p.1235-42 (15 Sept. 1983). The chaotic behaviour of solutions to Einstein's equations has recently been studied by Barrow within the framework of the dynamical systems theory. Barrow's program of gravitational turbulence is implemented in part by considering the solutions of type VII₀ and IX as well as some intermediate types. Quantitative measures of chaos, such as the power spectrum and Lyapunov characteristic exponent, are computed. By converting the equations of motion for the cosmic scale factors to stochastic Langevin's equations, the Mixmaster cosmology in the presence of driving noise terms is investigated. Possible sources of noise can be attributed to an imperfect cancellation of the effective vacuum energy density and the energy density associated with the Higgs field. An ensemble average over random trajectories leads to the suppression of chaotic behavior for type-IX cosmology. (25 refs.)

116904 Coherent scalar-field oscillations in an expensive Universe. M.S.Turner (Astron. & Astrophys. Center, Univ. of Chicago, Chicago, IL, USA).

Phys. Rev. D (USA), vol.28, no.6, p.1243-7 (15 Sept. 1983). Motivated by the cosmological importance of coherent (classical), scalar-field oscillations in the context of the invisible axion and the new inflationary-Universe scenario, the author analyzes in general, the classical evolution of a scalar field in an isotropic and homogeneous cosmology. For a scalar potential of the form $V(\phi) = a\phi^n$ the energy density of the scalar-field oscillations decreases as $R^{-6n/(n+2)}$ when the oscillations are rapid compared to the expansion rate (R = cosmic scalar factor). The author investigates the effect of higher-order terms in the potential perturbatively, and analyzes the decay of the coherent field oscillations due to quantum particle creation. (14 refs.)

116905 Preferred anisotropies of the Universe. F.H.Busse (Dept. of Earth & Space Sci., Univ. of California, Los Angeles, CA, USA).

Phys. Rev. D (USA), vol.28, no.6, p.1248-50 (15 Sept. 1983). The problem of bifurcation from an isotropic Universe is considered. It is shown that the degeneracy of bifurcating solutions is in part removed by nonlinear effects. In particular, preferred solutions are obtained in the limits of low and high values of n where n denotes the degree of the hyperspherical harmonics describing the bifurcating solution. (8 refs.)

116906 Homogeneity of Riemannian space-times of Godel type. M.J.Reboucas, J.Tiomno (Centro Brasileiro de Pesquisas Fisicas, Rio de Janeiro, Brazil).

Phys. Rev. D (USA), vol.28, no.6, p.1251-64 (15 Sept. 1983). The conditions for space-time homogeneities of a Riemannian manifold with a Godel-type metric are examined. The Raychaudhuri-Thakurta necessary conditions for space-time homogeneity are shown to be also sufficient and to lead to five linearly independent Killing vectors. These vector fields are exhibited for the most general case and their algebra is examined. The irreducible set of isotometrically independent space-time-homogeneous Godel type metrics is shown to be given, in cylindrical coordinates, by $d\bar{s}^2 = [dt + (4\Omega/m^2)\sinh^2(mr/2)d\phi]^2 - (1/m^2)\sinh^2(mr)d\phi^2 - dr^2 - dz^2$, where Ω is the vorticity and $-\infty \leq M^2 \leq +\infty$, $m^2 = 2\Omega^2$ corresponding to the Godel metric. Sources of Einstein's equations leading to these metrics as solutions are examined, and it is shown that the inclusion of a scalar field extends the previously known region of solutions $-\infty \leq m^2 \leq 2\Omega$ to $-\infty \leq m^2 \leq 4\Omega^2$. The problem of ambiguity of physical sources of the same metric and that of violation of causality in Godel-type space-time-homogeneous universes are examined. In the case $m^2 = 4\Omega^2$, the authors obtained the first exact Godel-type solution of Einstein's equations describing a completely causal space-time-homogeneous rotating universe. (16 refs.)

116907 Feynman propagator in a linearly expanding Universe. E.Calzetta (Inst. de Astron. y Fisica del Espacio, Buenos Aires, Argentina), M.Castagnino.

Phys. Rev. D (USA), vol.28, no.6, p.1298-307 (15 Sept. 1983). It is demonstrated that three reasonable physical criteria yield a unique Feynman propagator in a linearly expanding Robertson-Walker Universe. (24 refs.)

116908 New model of the metagalaxy. A.Meszaros.

Report KFKI-1983-68, Hungarian Acad. Sci., Budapest (1983), 22 pp. The known physical laws do not exclude the existence of anticollapsing bodies in nature (anticollapse is a gravitational collapse with time reversal). It is shown that the metagalaxy, i.e. the observed part of the Universe, may in the first approximation be the interior of a giant anticollapsing body having a boundary beyond the particle horizon. This is the 'anticollapse model' of the metagalaxy. The advantage of this model follows from the fact that some anisotropies in the metagalaxy are already considered in the first approximation. Theoretical considerations show that the anticollapse model is better than the usual Friedmann model. (19 refs.)

116909 Viscosity and the monopole density of the Universe. L.Diosi, B.Keszthelyi, B.Lukacs, G.Paal.

Report KFKI-1983-77, Hungarian Acad. Sci., Budapest (1983), 9 pp. It is shown that GUT monopoles with energy about 10^{16} GeV might themselves solve the so-called monopole problem of GUT cosmologies by their unavoidable viscosity, which may lead to a quasi-inflationary scenario even without appeal to a 'false vacuum'. (23 refs.)

BIBLIOGRAPHY INDEX

- Acoustic emission, (50 refs.).....115494
Active galactic nuclei, (59 refs.).....116857
Airborne radionuclides and radiation in buildings, (85 refs.).....115940
alpha contaminated wastes, management and disposal, (138 refs.).....112344
Amplitude equations for systems with competing instabilities, (72 refs.).....111593
Applications of laser annealing of semiconductors, (130 refs.).....114009
Asteroids, (50 refs.).....116516
Atmosphere large scale circulation, (117 refs.).....116255
Atmosphere remote sensing advances, (312 refs.).....116305
Atmospheric aerosol system, (242 refs.).....116261
Atmospheric boundary layers, (217 refs.).....116257
Atmospheric radiation, (1407 refs.).....116277
Atomic spectroscopy bibliography for January-June 1983, (599 refs.).....115594
Background atmospheric ^{222}Rn concentrations, (54 refs.).....115939
Beam-gas study of chemiluminescent reactions of Sn, Ge, and Si with F_2 , (64 refs.).....115560
Biomedical lasers, (76 refs.).....115897
Biomedical signal processing, (81 refs.).....115958
BL Lacertae-type objects, (51 refs.).....116858
Black holes, (58 refs.).....116739
Cancer and radiotherapy, (58 refs.).....115915
Cataclysmic variable stars, (71 refs.).....116697
Chemical vapour deposition of group IVB, VB, and VIB elements with non-metals, (259 refs.).....115076
Clean and adsorbate-induced surface phase transitions on $\text{W}\{100\}$, (73 refs.).....114310
Climate prediction, (84 refs.).....116260
Cloud electrification, (112 refs.).....116253
Cloud physics, (454 refs.).....116252
Collapse and explosion of white dwarfs, (68 refs.).....116648
Collective acceleration of ions in straight relativistic electron beams, (115 refs.).....112486
Cool stars chromospheres, (55 refs.).....116629
Cretaceous-Tertiary boundary sediments, (60 refs.).....116086
Differential polarization spectroscopy on single crystals of transition metal complexes, (83 refs.).....114802
Dynamic methods in plasma physics, (240 refs.).....113633
Electrical properties of dislocations and boundaries in semiconductors, (95 refs.).....114481
Electron positron pairs in radio pulsars, (128 refs.).....116724
Electronic transport in tetrahedral amorphous semiconductors, (92 refs.).....114520
Energy deposition during laser annealing of semiconductors, (50 refs.).....114003
Environmental half-time for radionuclides deposited on vegetation, (53 refs.).....115718
Epitaxy by pulsed annealing of ion-implanted silicon, (69 refs.).....114398
Epitaxy of deposited Si, (81 refs.).....114399
Extraterrestrial messenger probes in Solar System, (57 refs.).....116496
Ferroelectric and pyroelectric organic materials, (50 refs.).....114791
Fibre optic gyroscopes, (34 refs.).....113101
Fission fragment angular distributions from continuum states, (120 refs.).....112291
Fission gas release model, (55 refs.).....112332
Galaxies rotation curves, (334 refs.).....116492
Gamma ray bursters, (57 refs.).....116875
Gd, rare earth ion recoiling and high-spin states, (53 refs.).....112033
Generation of coherent far-infrared radiation using lasers, (234 refs.).....113059
Glacioisostasy, (64 refs.).....116060
Global Atmospheric Research Program, (791 refs.).....116279
Globular cluster stars, (141 refs.).....116775
Greece.....116033
Group theory of nonrigid molecules, (81 refs.).....112809
Hard inclusive processes in QCD, (131 refs.).....111964
Highly accurate inversion methods for three-dimensional stratified media, (51 refs.).....116308
Infrasound effects on human health, (22 refs.).....115830
Interstellar magnetic field, (116 refs.).....116796
Ion-induced sputtering, (59 refs.).....114993
Ion sources, (65 refs.).....111812
Large-angle scattering of 1p-shell nuclei, (51 refs.).....112241
Laser and electron beam annealing of compound semiconductors, (80 refs.).....114007
Late-type stars, (50 refs.).....116657
Lattice diffusion of substitutional elements in iron and iron-base solid solutions. A critical review, (248 refs.).....114270
Lepton spectroscopy, (560 refs.).....111934
Lightning, (138 refs.).....116254
Long Valley/Mono Basin volcanic complex, (69 refs.).....116056
Lorenz equations, real and complex, relevance to physical systems, (70 refs.).....113405
Lunar palaeomagnetism, (86 refs.).....116500
Magnetic ordering phenomena in rare earth semiconductors, (71 refs.).....114656
Marine sediment transport, (137 refs.).....116077
Medical NMR spectroscopy and microscopy, (52 refs.).....115895
Metal surfaces, microscopic structure effect on optical properties, (206 refs.).....114807
Meteorology and climatology of polar regions, (291 refs.).....116258
Meteorology at mesoscale, (291 refs.).....116256
Microstructure and topography of laser annealed semiconductors, (126 refs.).....113709
Molecular mechanics with an array processor, (66 refs.).....112647
Molecular mechanism of Na conductance changes in nerve, (55 refs.).....115775
Mossbauer spectroscopic studies of surface magnetism, (56 refs.).....114763
MRD-CI potential surfaces using balanced basis sets, (51 refs.).....112663
Na metal, ignition and burning behaviour in air, (87 refs.).....112401
Negative ion sources, (54 refs.).....111813
 NH_4Cl particle nucleation and growth dynamics, (52 refs.).....114153
Noncrystalline semiconductors, (59 refs.).....113738
Nonempirical calculations of molecular characteristics, (62 refs.).....112642
Nonlinear and frequency-dependent transport phenomena in low-dimensional conductors, (98 refs.).....114514
Nonlinear systems, orders and chaos, (101 refs.).....111564
Nonlinear waves: from hydrodynamics to plasma theory, (80 refs.).....113461
Nuclear data sheets for $A=153$, (203 refs.).....111328
Nuclear data sheets for $A=79$, (153 refs.).....111327
Nuclear data sheets, references for January-April 1983, (506 refs.).....111329
Nucleon energy in nucleus, (81 refs.).....112053
Ocean chemistry, recent research, (386 refs.).....116148
Ocean fine structure and microstructure, (211 refs.).....116142
Ocean internal waves, (232 refs.).....116143
Ocean mesoscale circulation, (134 refs.).....116136
Oceanic internal wave field, (170 refs.).....116146
Oceanic subsurface tropical gyres, (69 refs.).....116137
Oceanographic remote sensing, (503 refs.).....116144
Oceanography of continental shelf areas, (526 refs.).....116141
Oceanography of equatorial regions, (243 refs.).....116140
Oceanography of polar regions, (122 refs.).....116138
Oceans, organic chemistry, (591 refs.).....116149
Optical fibre sensors: principles and applications, (32 refs.).....113104
Optical image processing in coherent and incoherent light, (52 refs.).....112947
Oxygen clustering and effect on electrical behaviour in silicon, (102 refs.).....114190
Palaeo-oceanography, (426 refs.).....116145
Phase polarisation laser spectroscopy, (78 refs.).....111779
Photon and fluorescence correlation spectroscopy and light scattering of eye-lens proteins at moderate concentrations, (52 refs.).....115747
Photosphere MHD instability, (80 refs.).....116563
Planetary nebulae, (54 refs.).....116804
Planetary nebulae nuclei, (51 refs.).....116651
Plasma expansion into vacuum, (89 refs.).....116470
Point defect thermodynamics of semiconductors, (196 refs.).....113907
Polarisation effects in single-mode fibres, (81 refs.).....113118
Polymer blend melt flow, (87 refs.).....113722
Post-critical heat flux heat transfer in reactors, (71 refs.).....112367
Preparation of ceramics and glasses from organosilicon compounds, (81 refs.).....115144
PWR primary coolant, analytical and sampling problems, (178 refs.).....111336
Quenching-resolved emission anisotropy studies with single and multiphoton-containing proteins, (57 refs.).....115746
Radio elliptical galaxies, (51 refs.).....116848
Radio pulsars, (54 refs.).....116717
Radio sources circular polarisation, (68 refs.).....116494
radioactive jet from reactor accident, integral model, (61 refs.).....112448
Rotation barriers in molecules with lone pairs, bond orbital calculations, (54 refs.).....112643
Si:Zn structures, physical properties and functional possibilities, (69 refs.).....114547
Silicon molecular beam epitaxy, (236 refs.).....115059
Solar filaments, (50 refs.).....116625
Solid phase regrowth of semiconductors, (70 refs.).....114006
Soliton experiments in plasmas, (309 refs.).....113602
Solitons and numerical experiments, (142 refs.).....111903
Solubility of H_2 -He mixtures in fluid phases to 1 GPa, (56 refs.).....114179
Spectroscopic and structural properties of metallo-proteins, (202 refs.).....115739
Splitting up schemes for solving hyperbolic and parabolic nonlinear problems, (60 refs.).....111450
Stopping power for heavy ions in low energy region, (53 refs.).....112606
Surfaces and thin films, (353 refs.).....114317
Symbiotic novae, (59 refs.).....116660
Symbiotic stars, (52 refs.).....116698
Symmetries of Maxwell and Dirac equations, (64 refs.).....111902
Thermometric and calorimetric methods in electrochemical and corrosion studies, (66 refs.).....111686
Thermosyphon domestic solar energy water heaters, (97 refs.).....115693
Transition metal impurities in silicon, (55 refs.).....113936
Turbulence, (131 refs.).....113422
UV two photon spectroscopy of benzene, (65 refs.).....112802
Vibrational band intensities of hydrocarbons, (275 refs.).....112692
Vibrational energy relaxation of highly compressed gaseous H_2 and N_2 , (57 refs.).....112816
Voltage-dependent K conductance at the apical membrane of *Necturus* gall-bladder, (50 refs.).....115760
Wave optics and Fresnel's theory of diffraction, (58 refs.).....111388
Weather modification, (181 refs.).....116259
 $X\alpha$ multiple scattering calculations on iron (ii) porphine, (51 refs.).....112653

BOOK INDEX

- Advances in Mossbauer spectroscopy. Applications to physics, chemistry and biology;** *B.V.Thosar, P.K.Iyengar, J.K.Srivastava, S.C.Bhargava (editor/s)*, [Amsterdam, Netherlands: Elsevier 1983] 111334
Elastic media with microstructure II. Three-dimensional models; *I.A.Kunin*, [Berlin, Germany: Springer-Verlag 1983] 111318
Laser annealing of semiconductors; *J.M.Poate, J.W.Mayer (editor/s)*, [London, England: Academic Press 1982] 111333 (introductory abstract), 113709, 114001-9, 114321, 114398-9

- Optical fiber systems: Technology, design, and applications;** *C.K.Kao*, [New York, USA: McGraw-Hill 1982] 111330
Perturbative quantum chromodynamics; *M.Jacob (editor/s)*, [Amsterdam, Netherlands: North-Holland 1982] 111319
Radiation effects computer experiments; *J.R.Beeler Jr.*, [Amsterdam, Netherlands: North-Holland 1982] 111332
Surface physics. Second edition; *M.Prutton*, [Oxford, England: Clarendon 1983] 111335

CONFERENCE INDEX

- 1982 CERN School of Computing**; Zinal, Valais, Switzerland, 29 Aug.-11 Sept. 1982, [Geneva, Switzerland: CERN 1983] 112490, 112523
- Accelerator engineering and technology**; Santa Fe, NM, USA, 21-23 March 1983, [Aug. 1983] 112463-85, 112511
- Acoustics, speech and signal processing, 1982**; Paris, France, 3-5 May 1982, (*IEEE*) [New York, USA: IEEE 1982] 112394, 112310
- Application systems development**; Nurnberg, Germany, 22-24 March 1983, *H.J.Schneider (editor/s)*, [Stuttgart, Germany: B.G. Teubner 1983] 112612-13
- Applied electromagnetics**; Florence, Italy, 4-6 Oct. 1982, [May-June 1983] 111674, 111743, 113098-9, 116167-8, 116280-2, 116339
- Chemical vapour deposition**; Eindhoven, Netherlands, 31 May-2 June 1983, *J.Bloem, G.Verspu, L.R.Wolff (editor/s)*, [Eindhoven, Netherlands: Philips Centre Manuf. Technol. 1983] 111316 (introductory abstract), 112351, 112442, 113070, 113790, 114375, 114402-22, 114424-5, 114428, 114949, 115077-102, 115396-8, 115448-51, 115506
- Cineradiography with photons or particles**; Paris, France, 18-21 May 1981, (*CEA*) [1983] 111300 (introductory abstract), 111835-47, 112319, 112368-70, 112569-70, 113525, 113655-8, 113674
- Composite materials**; Capri, Italy, 15-19 June 1981, *J.C.Seferis, L.Nicolas (editor/s)*, [New York, USA: Plenum 1983] 111312 (introductory abstract), 112890, 113291-2, 113372, 115160-2, 115180, 115249-50, 115292-7, 115360-5, 115394-5, 115502-5
- Consumer electronics**; Des Plaines, IL, USA, 8-10 June 1983, (*IEEE*) [1983] 111695, 111794, 113150
- Cross sections for fusion and other applications**; College Station, TX, USA, 4-6 Nov. 1982, [1983] 111298 (introductory abstract), 112826-37, 112844-8, 112855, 113639, 114988
- Defects in semiconductors**; Boston, MA, USA, Nov. 1982, *S.Mahajan, J.W.Corbett (editor/s)*, [New York, USA: North-Holland 1983] 111315 (introductory abstract), 112997, 113742, 113905-7, 113915, 113923, 113930-1, 113936, 113943-7, 113954, 113981, 114020-1, 114077, 114190-6, 114201, 114251-2, 114275-9, 114284, 114322-3, 114400-1, 114476-83, 114549, 114611, 114629, 114734, 114871, 114897, 114926-7, 115060, 115114-15
- Electro '82**; Boston, MA, USA, 25-27 May 1982, [El Segundo, CA, USA: Electron. Conventions 1982] 111672-3, 113224-7, 115961
- Electrochemical Society technical meeting**; Washington, DC, USA, 9-14 Oct. 1983, [Pennington, NJ, USA: Electrochem. Soc. 1983] 111317 (introductory abstract)
- Fifteenth Hawaii International Conference on System Sciences 1982**; Honolulu, HI, USA, 6-8 Jan. 1982, (*Univ. Hawaii; Univ. Southwestern Louisiana; W.Riddle, K.Thurber, P.Keen, R.H.Sprague Jr., B.Shriver, T.M.Walker, R.R.Grams (editor/s)*, [HI, USA: Hawaii Int. Conference Syst. Sci. 1982] 115892, 115901, 115919-20
- Heat pumps**; Brussels, Belgium, 28-29 April & 12-13 May 1982, *H.Ehringer, P.Zegers, G.Hoyaux, J.A.Knobbout (editor/s)*, [Luxembourg: Comm. European Communities 1982] 111313 (introductory abstract), 115669-84
- IAU General Assembly 1982 Patras meeting proceedings**; Patras, Greece, 17-26 Aug. 1982, (*IAU*) *R.M.West (editor/s)*, [Dordrecht, Netherlands: Reidel 1983] 111314 (introductory abstract)
- Identification and system parameter identification**; Washington, DC, USA, 7-11 June 1982, (*IFAC*) *G.A.Bekey, G.N.Saridis (editor/s)*, [Oxford, England: Pergamon 1983] 115787-9, 115812, 115820-4, 116164-6, 116267, 116316-21
- Instrumentation in the mining and metallurgy industries**; Denver, CO, USA, 5-7 May 1982, *D.J.Spottiswood, D.H.Davis (editor/s)*, [Research Triangle Park, NC, USA: ISA 1982] 112460
- ITC/USA 82**; San Diego, CA, USA, 28-30 Sept. 1982, [*Int. Found. Telemetering*] [Woodland Hills, CA, USA: Int. Found. Telemetering 1982] 116480, 116486
- Laser-solid interactions and transient thermal processing of materials**; Boston, MA, USA, 1-4 Nov. 1982, (*US DOE*) *J.Narayan, W.L.Brown, R.A.Lemons (editor/s)*, [New York, USA: Elsevier 1983] 113942, 113988-9, 114010-19, 114027-31, 114054, 114475, 114530, 115050
- Light ion reaction mechanisms**; Osaka, Japan, 16-20 May 1983, *H.Ogata, T.Kammuri, I.Katayama (editor/s)*, [Osaka, Japan: Osaka University 1983] 111309 (introductory abstract), 112051-2, 112067, 112076, 112082, 112084, 112105, 112115-17, 112137-9, 112144-7, 112158-60, 112163, 112204-18, 112223-32, 112237, 112275-9, 112293, 112522
- Magnetosphere waves**; Kona Coast, HI, USA, 7-11 Feb. 1983, [1983] 111303 (introductory abstract), 116338, 116358-61, 116392-405, 116504, 116519
- Materials sciences under microgravity**; Madrid, Spain, 5-8 April 1983, (*ESA; UPM; ELGRA; COSPAR*) [Paris, France: ESA 1983] 113444, 113789, 114130-1, 114147-50, 114233, 114291, 114371, 115123, 115131, 115511
- Measurement methods and technology**; Berlin, Germany, 24-28 May 1982, *K.Havrilla, J.Solt, T.Kemeny (editor/s)*, [Amsterdam, Netherlands: North-Holland 1983] 111624, 111630-1, 111644-7, 111650, 111666-71, 111707-8, 112965, 113139, 113223, 113244, 113538-40, 115497, 115716-17, 115966-9, 115981
- Metallogeny and tectonics of North American Cordillera**; Calgary, Alta., Canada, 13 May 1981, [1983] 111299 (introductory abstract)
- Microscopy techniques and capabilities**; London, England, 21-22 Sept. 1982, (*IOP; IEE*) [1983] 111302 (introductory abstract), 111633, 111760-5, 111819, 111848-9, 113233-7, 115596-7, 115906, 115982
- Neutron radiography**; San Diego, CA, USA, 7-10 Dec. 1981, (*ASTM; American Soc. Nondestructive Testing; British Inst. Nondestructive Testing*) *J.P.Barton, P.Von Der Hardt (editor/s)*, [Dordrecht, Netherlands: Reidel 1983] 111857-61, 112391-3, 112521, 113541, 115498-501
- Neutron scattering in condensed matter**; Hakone, Japan, 1-4 Sept. 1982, [May 1983] 113720-1, 113749-53, 114105-9, 114114, 114119-20, 114163-5, 114215, 114250, 114459, 114792
- Nuclear physics**; Fuglso, Denmark, 16-20 Aug. 1982, (*NORDITA; Danish Natural Sci. Res. Council; Niels Bohr Inst*) [1983] 111306 (introductory abstract), 111387, 112026, 112037-49, 112058-9, 112064, 112074-5, 112088, 112111-13, 112131-2, 112136, 112154-6, 112162, 112260-9, 112290, 112292, 112440
- OPTICS 82, ECOSA 82**; Edinburgh, Scotland, 7-10 Sept. 1982, (*SPIE*) [1983] 111634-5, 111752-4, 111774-6, 111785, 112947, 112959, 112966, 113036-9, 113048, 113066, 113088, 113101-4, 113153-4, 113526, 113937, 113983

literature you
do not hold ?

BOSTON SPA

Can help you

Over 54000 current periodicals available*

Most of the papers listed in INSPEC services
are held at the British Library Lending Division (BLLD)

REQUESTS DEALT WITH IN 48 HOURS*

Write for further information to:

The Director General
The British Library Lending Division
Boston Spa
Wetherby
West Yorkshire LS23 7BQ
U.K.
Telephone 0937 843434

*Photocopies of papers are available for research or private study to organisations in the UK registered as users of the BLLD. Where individuals in the UK do not belong to an organisation registered with the BLLD they should apply via their public library. In case of difficulty please contact the BLLD.

All requests from outside the UK should be made via the BLLD Overseas Photocopy Service.

COMPUTER AND CONTROL ABSTRACTS

A Complete information Service in Computer Science and Control Engineering

Coverage

Over 40,000 references are included each year. These are selected by scanning over 3,000 journals and the proceedings of over 1,000 conferences. In addition coverage is given of books, reports and dissertations.

What Information is Included?

Each reference in CCA includes the following information:

Title of paper

All authors' names and affiliation of first author

Source of paper (eg name of journal, volume and issue number, page numbers and date of publication)

100-150 word abstract.

Ease of use

Careful classifying and indexing of entries puts information at your fingertips. References are classified under 250 headings, allowing you to go straight to the information of most interest to you. (A summary of the classification appears in every issue).

These six separate indexes are included in each issue:

Subject guide

Author index

Bibliography index

Book index

Conference index

Corporate author index

The above indexes are cumulated at six-monthly intervals.

The author and subject indexes are also cumulated at four-yearly intervals*.

Do You Have Access to This Important Journal?

Does your library or information service provide you with access to this important journal? If not, ask your librarian to contact INSPEC for a free sample and subscription details or write to us direct.

(*four year cumulative indexes not included in annual subscription price)

CUMULATIVE INDEXES

Cumulative indexes are available for *Physics Abstracts*, *Electrical & Electronics Abstracts* and *Computer & Control Abstracts*, for both authors and subjects. These cumulations generally cover a period of four years, with the exception of *Computer & Control Abstracts* where the initial volume covered the period 1966-68. The table below shows the prices and periods for the two types of cumulative index.

	PHYSICS ABSTRACTS		ELECTRICAL & ELECTRONICS ABSTRACTS		COMPUTER & CONTROL ABSTRACTS	
	Subject	Author	Subject	Author	Subject	Author
	£	£	£	£	£	£
1955-59	20	20	15	20	—	—
1960-64	40	17	20	12	—	—
1965-68	60	25	35	20	—	—
1969-72	—	—	72	64	48	30
1973-76	600	300	250	150	150	75
1977-80	770	450	380	250	250	120
1966-68	—	—	—	—	15

ORDERING PROCEDURE

THE AMERICAS

North (including Canada), Central and South

All orders from the above areas, and orders from members of Institute of Electrical and Electronics Engineers Inc. anywhere in the world, should be sent to Fulfillment Manager, Institute of Electrical & Electronics Engineers Inc., 445 Hoes Lane, Piscataway, N.J. 08854, USA. Telephone (201) 981 0060

日本のお客様にご案内申し上げます

日本国内に於ける INSPEC の購入価格はすべて円建てとなっております。また刊行物はすべて航空便で配達されます。INSPEC 刊行物の価格、その他についてのお問い合わせは最寄の支店取扱専門店または輸入総代理店株式会社・エス・エシテック・カンパニー 〒105 東京都港区新橋1-13-12、TEL 03 (502) 6471 までご連絡ください。

REMAINDER OF THE WORLD

All remaining subscriptions should be sent to INSPEC Marketing Department, P O Box 26, Hitchin, Herts SG5 7RS, England. Telephone Hitchin 53331, Telex 825962, Telegrams IEE G.

OTHER INSPEC SERVICES

SDI

(Selective Dissemination of Information.) This is a service individually tailored to the requirements and interests of the engineer or research worker. Details of information relevant to the interest profile of the individual subscriber are selected from the data being processed for the INSPEC database. Information is dispatched weekly on 150 mm x 100 mm (6" x 4") cards.

TOPICS

This is an SDI service based on standard profiles. There are over 70 subjects covering high-activity areas of research and development. This is an inexpensive card service designed to alert engineers and researchers to the availability of literature within their subject area.

MAGNETIC TAPES

Tapes containing all the information included in the INSPEC publications are issued twice monthly. They enable the larger research and development organisations to produce their own internal information and current-awareness services.

Summary Classification

The full classification and contents are given at the front of the journal, followed by an **Alphabetical Index** to the subjects covered

00.00 General

- 01.00 Communication, Education, History and Philosophy
- 02.00 Mathematical Methods in Physics
- 03.00 Classical and Quantum Physics; Mechanics and Fields
- 04.00 Relativity and Gravitation
- 05.00 Statistical Physics and Thermodynamics
- 06.00 Measurement Science, General Laboratory Techniques, and Instrumentation Systems
- 07.00 Specific Instrumentation and Techniques of General Use in Physics

10.00 The Physics of Elementary Particles and Fields

- 11.00 General Theory of Fields and Particles
- 12.00 Specific Theories and Interaction Models; Particle Systematics
- 13.00 Specific Reactions and Phenomenology
- 14.00 Properties of Specific Particles and Resonances

20.00 Nuclear Physics

- 21.00 Nuclear Structure
- 23.00 Radioactivity and Electromagnetic Transitions
- 24.00 Nuclear Reactions and Scattering: General
- 25.00 Nuclear Reactions and Scattering: Specific Reactions
- 27.00 Properties of Specific Nuclei listed by Mass Ranges
- 28.00 Nuclear Engineering and Nuclear Power Studies
- 29.00 Experimental Methods and Instrumentation for Elementary-Particle and Nuclear Physics

30.00 Atomic and Molecular Physics

- 31.00 Theory of Atoms and Molecules
- 32.00 Atomic Spectra and Interactions with Photons
- 33.00 Molecular Spectra and Interactions with Photons
- 34.00 Atomic and Molecular Collision Processes and Interactions
- 35.00 Properties of Atoms and Molecules; Instruments and Techniques
- 36.00 Studies of Special Atoms and Molecules

40.00 Classical Areas of Phenomenology

- 41.00 Electricity and Magnetism; Fields and Charged Particles
- 42.00 Optics
- 43.00 Acoustics
- 44.00 Heat Flow, Thermal and Thermodynamic Processes
- 46.00 Mechanics, Elasticity, Rheology
- 47.00 Fluid Dynamics

50.00 Fluids, Plasmas and Electric Discharges

- 51.00 Kinetic and Transport Theory of Fluids; Physical Properties of Gases
- 52.00 The Physics of Plasmas and Electric Discharges

60.00 Condensed Matter: Structure, Thermal and Mechanical Properties

- 61.00 Structure of Liquids and Solids; Crystallography
- 62.00 Mechanical and Acoustic Properties of Condensed Matter
- 63.00 Lattice Dynamics and Crystal Statistics
- 64.00 Equations of State, Phase Equilibria, and Phase Transitions
- 65.00 Thermal Properties of Condensed Matter
- 66.00 Transport Properties of Condensed Matter (Nonelectronic)
- 67.00 Quantum Fluids and Solids; Liquid and Solid Helium
- 68.00 Surfaces and Interfaces; Thin Films and Whiskers

70.00 Condensed Matter: Electronic Structure, Electrical, Magnetic, and Optical Properties

- 71.00 Electron States
- 72.00 Electronic Transport in Condensed Matter
- 73.00 Electronic Structure and Electrical Properties of Surfaces, Interfaces, and Thin Films
- 74.00 Superconductivity
- 75.00 Magnetic Properties and Materials
- 76.00 Magnetic Resonances and Relaxation in Condensed Matter; Mossbauer Effect
- 77.00 Dielectric Properties and Materials
- 78.00 Optical Properties and Condensed Matter Spectroscopy and other Interactions of Matter with Particles and Radiation
- 79.00 Electron and Ion Emission by Liquids and Solids; Impact Phenomena

80.00 Cross-Disciplinary Physics and Related Areas of Science and Technology

- 81.00 Materials Science
- 82.00 Physical Chemistry
- 86.00 Energy Research and Environmental Science
- 87.00 Biophysics, Medical Physics, and Biomedical Engineering

90.00 Geophysics, Astronomy and Astrophysics

- 91.00 Solid Earth Geophysics
- 92.00 Hydrospheric and Atmospheric Geophysics
- 93.00 Geophysical Observations, Instrumentation, and Techniques
- 94.00 Aeronomy and Space Physics
- 95.00 Fundamental Astronomy and Astrophysics, Instrumentation and Techniques and Astronomical Observations
- 96.00 Solar System
- 97.00 Stars
- 98.00 Stellar Systems; Galactic and Extragalactic Objects and Systems; The Universe
